The following figure describes two scenarios for the register re-load. Scenario (a) is a normal re-load where the buffers of the double-buffered registers are programmed and the GRE bit is set before the next MRS occurs. The scenario presented in (b) describes an error condition where the software did not signal the hardware that all registers are ready for re-load before the next MRS. This is indicated by GRE being at zero when MRS occurs. In this case, MRS_RE flag is set indicating the fault condition.

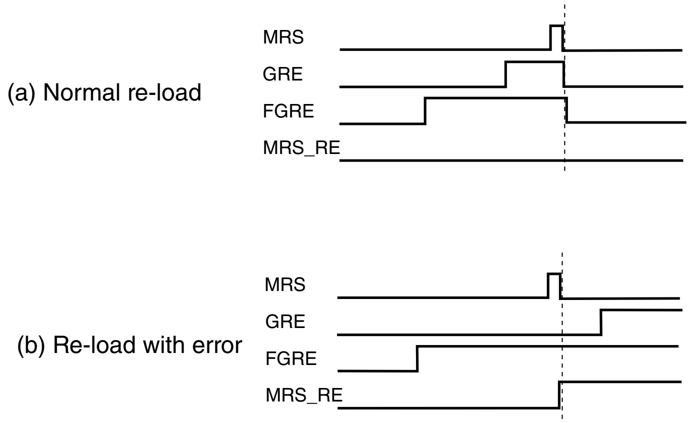

Figure 41-14. Reload scenarios

41.7 Interrupts and DMA Requests

41.7.1 DMA support

The DMA interface can be used to configure the CTU registers. A DMA request is issued if MRS occurs and the GRE bit is set. In this case, the previously transferred data is loaded from the buffers into the registers and a new transfer cycle is initiated with the DMA request. The DMA done signal from the DMA controller is used to set GRE bit which allows the reload to be performed. The following figure describes this operation.

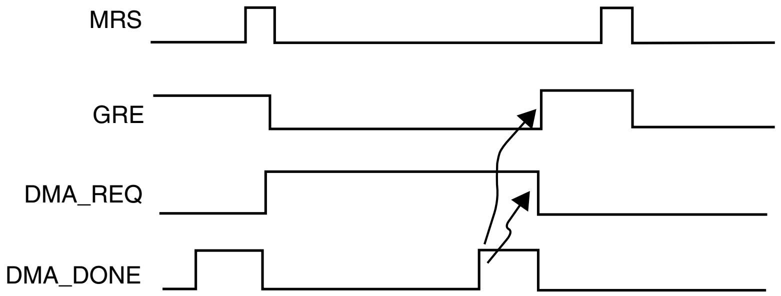

Figure 41-15. Register reload using DMA

DMA support can also be provided for reading FIFO stored data. Each FIFO can be configured to perform a DMA request when the number of stored words reaches a threshold value defined in the FTH register. See the FIFO Threshold, FTH, register for more information. After a DMA_DONE and the remaining data in the FIFO is below the watermark, then the DMA request is removed. Thus for an efficient operation, the DMA should be configured to execute a loop reading all data in the FIFO considering the amount of data the same as defined by the watermark.

41.7.2 CTU faults and errors

The CTU detects and signals the following error conditions:

- MRS reload error: MRS occurs while user is updating the double-buffered registers.
- Sequential mode trigger overrun SM_TO: more than 8 event signals occur before the next MRS in TGS sequential mode.

- Trigger event overrun indicated by 4 interrupt signals ADC_OE, T0_OE, T1_OE and ET_OE: a trigger event occurs during the time frame when the previous trigger was not completed.
- The CTU allows the user to pre-set a trigger to the eTimer1 in the middle of an ADC conversion. In parallel mode even two ADCs' commands can be issued at the same time. The error only occurs if the second trigger is targeting the same ADC.
- Invalid (unrecognized) ADC command occurs and the ICE bit is set.
- Master reload signal overrun MRS_O: MRS occurs before all triggers selected by (Tn_E and (TnETE or TnTmE or Tn_ADCE)) bits in THCR1/2 registers have occurred.
- TGS_OSM TGS overrun in sequential mode: a new event occurs before the trigger event selected by the previous event had occurred.

The faults/errors flags in the CTU error flag register and in the CTU interrupt flag register can be cleared by writing 1 to the respective bit. Writing 0 to these bits has no effect.

Note

> The CTU does not support write-protection mechanism for any register, meaning that all registers are accessible at any time.
>
> The CTU does not generate a transfer error when its reserved address space is accessed.

41.7.2.1 CTU parallel list errors

The command list operation in parallel mode may generate errors since two lists may be in execution at the same time. Below some error conditions are described.

Commands for the same ADC are issued at the same time by two lists. In this case:

- One of the commands is disregarded and an error is issued.
- The LIST_BE bit in the EFR register is set.
- The address of the list commands are shown in the LISTCSR register.
- The address of the command that was not executed is indicated in the LISTCSR register.

A third list is triggered when two lists are already being executed. In this case:

- The third list is not executed and an error is indicated by the ADC_OE bit in the EFR register.

One list is being executed and a second list is triggered; the first command of the second list is for the same ADC being used by the first list. In this case:

- The command of the second list is not executed.
- The address of the second list command is shown in the LISTCSR register.
- The LIST_BE bit in the EFR register is set.

41.7.3 CTU interrupt/DMA requests

The CTU generates the following interrupt/DMA requests which are controlled by the IR register:

- Error interrupt request, see CTU faults and errors (1 interrupt line)
- ADC command interrupt request (1 interrupt line).
- MRS interrupt request (1 interrupt line)
- Trigger event interrupt request (1 interrupt line for each trigger event)
- FIFOs interrupt and/or DMA transfer request (1 interrupt line for each FIFO). See FIFO control register, FCR.
- DMA transfer request on the MRS occurrence if GRE bit is set

41.8 Self test mode

The CTU is capable of issuing a self test command to the ADC.

The CLRx register is used to set up a self test command. Table 41-2 describes the ST0 and ST1 bits that control self-test functionality.

Table 41-2. Self-test command

ST_CMS bit	ST1 bit	ST0 bit	Command description
0	Not Used	0	no self test single conversion
1	Not Used	0	no self test dual conversion
Not Used	0	1	self test command

Table continues on the next page...

Table 41-2. Self-test command (continued)

ST_CMS bit	ST1 bit	ST0 bit	Command description
0	1	1	no self test command single conversion
1	1	1	no self test command dual conversion

Two algorithms are available in self test mode, see Table 41-3.

Table 41-3. Self-test algorithm selection

ALG[1]	Number of steps	Executed Algorithm
00	3	Algorithm S
01[2]	–	Reserved
10	12	Algorithm C
11	15	Algorithm FULL (S + C)

[1] ALG refers to the CLRx register field.
[2] The 01 selection causes a command execution error and the LIST_BE flag is set in the Error Flag Register (EFR).

The self-test S algorithm is executed in an atomic burst of conversions independent of the BSIZE value in the CLRx register. Below are described the steps for this algorithm execution.

- Step 0: VBGAP/VREF test
- Step 1: VDD/VREF test
- Step 2: VREF/VREF test

When the FULL algorithm is selected, the CTU executes the S algorithm followed by the C algorithm.

The self-test execution follows the trigger scheme selected for the CTU, either triggered mode or sequential mode can be selected.

In order to completely execute one of the algorithms described in Table 41-3 a certain number of steps need to be performed. Each step corresponds to the time for one ADC conversion to complete. These steps may be executed at once, by just one command, or they can be interleaved with other ADC commands. In order to executed self-test commands interleaved with other conversion commands it is sufficient to set the BSIZE field in the CLRx register for a value lower than the number of steps defined for the selected algorithm. The following figure shows the execution of the C algorithm interleaved with regular ADC commands.

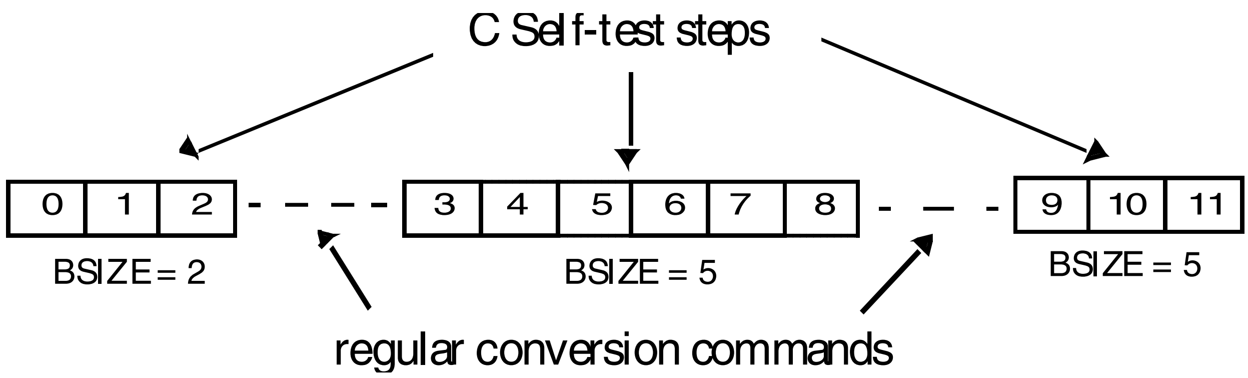

Figure 41-16. C Algorithm execution interleaved with others ADC commands

In the figure above, the last C self-test sequence intentionally shows BSIZE set to a larger value than the remaining steps needed to complete the C algorithm. In this case, the number of executed self-test steps does not follow BSIZE but instead it follows the number of remaining steps for the selected self-test algorithm, which in this case is 3 steps.

Note

> The S algorithm steps do not interleave with other ADC commands even if BSIZE is smaller than 3. Independent of BSIZE value all the 3 steps of the S algorithm are executed in a contiguous sequence.

The number of steps needed to completely execute the selected self-test algorithm is as follows:

- S algorithm requires 3 steps
- C algorithm requires 12 steps
- FULL runs all algorithm and requires 15 steps

In the figure below, the FULL algorithm is executed interleaved with other ADC commands. The BSIZE = 3 in the first and second self-test commands produces different number of executed self-test steps.

regular conversion commands

Figure 41-17. FULL algorithm execution interleaved with other ADC commands

41.8.1 Self-test execution errors

When a self-test algorithm is initiated for an ADC, it should complete before any other self-test algorithm is started in the same ADC. In other words, one self-test algorithm should not be interleaved with another self-test algorithm. Any attempt to do so will cause the ongoing list execution to be halted and cause the LIST_BE error flag (see LIST_BE) to be set. In order to evaluate if a self-test algorithm is running, the CS bit (see CS) can be checked. If set, this bit indicates a self-test has initiated in one of the ADCs. If a self-test algorithm conflict occurs, as described, the recovery procedure is to issue a software reset through the CTU_ADC_R bit in the CR register.

An error condition (see LIST_BE) is also caused when the reserved value 01 is selected for the self-test algorithm.

41.9 Power saving modes

In order to reduce power consumption, a STOP mode is provided.

41.9.1 STOP mode

The STOP signal is an input to the CTU that disables the clocks for all registers including memory mapped registers. Thus, writes have no effect and reads do not return valid data after STOP mode is entered.

The CTU enters STOP mode immediately after STOP signal is asserted, thus in order to avoid wrong module operation some housekeeping should be performed prior to entering low power mode:

- The triggers should be disabled thus no pending ADC commands exist.
- The CTU output need also be disabled through the CTU_ODIS bit.
- The FIFOs should be empty with no pending data conversion for read.

Chapter 42
System Timer Module (STM)

42.1 Introduction

NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

This section provides an overview, list of features, and modes of operation for the STM.

42.1.1 Overview

The System Timer Module (STM) is a 32-bit timer designed to support commonly required system and application software timing functions. The STM includes a 32-bit up counter and four 32-bit compare channels with a separate interrupt source for each channel. The counter is driven by the system clock divided by an 8-bit prescale value (1 to 256).

42.1.2 Features

The STM has the following features:

- One 32-bit up counter with 8-bit prescaler
- Four 32-bit compare channels
- Independent interrupt source for each channel
- Counter can be stopped in debug mode

42.1.3 Modes of operation

The STM supports two device modes of operation: normal and debug. When the STM is enabled in normal mode, its counter runs continuously. In debug mode, operation of the counter is controlled by the FRZ bit in the STM_CR register. If the FRZ bit is set, the counter is stopped in debug mode, otherwise it continues to run.

42.2 External signal description

The STM does not have any external interface signals.

42.3 Memory map and registers

The STM programming model includes a group of 32-bit registers—a module control register, a counter value register, and three registers for each channel.

The STM registers can only be accessed using 32-bit (word) accesses. Attempted references using a different size or to a reserved address generates a bus error termination.

STM memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	STM Control Register (STM_CR)	32	R/W	0000_0000h	42.3.1/1275

STM_CMP*n* field descriptions

Field	Description
0–31 CMP	Compare value for channel n. If the STM_CCRn[CEN] bit is set and the STM_CMPn register matches the STM_CNT register, a channel interrupt request is generated and the STM_CIRn[CIF] bit is set.

STM_CMP*n* field descriptions (continued)

Field	Description

42.4 Functional description

The STM has one 32-bit up counter (STM_CNT) that is used as the time base for all channels. When enabled, the counter increments at the system clock frequency divided by a prescale value. The STM_CR[CPS] field sets the divider to any value in the range from 1 to 256. The counter is enabled with the STM_CR[TEN] bit. When enabled in normal mode, the counter continuously increments. When enabled in debug mode, the counter operation is controlled by the STM_CR[FRZ] bit. When the STM_CR[FRZ] bit is set, the counter is stopped in debug mode; otherwise, it continues to run in debug mode. The counter rolls over at 0xFFFF_FFFF to 0x0000_0000 with no restrictions at this boundary.

The STM has four identical compare channels. Each channel includes a channel control register (STM_CCR*n*), a channel interrupt register (STM_CIR*n*), and a channel compare register (STM_CMP*n*). The channel is enabled by setting the STM_CCR*n*[CEN] bit. When enabled, the channel will set the STM_CIR*n*[CIF] bit and generate an interrupt request when the channel compare register matches the timer counter. The interrupt request is cleared by writing 1 to the STM_CIR*n*[CIF] bit. A write of 0 to the STM_CIR*n*[CIF] bit has no effect.

NOTE

> The STM counter does not advance when the system clock is stopped.

Chapter 43
Software Watchdog Timer (SWT)

43.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

This section provides an overview, list of features, and modes of operation for the SWT.

43.1.1 Overview

The Software Watchdog Timer (SWT) is a peripheral module that can prevent system lockup in situations such as software getting trapped in a loop or if a bus transaction fails to terminate. When enabled, the SWT requires periodic execution of a watchdog servicing operation. The servicing operation resets the timer to a specified time-out period. If this servicing action does not occur before the timer expires, the SWT generates an interrupt or hardware reset request. The SWT can be configured to generate a reset request or interrupt on an initial time-out. The SWT always generates a reset request on a second consecutive time-out.

43.1.2 Features

The SWT has the following features:

- 32-bit time-out register to set the time-out period
- Programmable selection of window mode or regular servicing
- Programmable selection of reset or interrupt on an initial time-out
- Programmable selection of the servicing mode

- Master access protection
- Hard and soft configuration lock bits
- Reset configuration inputs allow timer to be enabled out of reset

43.1.3 Modes of operation

The SWT supports three device modes of operation: normal, debug and stop. When the SWT is enabled in normal mode, its counter runs continuously. In debug mode, operation of the counter is controlled by the FRZ bit in the SWT_CR. If the FRZ bit is set, the counter is stopped in debug mode, otherwise it continues to run. In stop mode, operation of the counter is controlled by the STP bit in the SWT_CR. If the STP bit is set, the counter is stopped in stop mode, otherwise it continues to run.

43.2 External signal description

The SWT module does not have any external interface signals.

43.3 Memory Map and Registers

The SWT programming model has seven 32-bit registers. The programming model can only be accessed using 32-bit (word) accesses. References using a different size are invalid. Other types of invalid accesses include: writes to read-only registers, incorrect values written to the service register when enabled, accesses to reserved addresses and accesses by masters without permission. If the RIA bit in the SWT_CR is set then the SWT generates a system reset on an invalid access otherwise a bus error is generated. If either the HLK or SLK bits in the SWT_CR are set, then the SWT_CR, SWT_TO, SWT_WN, and SWT_SK registers are read-only.

The SWT memory map is shown in the following table.

SWT memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	SWT Control Register (SWT_CR)	32	R/W	FF00_011Bh	43.3.1/1281

27 SLK	Soft Lock. This bit is cleared by writing the unlock sequence to the service register. 0 SWT_CR, SWT_TO, SWT_WN and SWT_SK are read/write registers if HLK=0 1 SWT_CR, SWT_TO, SWT_WN and SWT_SK are read-only registers
28 Reserved	Reserved This field is reserved.
29 STP	Stop Mode Control. Allows the watchdog timer to be stopped when the device enters stop mode. 0 SWT counter continues to run in stop mode 1 SWT counter is stopped in stop mode
30 FRZ	Debug Mode Control. Allows the watchdog timer to be stopped when the device enters debug mode. 0 SWT counter continues to run in debug mode 1 SWT counter is stopped in debug mode
31 WEN	Watchdog Enabled. 0 SWT is disabled 1 SWT is enabled

43.3.2 SWT Interrupt Register (SWT_IR)

The SWT_IR contains the time-out interrupt flag.

Address: 0h base + 4h offset = 4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	0															TIF
W																w1c
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SWT_IR field descriptions

Field	Description
0–30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 TIF	Time-out Interrupt Flag The flag and interrupt are cleared by writing a 1 to this bit. Writing a 0 has no effect. 0 No interrupt request 1 Interrupt request due to an initial time-out

43.3.3 SWT Time-out Register (SWT_TO)

The SWT Time-out (SWT_TO) register contains the 32-bit time-out period. This register is read-only if either the SWT_CR[HLK] or SWT_CR[SLK] bits are set.

Address: 0h base + 8h offset = 8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SWT_TO field descriptions

Field	Description
0–31 WTO	Watchdog time-out period in clock cycles. An internal 32-bit down counter is loaded with 261600 cycles, when the service sequence is written or when the SWT is enabled.

43.3.4 SWT Window Register (SWT_WN)

The SWT Window (SWT_WN) register contains the 32-bit window start value. This register is cleared on reset. This register is read-only if either the SWT_CR[HLK] or SWT_CR[SLK] bits are set.

Address: 0h base + Ch offset = Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SWT_WN field descriptions

Field	Description
0–31 WST	Window Start Value When window mode is enabled, the service sequence can only be written when the internal down counter is less than this value.

43.3.5 SWT Service Register (SWT_SR)

The SWT Service (SWT_SR) register is the target for service operation writes used to reset the watchdog timer.

Address: 0h base + 10h offset = 10h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SWT_SR field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 WSC	Watchdog Service Code This field is used to service the watchdog and to clear the soft lock bit (SWT_CR[SLK]). If the SWT_CR[SMD] field is 01b, two pseudorandom key values are written to service the watchdog, see Functional description for details. Otherwise, the sequence 0xA602 followed by 0xB480 is written to the WSC field. To clear the soft lock bit (SWT_CR[SLK]), the value 0xC520 followed by 0xD928 is written to the WSC field. When read, the WSC field always returns zero.

43.3.6 SWT Counter Output Register (SWT_CO)

The SWT Counter Output (SWT_CO) register is a read-only register that shows the value of the internal down counter when the SWT is disabled.

Address: 0h base + 14h offset = 14h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SWT_CO field descriptions

Field	Description
0–31 CNT	Watchdog Count. When the watchdog is disabled (SWT_CR[WEN]=0), this field shows the value of the internal down counter. When the watchdog is enabled (SWT_CR[WEN]=1), this field is cleared (the value is 0x0000_0000). Values in this field can lag behind the internal counter value for up to six system plus eight counter clock cycles. Therefore, the value read from this field immediately after disabling the watchdog may be higher than the actual value of the internal counter.

43.3.7 SWT Service Key Register (SWT_SK)

The SWT Service Key (SWT_SK) register holds the previous (or initial) service key value. This register is read-only if either the SWT_CR[HLK] or SWT_CR[SLK] bits are set.

Address: 0h base + 18h offset = 18h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0																SK															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SWT_SK field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 SK	Service Key This field is the previous (or initial) service key value used in keyed service mode. If SWT_CR[SMD] is 01b, the next key value to be written to the SWT_SR is (17*SK+3) mod 2^{16} .

43.4 Functional description

43.4.1 Introduction

The SWT is a 32-bit window watchdog timer designed to enable the system to recover in situations such as software getting trapped in a loop or if a bus transaction fails to terminate. It includes:

- a control register (SWT_CR),
- an interrupt register (SWT_IR),
- a time-out register (SWT_TO),
- a window register (SWT_WN),
- a service register (SWT_SR),
- a counter output register (SWT_CO), and
- a service key register (SWT_SK).

Accesses to SWT registers occur with no peripheral bus wait states. (The peripheral bus bridge may add one or more system wait states.) However, due to synchronization logic in the SWT design, recognition of the service sequence or configuration changes may require up to three system plus seven counter clock cycles.

43.4.1.1 SWT_CR register

The SWT_CR register includes bits to enable the timer, set configuration options, and lock configuration of the module. The watchdog is enabled by setting the SWT_CR[WEN] bit. The reset value of the SWT_CR[WEN] bit is device specific.[1] If the reset value of this bit is 1, the watchdog starts operation automatically after reset is released. Some devices can be configured to clear this bit automatically during the boot process.

43.4.1.2 SWT_TO register

The SWT_TO register holds the watchdog time-out period in clock cycles unless the value is less than 0x100, in which case the time-out period is set to 0x100. When the SWT is enabled, the time-out period is loaded into an internal 32-bit down counter each time a valid service operation is performed. See the Configuration section to determine the source that is used to clock the down counter.

43.4.1.3 SWT_CO register

The SWT_CO register shows the value of the down counter when the watchdog is disabled. When the watchdog is enabled this register is cleared. The value shown in this register can lag behind the value in the internal counter for up to six system plus eight counter clock cycles.

The SWT_CO register can be used during a software self test of the SWT. For example, the SWT can be enabled and not serviced for a fixed period of time less than the time-out value. Then the SWT can be disabled (SWT_CR[WEN] cleared) and the value of the SWT_CO register read to determine if the internal down counter is working properly.

[1] See the chip-specific SWT information.

43.4.2 Configuration locking

The configuration of the SWT can be locked through use of either a soft lock or a hard lock. In either case, when locked, the SWT_CR, SWT_TO, SWT_WN and SWT_SK registers are read-only.

43.4.2.1 Hard lock

The hard lock is enabled by setting the SWT_CR[HLK] bit, which can only be cleared by a reset.

43.4.2.2 Soft lock

The soft lock is enabled by setting the SWT_CR[SLK] bit and is cleared by writing the unlock sequence to the service register.

43.4.3 Unlock sequence

The unlock sequence is a write of 0xC520 followed by a write of 0xD928 to the SWT_SR[WSC] field. There is no timing requirement between the two writes. The unlock sequence logic ignores service sequence writes and recognizes the 0xC520, 0xD928 sequence regardless of previous writes. The unlock sequence can be written at any time and does not require the SWT_CR[WEN] bit to be set.

43.4.4 Servicing operations

When enabled, the SWT requires periodic execution of a servicing operation that is determined by the SWT_CR[SMD] field. Properly servicing the watchdog loads the internal down counter with the time-out period. The servicing modes are:

- fixed service sequence
- keyed service sequence

43.4.4.1 Fixed service sequence mode

If the SWT_CR[SMD] field is 00b, the fixed service sequence mode is selected, which requires writing 0xA602, then 0xB480 to the SWT_SR[WSC] field to service the watchdog. There is no timing requirement between the two writes and the service sequence logic ignores unlock sequence writes.

43.4.4.2 Keyed service sequence mode

If the SWT_CR[SMD] field is 01b, then the keyed service sequence mode is selected, which requires writing two pseudorandom keys to the SWT_SR[WSC] field to service the watchdog. The key values are determined by the pseudorandom key generator defined by the equation in the following figure. This algorithm will generate a sequence of 2^{16} different key values before repeating. The state of the key generator is held in the SWT_SK register. For example, if SWT_SK[SK] is 0x0100, then the service sequence keys are 0x1103, 0x2136. In this mode, each time a valid key is written to the SWT_SR register, the SWT_SK register is updated. So, after servicing the watchdog by writing 0x1103 and then 0x2136 to the SWT_SR[WSC] field, SWT_SK[SK] is 0x2136 and the next key sequence is 0x3499, 0x7E2C.

$$\mathrm{SK}_{n+1} = (17 \times \mathrm{SK}_n + 3) \bmod 2^{16}$$

Figure 43-1. Pseudorandom Key Generator

43.4.4.3 Window mode

If window mode is enabled (SWT_CR[WND] bit is set), the service sequence must be performed in the last part of the time-out period defined by the window register. The window is open when the down counter is less than the value in the SWT_WN register. Outside of this window, service sequence writes are invalid accesses and generate a bus error or reset depending on the value of the SWT_CR[RIA] bit. For example, if the SWT_TO register is set to 5000 and SWT_WN register is set to 1000, then the service sequence must be performed in the last 20% of the time-out period. There is a short lag in the time it takes for the window to open due to synchronization logic in the watchdog design. This delay could be up to three system plus four counter clock cycles.

43.4.5 Time-out

The Interrupt Then Reset bit (SWT_CR[ITR]) controls the SWT's action taken when a time-out occurs.

- If the SWT_CR[ITR] bit is 0, the SWT generates a reset request immediately on any time-out.
- If the SWT_CR[ITR] bit is 1, an initial time-out causes the SWT to generate an interrupt and load the down counter with the time-out period.
    - The interrupt is indicated by the Time-out Interrupt Flag (SWT_IR[TIF]).
    - Clear the interrupt by writing 1 to SWT_IR[TIF].

If the service sequence is not written before the second consecutive time-out, the SWT generates a reset request.

43.4.6 Initialization

All registers should be initialized before setting the SWT_CR[WEN] bit to enable the watchdog. Registers can be initialized in any sequence.

Chapter 44
Periodic Interrupt Timer (PIT)

44.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The PIT module is an array of timers that can be used to raise interrupts and trigger DMA channels.

44.1.1 Block diagram

The following figure shows the block diagram of the PIT module.

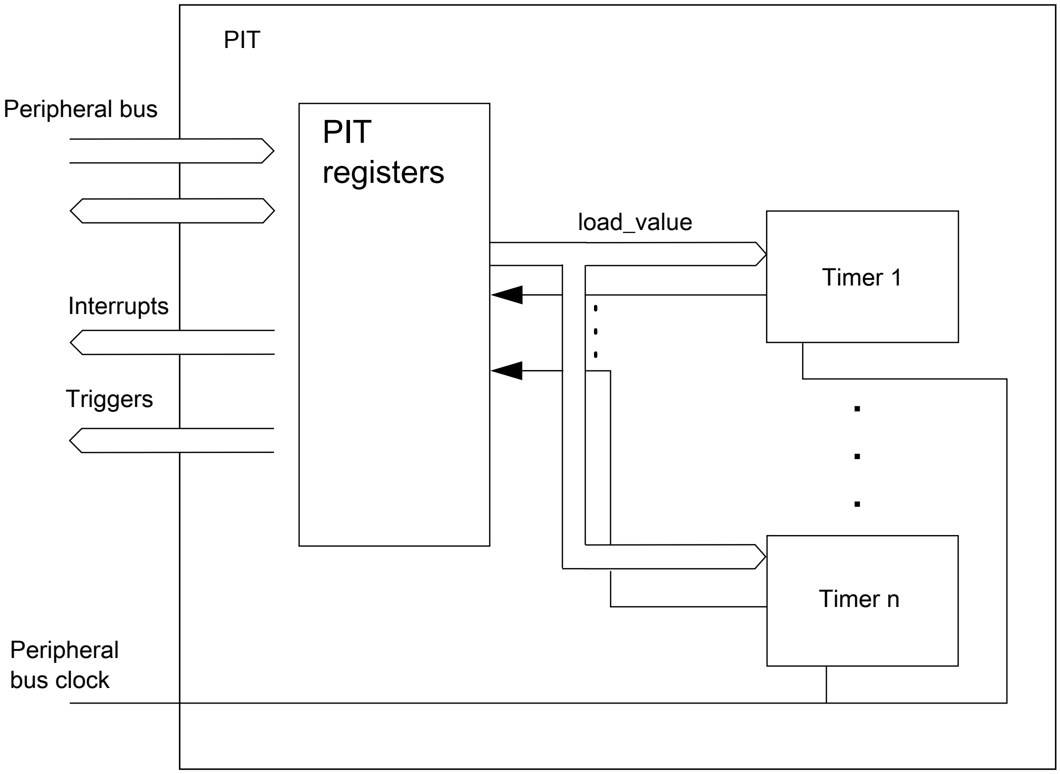

Figure 44-1. Block diagram of the PIT

NOTE

See the chip-specific PIT information for the number of PIT channels used in this MCU.

44.1.2 Features

The main features of this block are:

- Ability of timers to generate DMA trigger pulses
- Ability of timers to generate interrupts
- Maskable interrupts
- Independent timeout periods for each timer

44.2 Signal description

The PIT module has no external pins.

44.3 Memory map/register description

This section provides a detailed description of all registers accessible in the PIT module.

- Reserved registers will read as 0, writes will have no effect.
- See the chip-specific PIT information for the number of PIT channels used in this MCU.

PIT memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

PIT_MCR field descriptions

Field	Description
0–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
29 Reserved	This field is reserved.
30 MDIS	Module Disable - (PIT section) Disables the standard timers. This field must be enabled before any other setup is done. **NOTE:** Always write to this bit after at least 3 bus clock cycles of enabling the PIT clock gate in the device clock generation module. 0 Clock for standard PIT timers is enabled. 1 Clock for standard PIT timers is disabled.
31 FRZ	Freeze Allows the timers to be stopped when the device enters the Debug mode. 0 Timers continue to run in Debug mode. 1 Timers are stopped in Debug mode.

44.3.2 PIT Upper Lifetime Timer Register (PIT_LTMR64H)

This register is intended for applications that chain timer 0 and timer 1 to build a 64-bit lifetimer.

Access: User read only

Address: 0h base + E0h offset = E0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PIT_LTMR64H field descriptions

Field	Description
0–31 LTH	Life Timer value Shows the timer value of timer 1. If this register is read at a time t1, LTMR64L shows the value of timer 0 at time t1.

44.3.3 PIT Lower Lifetime Timer Register (PIT_LTMR64L)

This register is intended for applications that chain timer 0 and timer 1 to build a 64-bit lifetimer.

To use LTMR64H and LTMR64L, timer 0 and timer 1 need to be chained. To obtain the correct value, first read LTMR64H and then LTMR64L. LTMR64H will have the value of CVAL1 at the time of the first access, LTMR64L will have the value of CVAL0 at the time of the first access, therefore the application does not need to worry about carry-over effects of the running counter.

Access: User read only

Address: 0h base + E4h offset = E4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

PIT_TFLG*n* field descriptions

Field	Description
0–30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 TIF	Timer Interrupt Flag Sets to 1 at the end of the timer period. Writing 1 to this flag clears it. Writing 0 has no effect. If enabled, or, when TCTRLn[TIE] = 1, TIF causes an interrupt request. 0 Timeout has not yet occurred. 1 Timeout has occurred.

44.4 Functional description

This section provides the functional description of the module.

44.4.1 General operation

This section gives detailed information on the internal operation of the module. Each timer can be used to generate trigger pulses and interrupts. Each interrupt is available on a separate interrupt line.

44.4.1.1 Timers

The timers generate triggers at periodic intervals, when enabled. The timers load the start values as specified in their LDVAL registers, count down to 0 and then load the respective start value again. Each time a timer reaches 0, it will generate a trigger pulse and set the interrupt flag.

All interrupts can be enabled or masked by setting TCTRLn[TIE]. A new interrupt can be generated only after the previous one is cleared.

If desired, the current counter value of the timer can be read via the CVAL registers.

The counter period can be restarted, by first disabling, and then enabling the timer with TCTRLn[TEN]. See the following figure.

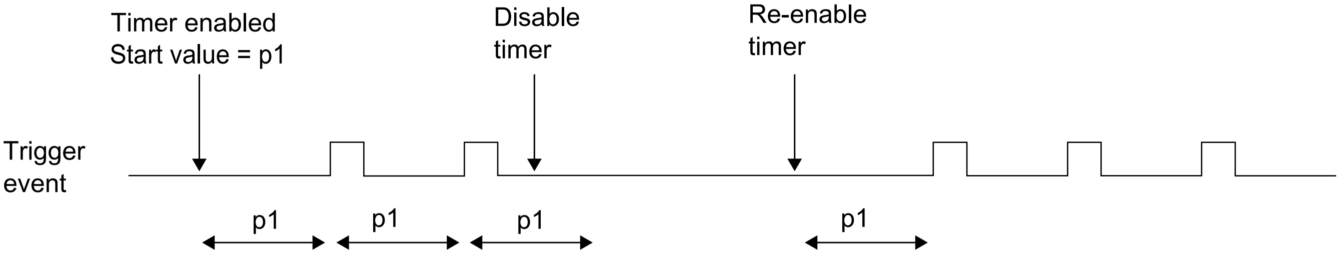

Figure 44-2. Stopping and starting a timer

The counter period of a running timer can be modified, by first disabling the timer, setting a new load value, and then enabling the timer again. See the following figure.

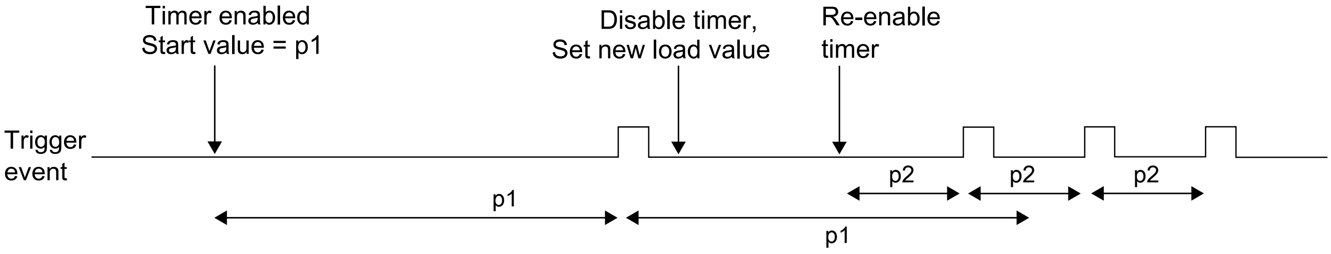

Figure 44-3. Modifying running timer period

It is also possible to change the counter period without restarting the timer by writing LDVAL with the new load value. This value will then be loaded after the next trigger event. See the following figure.

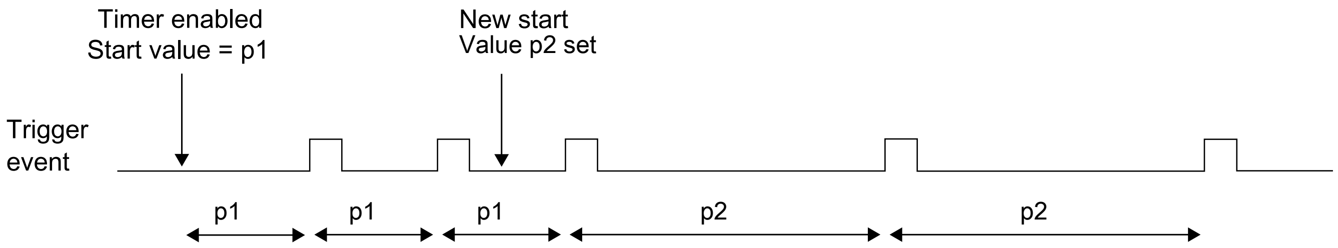

Figure 44-4. Dynamically setting a new load value

44.4.1.2 Debug mode

In Debug mode, the timers will be frozen based on MCR[FRZ]. This is intended to aid software development, allowing the developer to halt the processor, investigate the current state of the system, for example, the timer values, and then continue the operation.

44.4.2 Interrupts

All the timers support interrupt generation. See the MCU specification for related vector addresses and priorities.

Timer interrupts can be enabled by setting TCTRLn[TIE]. TFLGn[TIF] are set to 1 when a timeout occurs on the associated timer, and are cleared to 0 by writing a 1 to the corresponding TFLGn[TIF].

44.4.3 Chained timers

When a timer has chain mode enabled, it will only count after the previous timer has expired. So if timer n-1 has counted down to 0, counter n will decrement the value by one. This allows to chain some of the timers together to form a longer timer. The first timer (timer 0) cannot be chained to any other timer.

44.5 Initialization and application information

In the example configuration:

- The PIT clock has a frequency of 50 MHz.

- Timer 1 creates an interrupt every 5.12 ms.
- Timer 3 creates a trigger event every 30 ms.

The PIT module must be activated by writing a 0 to MCR[MDIS].

The 50 MHz clock frequency equates to a clock period of 20 ns. Timer 1 needs to trigger every 5.12 ms/20 ns = 256,000 cycles and Timer 3 every 30 ms/20 ns = 1,500,000 cycles. The value for the LDVAL register trigger is calculated as:

LDVAL trigger = (period / clock period) -1

This means LDVAL1 and LDVAL3 must be written with 0x0003E7FF and 0x0016E35F respectively.

The interrupt for Timer 1 is enabled by setting TCTRL1[TIE]. The timer is started by writing 1 to TCTRL1[TEN].

Timer 3 shall be used only for triggering. Therefore, Timer 3 is started by writing a 1 to TCTRL3[TEN]. TCTRL3[TIE] stays at 0.

The following example code matches the described setup:

```
// turn on PIT
PIT_MCR = 0x00;

// Timer 1
PIT_LDVAL1 = 0x0003E7FF; // setup timer 1 for 256000 cycles
PIT_TCTRL1 = TIE; // enable Timer 1 interrupts
PIT_TCTRL1 |= TEN; // start Timer 1

// Timer 3
PIT_LDVAL3 = 0x0016E35F; // setup timer 3 for 1500000 cycles
PIT_TCTRL3 |= TEN; // start Timer 3
```

44.6 Example configuration for chained timers

NOTE

> Check if 100 MHz frequency for PIT timer is valid for your device in the clocking chapter.

In the example configuration:

- The PIT clock has a frequency of 100 MHz.
- Timers 1 and 2 are available.
- An interrupt shall be raised every 1 minute.

The PIT module needs to be activated by writing a 0 to MCR[MDIS].

The 100 MHz clock frequency equates to a clock period of 10 ns, so the PIT needs to count for 6000 million cycles, which is more than a single timer can do. So, Timer 1 is set up to trigger every 6 s (600 million cycles). Timer 2 is chained to Timer 1 and programmed to trigger 10 times.

The value for the LDVAL register trigger is calculated as number of cycles-1, so LDVAL1 receives the value 0x23C345FF and LDVAL2 receives the value 0x00000009.

The interrupt for Timer 2 is enabled by setting TCTRL2[TIE], the Chain mode is activated by setting TCTRL2[CHN], and the timer is started by writing a 1 to TCTRL2[TEN]. TCTRL1[TEN] needs to be set, and TCTRL1[CHN] and TCTRL1[TIE] are cleared.

The following example code matches the described setup:

```
// turn on PIT
PIT_MCR = 0x00;

// Timer 2
PIT_LDVAL2 = 0x00000009; // setup Timer 2 for 10 counts
PIT_TCTRL2 = TIE; // enable Timer 2 interrupt
PIT_TCTRL2 |= CHN; // chain Timer 2 to Timer 1
PIT_TCTRL2 |= TEN; // start Timer 2

// Timer 1
PIT_LDVAL1 = 0x23C345FF; // setup Timer 1 for 600 000 000 cycles
PIT_TCTRL1 = TEN; // start Timer 1
```

44.7 Example configuration for the lifetime timer

To configure the lifetimer timer, channels 0 and 1 need to be chained together.

First the PIT module needs to be activated by writing a 0 to the MDIS bit in the CTRL register, then the LDVAL registers need to be set to the maximum value.

The timer is a downcounter.

The following example code matches the described setup:

```
// turn on PIT
PIT_MCR = 0x00;

// Timer 1
PIT_LDVAL1 = 0xFFFFFFFF; // setup timer 1 for maximum counting period
PIT_TCTRL1 = 0x0; // disable timer 1 interrupts
PIT_TCTRL1 |= CHN; // chain timer 1 to timer 0
PIT_TCTRL1 |= TEN; // start timer 1
```

```
// Timer 0
PIT_LDVAL0 = 0xFFFFFFFF; // setup timer 0 for maximum counting period
PIT_TCTRL0 = TEN; // start timer 0
```

To access the lifetime, read first LTMR64H and then LTMR64L.

```
current_uptime = PIT_LTMR64H<<32;
current_uptime = current_uptime + PIT_LTMR64L;
```

Chapter 45
CAN (FlexCAN)

45.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The FlexCAN module is a communication controller implementing the CAN protocol according to the CAN 2.0 B protocol specification. A general block diagram is shown in the following figure, which describes the main subblocks implemented in the FlexCAN module, including one associated memory for storing message buffers, Receive (Rx) Global Mask registers, Receive Individual Mask registers, Receive FIFO filters, and Receive FIFO ID filters. The functions of the submodules are described in subsequent sections.

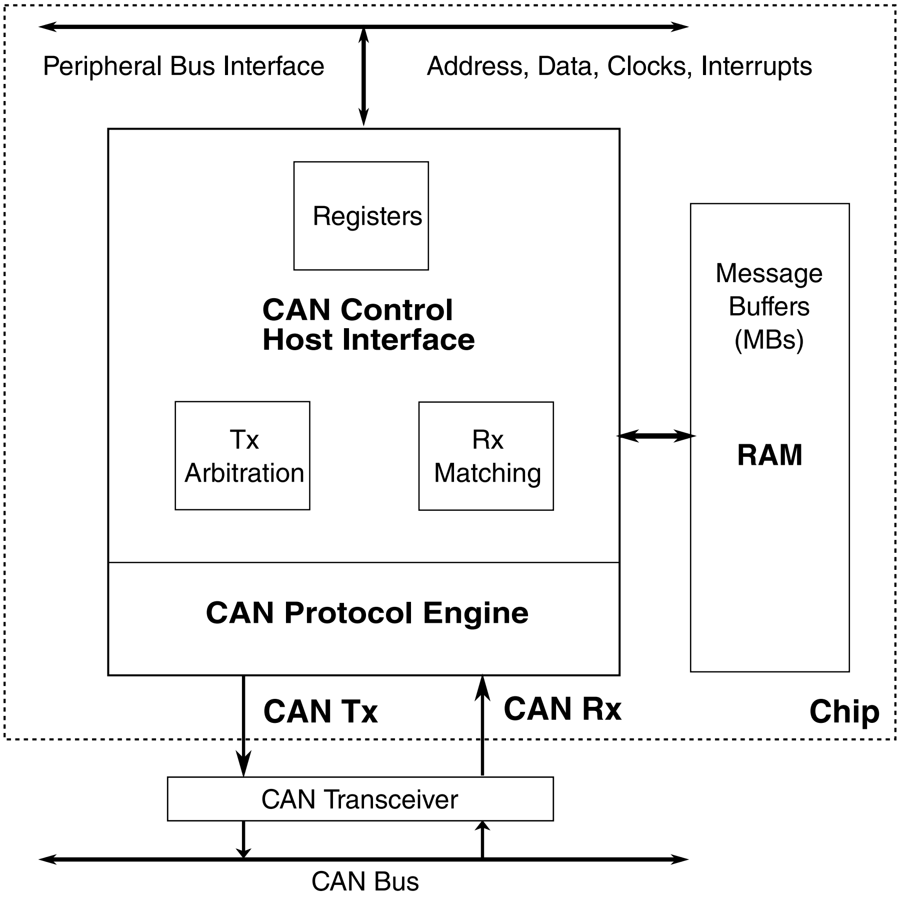

Figure 45-1. FlexCAN block diagram

45.1.1 Overview

The CAN protocol was primarily designed to be used as a vehicle serial data bus, meeting the specific requirements of this field:

- Real-time processing
- Reliable operation in the EMI environment of a vehicle
- Cost-effectiveness
- Required bandwidth

The FlexCAN module is a full implementation of the CAN protocol specification, Version 2.0 B, which supports both standard and extended message frames. The message buffers are stored in an embedded RAM dedicated to the FlexCAN module. See the chip-specific FlexCAN information for the actual number of message buffers configured in the chip.

The CAN Protocol Engine (PE) submodule manages the serial communication on the CAN bus:

- Requesting RAM access for receiving and transmitting message frames

- Validating received messages
- Performing error handling

The Controller Host Interface (CHI) sub-module handles message buffer selection for reception and transmission, taking care of arbitration and ID matching algorithms.

The Bus Interface Unit (BIU) sub-module controls the access to and from the internal interface bus, in order to establish connection to the CPU and to other blocks. Clocks, address and data buses, interrupt outputs and test signals are accessed through the BIU.

45.1.2 FlexCAN module features

The FlexCAN module includes these distinctive legacy features:

- Full implementation of the CAN protocol specification, Version 2.0 B
    - Standard data and remote frames
    - Extended data and remote frames
    - Zero to eight bytes data length
    - Programmable bit rate up to 1 Mb/sec
    - Content-related addressing
- Compliant with the ISO 11898-1 standard
- Flexible mailboxes of zero to eight bytes data length
- Each mailbox configurable as receive or transmit, all supporting standard and extended messages
- Individual Rx Mask registers per mailbox
- Full-featured Rx FIFO with storage capacity for up to six frames and automatic internal pointer handling
- Transmission abort capability
- Programmable clock source to the CAN Protocol Interface, either bus clock or crystal oscillator
- Unused structures space can be used as general purpose RAM space
- Listen-Only mode capability
- Programmable Loop-Back mode supporting self-test operation

- Programmable transmission priority scheme: lowest ID, lowest buffer number, or highest priority
- Time stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts
- Independence from the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes

New major features are also provided:

- Remote request frames may be handled automatically or by software
- CAN bit time settings and configuration bits can only be written in Freeze mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- Identifier Acceptance Filter Hit Indicator (IDHIT) register for received frames
- SYNCH bit available in Error in Status 1 register to inform that the module is synchronous with CAN bus
- CRC status for transmitted message
- Rx FIFO Global Mask register
- Selectable priority between mailboxes and Rx FIFO during matching process
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard, or 512 partial (8 bit) IDs, with up to 32 individual masking capability
- 100% backward compatibility with previous FlexCAN version
- Supports detection and correction of errors in memory read accesses. Each byte of FlexCAN memory is associated to 5 parity bits and the error correction mechanism assures that in this 13-bit word, errors in one bit can be corrected (corrected errors) and errors in 2 bits can be detected but not corrected (non-corrected errors).

45.1.3 Modes of operation

The FlexCAN module has these functional modes:

- Normal mode (User or Supervisor):

  In Normal mode, the module operates receiving and/or transmitting message frames, errors are handled normally, and all CAN Protocol functions are enabled. User and Supervisor Modes differ in the access to some restricted control registers.

- Freeze mode:

  Freeze mode is enabled when the FRZ bit in MCR is asserted. If enabled, Freeze mode is entered when MCR[HALT] is set or when Debug mode is requested at chip level and MCR[FRZ_ACK] is asserted by the FlexCAN. In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See Freeze mode for more information.

- Listen-Only mode:

  The module enters this mode when the LOM field in the Control 1 Register is asserted. In this mode, transmission is disabled, all error counters are frozen, and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FlexCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- Loop-Back mode:

  The module enters this mode when the LPB field in the Control 1 Register is asserted. In this mode, FlexCAN performs an internal loop back that can be used for self-test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The Rx CAN input pin is ignored and the Tx CAN output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

For low-power operation, the FlexCAN module has:

- Module Disable mode:

  This low-power mode is entered when the MDIS bit in the MCR Register is asserted by the CPU and the LPM_ACK is asserted by the FlexCAN. When disabled, the module requests to disable the clocks to the CAN Protocol Engine and Controller Host Interface submodules. Exit from this mode is done by negating the MDIS bit in the MCR register. See Module Disable mode for more information.

- Stop mode:

This low power mode is entered when Stop mode is requested at chip level and the LPM_ACK bit in the MCR Register is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the CPU that the clocks can be shut down globally. Exit from this mode happens when the Stop mode request is removed. See Stop mode for more information.

45.2 FlexCAN signal descriptions

The FlexCAN module has two I/O signals connected to the external chip pins. These signals are summarized in the following table and described in more detail in the next subsections.

Table 45-1. FlexCAN signal descriptions

Signal	Description	I/O
CAN Rx	CAN Receive Pin	Input
CAN Tx	CAN Transmit Pin	Output

45.2.1 CAN Rx

This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level 0. Recessive state is represented by logic level 1.

45.2.2 CAN Tx

This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level 0. Recessive state is represented by logic level 1.

45.3 Memory map/register definition

This section describes the registers and data structures in the FlexCAN module. The base address of the module depends on the particular memory map of the chip.

45.3.1 FlexCAN memory mapping

The complete memory map for a FlexCAN module is shown in the following table.

The address space occupied by FlexCAN has 128 bytes for registers starting at the module base address, followed by embedded RAM starting at address 0x0080.

Each individual register is identified by its complete name and the corresponding mnemonic. The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming the SUPV field in the MCR register. These registers are identified as S/U in the Access column of Table 45-2.

Table 45-2. Register access and reset information

Register	Access type	Affected by hard reset	Affected by soft reset
Module Configuration Register (MCR)	S	Yes	Yes
Control 1 register (CTRL1)	S/U	Yes	No
Free Running Timer register (TIMER)	S/U	Yes	Yes
Rx Mailboxes Global Mask register (RXMGMASK)	S/U	No	No
Rx Buffer 14 Mask register (RX14MASK)	S/U	No	No
Rx Buffer 15 Mask register (RX15MASK)	S/U	No	No
Error Counter Register (ECR)	S/U	Yes	Yes
Error and Status 1 Register (ESR1)	S/U	Yes	Yes
Interrupt Masks 2 register (IMASK2)	S/U	Yes	Yes
Interrupt Masks 1 register (IMASK1)	S/U	Yes	Yes
Interrupt Flags 2 register (IFLAG2)	S/U	Yes	Yes
Interrupt Flags 1 register (IFLAG1)	S/U	Yes	Yes
Control 2 Register (CTRL2)	S/U	Yes	No
Error and Status 2 Register (ESR2)	S/U	Yes	Yes
CRC Register (CRCR)	S/U	Yes	Yes
Rx FIFO Global Mask register (RXFGMASK)	S/U	No	No
Rx FIFO Information Register (RXFIR)	S/U	No	No
Message buffers	S/U	No	No
Rx Individual Mask Registers	S/U	No	No
Memory Error Control Register (MECR)	S/U	Yes	Yes
Error Injection Address Register (ERRIAR)	S/U	Yes	Yes
Error Injection Data Pattern Register (ERRIDPR)	S/U	Yes	Yes
Error Injection Parity Pattern Register (ERRIPPR)	S/U	Yes	Yes
Error Report Address Register (RERRAR)	S/U	Yes	Yes
Error Report Data Register (RERRDR)	S/U	Yes	Yes
Error Report Syndrome Register (RERRSYNR)	S/U	Yes	Yes
Error Status Register (ERRSR)	S/U	Yes	Yes

The FlexCAN module can store CAN messages for transmission and reception using mailboxes and Rx FIFO structures.

This module's memory map includes sixty-four 128-bit message buffers (MBs) that occupy the range from offset 0x80 to 0x47F .

CAN memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	Module Configuration Register (CAN_MCR)	32	R/W	D890_000Fh	45.3.2/1318

CAN_MCR field descriptions

Field	Description
0 MDIS	Module Disable This bit controls whether FlexCAN is enabled or not. When disabled, FlexCAN disables the clocks to the CAN Protocol Engine and Controller Host Interface sub-modules. This is the only bit within this register not affected by soft reset.

Table continues on the next page...

CAN_MCR field descriptions (continued)

Field	Description
	0 Enable the FlexCAN module. 1 Disable the FlexCAN module.
1 FRZ	Freeze Enable The FRZ bit specifies the FlexCAN behavior when the HALT bit in the MCR Register is set or when Debug mode is requested at chip level . When FRZ is asserted, FlexCAN is enabled to enter Freeze mode. Negation of this bit field causes FlexCAN to exit from Freeze mode. 0 Not enabled to enter Freeze mode. 1 Enabled to enter Freeze mode.
2 RFEN	Rx FIFO Enable This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (0x80-0xDC) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID Filter Table elements. RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in the table "Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate" (in section "Arbitration and Matching Timing"). This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Rx FIFO not enabled. 1 Rx FIFO enabled.
3 HALT	Halt FlexCAN Assertion of this bit puts the FlexCAN module into Freeze mode. The CPU should clear it after initializing the Message Buffers and Control Register. No reception or transmission is performed by FlexCAN before this bit is cleared. Freeze mode cannot be entered while FlexCAN is in a low power mode. 0 No Freeze mode request. 1 Enters Freeze mode if the FRZ bit is asserted.
4 NOTRDY	FlexCAN Not Ready This read-only bit indicates that FlexCAN is either in Disable mode , Stop mode or Freeze mode. It is negated once FlexCAN has exited these modes. 0 FlexCAN module is either in Normal mode, Listen-Only mode or Loop-Back mode. 1 FlexCAN module is either in Disable mode , Stop mode or Freeze mode.
5 Reserved	This field is reserved. Always write 0 to this field.
6 SOFTRST	Soft Reset When this bit is asserted, FlexCAN resets its internal state machines and some of the memory mapped registers. The following registers are reset: MCR (except the MDIS bit), TIMER , ECR, ESR1, ESR2, IMASK1, IMASK2, IFLAG1, IFLAG2 and CRCR. Configuration registers that control the interface to the CAN bus are not affected by soft reset. The following registers are unaffected: CTRL1, CTRL2, all RXIMR registers, RXMGMASK, RX14MASK, RX15MASK, RXFGMASK, RXFIR, all Message Buffers . The SOFTRST bit can be asserted directly by the CPU when it writes to the MCR Register, but it is also asserted when global soft reset is requested at chip level . Because soft reset is synchronous and has to follow a request/acknowledge procedure across clock domains, it may take some time to fully propagate its effect. The SOFTRST bit remains asserted while reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed.

Table continues on the next page...

CAN_MCR field descriptions (continued)

Field	Description
	Soft reset cannot be applied while clocks are shut down in a low power mode. The module should be first removed from low power mode, and then soft reset can be applied. 0 No reset request. 1 Resets the registers affected by soft reset.
7 FRZACK	Freeze Mode Acknowledge This read-only bit indicates that FlexCAN is in Freeze mode and its prescaler is stopped. The Freeze mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZACK bit to know when FlexCAN has actually entered Freeze mode. If Freeze Mode request is negated, then this bit is negated after the FlexCAN prescaler is running again. If Freeze mode is requested while FlexCAN is in a low power mode, then the FRZACK bit will be set only when the low-power mode is exited. See Section "Freeze Mode". **NOTE:** FRZACK will be asserted within 178 CAN bits from the freeze mode request by the CPU, and negated within 2 CAN bits after the freeze mode request removal (see Section "Protocol Timing"). 0 FlexCAN not in Freeze mode, prescaler running. 1 FlexCAN in Freeze mode, prescaler stopped.
8 SUPV	Supervisor Mode This bit configures the FlexCAN to be either in Supervisor or User mode. The registers affected by this bit are marked as S/U in the Access Type column of the module memory map. Reset value of this bit is 1, so the affected registers start with Supervisor access allowance only . This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 FlexCAN is in User mode. Affected registers allow both Supervisor and Unrestricted accesses . 1 FlexCAN is in Supervisor mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location .
9 Reserved	This field is reserved. Always write 0 to this field.
10 WRNEN	Warning Interrupt Enable When asserted, this bit enables the generation of the TWRNINT and RWRNINT flags in the Error and Status Register. If WRNEN is negated, the TWRNINT and RWRNINT flags will always be zero, independent of the values of the error counters, and no warning interrupt will ever be generated. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 TWRNINT and RWRNINT bits are zero, independent of the values in the error counters. 1 TWRNINT and RWRNINT bits are set when the respective error counter transitions from less than 96 to greater than or equal to 96.
11 LPMACK	Low-Power Mode Acknowledge This read-only bit indicates that FlexCAN is in a low-power mode (Disable mode , Stop mode). A low-power mode cannot be entered until all current transmission or reception processes have finished, so the CPU can poll the LPMACK bit to know when FlexCAN has actually entered low power mode. **NOTE:** LPMACK will be asserted within 180 CAN bits from the low-power mode request by the CPU, and negated within 2 CAN bits after the low-power mode request removal (see Section "Protocol Timing"). 0 FlexCAN is not in a low-power mode. 1 FlexCAN is in a low-power mode.

Table continues on the next page...

CAN_MCR field descriptions (continued)

Field	Description
12 Reserved	This field is reserved. Always write 0 to this field.
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 SRXDIS	Self Reception Disable This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Self reception enabled. 1 Self reception disabled.
15 IRMQ	Individual Rx Masking And Queue Enable This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK and RX15MASK, RXFGMASK. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Individual Rx masking and queue feature are disabled. For backward compatibility with legacy applications, the reading of C/S word locks the MB even if it is EMPTY. 1 Individual Rx masking and queue feature are enabled.
16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18 LPRIOEN	Local Priority Enable This bit is provided for backwards compatibility with legacy applications. It controls whether the local priority feature is enabled or not. It is used to expand the ID used during the arbitration process. With this expanded ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Local Priority disabled. 1 Local Priority enabled.
19 AEN	Abort Enable This bit is supplied for backwards compatibility with legacy applications. When asserted, it enables the Tx abort mechanism. This mechanism guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. **NOTE:** When MCR[AEN] is asserted, only the abort mechanism (see Section "Transmission Abort Mechanism") must be used for updating Mailboxes configured for transmission. **CAUTION:** Writing the Abort code into Rx Mailboxes can cause unpredictable results when the MCR[AEN] is asserted. 0 Abort disabled. 1 Abort enabled.

Table continues on the next page...

CAN_MCR field descriptions (continued)

Field	Description
20–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22–23 IDAM	ID Acceptance Mode This 2-bit field identifies the format of the Rx FIFO ID Filter Table elements. Note that all elements of the table are configured at the same time by this field (they are all the same format). See Section "Rx FIFO Structure". This field can be written only in Freeze mode because it is blocked by hardware in other modes. 00 Format A: One full ID (standard and extended) per ID Filter Table element. 01 Format B: Two full standard IDs or two partial 14-bit (standard and extended) IDs per ID Filter Table element. 10 Format C: Four partial 8-bit Standard IDs per ID Filter Table element. 11 Format D: All frames rejected.
24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25–31 MAXMB	Number Of The Last Message Buffer This 7-bit field defines the number of the last Message Buffers that will take part in the matching and arbitration processes. The reset value (0x0F) is equivalent to a 16 MB configuration. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Number of the last MB = MAXMB **NOTE:** MAXMB must be programmed with a value smaller than the parameter NUMBER_OF_MB, otherwise the number of the last effective Message Buffer will be: (NUMBER_OF_MB - 1) Additionally, the value of MAXMB must encompass the FIFO size defined by CTRL2[RFFN]. MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table "Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate" (in Section "Arbitration and Matching Timing").

45.3.3 Control 1 register (CAN_CTRL1)

This register is defined for specific FlexCAN control features related to the CAN bus, such as bit-rate, programmable sampling point within an Rx bit, Loop Back mode, Listen-Only mode, Bus Off recovery behavior and interrupt enabling (Bus-Off, Error, Warning). It also determines the Division Factor for the clock prescaler.

CAN_CTRL1 field descriptions

Field	Description
0–7 PRESDIV	Prescaler Division Factor This 8-bit field defines the ratio between the PE clock frequency and the Serial Clock (Sclock) frequency. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency. The Maximum value of this field is 0xFF, that gives a minimum Sclock frequency equal to the PE clock frequency divided by 256. See Section "Protocol Timing". This field can be written only in Freeze mode because it is blocked by hardware in other modes. Sclock frequency = PE clock frequency / (PRESDIV + 1)
8–9 RJW	Resync Jump Width This 2-bit field defines the maximum number of time quanta that a bit time can be changed by one re-synchronization. One time quantum is equal to the Sclock period. The valid programmable values are 0–3. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Resync Jump Width = RJW + 1.
10–12 PSEG1	Phase Segment 1 This 3-bit field defines the length of Phase Buffer Segment 1 in the bit time. The valid programmable values are 0–7. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Phase Buffer Segment 1 = (PSEG1 + 1) × Time-Quanta.
13–15 PSEG2	Phase Segment 2

Table continues on the next page...

CAN_CTRL1 field descriptions (continued)

Field	Description
	This 3-bit field defines the length of Phase Buffer Segment 2 in the bit time. The valid programmable values are 1–7. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Phase Buffer Segment 2 = (PSEG2 + 1) × Time-Quanta.
16 BOFFMSK	Bus Off Mask This bit provides a mask for the Bus Off Interrupt. 0 Bus Off interrupt disabled. 1 Bus Off interrupt enabled.
17 ERRMSK	Error Mask This bit provides a mask for the Error Interrupt. 0 Error interrupt disabled. 1 Error interrupt enabled.
18 CLKSRC	CAN Engine Clock Source This bit selects the clock source to the CAN Protocol Engine (PE) to be either the peripheral clock (driven by the PLL) or the crystal oscillator clock. The selected clock is the one fed to the prescaler to generate the Serial Clock (Sclock). In order to guarantee reliable operation, this bit can be written only in Disable mode because it is blocked by hardware in other modes. See Section "Protocol Timing". 0 The CAN engine clock source is the oscillator clock. Under this condition, the oscillator clock frequency must be lower than the bus clock. 1 The CAN engine clock source is the peripheral clock.
19 LPB	Loop Back Mode This bit configures FlexCAN to operate in Loop-Back mode. In this mode, FlexCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The Rx CAN input pin is ignored and the Tx CAN output goes to the recessive state (logic 1). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. **NOTE:** In this mode, the MCR[SRXDIS] cannot be asserted because this will impede the self reception of a transmitted message. 0 Loop Back disabled. 1 Loop Back enabled.
20 TWRNMSK	Tx Warning Interrupt Mask This bit provides a mask for the Tx Warning Interrupt associated with the TWRNINT flag in the Error and Status Register. This bit is read as zero when MCR[WRNEN] bit is negated. This bit can be written only if MCR[WRNEN] bit is asserted. 0 Tx Warning Interrupt disabled. 1 Tx Warning Interrupt enabled.
21 RWRNMSK	Rx Warning Interrupt Mask

Table continues on the next page...

CAN_CTRL1 field descriptions (continued)

Field	Description
	This bit provides a mask for the Rx Warning Interrupt associated with the RWRNINT flag in the Error and Status Register. This bit is read as zero when MCR[WRNEN] bit is negated. This bit can be written only if MCR[WRNEN] bit is asserted. 0 Rx Warning Interrupt disabled. 1 Rx Warning Interrupt enabled.
22–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 SMP	CAN Bit Sampling This bit defines the sampling mode of CAN bits at the Rx input. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Just one sample is used to determine the bit value. 1 Three samples are used to determine the value of the received bit: the regular one (sample point) and 2 preceding samples; a majority rule is used.
25 BOFFREC	Bus Off Recovery This bit defines how FlexCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFFREC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FlexCAN will re-synchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFFREC bit can be re-asserted again during Bus Off, but it will be effective only the next time the module enters Bus Off. If BOFFREC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery. 0 Automatic recovering from Bus Off state enabled, according to CAN Spec 2.0 part B. 1 Automatic recovering from Bus Off state disabled.
26 TSYN	Timer Sync This bit enables a mechanism that resets the free-running timer each time a message is received in Message Buffer 0. This feature provides means to synchronize multiple FlexCAN stations with a special “SYNC” message, that is, global network time. If the RFEN bit in MCR is set (Rx FIFO enabled), the first available Mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Timer Sync feature disabled 1 Timer Sync feature enabled
27 LBUF	Lowest Buffer Transmitted First This bit defines the ordering mechanism for Message Buffer transmission. When asserted, the LPRIOEN bit does not affect the priority arbitration. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Buffer with highest priority is transmitted first. 1 Lowest number buffer is transmitted first.
28 LOM	Listen-Only Mode This bit configures FlexCAN to operate in Listen-Only mode. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages

Table continues on the next page...

CAN_CTRL1 field descriptions (continued)

Field	Description
	acknowledged by another CAN station will be received. If FlexCAN detects a message that has not been acknowledged, it will flag a BIT0 error without changing the REC, as if it was trying to acknowledge the message. Listen-Only mode acknowledgement can be obtained by the state of ESR1[FLTCONF] field which is Passive Error when Listen-Only mode is entered. There can be some delay between the Listen-Only mode request and acknowledge. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Listen-Only mode is deactivated. 1 FlexCAN module operates in Listen-Only mode.
29–31 PROPSEG	Propagation Segment This 3-bit field defines the length of the Propagation Segment in the bit time. The valid programmable values are 0–7. This field can be written only in Freeze mode because it is blocked by hardware in other modes. Propagation Segment Time = (PROPSEG + 1) × Time-Quanta. Time-Quantum = one Sclock period.

45.3.4 Free Running Timer (CAN_TIMER)

This register represents a 16-bit free running counter that can be read and written by the CPU. The timer starts from 0x0 after Reset, counts linearly to 0xFFFF, and wraps around.

The timer is clocked by the FlexCAN bit-clock, which defines the baud rate on the CAN bus. During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. The timer is not incremented during Disable , Stop, and Freeze modes.

The timer value is captured when the second bit of the identifier field of any frame is on the CAN bus. This captured value is written into the Time Stamp entry in a message buffer after a successful reception or transmission of a message.

If bit CTRL1[TSYN] is asserted, the Timer is reset whenever a message is received in the first available Mailbox, according to CTRL2[RFFN] setting.

The CPU can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure; see Section "Mailbox Lock Mechanism".

Address: 0h base + 8h offset = 8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

CAN_TIMER field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 TIMER	Timer Value Contains the free-running counter value.

45.3.5 Rx Mailboxes Global Mask Register (CAN_RXMGMASK)

This register is located in RAM.

RXMGMASK is provided for legacy application support.

- When the MCR[IRMQ] bit is negated, RXMGMASK is always in effect.
- When the MCR[IRMQ] bit is asserted, RXMGMASK has no effect.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

Address: 0h base + 10h offset = 10h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

CAN_RXMGMASK field descriptions

Field	Description
0–31 MG[31:0]	Rx Mailboxes Global Mask Bits These bits mask the Mailbox filter bits. Note that the alignment with the ID word of the Mailbox is not perfect as the two most significant MG bits affect the fields RTR and IDE, which are located in the Control and Status word of the Mailbox. The following table shows in detail which MG bits mask each Mailbox filter field.

CAN_RXMGMASK field descriptions (continued)

Field	Description

SMB[RTR] [1]	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	Reserved
0	-	0	note [2]	note [3]	MG[28:0]	MG[31:29]
0	-	1	MG[31]	MG[30]	MG[28:0]	MG[29]
1	0	-	-	-	-	MG[31:0]
1	1	0	-	-	MG[28:0]	MG[31:29]
1	1	1	MG[31]	MG[30]	MG[28:0]	MG[29]

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If the CTRL2[EACEN] bit is negated, the RTR bit of Mailbox is never compared with the RTR bit of the incoming frame.
3. If the CTRL2[EACEN] bit is negated, the IDE bit of Mailbox is always compared with the IDE bit of the incoming frame.

0 The corresponding bit in the filter is "don't care."
1 The corresponding bit in the filter is checked.

[1] RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
[2] If the CTRL2[EACEN] bit is negated, the RTR bit of Mailbox is never compared with the RTR bit of the incoming frame.
[3] If the CTRL2[EACEN] bit is negated, the IDE bit of Mailbox is always compared with the IDE bit of the incoming frame.

45.3.6 Rx 14 Mask register (CAN_RX14MASK)

This register is located in RAM.

RX14MASK is provided for legacy application support. When the MCR[IRMQ] bit is asserted, RX14MASK has no effect.

RX14MASK is used to mask the filter fields of Message Buffer 14.

This register can only be programmed while the module is in Freeze mode as it is blocked by hardware in other modes.

Address: 0h base + 14h offset = 14h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

CAN_RX14MASK field descriptions

Field	Description
0–31 RX14M[31:0]	Rx Buffer 14 Mask Bits Each mask bit masks the corresponding Mailbox 14 filter field in the same way that RXMGMASK masks other Mailboxes' filters. See the description of the CAN_RXMGMASK register.

CAN_RX14MASK field descriptions (continued)

Field	Description
	0 The corresponding bit in the filter is "don’t care." 1 The corresponding bit in the filter is checked.

45.3.7 Rx 15 Mask register (CAN_RX15MASK)

This register is located in RAM.

RX15MASK is provided for legacy application support. When the MCR[IRMQ] bit is asserted, RX15MASK has no effect.

RX15MASK is used to mask the filter fields of Message Buffer 15.

This register can be programmed only while the module is in Freeze mode because it is blocked by hardware in other modes.

Address: 0h base + 18h offset = 18h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

CAN_RX15MASK field descriptions

Field	Description
0–31 RX15M[31:0]	Rx Buffer 15 Mask Bits Each mask bit masks the corresponding Mailbox 15 filter field in the same way that RXMGMASK masks other Mailboxes' filters. See the description of the CAN_RXMGMASK register. 0 The corresponding bit in the filter is "don’t care." 1 The corresponding bit in the filter is checked.

45.3.8 Error Counter (CAN_ECR)

This register has two 8-bit fields reflecting the value of two FlexCAN error counters: Transmit Error Counter (TXERRCNT field) and Receive Error Counter (RXERRCNT field). The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FlexCAN module. Both counters are read-only except in Freeze mode, where they can be written by the CPU.

FlexCAN responds to any bus state as described in the protocol, for example, transmit Error Active or Error Passive flag, delay its transmission start time (Error Passive) and avoid any influence on the bus when in Bus Off state.

The following are the basic rules for FlexCAN bus state transitions:

- If the value of TXERRCNT or RXERRCNT increases to be greater than or equal to 128, the FLTCONF field in the Error and Status Register is updated to reflect ‘Error Passive’ state.
- If the FlexCAN state is ‘Error Passive’, and either TXERRCNT or RXERRCNT decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLTCONF field in the Error and Status Register is updated to reflect ‘Error Active’ state.
- If the value of TXERRCNT increases to be greater than 255, the FLTCONF field in the Error and Status Register is updated to reflect ‘Bus Off’ state, and an interrupt may be issued. The value of TXERRCNT is then reset to zero.
- If FlexCAN is in ‘Bus Off’ state, then TXERRCNT is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, TXERRCNT is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the TXERRCNT. When TXERRCNT reaches the value of 128, the FLTCONF field in the Error and Status Register is updated to be ‘Error Active’ and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the TXERRCNT value.
- If during system start-up, only one node is operating, then its TXERRCNT increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACKERR bit in the Error and Status Register). After the transition to ‘Error Passive’ state, the TXERRCNT does not increment anymore by acknowledge errors. Therefore the device never goes to the ‘Bus Off’ state.
- If the RXERRCNT increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next successful message reception, the counter is set to a value between 119 and 127 to resume to ‘Error Active’ state.

45.3.9 Error and Status 1 register (CAN_ESR1)

This register reflects various error conditions and some general status of the device. It is also the source of interrupts to the CPU.

A CPU read operation clears the following fields to 0, so these fields report error conditions that occurred after the last time the CPU read this register: BIT1ERR, BIT0ERR, ACKERR, CRCERR, FRMERR, and STFERR. TXWRN, RXWRN, IDLE, TX, FLTCONF, and RX provide status information.

The following table shows the FlexCAN state variables and their meanings. Combinations not shown in the table are reserved.

SYNCH	IDLE	TX	RX	FlexCAN state
0	0	0	0	Not synchronized to CAN bus
1	1	x	x	Idle
1	0	1	0	Transmitting
1	0	0	1	Receiving

Address: 0h base + 20h offset = 20h

CAN_ESR1 field descriptions

Field	Description
0–12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 SYNCH	CAN Synchronization Status This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. See the table in the overall CAN_ESR1 register description. 0 FlexCAN is not synchronized to the CAN bus. 1 FlexCAN is synchronized to the CAN bus.
14 TWRNINT	Tx Warning Interrupt Flag If the WRNEN bit in MCR is asserted, the TWRNINT bit is set when the TXWRN flag transitions from 0 to 1, meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRNMSK) is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. When WRNEN is negated, this flag is masked. CPU must clear this flag before disabling the bit. Otherwise it will be set when the WRNEN is set again. Writing 0 has no effect. This flag is not generated during Bus Off state. This bit is not updated during Freeze mode. 0 No such occurrence. 1 The Tx error counter transitioned from less than 96 to greater than or equal to 96.
15 RWRNINT	Rx Warning Interrupt Flag If the WRNEN bit in MCR is asserted, the RWRNINT bit is set when the RXWRN flag transitions from 0 to 1, meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRNMSK) is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. When WRNEN is negated, this flag is masked. CPU must clear this flag before disabling the bit. Otherwise it will be set when the WRNEN is set again. Writing 0 has no effect. This bit is not updated during Freeze mode. 0 No such occurrence. 1 The Rx error counter transitioned from less than 96 to greater than or equal to 96.
16 BIT1ERR	Bit1 Error This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.

Table continues on the next page...

CAN_ESR1 field descriptions (continued)

Field	Description
	NOTE: This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits. 0 No such occurrence. 1 At least one bit sent as recessive is received as dominant.
17 BIT0ERR	Bit0 Error This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message. 0 No such occurrence. 1 At least one bit sent as dominant is received as recessive.
18 ACKERR	Acknowledge Error This bit indicates that an Acknowledge Error has been detected by the transmitter node, that is, a dominant bit has not been detected during the ACK SLOT. 0 No such occurrence. 1 An ACK error occurred since last read of this register.
19 CRCERR	Cyclic Redundancy Check Error This bit indicates that a CRC Error has been detected by the receiver node, that is, the calculated CRC is different from the received. 0 No such occurrence. 1 A CRC error occurred since last read of this register.
20 FRMERR	Form Error This bit indicates that a Form Error has been detected by the receiver node, that is, a fixed-form bit field contains at least one illegal bit. 0 No such occurrence. 1 A Form Error occurred since last read of this register.
21 STFERR	Stuffing Error This bit indicates that a Stuffing Error has been etected. 0 No such occurrence. 1 A Stuffing Error occurred since last read of this register.
22 TXWRN	TX Error Warning This bit indicates when repetitive errors are occurring during message transmission. This bit is not updated during Freeze mode. 0 No such occurrence. 1 TXERRCNT is greater than or equal to 96.
23 RXWRN	Rx Error Warning This bit indicates when repetitive errors are occurring during message reception. This bit is not updated during Freeze mode. 0 No such occurrence. 1 RXERRCNT is greater than or equal to 96.

Table continues on the next page...

CAN_ESR1 field descriptions (continued)

Field	Description
24 IDLE	This bit indicates when CAN bus is in IDLE state. See the table in the overall CAN_ESR1 register description. 0 No such occurrence. 1 CAN bus is now IDLE.
25 TX	FlexCAN In Transmission This bit indicates if FlexCAN is transmitting a message. See the table in the overall CAN_ESR1 register description. 0 FlexCAN is not transmitting a message. 1 FlexCAN is transmitting a message.
26–27 FLTCONF	Fault Confinement State This 2-bit field indicates the Confinement State of the FlexCAN module. If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLTCONF field will indicate “Error Passive”. The very same delay affects the way how FLTCONF reflects an update to ECR register by the CPU. It may be necessary up to one CAN bit time to get them coherent again. Because the Control Register is not affected by soft reset, the FLTCONF field will not be affected by soft reset if the LOM bit is asserted. 00 Error Active 01 Error Passive 1x Bus Off
28 RX	FlexCAN In Reception This bit indicates if FlexCAN is receiving a message. See the table in the overall CAN_ESR1 register description. 0 FlexCAN is not receiving a message. 1 FlexCAN is receiving a message.
29 BOFFINT	Bus Off Interrupt This bit is set when FlexCAN enters ‘Bus Off’ state. If the corresponding mask bit in the Control Register (BOFFMSK) is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. Writing 0 has no effect. 0 No such occurrence. 1 FlexCAN module entered Bus Off state.
30 ERRINT	Error Interrupt This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit CTRL1[ERRMSK] is set, an interrupt is generated to the CPU. This bit is cleared by writing it to 1. Writing 0 has no effect. 0 No such occurrence. 1 Indicates setting of any Error Bit in the Error and Status Register.
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

45.3.10 Interrupt Masks 2 register (CAN_IMASK2)

This register allows any number of a range of the 32 Message Buffer Interrupts to be enabled or disabled for MB63 to MB32. It contains one interrupt mask bit per buffer, enabling the CPU to determine which buffer generates an interrupt after a successful transmission or reception, that is, when the corresponding IFLAG2 bit is set.

Address: 0h base + 24h offset = 24h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

CAN_IMASK2 field descriptions

Field	Description
0–31 BUFHM	Buffer MB $_i$ Mask Each bit enables or disables the corresponding FlexCAN Message Buffer Interrupt for MB63 to MB32. **NOTE:** Setting or clearing a bit in the IMASK2 Register can assert or negate an interrupt request, if the corresponding IFLAG2 bit is set. 0 The corresponding buffer Interrupt is disabled. 1 The corresponding buffer Interrupt is enabled.

45.3.11 Interrupt Masks 1 register (CAN_IMASK1)

This register allows any number of a range of the 32 Message Buffer Interrupts to be enabled or disabled for MB31 to MB0. It contains one interrupt mask bit per buffer, enabling the CPU to determine which buffer generates an interrupt after a successful transmission or reception, that is, when the corresponding IFLAG1 bit is set.

Address: 0h base + 28h offset = 28h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

CAN_IMASK1 field descriptions

Field	Description
0–31 BUFLM	Buffer MB $_i$ Mask

CAN_IMASK1 field descriptions (continued)

Field	Description
	Each bit enables or disables the corresponding FlexCAN Message Buffer Interrupt for MB31 to MB0. **NOTE:** Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set. 0 The corresponding buffer Interrupt is disabled. 1 The corresponding buffer Interrupt is enabled.

45.3.12 Interrupt Flags 2 register (CAN_IFLAG2)

This register defines the flags for the 32 Message Buffer interrupts for MB63 to MB32. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG2 bit. If the corresponding IMASK2 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing 1 to it. Writing 0 has no effect.

Before updating MCR[MAXMB] field, CPU must service the IFLAG2 bits whose MB value is greater than the MCR[MAXMB] to be updated; otherwise, they will remain set and be inconsistent with the number of MBs available.

Address: 0h base + 2Ch offset = 2Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	BUFHI																															
W	w1c																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CAN_IFLAG2 field descriptions

Field	Description
0–31 BUFHI	Buffer MB $_i$ Interrupt Each bit flags the corresponding FlexCAN Message Buffer interrupt for MB63 to MB32. 0 The corresponding buffer has no occurrence of successfully completed transmission or reception. 1 The corresponding buffer has successfully completed transmission or reception.

45.3.13 Interrupt Flags 1 register (CAN_IFLAG1)

This register defines the flags for the 32 Message Buffer interrupts for MB31 to MB0. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing 1 to it. Writing 0 has no effect.

The BUF7I to BUF5I flags are also used to represent FIFO interrupts when the Rx FIFO is enabled. When the bit MCR[RFEN] is set, the function of the 8 least significant interrupt flags BUF[7:0]I changes: BUF7I, BUF6I and BUF5I indicate operating conditions of the FIFO, and the BUF4TO0I field is reserved.

Before enabling the RFEN, the CPU must service the IFLAG bits asserted in the Rx FIFO region; see Section "Rx FIFO". Otherwise, these IFLAG bits will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When the RFEN bit is negated, the FIFO flags must be cleared. The same care must be taken when an RFFN value is selected extending Rx FIFO filters beyond MB7. For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAG bits must be cleared.

Before updating MCR[MAXMB] field, CPU must service the IFLAG1 bits whose MB value is greater than the MCR[MAXMB] to be updated; otherwise, they will remain set and be inconsistent with the number of MBs available.

Address: 0h base + 30h offset = 30h

CAN_IFLAG1 field descriptions

Field	Description
0–23 BUF31TO8I	Buffer MB_i Interrupt Each bit flags the corresponding FlexCAN Message Buffer interrupt for MB31 to MB8. 0 The corresponding buffer has no occurrence of successfully completed transmission or reception. 1 The corresponding buffer has successfully completed transmission or reception.
24 BUF7I	Buffer MB7 Interrupt Or "Rx FIFO Overflow" When the RFEN bit in the MCR is cleared (Rx FIFO disabled), this bit flags the interrupt for MB7. **NOTE:** This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by CPU writes. The BUF7I flag represents "Rx FIFO Overflow" when MCR[RFEN] is set. In this case, the flag indicates that a message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. 0 No occurrence of MB7 completing transmission/reception when MCR[RFEN]=0, or of Rx FIFO overflow when MCR[RFEN]=1 1 MB7 completed transmission/reception when MCR[RFEN]=0, or Rx FIFO overflow when MCR[RFEN]=1
25 BUF6I	Buffer MB6 Interrupt Or "Rx FIFO Warning" When the RFEN bit in the MCR is cleared (Rx FIFO disabled), this bit flags the interrupt for MB6. **NOTE:** This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by CPU writes. The BUF6I flag represents "Rx FIFO Warning" when MCR[RFEN] is set. In this case, the flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4, it does not assert again until the number of unread messages within the Rx FIFO is decreased to be equal to or less than 4. 0 No occurrence of MB6 completing transmission/reception when MCR[RFEN]=0, or of Rx FIFO almost full when MCR[RFEN]=1 1 MB6 completed transmission/reception when MCR[RFEN]=0, or Rx FIFO almost full when MCR[RFEN]=1
26 BUF5I	Buffer MB5 Interrupt Or "Frames available in Rx FIFO" When the RFEN bit in the MCR is cleared (Rx FIFO disabled), this bit flags the interrupt for MB5. **NOTE:** This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by CPU writes. The BUF5I flag represents "Frames available in Rx FIFO" when MCR[RFEN] is set. In this case, the flag indicates that at least one frame is available to be read from the Rx FIFO. 0 No occurrence of MB5 completing transmission/reception when MCR[RFEN]=0, or of frame(s) available in the FIFO, when MCR[RFEN]=1 1 MB5 completed transmission/reception when MCR[RFEN]=0, or frame(s) available in the Rx FIFO when MCR[RFEN]=1
27–30 BUF4TO1I	Buffer MB $_i$ Interrupt Or "reserved" When the RFEN bit in the MCR is cleared (Rx FIFO disabled), these bits flag the interrupts for MB4 to MB1. **NOTE:** These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by CPU writes. The BUF4TO1I flags are reserved when MCR[RFEN] is set.

Table continues on the next page...

CAN_IFLAG1 field descriptions (continued)

Field	Description
	0 The corresponding buffer has no occurrence of successfully completed transmission or reception when MCR[RFEN]=0. 1 The corresponding buffer has successfully completed transmission or reception when MCR[RFEN]=0.
31 BUF0I	Buffer MB0 Interrupt Or "reserved" When the RFEN bit in the MCR is cleared (Rx FIFO disabled), this bit flags the interrupt for MB0. **NOTE:** This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by CPU writes. The BUF0I flag is reserved when MCR[RFEN] is set. 0 The corresponding buffer has no occurrence of successfully completed transmission or reception when MCR[RFEN]=0. 1 The corresponding buffer has successfully completed transmission or reception when MCR[RFEN]=0.

45.3.14 Control 2 register (CAN_CTRL2)

This register contains control bits for CAN errors, FIFO features, and mode selection.

Address: 0h base + 34h offset = 34h

CAN_CTRL2 field descriptions

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 ECRWRE	Error-correction Configuration Register Write Enable Enable that the MECR register is updated. This bit is automatically set to 0 if the protocol described in the "Detection and Correction of Memory Errors" section is not followed. 0 Disable update. 1 Enable update.

Table continues on the next page...

CAN_CTRL2 field descriptions (continued)

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>3
WRMFRZ</td><td>Write-Access To Memory In Freeze Mode

Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode.

0 Maintain the write access restrictions.
1 Enable unrestricted write access to FlexCAN memory.</td></tr>
<tr><td>4–7
RFFN</td><td>Number Of Rx FIFO Filters

This 4-bit field defines the number of Rx FIFO filters, as shown in the following table. The maximum selectable number of filters is determined by the chip. This field can only be written in Freeze mode as it is blocked by hardware in other modes. This field must not be programmed with values that make the number of Message Buffers occupied by Rx FIFO and ID Filter exceed the number of Mailboxes present, defined by MCR[MAXMB].

<b>NOTE:</b> Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value correponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

(SETUP_MB - 6) × 4

where SETUP_MB is the least between NUMBER_OF_MB and MAXMB.

The number of remaining Mailboxes available will be:

(SETUP_MB - 8) - (RFFN × 2)

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP_MB value (memory space available) the exceeding ones will not be functional.

CAN_CTRL2 field descriptions (continued)

RFFN[3:0]	Number of Rx FIFO filters	Message Buffers occupied by Rx FIFO and ID Filter Table	Remaining Available Mailboxes[1]	Rx FIFO ID Filter Table Elements Affected by Rx Individual Masks	Rx FIFO ID Filter Table Elements Affected by Rx FIFO Global Mask [2]
0xE	120	MB 0-35	MB 36-63	Elements 0-31	Elements 32-119
0xF	128	MB 0-37	MB 38-63	Elements 0-31	Elements 32-127

1. The number of the last remaining available mailboxes is defined by the least value between the parameter NUMBER_OF_MB minus 1 and the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Field	Description
8–12 TASD	Tx Arbitration Start Delay This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can be written only in Freeze mode because it is blocked by hardware in other modes. This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs. The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency. The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa. If TASD is 0 then the arbitration start is not delayed, thus the CPU has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration. On the other hand, if TASD is 24 then the CPU can configure a Tx MB later and less time is reserved for arbitration. If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that the CPU reconfigures some Tx MBs and the winner MB is not the best to be transmitted. The optimal configuration for TASD can be calculated as: $TASD = 25 - \{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2\} / \{f_{SYS} \times [1+(PSEG1+1)+(PSEG2+1)+(PROPSEG+1)] \times (PRESDIV+1)\}$ where: • f_{CANCLK} is the Protocol Engine (PE) Clock (see section "Protocol Timing"), in Hz • f_{SYS} is the peripheral clock, in Hz • MAXMB is the value in CTRL1[MAXMB] field • RFEN is the value in CTRL1[RFEN] bit • RFFN is the value in CTRL2[RFFN] field • PSEG1 is the value in CTRL1[PSEG1] field • PSEG2 is the value in CTRL1[PSEG2] field • PROPSEG is the value in CTRL1[PROPSEG] field • PRESDIV is the value in CTRL1[PRESDIV] field

Table continues on the next page...

CAN_CTRL2 field descriptions (continued)

Field	Description
	See Section "Arbitration process" and Section "Protocol Timing" for more details.
13 MRP	Mailboxes Reception Priority If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Matching starts from Rx FIFO and continues on Mailboxes. 1 Matching starts from Mailboxes and continues on Rx FIFO.
14 RRS	Remote Request Storing If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated. If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Remote Response Frame is generated. 1 Remote Request Frame is stored.
15 EACEN	Entire Frame Arbitration Field Comparison Enable For Rx Mailboxes This bit controls the comparison of IDE and RTR bits whithin Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can be written only in Freeze mode because it is blocked by hardware in other modes. 0 Rx Mailbox filter’s IDE bit is always compared and RTR is never compared despite mask bits. 1 Enables the comparison of both Rx Mailbox filter’s IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply.
16–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

1. The number of the last remaining available mailboxes is defined by the least value between the parameter NUMBER_OF_MB minus 1 and the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

45.3.15 Error and Status 2 register (CAN_ESR2)

This register reflects various interrupt flags and some general status.

Address: 0h base + 38h offset = 38h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0									LPTM						
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0	VPS	IMB	0												
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CAN_ESR2 field descriptions

Field	Description
0–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–15 LPTM	Lowest Priority Tx Mailbox If ESR2[VPS] is asserted, this field indicates the lowest number inactive Mailbox (see the IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value. If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one that has the greatest arbitration value (see the "Highest priority Mailbox first" section). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number.
16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 VPS	Valid Priority Status This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the CPU writes to Control and Status word of a Mailbox that has already been scanned, that is, it is behind Tx Arbitration Pointer, during the Tx arbitration process. If there is no inactive Mailbox and only one Tx Mailbox that is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox. **NOTE:** ESR2[VPS] is not affected by any CPU write into Control Status (C/S) of a MB that is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is being transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked. 0 Contents of IMB and LPTM are invalid. 1 Contents of IMB and LPTM are valid.
18 IMB	Inactive Mailbox If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000). This bit is asserted in the following cases:

Table continues on the next page...

CAN_ESR2 field descriptions (continued)

Field	Description
	• During arbitration, if an LPTM is found and it is inactive. • If IMB is not asserted and a frame is transmitted successfully. This bit is cleared in all start of arbitration (see Section "Arbitration process"). **NOTE:** LPTM mechanism have the following behavior: if an MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM]. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox. 1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one.
19–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

45.3.16 CRC Register (CAN_CRCR)

This register provides information about the CRC of transmitted messages.

Address: 0h base + 44h offset = 44h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0									MBCRC						
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0	TXCRC														
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CAN_CRCR field descriptions

Field	Description
0–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–15 MBCRC	CRC Mailbox This field indicates the number of the Mailbox corresponding to the value in TXCRC field.
16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17–31 TXCRC	CRC Transmitted This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted.

45.3.17 Rx FIFO Global Mask register (CAN_RXFGMASK)

This register is located in RAM.

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

Address: 0h base + 48h offset = 48h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
0 The corresponding bit in the filter is "don’t care."
1 The corresponding bit in the filter is checked.</td></tr>
</table>

[1] If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

[2] If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

45.3.18 Rx FIFO Information Register (CAN_RXFIR)

RXFIR provides information on Rx FIFO.

This register is the port through which the CPU accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. See Section "Rx FIFO" for instructions on reading this register.

Address: 0h base + 4Ch offset = 4Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

* Notes:
- x = Undefined at reset.

CAN_RXFIR field descriptions

Field	Description
0–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23–31 IDHIT	Identifier Acceptance Filter Hit Indicator This field indicates which Identifier Acceptance Filter was hit by the received message that is in the output of the Rx FIFO. If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted.

45.3.19 Rx Individual Mask Registers (CAN_RXIMR*n*)

These registers are located in RAM.

RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO. If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on the setting of CTRL2[RFFN].

RXIMR can only be written by the CPU while the module is in Freeze mode; otherwise, they are blocked by hardware.

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

Address: 0h base + 880h offset + (4d × i), where i=0d to 63d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

* Notes:
- x = Undefined at reset.

CAN_RXIMR*n* field descriptions

Field	Description
0–31 MI[31:0]	Individual Mask Bits Each Individual Mask Bit masks the corresponding bit in both the Mailbox filter and Rx FIFO ID Filter Table element in distinct ways. For Mailbox filters, see the RXMGMASK register description. For Rx FIFO ID Filter Table elements, see the RXFGMASK register description. 0 The corresponding bit in the filter is "don't care." 1 The corresponding bit in the filter is checked.

45.3.20 Memory Error Control Register (CAN_MECR)

This register contains control bits for memory error detection and correction (ECC).

NOTE

> When bit CTRL2[ECRWRE] is 0, this register is read-only and writes to this register result in bus transfer errors.

Address: 0h base + AE0h offset = AE0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

W																
Reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

CAN_MECR field descriptions

Field	Description
0 ECRWRDIS	Error Configuration Register Write Disable Disables writes on this register. 0 Write is enabled. 1 Write is disabled.
1–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15 CEI_MSK	Correctable Errors Interrupt Mask Enables the interrupt in case of correctable errors detected in memory reads issued by the host or FlexCAN internal processes. 0 Interrupt is disabled. 1 Interrupt is enabled.
16 HAERRIE	Host Access Error Injection Enable Enables the injection of errors only in memory reads issued by the host (CPU). 0 Injection is disabled. 1 Injection is enabled.
17 FAERRIE	FlexCAN Access Error Injection Enable Enables the injection of errors only in memory reads issued by the FlexCAN internal processes. 0 Injection is disabled. 1 Injection is enabled.
18 EXTERRIE	Extended Error Injection Enable Memory accesses performed by internal FlexCAN processes are 64-bit. This bit extends the error injection on 32-bit memory accesses to the complementary 32-bit word using the same 32-bit error injection data and parity words. See Error Injection Data Pattern Register (FCERRIDPR) and Error Injection Parity Pattern Register (FCERRIPPR) 0 Error injection is applied only to the 32-bit word. 1 Error injection is applied to the 64-bit word.
19–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 RERRDIS	Error Report Disable Disables the update of the error report registers. The update of error-related flags and the generation of bus transfer errors are still active.

Table continues on the next page...

CAN_MECR field descriptions (continued)

Field	Description
	NOTE: When reading the report registers, this bit must be cleared to assure coherence on the consecutive register reads. 0 Enable updates of the error report registers. 1 Disable updates of the error report registers.
23 ECCDIS	Error Correction Disable Disables completely the memory error detection and correction mechanism. Besides disabling the error report mechanism, it also stops the update of the error-related flags and generation of bus transfer errors. The parity bits continue being calculated and written into memory on write transactions. 0 Enable memory error correction. 1 Disable memory error correction.
24 NCEFAFRZ	Non-Correctable Errors In FlexCAN Access Put Device In Freeze Mode Determines the response when a non-correctable error is detected in a memory read performed by FlexCAN internal processes. In this case, entering Freeze mode prevents corrupted data from being treated as valid by FlexCAN internal processes. 0 Keep normal operation. 1 Put FlexCAN in Freeze mode (according to the "Freeze mode" section).
25–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

45.3.21 Error Injection Address Register (CAN_ERRIAR)

This register holds the address where error is to be injected.

Use the following table to convert from the memory map address to the location in the physical FlexCAN RAM:

RAM contents	Injection address	Memory map
FlexCAN Registers	Not mapped	-
MBs	0x0000	0x0080
Reserved	-	0x0480
RXIMRs	0x0400	0x0880
Reserved	-	0x0980
RXFIR_0	0x0500	0x0A80
RXFIR_1	0x0504	0x0A84
RXFIR_2	0x0508	0x0A88
RXFIR_3	0x050C	0x0A8C
RXFIR_4	0x0510	0x0A90
RXFIR_5	0x0514	0x0A94

CAN_ERRIDPR field descriptions

Field	Description
0–31 DFLIP	Data flip pattern Bits set to 1 in the flip pattern cause the corresponding data bit in the word read from memory to invert.

45.3.23 Error Injection Parity Pattern Register (CAN_ERRIPPR)

Holds the error pattern to be injected in parity bits read from memory along with data word.

Bits set to 1 in the flip pattern cause the corresponding parity bit in the word read from memory to invert.

Address: 0h base + AECh offset = AECh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

CAN_ERRIPPR field descriptions

Field	Description
0–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3–7 PFLIP3	Parity Flip Pattern For Byte 3 (most significant)
8–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11–15 PFLIP2	Parity Flip Pattern For Byte 2
16–18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19–23 PFLIP1	Parity Flip Pattern For Byte 1
24–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–31 PFLIP0	Parity Flip Pattern For Byte 0 (Least Significant)

45.3.24 Error Report Address Register (CAN_RERRAR)

Reports the address used for an access in which an error (correctable or non-correctable) was detected, and also reports the identification of the source of that access.

This address is always reported using a 32-bit alignment. Non-aligned accesses (ERRADDR[1:0] non-0) are reported with the address aligned and data is reported in RERRDR accordingly shifted. In case of errors detected in accesses larger than 32-bit (as performed by FlexCAN internal processes), the address of the 32-bit word in which the error was detected is reported. In case of errors detected in more than one 32-bit word, only the least significant address is reported.

Address: 0h base + AF0h offset = AF0h

CAN_RERRDR field descriptions

Field	Description
0–31 RDATA	Raw data word read from memory with error

45.3.26 Error Report Syndrome Register (CAN_RERRSYNR)

Holds the syndrome detected in a memory read with error. It also reports the bytes which were read in this 32-bit read transaction.

Each SYNDn field indicates the type of error and which bit in byte (n) is affected by the error. (SYND3 corresponds to the most significant byte in the data word read from memory; SYND0 corresponds to the least significant.)

Table 45-4. Syndrome Definition

SYNDn (hex)	Type	Bit affected
00	-	none (no error)
01	Code	0
02	Code	1

Table continues on the next page...

Table 45-4. Syndrome Definition (continued)

SYNDn (hex)	Type	Bit affected
04	Code	2
07	Data	5
08	Code	3
0E	Data	7
10	Code	4
13	Data	2
15	Data	6
16	Data	1
19	Data	3
1A	Data	4
1C	Data	0
All others	-	Non-correctable error

Each BEn field indicates which byte in the 32-bit word reported was effectively read. The syndrome bits are calculated for all bytes, even for the non-read ones. Errors detected in non-read bytes are indicated (see the "Error Indication" section) and reported (see the "Error Reporting" section).

Address: 0h base + AF8h offset = AF8h

Field	Description
8 BE2	Byte Enabled For Byte 2 0 The byte was not read. 1 The byte was read.
9–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11–15 SYND2	Error Syndrome For Byte 2 See the "Syndrome Definition" table.
16 BE1	Byte Enabled For Byte 1 0 The byte was not read. 1 The byte was read.
17–18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19–23 SYND1	Error Syndrome for Byte 1 See the "Syndrome Definition" table.
24 BE0	Byte Enabled For Byte 0 (least significant) 0 The byte was not read. 1 The byte was read.
25–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–31 SYND0	Error Syndrome For Byte 0 (least significant) See the "Syndrome Definition" table.

45.3.27 Error Status Register (CAN_ERRSR)

Holds the status bits of the error correction and detection operations. After raised, these flags must be cleared by writing 1 to them. Writing 0 has no effect.

Address: 0h base + AFCh offset = AFCh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

CAN_ERRSR field descriptions

Field	Description
0–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 HANCEIF	Host Access With Non-Correctable Error Interrupt Flag Indicates that a non-correctable error was detected in a memory access initiated by Host. A bus transfer error is asserted for that access. No interrupt is associated to this flag. 0 No non-correctable errors were detected in Host accesses so far. 1 A non-correctable error was detected in a Host access.
13 FANCEIF	FlexCAN Access With Non-Correctable Error Interrupt Flag

Table continues on the next page...

CAN_ERRSR field descriptions (continued)

Field	Description
	Indicates that a non-correctable error was detected in a memory access initiated by FlexCAN internal processes. No interrupt is associated to this flag. 0 No non-correctable errors were detected in FlexCAN accesses so far. 1 A non-correctable error was detected in a FlexCAN access.
14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15 CEIF	Correctable Error Interrupt Flag Indicates that a correctable error was detected in a memory access. If MECR[CEI_MSK] is set, the interrupt is asserted. 0 No correctable errors were detected so far. 1 A correctable error was detected.
16–27 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28 HANCEIOF	Host Access With Non-Correctable Error Interrupt Overrun Flag Indicates that a non-correctable error was detected in a memory access initiated by Host when HANCEIF was set. No interrupt is associated to this flag. (See the "Error Indication" section.) 0 No overrun on non-correctable errors in Host access 1 Overrun on non-correctable errors in Host access
29 FANCEIOF	FlexCAN Access With Non-Correctable Error Interrupt Overrun Flag Indicates that a non-correctable error was detected in a memory access initiated by FlexCAN internal processes when FANCEIF was set. No interrupt is associated to this flag. (See the "Error Indication" section.) 0 No overrun on non-correctable errors in FlexCAN access 1 Overrun on non-correctable errors in FlexCAN access
30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 CEIOF	Correctable Error Interrupt Overrun Flag Indicates that a correctable error was detected in a memory access when CEIF was set. No interrupt is associated to this flag. (See the "Error Indication" section.) 0 No overrun on correctable errors 1 Overrun on correctable errors

45.3.28 Message buffer structure

The message buffer structure used by the FlexCAN module is represented in the following figure. Both Extended (29-bit identifier) and Standard (11-bit identifier) frames used in the CAN specification (Version 2.0 Part B) are represented. Each individual MB is formed by 16 bytes.

The memory area from 0x80 to 0x47F is used by the mailboxes.

CODE — Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FlexCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in Table 45-6 and Table 45-7. See Functional description for additional information.

Table 45-6. Message buffer code for Rx buffers

CODE description	Rx code BEFORE receive new frame	SRV[1]	Rx code AFTER successful reception[2]	RRS[3]	Comment
0b0000: INACTIVE — MB is not active.	INACTIVE	—	—	—	MB does not participate in the matching process.
0b0100: EMPTY — MB is active and empty.	EMPTY	—	FULL	—	When a frame is received successfully (after the Move-in) process), the CODE field is automatically updated to FULL.
0b0010: FULL — MB is full.	FULL	Yes	FULL	—	The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a new frame is moved to the MB after the MB was serviced, the code still remains FULL. See Matching process for matching details related to FULL code.

Table continues on the next page...

Table 45-6. Message buffer code for Rx buffers (continued)

CODE description	Rx code BEFORE receive new frame	SRV[1]	Rx code AFTER successful reception[2]	RRS[3]	Comment
		No	OVERRUN	—	If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. See Matching process for details about overrun behavior.
0b0110: OVERRUN — MB is being overwritten into a full buffer.	OVERRUN	Yes	FULL	—	If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB then the code returns to FULL.
		No	OVERRUN	—	If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. See Matching process for details about overrun behavior.
0b1010: RANSWER[4] — A frame was configured to recognize a Remote Request Frame and transmit a Response Frame in return.	RANSWER	—	TANSWER(0b1110)	0	A Remote Answer was configured to recognize a remote request frame received. After that an MB is set to transmit a response frame. The code is automatically changed to TANSWER (0b1110). See Matching process for details. If CTRL2[RRS] is negated, transmit a response frame whenever a remote

					request frame with the same ID is received.
		—	—	1	This code is ignored during matching and arbitration process. See Matching process for details.
CODE[0]=1b1: BUSY — FlexCAN is updating the contents of the MB. The CPU must not access the MB.	BUSY[5]	—	FULL	—	Indicates that the MB is being updated. It will be negated automatically and does not interfere with the next CODE.
		—	OVERRUN	—	

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered a successful reception after the frame to be moved to MB (move-in process). See Move-in for details.
3. Remote Request Stored bit from CTRL2 register. See section "Control 2 Register (CTRL2)" for details.
4. Code 0b1010 is not considered Tx and an MB with this code should not be aborted.
5. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

Table 45-7. Message buffer code for Tx buffers

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
0b1000: INACTIVE — MB is not active	INACTIVE	—	—	MB does not participate in arbitration process.
0b1001: ABORT — MB is aborted	ABORT	—	—	MB does not participate in arbitration process.
0b1100: DATA — MB is a Tx Data Frame (MB RTR must be 0)	DATA	0	INACTIVE	Transmit data frame unconditionally once. After transmission, the MB automatically returns to the INACTIVE state.
0b1100: REMOTE — MB is a Tx Remote Request Frame (MB RTR must be 1)	REMOTE	1	EMPTY	Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID.
0b1110: TANSWER — MB is a Tx Response	TANSWER	—	RANSWER	This is an intermediate code that is

Table 45-7. Message buffer code for Tx buffers

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
Frame from an incoming Remote Request Frame				automatically written to the MB by the CHI as a result of a match to a remote request frame. The remote response frame will be transmitted unconditionally once, and then the code will automatically return to RANSWER (0b1010). The CPU can also write this code with the same effect. The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. See Matching process and Arbitration process for details.

SRR — Substitute Remote Request

Fixed recessive bit, used only in extended format. It must be set to one by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FlexCAN receives this bit as dominant, then it is interpreted as an arbitration loss.

1 = Recessive value is compulsory for transmission in extended format frames

0 = Dominant is not a valid value for transmission in extended format frames

IDE — ID Extended Bit

This field identifies whether the frame format is standard or extended.

1 = Frame format is extended

0 = Frame format is standard

RTR — Remote Transmission Request

This bit affects the behavior of remote frames and is part of the reception filter. See Table 45-6, Table 45-7, and the description of the RRS bit in Control 2 Register (CTRL2) for additional details.

If FlexCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as an arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FlexCAN module treats it as a bit error. If the value received matches the value transmitted, it is considered a successful bit transmission.

1 = Indicates the current MB may have a remote request frame to be transmitted if MB is Tx. If the MB is Rx then incoming remote request frames may be stored.

0 = Indicates the current MB has a data frame to be transmitted. In Rx MB it may be considered in matching processes.

DLC — Length of Data in Bytes

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 0x8 through 0xF of the MB space (see the Table 45-5). In reception, this field is written by the FlexCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the CPU and corresponds to the DLC field value of the frame to be transmitted. When RTR = 1, the frame to be transmitted is a remote frame and does not include the data field, regardless of the DLC field (see Table 45-8).

TIME STAMP — Free-Running Counter Time Stamp

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

PRIO — Local priority

This 3-bit field is used only when LPRIO_EN bit is set in MCR, and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See Arbitration process.

ID — Frame Identifier

In standard frame format, only the 11 most significant bits (3 to 13) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In extended frame format, all bits are used for frame identification in both receive and transmit cases.

DATA BYTE 0–7 — Data Field

Up to eight bytes can be used for a data frame.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE (*n*) is valid only if *n* is less than DLC as shown in the table below.

For Tx frames, the CPU prepares the data field to be transmitted within the frame.

Table 45-8. DATA BYTEs validity

DLC	Valid DATA BYTEs
0	none
1	DATA BYTE 0
2	DATA BYTE 0–1
3	DATA BYTE 0–2
4	DATA BYTE 0–3
5	DATA BYTE 0–4
6	DATA BYTE 0–5
7	DATA BYTE 0–6
8	DATA BYTE 0–7

45.3.29 Rx FIFO structure

When the MCR[RFEN] bit is set, the memory area from 0x80 to 0xDC (which is normally occupied by MBs 0–5) is used by the reception FIFO engine.

The region 0x80-0x8C contains the output of the FIFO which must be read by the CPU as a message buffer. This output contains the oldest message that has been received but not yet read. The region 0x90-0xDC is reserved for internal use of the FIFO engine.

An additional memory area, which starts at 0xE0 and may extend up to 0x2DC (normally occupied by MBs 6–37) depending on the CTRL2[RFFN] field setting, contains the ID filter table (configurable from 8 to 128 table elements) that specifies filtering criteria for accepting frames into the FIFO.

Out of reset, the ID filter table flexible memory area defaults to 0xE0 and extends only to 0xFC, which corresponds to MBs 6 to 7 for RFFN = 0, for backward compatibility with previous versions of FlexCAN.

The following shows the Rx FIFO data structure.

Table 45-9. Rx FIFO structure

<table>
<tr><th></th><th>0</th><th>3</th><th>7</th><th>8</th><th>9</th><th>10</th><th>11</th><th>12</th><th>13</th><th>14</th><th>15</th><th>16</th><th>23</th><th>24</th><th>31</th></tr>
<tr><td>0x80</td><td colspan="4"></td><td>SRR</td><td>IDE</td><td>RTR</td><td colspan="4">DLC</td><td colspan="4">TIME STAMP</td></tr>
<tr><td>0x84</td><td></td><td colspan="8">ID standard</td><td colspan="6">ID extended</td></tr>
<tr><td>0x88</td><td colspan="3">Data byte 0</td><td colspan="8">Data byte 1</td><td colspan="2">Data byte 2</td><td colspan="2">Data byte 3</td></tr>
<tr><td>0x8C</td><td colspan="3">Data byte 4</td><td colspan="8">Data byte 5</td><td colspan="2">Data byte 6</td><td colspan="2">Data byte 7</td></tr>
<tr><td>0x90
to
0xDC</td><td colspan="15">Reserved</td></tr>
</table>

Table continues on the next page...

Table 45-9. Rx FIFO structure (continued)

0xE0	ID filter table element 0
0xE4	ID filter table element 1
0xE8 to 0x2D4	ID filter table elements 2 to 125
0x2D8	ID filter table element 126
0x2DC	ID filter table element 127
▨	= Unimplemented or reserved

Each ID filter table element occupies an entire 32-bit word and can be compounded by one, two, or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. The following figures show the IDAF indexation.

The following table shows the three different formats of the ID table elements. Note that all elements of the table must have the same format. See Rx FIFO for more information.

Table 45-10. ID table structure

Format	0	1	2 … 7	8 … 15	16	17	18 … 23	24 … 30	31
A	RTR	IDE	RXIDA (standard = 2–12, extended = 2–30)						▨
B	RTR	IDE	RXIDB_0 (standard = 2–12, extended = 2–15)		RTR	IDE	RXIDB_1 (standard = 18–28, extended = 18–31)		
C	RXIDC_0 (std/ext = 0–7)			RXIDC_1 (std/ext = 8–15)	RXIDC_2 (std/ext = 16–23)			RXIDC_3 (std/ext = 24–31)	
	▨		= Unimplemented or Reserved						

RTR — Remote Frame

This bit specifies if Remote Frames are accepted into the FIFO if they match the target ID.

1 = Remote Frames can be accepted and data frames are rejected

0 = Remote Frames are rejected and data frames can be accepted

IDE — Extended Frame

Specifies whether extended or standard frames are accepted into the FIFO if they match the target ID.

1 = Extended frames can be accepted and standard frames are rejected

0 = Extended frames are rejected and standard frames can be accepted

RXIDA — Rx Frame Identifier (Format A)

Specifies an ID to be used as acceptance criteria for the FIFO. In the standard frame format, only the 11 most significant bits (2 to 12) are used for frame identification. In the extended frame format, all bits are used.

RXIDB_0, RXIDB_1 — Rx Frame Identifier (Format B)

Specifies an ID to be used as acceptance criteria for the FIFO. In the standard frame format, the 11 most significant bits (a full standard ID) (2 to 12 and 18 to 28) are used for frame identification. In the extended frame format, all 14 bits of the field are compared to the 14 most significant bits of the received ID.

RXIDC_0, RXIDC_1, RXIDC_2, RXIDC_3 — Rx Frame Identifier (Format C)

Specifies an ID to be used as acceptance criteria for the FIFO. In both standard and extended frame formats, all 8 bits of the field are compared to the 8 most significant bits of the received ID.

45.4 Functional description

The FlexCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames. The mailbox system is composed by a set of Message Buffers (MB) that store configuration and control data, time stamp, message ID and data (see Message buffer structure). The memory corresponding to the first 38 MBs can be configured to support a FIFO reception scheme with a powerful ID filtering mechanism, capable of checking incoming frames against a table of IDs (up to 128 extended IDs or 256 standard IDs or 512 8-bit ID slices), with individual mask register for up to 32 ID Filter Table elements. Simultaneous reception through FIFO and mailbox is supported. For mailbox reception, a matching algorithm makes it possible to store received frames only into MBs that have the same ID programmed on its ID field. A masking scheme makes it possible to match the ID programmed on the MB with a range of IDs on received CAN frames. For transmission, an arbitration algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A Message Buffer is said to be "active" at a given time if it can participate in both the Matching and Arbitration processes. An Rx MB with a 0b0000 code is inactive (refer to Table 45-6). Similarly, a Tx MB with a 0b1000 or 0b1001 code is also inactive (refer to Table 45-7).

45.4.1 Transmit process

To transmit a CAN frame, the CPU must prepare a Message Buffer for transmission by executing the following procedure:

1. Check whether the respective interrupt bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (0b1001) to the CODE field of the Control and Status word to request an abortion of the transmission. Wait for the corresponding IFLAG to be asserted by polling the IFLAG register or by the interrupt request if enabled by the respective IMASK. Then read back the CODE field to check if the transmission was aborted or transmitted (see Transmission abort mechanism). If backwards compatibility is desired (MCR[AEN] bit is negated), just write the INACTIVE code (0b1000) to the CODE field to inactivate the MB but then the pending frame may be transmitted without notification (see Mailbox inactivation).
3. Write the ID word.
4. Write the data bytes.
5. Write the DLC, Control, and CODE fields of the Control and Status word to activate the MB.

When the MB is activated, it will participate into the arbitration process and eventually be transmitted according to its priority. At the end of the successful transmission, the value of the Free Running Timer is written into the Time Stamp field, the CODE field in the Control and Status word is updated, the CRC Register is updated, a status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit. The new CODE field after transmission depends on the code that was used to activate the MB (see Table 45-6 and Table 45-7 in Message buffer structure).

When the Abort feature is enabled (MCR[AEN] is asserted), after the Interrupt Flag is asserted for a Mailbox configured as transmit buffer, the Mailbox is blocked, therefore the CPU is not able to update it until the Interrupt Flag is negated by CPU. This means that the CPU must clear the corresponding IFLAG before starting to prepare this MB for a new transmission or reception.

45.4.2 Arbitration process

The arbitration process scans the Mailboxes searching the Tx one that holds the message to be sent in the next opportunity. This Mailbox is called the *arbitration winner*.

The scan starts from the lowest number Mailbox and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the CTRL2[TASD] field value.
- During the Error Delimiter field of a CAN frame.
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When there is CPU write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.
- When CHI is in Idle state and the CPU writes to the C/S word of any MB.
- When FlexCAN exits Bus Off state.
- Upon leaving Freeze mode or Low Power mode.

If the arbitration process does not manage to evaluate all Mailboxes before the CAN bus has reached the first bit of the Intermission field the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx Mailboxes at the end of the scan according to both CTRL1[LBUF] and MCR[LPRIOEN] bits settings.

45.4.2.1 Lowest-number Mailbox first

If CTRL1[LBUF] bit is asserted the first (lowest number) active Tx Mailbox found is the arbitration winner. MCR[LPRIOEN] bit has no effect when CTRL1[LBUF] is asserted.

45.4.2.2 Highest-priority Mailbox first

If CTRL1[LBUF] bit is negated, then the arbitration process searches the active Tx Mailbox with the highest priority, which means that this Mailbox's frame would have a higher probability to win the arbitration on CAN bus when multiple external nodes compete for the bus at the same time.

The sequence of bits considered for this arbitration is called the *arbitration value* of the Mailbox. The highest-priority Tx Mailbox is the one that has the lowest arbitration value among all Tx Mailboxes.

If two or more Mailboxes have equivalent arbitration values, the Mailbox with the lowest number is the arbitration winner.

The composition of the arbitration value depends on MCR[LPRIOEN] bit setting.

45.4.2.2.1 Local Priority disabled

If MCR[LPRIOEN] bit is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see the following table) in such a way that the Local Priority is disabled.

Table 45-11. Composition of the arbitration value when Local Priority is disabled

Format	Mailbox Arbitration Value (32 bits)				
Standard (IDE = 0)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	Extended ID[28:18] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)

45.4.2.2.2 Local Priority enabled

If Local Priority is desired MCR[LPRIOEN] must be asserted. In this case the Mailbox PRIO field is included at the very left of the arbitration value (see the following table).

Table 45-12. Composition of the arbitration value when Local Priority is enabled

Format	Mailbox Arbitration Value (35 bits)					
Standard (IDE = 0)	PRIO (3 bits)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	PRIO (3 bits)	Extended ID[28:18] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)

As the PRIO field is the most significant part of the arbitration value Mailboxes with low PRIO values have higher priority than Mailboxes with high PRIO values regardless the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

45.4.2.3 Arbitration process (continued)

After the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called move-out and after it is done, write access to the corresponding MB is blocked (if the AEN bit in MCR is asserted). The write access is released in the following events:

- After the MB is transmitted
- FlexCAN enters in Freeze mode or Bus Off
- FlexCAN loses the bus arbitration or there is an error during the transmission

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules. FlexCAN transmits up to eight data bytes, even if the Data Length Code (DLC) field value is greater than that.

Arbitration process can be triggered in the following situations:

- During Rx and Tx frames from CAN CRC field to end of frame. TASD value may be changed to optimize the arbitration start point.
- During CAN BusOff state from TX_ERR_CNT=124 to 128. TASD value may be changed to optimize the arbitration start point.
- During C/S write by CPU in BusIdle. First C/S write starts arbitration process and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after arbitration process has finished, then TX arbitration machine begins a new arbitration process.
    - If there is a pending arbitration and BusIdle state starts then an arbitration process is triggered. In this case the first and second C/S write in BusIdle will not restart the arbitration process. It is possible that there is not enough time to finish arbitration in WaitForBusIdle state and the next state is Idle. In this case the scan is not interrupted, and it is completed during BusIdle state. During this arbitration C/S write does not cause arbitration restart.
- Arbitration winner deactivation during a valid arbitration window.
- Upon Leave Freeze mode (first bit of the WaitForBusIdle state). If there is a re-synchronization during WaitForBusIdle arbitration process is restarted.

Arbitration process stops in the following situation:

- All Mailboxes were scanned
- A Tx active Mailbox is found in case of Lowest Buffer feature enabled
- Arbitration winner inactivation or abort during any arbitration process
- There was not enough time to finish Tx arbitration process (for instance, when a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or Overload flag in the bus
- Low Power or Freeze mode request in Idle state

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time
- C/S write during arbitration if write is performed in a MB whose number is lower than the Tx arbitration pointer
- Any C/S write if there is no Tx Arbitration process in progress
- Rx Match has just updated a Rx Code to Tx Code
- Entering Busoff state

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- If C/S write is performed in a MB whose number is higher than the Tx arbitration pointer, the ongoing arbitration process will scan this MB as normal.

45.4.3 Receive process

To be able to receive CAN frames into a Mailbox, the CPU must prepare it for reception by executing the following steps:

1. If the Mailbox is active (either Tx or Rx) inactivate the Mailbox (see Mailbox inactivation), preferably with a safe inactivation (see Transmission abort mechanism).

2. Write the ID word

3. Write the EMPTY code (0b0100) to the CODE field of the Control and Status word to activate the Mailbox.

After the MB is activated, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the Mailbox is updated by the *move-in* process (see Move-in) as follows:

1. The received Data field (8 bytes at most) is stored.
2. The received Identifier field is stored.
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the Mailbox's Time Stamp field.
4. The received SRR, IDE, RTR, and DLC fields are stored.
5. The CODE field in the Control and Status word is updated (see Table 45-6 and Table 45-7 in Section Message buffer structure).
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for CPU servicing (read) the frame received in an Mailbox is using the following procedure:

1. Read the Control and Status word of that Mailbox.
2. Check if the BUSY bit is deasserted, indicating that the Mailbox is locked. Repeat step 1) while it is asserted. See Mailbox lock mechanism.
3. Read the contents of the Mailbox. Once Mailbox is locked now, its contents won't be modified by FlexCAN Move-in processes. See Move-in.
4. Acknowledge the proper flag at IFLAG registers.
5. Read the Free Running Timer. It is optional but recommended to unlock Mailbox as soon as possible and make it available for reception.

The CPU should synchronize to frame reception by the status flag bit for the specific Mailbox in one of the IFLAG Registers and not by the CODE field of that Mailbox. Polling the CODE field does not work because once a frame was received and the CPU services the Mailbox (by reading the C/S word followed by unlocking the Mailbox), the CODE field will not return to EMPTY. It will remain FULL, as explained in Table 45-6 . If the CPU tries to workaround this behavior by writing to the C/S word to force an EMPTY code after reading the Mailbox without a prior *safe inactivation*, a newly received frame matching the filter of that Mailbox may be lost.

CAUTION

In summary: *never do polling by reading directly the C/S word of the Mailboxes. Instead, read the IFLAG registers.*

Note that the received frame's Identifier field is always stored in the matching Mailbox, thus the contents of the ID field in an Mailbox may change if the match was due to masking. Note also that FlexCAN does receive frames transmitted by itself if there exists a matching Rx Mailbox, provided the MCR[SRXDIS] bit is not asserted. If the MCR[SRXDIS] bit is asserted, FlexCAN will not store frames transmitted by itself in any MB, even if it contains a matching MB, and no interrupt flag or interrupt signal will be generated due to the frame reception.

To be able to receive CAN frames through the Rx FIFO, the CPU must enable and configure the Rx FIFO during Freeze mode (see Rx FIFO). Upon receiving the Frames Available in Rx FIFO interrupt (see the description of the IFLAG[BUF5I] "Frames available in Rx FIFO" bit in the IMASK1 register), the CPU should service the received frame using the following procedure:

1. Read the Control and Status word (optional – needed only if a mask was used for IDE and RTR bits)
2. Read the ID field (optional – needed only if a mask was used)
3. Read the Data field
4. Read the RXFIR register (optional)
5. Clear the Frames Available in Rx FIFO interrupt by writing 1 to IFLAG[BUF5I] bit (mandatory – releases the MB and allows the CPU to read the next Rx FIFO entry)

45.4.4 Matching process

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus. If the FIFO is enabled, the priority of scanning can be selected between Mailboxes and FIFO filters. In any case, the matching starts from the lowest number Message Buffer toward the higher ones. If no match is found within the first structure then the other is scanned subsequently. In the event that the FIFO is full, the matching algorithm will always look for a matching MB outside the FIFO region.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- If the received frame is a remote frame, the start point is the CRC field of the frame

- If the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame
- If the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame

If a matching ID is found in the FIFO table or in one of the Mailboxes, the contents of the SMB will be transferred to the FIFO or to the matched Mailbox by the move-in process. If any CAN protocol error is detected then no match results will be transferred to the FIFO or to the matched Mailbox at the end of reception.

The matching process scans all matching elements of both Rx FIFO (if enabled) and active Rx Mailboxes (CODE is EMPTY, FULL, OVERRUN or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The SMB has the same structure of a Mailbox. The reception structures (Rx FIFO or Mailboxes) associated with the matching elements that had a successful comparison are the *matched structures*. The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. See the following table.

Table 45-13. Matching architecture

Structure	SMB[RTR]	CTRL2[RRS]	CTRL2[EACEN]	MB[IDE]	MB[RTR]	MB[ID[1]]	MB[CODE]
Mailbox	0	-	0	cmp[2]	no_cmp[3]	cmp_msk[4]	EMPTY or FULL or OVERRUN
Mailbox	0	-	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	0	-	cmp	no_cmp	cmp	RANSWER
Mailbox	1	1	0	cmp	no_cmp	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	1	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
FIFO[5]	-	-	-	cmp_msk	cmp_msk	cmp_msk	-

[1] For Mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). If SMB[IDE] is negated, the ID is only 11 bits (ID Standard). For FIFO structure, the ID depends on IDAM.
[2] cmp: Compares the SMB contents with the MB contents regardless the masks.
[3] no_cmp: The SMB contents are not compared with the MB contents
[4] cmp_msk: Compares the SMB contents with MB contents taking into account the masks.
[5] SMB[IDE] and SMB[RTR] are not taken into account when IDAM is type C.

A reception structure is *free-to-receive* when any of the following conditions is satisfied:

- The CODE field of the Mailbox is EMPTY

- The CODE field of the Mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the CPU and unlocked as described in Mailbox lock mechanism)
- The CODE field of the Mailbox is either FULL or OVERRUN and an inactivation (see Mailbox inactivation) is performed
- The Rx FIFO is not full

The scan order for Mailboxes and Rx FIFO is from the matching element with lowest number to the higher ones.

The matching winner search for Mailboxes is affected by the MCR[IRMQ] bit. If it is negated the matching winner is the first matched Mailbox regardless if it is free-to-receive or not. If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched Mailbox;
2. the last non free-to-receive matched Mailbox.

It is possible to select the priority of scan between Mailboxes and Rx FIFO by the CTRL2[MRP] bit.

If the selected priority is Rx FIFO first:

- If the Rx FIFO is a matched structure and is free-to-receive then the Rx FIFO is the matching winner regardless of the scan for Mailboxes
- Otherwise (the Rx FIFO is not a matched structure or is not free-to-receive), then the matching winner is searched among Mailboxes as described above

If the selected priority is Mailboxes first:

- If a free-to-receive matched Mailbox is found, it is the matching winner regardless the scan for Rx FIFO
- If no matched Mailbox is found, then the matching winner is searched in the scan for the Rx FIFO
- If both conditions above are not satisfied and a non free-to-receive matched Mailbox is found then the matching winner determination is conditioned by the MCR[IRMQ] bit:
    - If MCR[IRMQ] bit is negated the matching winner is the first matched Mailbox
    - If MCR[IRMQ] bit is asserted the matching winner is the Rx FIFO if it is a free-to-receive matched structure, otherwise the matching winner is the last non free-to-receive matched Mailbox

See the following table for a summary of matching possibilities.

Table 45-14. Matching possibilities and resulting reception structures

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception structure	Description
No FIFO, only MB, match is always MB first						
0	0	X[1]	None[2]	-[3]	None	Frame lost by no match
0	0	X	Free[4]	-	FirstMB	
0	1	X	None	-	None	Frame lost by no match
0	1	X	Free	-	FirstMb	
0	1	X	NotFree	-	LastMB	Overrun
FIFO enabled, no match in FIFO is as if FIFO does not exist						
1	0	X	None	None[5]	None	Frame lost by no match
1	0	X	Free	None	FirstMB	
1	1	X	None	None	None	Frame lost by no match
1	1	X	Free	None	FirstMb	
1	1	X	NotFree	None	LastMB	Overrun
FIFO enabled, Queue disabled						
1	0	0	X	NotFull[6]	FIFO	
1	0	0	None	Full[7]	None	Frame lost by FIFO full (FIFO Overflow)
1	0	0	Free	Full	FirstMB	
1	0	0	NotFree	Full	FirstMB	
1	0	1	None	NotFull	FIFO	
1	0	1	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	0	1	Free	X	FirstMB	
1	0	1	NotFree	X	FirtsMb	Overrun
FIFO enabled, Queue enabled						
1	1	0	X	NotFull	FIFO	
1	1	0	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	1	0	Free	Full	FirstMB	
1	1	0	NotFree	Full	LastMb	Overrun
1	1	1	None	NotFull	FIFO	
1	1	1	Free	X	FirstMB	
1	1	1	NotFree	NotFull	FIFO	
1	1	1	NotFree	Full	LastMb	Overrun

[1] This is a don't care condition.

[2] Matched in MB "None" means that the frame has not matched any MB (free-to-receive or non-free-to-receive).

3. This is a forbidden condition.
4. Matched in MB “Free” means that the frame matched at least one MB free-to-receive regardless of whether it has matched MBs non-free-to-receive.
5. Matched in FIFO “None” means that the frame has not matched any filter in FIFO. It is as if the FIFO didn’t exist (CTRL2[RFEN]=0).
6. Matched in FIFO “NotFull” means that the frame has matched a FIFO filter and has empty slots to receive it.
7. Matched in FIFO “Full” means that the frame has matched a FIFO filter but couldn’t store it because it has no empty slots to receive it.

If a non-safe Mailbox inactivation (see Mailbox inactivation) occurs during matching process and the Mailbox inactivated is the temporary matching winner then the temporary matching winner is invalidated. The matching elements scan is not stopped nor restarted, it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that the FIFO is disabled, IRMQ is enabled and there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm will find the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm will find MB number 2 again, but it is not "free-to-receive", so it will keep looking and find MB number 5 and store the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue (in addition to the full featured FIFO) to allow more time for the CPU to service the MBs. By programming more than one MB with the same ID, received messages will be queued into the MBs. The CPU can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID Acceptance Masks. FlexCAN supports individual masking per MB. Refer to the description of the Rx Individual Mask Registers (RXIMRx). During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is "don't care". Please note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed while the module is in Freeze mode; otherwise, they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RXGMASK, RX14MASK, RX15MASK and RXFGMASK) for backwards compatibility with legacy applications. This alternate masking scheme is enabled when the IRMQ bit in the MCR Register is negated.

45.4.5 Move process

There are two types of move process: move-in and move-out.

45.4.5.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to a Rx Mailbox or FIFO that has matched it. If the move destination is the Rx FIFO, attributes of the message are also copied to the RXFIR FIFO. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead. The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see Matching process) and all of the following conditions are true:

- The CAN bus has reached or let past either:
  - The second bit of Intermission field next to the frame that carried the message that is in the Rx SMB
  - The first bit of an overload frame next to the frame that carried the message that is in the Rx SMB
- There is no ongoing matching process
- The destination Mailbox is not locked by the CPU
- There is no ongoing move-in process from another Rx SMB. If more than one move-in processes are to be started at the same time both are performed and the newest substitutes the oldest.

The term *pending move-in* is used throughout the documentation and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- The destination Mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished
- There is a previous pending move-in to the same destination Mailbox
- The Rx SMB is receiving a frame transmitted by the FlexCAN itself and the self-reception is disabled (MCR[SRXDIS] bit is asserted)
- Any CAN protocol error is detected

Note that the pending move-in is not cancelled if the module enters Freeze or Low-Power mode. It only stays on hold waiting for exiting Freeze and Low-Power mode and to be unlocked. If an MB is unlocked during Freeze mode, the move-in happens immediately.

The move-in process is the execution by the FlexCAN of the following steps:

1. if the message is destined to the Rx FIFO, push IDHIT into the RXFIR FIFO;
2. reads the words DATA0-3 and DATA4-7 from the Rx SMB;
3. writes it in the words DATA0-3 and DATA4-7 of the Rx Mailbox;
4. reads the words Control/Status and ID from the Rx SMB;
5. writes it in the words Control/Status and ID of the Rx Mailbox, updating the CODE field.

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination Mailbox (see Mailbox inactivation) and in this case the Mailbox may be left partially updated, thus incoherent. The exception is if the move-in destination is an Rx FIFO Message Buffer, then the process cannot be cancelled.

The BUSY Bit (least significant bit of the CODE field) of the destination Message Buffer is asserted while the move-in is being performed to alert the CPU that the Message Buffer content is temporarily incoherent.

45.4.5.2 Move-out

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see Section "Arbitration process"). The move-out occurs in the following conditions:

- The first bit of Intermission field
- During Bus Off state when TX Error Counter is in the 124 to 128 range
- During Bus Idle state
- During Wait For Bus Idle state

The move-out process is not atomic. Only the CPU has priority to access the memory concurrently out of Bus Idle state. In Bus Idle, the move-out has the lowest priority to the concurrent memory accesses.

45.4.6 Data coherence

In order to maintain data coherency and FlexCAN proper operation, the CPU must obey the rules described in Transmit process and Receive process.

45.4.6.1 Transmission abort mechanism

The abort mechanism provides a safe way to request the abortion of a pending transmission. A feedback mechanism is provided to inform the CPU if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

Two primary conditions must be fulfilled in order to abort a transmission:

- MCR[AEN] bit must be asserted
- The first CPU action must be the writing of abort code (0b1001) into the CODE field of the Control and Status word.

The active MBs configured as transmission must be aborted first and then they may be updated. If the abort code is written to a Mailbox that is currently being transmitted, or to a Mailbox that was already loaded into the SMB for transmission, the write operation is blocked and the MB is kept active, but the abort request is captured and kept pending until one of the following conditions are satisfied:

- The module loses the bus arbitration
- There is an error during the transmission
- The module is put into Freeze mode
- The module enters in BusOff state
- There is an overload frame

If none of the conditions above are reached, the MB is transmitted correctly, the interrupt flag is set in the IFLAG register, and an interrupt to the CPU is generated (if enabled). The abort request is automatically cleared when the interrupt flag is set. On the other hand, if one of the above conditions is reached, the frame is not transmitted; therefore, the abort code is written into the CODE field, the interrupt flag is set in the IFLAG, and an interrupt is (optionally) generated to the CPU.

If the CPU writes the abort code before the transmission begins internally, then the write operation is not blocked; therefore, the MB is updated and the interrupt flag is set. In this way the CPU just needs to read the abort code to make sure the active MB was *safely inactivated*. Although the AEN bit is asserted and the CPU wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is only aborted when the abort request is captured and kept pending until one of the previous conditions are satisfied.

The abort procedure can be summarized as follows:

- CPU checks the corresponding IFLAG and clears it, if asserted.

- CPU writes 0b1001 into the CODE field of the C/S word.
- CPU waits for the corresponding IFLAG indicating that the frame was either transmitted or aborted.
- CPU reads the CODE field to check if the frame was either transmitted (CODE=0b1000) or aborted (CODE=0b1001).
- It is necessary to clear the corresponding IFLAG in order to allow the MB to be reconfigured.

45.4.6.2 Mailbox inactivation

Inactivation is a mechanism provided to protect the Mailbox against updates by the FlexCAN internal processes, thus allowing the CPU to rely on Mailbox data coherence after having updated it, even in Normal mode.

Inactivation of transmission Mailboxes must be performed just when MCR[AEN] bit is deasserted.

If a Mailbox is inactivated, it participates in neither the arbitration process nor the matching process until it is reactivated. See Transmit process and Receive process for more detailed instruction on how to inactivate and reactivate a Mailbox.

To inactivate a Mailbox, the CPU must update its CODE field to INACTIVE (either 0b0000 or 0b1000).

Because the user is not able to synchronize the CODE field update with the FlexCAN internal processes, an inactivation can lead to undesirable results:

- A frame in the bus that matches the filtering of the inactivated Rx Mailbox may be lost without notice, even if there are other Mailboxes with the same filter
- A frame containing the message within the inactivated Tx Mailbox may be transmitted without notice

In order to eliminate such risk and perform a *safe inactivation* the CPU must use the following mechanism along with the inactivation itself:

- For Tx Mailboxes, the Transmission Abort (see Transmission abort mechanism)

The inactivation automatically unlocks the Mailbox (see Mailbox lock mechanism).

NOTE

Message Buffers that are part of the Rx FIFO cannot be inactivated. There is no write protection on the FIFO region by

FlexCAN. CPU must maintain data coherency in the FIFO region when RFEN is asserted.

45.4.6.3 Mailbox lock mechanism

Other than Mailbox inactivation, FlexCAN has another data coherence mechanism for the receive process. When the CPU reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that the CPU wants to read the whole MB in an atomic operation, and therefore it sets an internal lock flag for that MB. The lock is released when the CPU reads the Free Running Timer (global unlock operation), or when it reads the Control and Status word of another MB regardless of its code. A CPU write into C/S word also unlocks the MB, but this procedure is not recommended for normal unlock use because it cancels a pending-move and potentially may lose a received message. The MB locking is done to prevent a new frame to be written into the MB while the CPU is reading it.

NOTE

The locking mechanism applies only to Rx MBs that are not part of FIFO and have a code different than INACTIVE (0b0000) or EMPTY[1] (0b0100). Also, Tx MBs can not be locked.

Suppose, for example, that the FIFO is disabled and the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the CPU decides to read MB number 5 and at the same time another message with the same ID is arriving. When the CPU reads the Control and Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no "free-to-receive" MBs, so it decides to override MB number 5. However, this MB is locked, so the new message can not be written there. It will remain in the SMB waiting for the MB to be unlocked, and only then will be written to the MB.

If the MB is not unlocked in time and yet another new message with the same ID arrives, then the new message overwrites the one on the SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved-in from the SMB to the MB, the BUSY bit on the CODE field is asserted. If the CPU reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

[1] In previous FlexCAN versions, reading the C/S word locked the MB even if it was EMPTY. This behavior is maintained when the IRMQ bit is negated.

Note

> If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If the CPU inactivates a locked Rx MB, then its lock status is negated and the MB is marked as invalid for the current matching round. Any pending message on the SMB will not be transferred anymore to the MB. An MB is unlocked when the CPU reads the Free Running Timer Register (see Section "Free Running Timer Register (TIMER)"), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during a low power mode (see Modes of operation) and it will take place only when the module resumes to Normal or Freeze modes.

45.4.7 Rx FIFO

The Rx FIFO is receive-only and is enabled by asserting the MCR[RFEN] bit. The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature. The FIFO is 6-message deep. The memory region occupied by the FIFO structure (both Message Buffers and FIFO engine) is described in Rx FIFO structure. The CPU can read the received messages sequentially, in the order they were received, by repeatedly reading a Message Buffer structure at the output of the FIFO.

The IFLAG[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, the CPU can read the message (accessing the output of the FIFO as a Message Buffer) and the RXFIR register and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and update the RXFIR with the attributes of that message, reissuing the interrupt to the CPU. Otherwise, the flag remains negated. The output of the FIFO is only valid whilst the IFLAG[BUF5I] is asserted.

The IFLAG[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until the CPU clears it.

The IFLAG[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the CPU clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, reducing the interrupt servicing work load. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also Rx FIFO structure):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Note

> A chosen format is applied to all entries of the filter table. It is not possible to mix formats within the table.

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read by accessing the RXFIR register. The RXFIR[IDHIT] field refers to the message at the output of the FIFO and is valid while the IFLAG[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to 32 elements of the filter table are individually affected by the Individual Mask Registers (RXIMRx), according to the setting of CTRL2[RFFN], allowing very powerful filtering criteria to be defined. If the IRMQ bit is negated, then the FIFO filter table is affected by RXFGMASK.

45.4.8 CAN protocol related features

This section describes the CAN protocol related features.

45.4.8.1 Remote frames

Remote frame is a special kind of frame. The user can program a mailbox to be a Remote Request Frame by writing the mailbox as Transmit with the RTR bit set to '1'. After the remote request frame is transmitted successfully, the mailbox becomes a Receive Message Buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on Remote Request Storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]) bits:

- If RRS is negated the frame's ID is compared to the IDs of the Transmit Message Buffers with the CODE field 0b1010. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame was received and matched a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0b0100, 0b0010 or 0b0110. If there is a matching ID, then this mailbox will store the remote frame in the same fashion of a data frame. No automatic remote response frame will be generated. The mask registers are used in the matching process.
- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the CPU. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID). Remote Request Frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

45.4.8.2 Overload frames

FlexCAN does transmit overload frames due to detection of following conditions on CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission
- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

45.4.8.3 Time stamp

The value of the Free Running Timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of "move-in" in the TIME STAMP field, providing network behavior with respect to time.

The Free Running Timer can be reset upon a specific frame reception, enabling network time synchronization. See the TSYN description in the description of the Control 1 Register (CTRL1).

45.4.8.4 Protocol timing

The following figure shows the structure of the clock generation circuitry that feeds the CAN Protocol Engine (PE) submodule. The clock source bit CLKSRC in the CTRL1 Register defines whether the internal clock is connected to the output of a crystal oscillator (Oscillator Clock) or to the Peripheral Clock. In order to guarantee reliable operation, the clock source should be selected while the module is in Disable Mode (bit MDIS set in the Module Configuration Register).

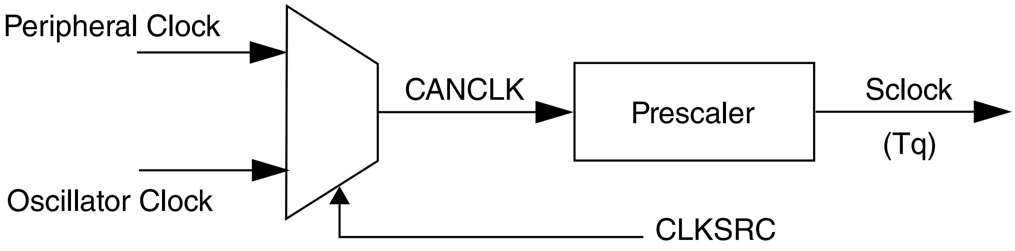

Figure 45-2. CAN engine clocking scheme

The oscillator clock should be selected whenever a tight tolerance (up to 0.1%) is required in the CAN bus timing. The oscillator clock has better jitter performance.

The FlexCAN module supports a variety of means to setup bit timing parameters that are required by the CAN protocol. The Control Register has various fields used to control bit timing parameters: PRESDIV, PROPSEG, PSEG1, PSEG2 and RJW. See the description of the Control 1 Register (CTRL1).

The PRESDIV field controls a prescaler that generates the Serial Clock (Sclock), whose period defines the 'time quantum' used to compose the CAN waveform. A time quantum is the atomic unit of time handled by the CAN engine.

$$f_{Tq} = \frac{f_{CANCLK}}{(\text{Prescaler Value})}$$

A bit time is subdivided into three segments[1] (see Figure 45-3 and Table 45-15):

- SYNC_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section
- Time Segment 1: This segment includes the Propagation Segment and the Phase Segment 1 of the CAN standard. It can be programmed by setting the PROPSEG and the PSEG1 fields of the CTRL1 Register so that their sum (plus 2) is in the range of 4 to 16 time quanta
- Time Segment 2: This segment represents the Phase Segment 2 of the CAN standard. It can be programmed by setting the PSEG2 field of the CTRL1 Register (plus 1) to be 2 to 8 time quanta long

$$\text{Bit Rate} = \frac{f_{Tq}}{(\text{number of Time Quanta})}$$

[1] For further explanation of the underlying concepts, see ISO/DIS 11519–1, Section 10.3. See also the CAN 2.0A/B protocol specification for bit timing.

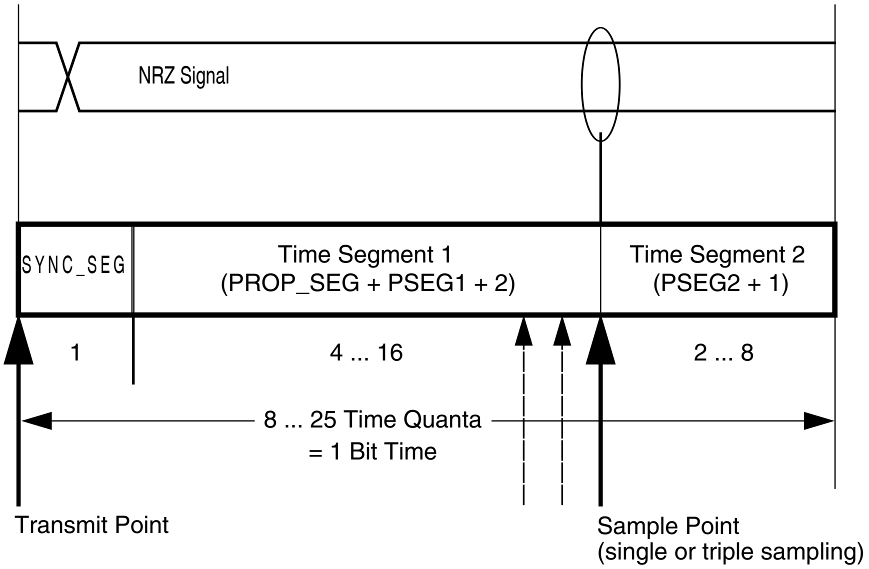

Figure 45-3. Segments within the bit time

Whenever CAN bit is used as a measure of duration (for example, MCR[FRZACK] and MCR[LPMACK]), the number of peripheral clocks in one CAN bit can be calculated as:

$$\mathrm{NCCP} = \frac{f_{SYS} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRESDIV + 1)}{f_{CANCLK}}$$

where:

- NCCP is the number of peripheral clocks in one CAN bit;
- f_{CANCLK} is the Protocol Engine (PE) Clock (see Figure "CAN Engine Clocking Scheme"), in Hz;
- f_{SYS} is the frequency of operation of the system (CHI) clock, in Hz;
- PSEG1 is the value in CTRL1[PSEG1] field;
- PSEG2 is the value in CTRL1[PSEG2] field;
- PROPSEG is the value in CTRL1[PROPSEG] field;
- PRESDIV is the value in CTRL1[PRESDIV] field.

For example, 180 CAN bits = 180 x NCCP peripheral clock periods.

Table 45-15. Time segment syntax

Syntax	Description
SYNC_SEG	System expects transitions to occur on the bus during this period.
Transmit Point	A node in transmit mode transfers a new value to the CAN bus at this point.
Sample Point	A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample.

The following table gives an overview of the CAN compliant segment settings and the related parameter values.

Table 45-16. Bosch CAN 2.0B standard compliant bit time segment settings

Time segment 1	Time segment 2	Re-synchronization jump width
5 .. 10	2	1 .. 2
4 .. 11	3	1 .. 3
5 .. 12	4	1 .. 4
6 .. 13	5	1 .. 4
7 .. 14	6	1 .. 4
8 .. 15	7	1 .. 4
9 .. 16	8	1 .. 4

Note

The user must ensure the bit time settings are in compliance with the CAN Protocol standard (ISO 11898-1). For bit time calculations, use an IPT (Information Processing Time) of 2, which is the value implemented in the FlexCAN module.

45.4.8.5 Arbitration and matching timing

During normal reception and transmission of frames, the matching, arbitration, move-in and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

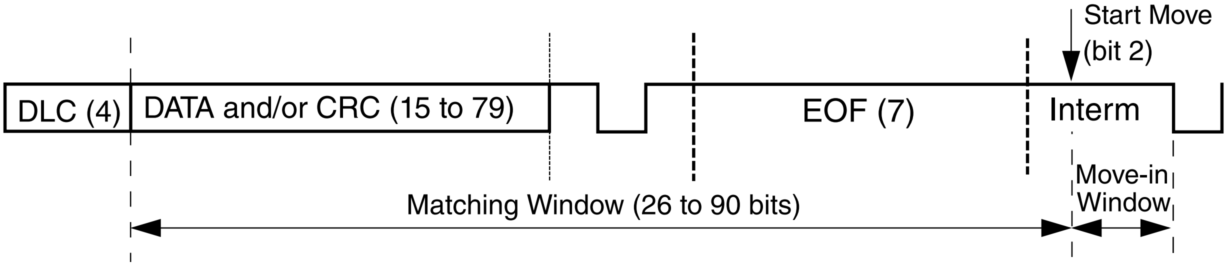

Figure 45-4. Matching and move-in time windows

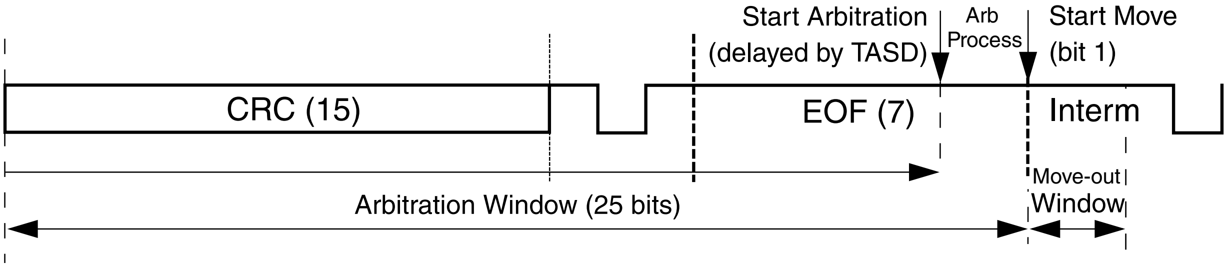

Figure 45-5. Arbitration and move-out time windows

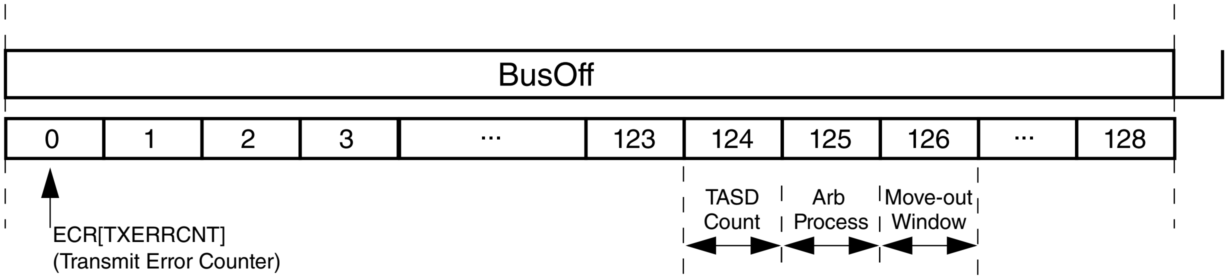

Figure 45-6. Arbitration at the end of bus off and move-out time windows

NOTE

The matching and arbitration timing shown in the preceding figures do not take into account the delay caused by the concurrent memory access due to the CPU or other internal FlexCAN sub-blocks.

When doing matching and arbitration, FlexCAN needs to scan the whole Message Buffer memory during the available time slot. In order to have sufficient time to do that, the following requirements must be observed:

- A valid CAN bit timing must be programmed, as indicated in Table 45-16
- The peripheral clock frequency can not be smaller than the oscillator clock frequency, see Clock domains and restrictions
- There must be a minimum ratio between the peripheral clock frequency and the CAN bit rate, as specified in the following table:

Table 45-17. Minimum ratio between peripheral clock frequency and CAN bit rate

Number of Message Buffers	RFEN	Minimum number of peripheral clocks per CAN bit
16 and 32	0	16
64	0	25
16	1	16
32	1	17
64	1	30

A direct consequence of the first requirement is that the minimum number of time quanta per CAN bit must be 8, therefore the oscillator clock frequency should be at least 8 times the CAN bit rate. The minimum frequency ratio specified in the preceding table can be achieved by choosing a high enough peripheral clock frequency when compared to the oscillator clock frequency, or by adjusting one or more of the bit timing parameters (PRESDIV, PROPSEG, PSEG1, PSEG2) contained in the Control 1 Register (CTRL1).

In case of synchronous operation (when the peripheral clock frequency is equal to the oscillator clock frequency), the number of peripheral clocks per CAN bit can be adjusted by selecting an adequate value for PRESDIV in order to meet the requirement in the preceding table. In case of asynchronous operation (the peripheral clock frequency greater than the oscillator clock frequency), the number of peripheral clocks per CAN bit can be adjusted by both PRESDIV and/or the frequency ratio.

As an example, taking the case of 64 MBs, if the oscillator and peripheral clock frequencies are equal and the CAN bit timing is programmed to have 8 time quanta per bit, then the prescaler factor (PRESDIV + 1) should be at least 2. For prescaler factor equal to one and CAN bit timing with 8 time quanta per bit, the ratio between peripheral and oscillator clock frequencies should be at least 2.

45.4.9 Clock domains and restrictions

The FlexCAN module has two clock domains asynchronous to each other:

- The Bus Domain feeds the Control Host Interface (CHI) submodule and is derived from the peripheral clock.
- The Oscillator Domain feeds the CAN Protocol Engine (PE) submodule and is derived directly from a crystal oscillator clock, so that very low jitter performance can be achieved on the CAN bus.

When CTRL1[CLKSRC] bit is set, synchronous operation occurs because both domains are connected to the peripheral clock (creating a 1:1 ratio between the peripheral and oscillator domain clocks).

When the two domains are connected to clocks with different frequencies and/or phases, there are restrictions on the frequency relationship between the two clock domains. In the case of asynchronous operation, the Bus Domain clock frequency must always be greater than the Oscillator Domain clock frequency.

NOTE

Asynchronous operation with a 1:1 ratio between peripheral and oscillator clocks is not allowed.

45.4.10 Modes of operation details

The FlexCAN module has functional modes and low-power modes. See Modes of operation for an introductory description of all the modes of operation. The following sub-sections contain functional details on Freeze mode and the low-power modes.

CAUTION

> "Permanent Dominant" failure on CAN Bus line is not supported by FlexCAN. If a Low-Power request or Freeze mode request is done during a "Permanent Dominant", the corresponding acknowledge can never be asserted.

45.4.10.1 Freeze mode

This mode is requested by the CPU through the assertion of the HALT bit in the MCR Register or when the chip is put into Debug mode. In both cases it is also necessary that the FRZ bit is asserted in the MCR Register and the module is not in a low-power mode. The acknowledgement is obtained through the assertion by the FlexCAN of FRZ_ACK bit in the same register. The CPU must only consider the FlexCAN in Freeze mode when both request and acknowledgement conditions are satisfied.

When Freeze mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off or Idle state
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. A pending move-in is not taken into account.
- Ignores the Rx input pin and drives the Tx pin as recessive
- Stops the prescaler, thus halting all CAN protocol activities
- Grants write access to the Error Counters Register, which is read-only in other modes
- Sets the NOT_RDY and FRZ_ACK bits in MCR

After requesting Freeze mode, the user must wait for the FRZ_ACK bit to be asserted in MCR before executing any other action, otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory mapped registers are accessible, except for CTRL1[CLK_SRC] bit that can be read but cannot be written.

Exiting Freeze mode is done in one of the following ways:

- CPU negates the FRZ bit in the MCR Register
- The chip is removed from Debug Mode and/or the HALT bit is negated

The FRZ_ACK bit is negated after the protocol engine recognizes the negation of the freeze request. When out of Freeze mode, FlexCAN tries to re-synchronize to the CAN bus by waiting for 11 consecutive recessive bits.

45.4.10.2 Module Disable mode

This low power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the CPU through the assertion of the MDIS bit in the MCR Register and the acknowledgement is obtained through the assertion by the FlexCAN of the LPM_ACK bit in the same register. The CPU must only consider the FlexCAN in Disable mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze mode, it requests to disable the clocks to the PE and CHI sub-modules, sets the LPM_ACK bit and negates the FRZ_ACK bit.

If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. A pending move-in is not taken into account.
- Ignores its Rx input pin and drives its Tx pin as recessive
- Shuts down the clocks to the PE and CHI sub-modules
- Sets the NOTRDY and LPMACK bits in MCR

The Bus Interface Unit continues to operate, enabling the CPU to access memory mapped registers, except the Rx Mailboxes Global Mask Registers, the Rx Buffer 14 Mask Register, the Rx Buffer 15 Mask Register, the Rx FIFO Global Mask Register. The Rx FIFO Information Register, the Message Buffers, the Rx Individual Mask Registers, and the reserved words within RAM may not be accessed when the module is in Disable Mode. Exiting from this mode is done by negating the MDIS bit by the CPU, which causes the FlexCAN to request to resume the clocks and negate the LPM_ACK bit after the CAN protocol engine recognizes the negation of disable mode requested by the CPU.

45.4.10.3 Stop mode

This is a system low-power mode in which all chip clocks can be stopped for maximum power savings. The Stop mode is globally requested by the CPU and the acknowledgement is obtained through the assertion by the FlexCAN of a Stop Acknowledgement signal. The CPU must only consider the FlexCAN in Stop mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop mode request during Freeze mode, it sets the LPMACK bit, negates the FRZACK bit and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally.

If Stop mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. A pending move-in is not taken into account.
- Ignores its Rx input pin and drives its Tx pin as recessive
- Sets the NOTRDY and LPMACK bits in MCR
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Stop mode is exited when the CPU resumes the clocks and removes the Stop Mode request.

After the CAN protocol engine recognizes the negation of the Stop mode request, the FlexCAN negates the LPMACK bit. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up.

45.4.11 Interrupts

The module has many interrupt sources: interrupts due to message buffers and interrupts due to the ORed interrupts from MBs, Bus Off, Error, ECC Host Access Non-correctable Error, ECC FlexCAN Access Non-correctable Error, ECC Correctable Error, Tx Warning, and Rx Warning.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception.

Each of the buffers has assigned a flag bit in the IFLAG registers. The bit is set when the corresponding buffer completes a successful transfer and is cleared when the CPU writes it to 1 (unless another interrupt is generated at the same time).

Note

> It must be guaranteed that the CPU clears only the bit causing the current interrupt. For this reason, bit manipulation instructions (BSET) must not be used to clear interrupt flags. These instructions may cause accidental clearing of interrupt flags which are set after entering the current interrupt service routine.

If the Rx FIFO is enabled (MCR[RFEN] = 1), the interrupts corresponding to MBs 0 to 7 have different meanings. Bit 7 of IFLAG1 becomes the "FIFO Overflow" flag; bit 6 becomes the FIFO Warning flag, bit 5 becomes the "Frames Available in FIFO flag," and bits 4-0 are unused. See the description of IFLAG1 for more information.

For a combined interrupt where multiple MB interrupt sources are ORed together, the interrupt is generated when any of the associated MBs (or FIFO, if applicable) generates an interrupt. In this case, the CPU must read the IFLAG registers to determine which MB or FIFO source caused the interrupt.

The interrupt sources for Bus Off, Error, Tx Warning, and Rx Warning generate interrupts like the MB interrupt sources, and they can be read from ESR1 and ESR2. The Bus Off, Error, Tx Warning, and Rx Warning interrupt mask bits are located in CTRL1.

The interrupt sources for ECC errors—Host Access with Non-correctable Interrupt Flag, FlexCAN Access with Non-correctable Interrupt Flag, and Correctable Error Interrupt Flag—can be read in ERRSR and the corresponding interrupts masks bits are located in MECR.

45.4.12 Bus interface

The CPU access to FlexCAN registers are subject to the following rules:

- Unrestricted read and write access to supervisor registers (registers identified with S/U in Table "Module Memory Map" in Supervisor Mode or with S only) results in access error.
- Read and write access to implemented reserved address space results in access error.

- Write access to positions whose bits are all currently read-only results in access error. If at least one of the bits is not read-only then no access error is issued. Write permission to positions or some of their bits can change depending on the mode of operation or transitory state. Refer to register and bit descriptions for details.
- Read and write access to unimplemented address space results in access error.
- Read and write access to RAM located positions during Low Power Mode results in access error.
- If MAXMB is programmed with a value smaller than the available number of MBs, then the unused memory space can be used as general purpose RAM space. Note that reserved words within RAM cannot be used. As an example, suppose FlexCAN is configured with 16 MBs, RFFN is 0x0, and MAXMB is programmed with zero. The maximum number of MBs in this case becomes one. The RAM starts at 0x0080, and the space from 0x0080 to 0x008F is used by the one MB. The memory space from 0x0090 to 0x017F is available. The space between 0x0180 and 0x087F is reserved. The space from 0x0880 to 0x0883 is used by the one Individual Mask and the available memory in the Mask Registers space would be from 0x0884 to 0x08BF. From 0x08C0 through 0x09DF there are reserved words for internal use which cannot be used as general purpose RAM. As a general rule, free memory space for general purpose depends only on MAXMB.

45.4.13 Detection and Correction of Memory Errors

FlexCAN supports detection and correction of errors in memory read accesses. Each byte of FlexCAN memory is associated to 5 parity bits and the error correction mechanism assures that in this 13-bit word, errors in one bit can be corrected (corrected errors) and errors in 2 bits can be detected but not corrected (non-corrected errors). Errors in more than 2 bits may not be detected. When read, the parity bits are used to calculate a syndrome, which indicates the error in each byte.

Memory errors are indicated to Host through status register (Error Status Register (ERRSR)) and bus transfer errors, and reported through report registers (Error Report Address Register (RERRAR), Error Report Data Register (RERRDR) and Error Report Syndrome Register (RERRSYNR)).

The error detection and correction mechanism can be activated or not, controlled by ECCDIS bit in Memory Error Control Register (MECR). When disabled, updates on indications and reporting registers are stopped, but the parity bits are still calculated and written along with data in memory write operations. It assures that memory has consistent parity bits associated to data.

NOTE

All FlexCAN memory must be initialized before starting its operation in order to have the parity bits in memory properly updated. The WRMFRZ bit in Control 2 Register (CTRL2) grants write access to all memory positions from 0x080 to 0xADF.

To avoid that critical error correction configuration be accidentally changed, this protocol must be followed to enable the update of the Memory Error Control Register (MECR):

1. By default, ECRWRE bit in Control 2 Register (CTRL2) is 0 and ECRWRDIS bit in Memory Error Control Register (MECR) is 1.
2. Set ECRWRE bit in Control 2 Register (CTRL2).
3. Clear ECRWRDIS bit.
4. All writes to Memory Error Control Register (MECR) must keep ECRWRDIS cleared.
5. After configuration is done, lock the Memory Error Control Register (MECR) by either setting ECRWRDIS or clearing ECRWRE.

45.4.13.1 Sources of the Memory Access

The FlexCAN memory can be accessed by 2 major sources (or requestors):

- by Host (CPU): largest word accessed is 32-bit wide
- by FlexCAN internals processes (Match, Arbitration, RxMove on reception, TxMove on transmission): largest word accessed is 64-bit wide

The way that non-correctable errors are indicated and reported depends on the source of access.

45.4.13.2 Error Indication

Memory errors are indicated by flags HANCEIF, FANCEIF, CEIF in the Error Status Register (ERRSR). Non-correctable errors detected in memory reads requested by Host are indicated separatedly than the ones detected in requests by FlexCAN internal processes. Corrected errors indication makes no distinction of the source of the access. There are 3 independent flags for these 3 cases, and each flag will raise an interrupt unless it is masked by mask bits in Memory Error Control Register (MECR). If both non-corrected and corrected errors are found in different bytes in the same read operation both flags are set.

The non-corrected error detected in Host accesses are also indicated as a bus transfer error. A bus wait request may be asserted to extend the memory transaction to the moment the report registers are updated. This indication cannot be masked. If the flag bit HANCEIF is not masked, the same non-corrected error will raise a bus transfer error and an interrupt request.

Each indication flag has one Overrun flag in Error Status Register (ERRSR). The Overrun flags do not request interrupts. Overrun flags for non-correctable errors indicate that other errors of the same nature were detected after current error being treated, while overrun flags for correctable errors indicate that other errors of the same nature were detected before the current error being treated. This is the recommended handling sequence for error indication:

1. Get error report information from report registers
2. Use this information to take proper measures in the application
3. Clear the Interrupt flag
4. If the Overrun flag is active:
    a. Alert application that at least one error could not be handled
    b. Clear the Overrun flag

The FlexCAN internal processes can access memory in transactions larger than 32-bits. For the indication, this kind of access is considered a consecutive sequence of 32-bit accesses. If errors are found in 2 or more 32-bit words the Interrupt and Overrun flags are set simultaneously.

45.4.13.3 Error Reporting

Report registers Error Report Address Register (RERRAR), Error Report Data Register (RERRDR) and Error Report Syndrome Register (RERRSYNR) provide detailed information about the address read, raw data and syndrome read with error and indicated by the flags described in the “Error Indication” section. The address, data and syndrome registers are updated simultaneously along with the error flags, according to these rules.

1. If any of the 2 non-corrected error flags is currently set, does not update the registers (preserve the old non-corrected error reporting)
2. Else (no error flag is currently set or only the corrected error flag is currently set), update the report registers according to the new error; or according to the most severe of new errors if non-corrected and corrected errors are simultaneously detected

Reporting of errors detected in accesses larger than 32-bit follows the semantic described in the “Error Indication” section and in the Error Report Address Register (RERRAR) description.

The address reported in RERRAR and defined in ERRIAR are not the same listed in the module memory map. How the reported addresses correspond to locations in the module memory map is shown in the Error Injection Address Register (ERRIAR) description.

Addresses reported when reading memory portions organized as FIFOs, such as the Rx FIFO Structure and the Rx FIFO Information Register (RXFIR), refer to the address of the element accessed in the FIFO, not to the FIFO base address.

To assure coherence of the error report registers it is necessary to turn off the report update by clearing the MECR[RERRDIS] bit before reading the report registers.

45.4.13.4 Response to Errors

Correctable errors have no consequence on FlexCAN operation, once the corrected data is used by Host or FlexCAN internal processes. For host-initiated reads, a non-corrected error detected does not affect FlexCAN operation.

Non-corrected errors detected on memory reads requested by FlexCAN do not stop the FlexCAN processing and this may result in incorrect operation.

If a non-corrected error occurs during a reception process (Match or RxMove), an incorrect destination may be selected to store the incoming frame, a corrupted frame may be stored in the correct destination, or both. If a non-corrected error occurs during either an Arbitration or a TxMove process, either a non-highest priority frame may be mistakenly selected to be transmitted or no frame may be transmitted at all, when MECR[NCEFAFRZ] = 1.

The error report registers can provide information to the application for a customized handling of these situations. If the delay of this handling is not accepted and MECR[NCEFAFRZ] = 1, the FlexCAN stops operation automatically and enters Freeze mode when these errors are detected. See the Memory Error Control Register (MECR) description for more details.

45.4.13.5 Error Injection

The error injection registers ERRIAR, ERRIDPR, and ERRIPPR are used to inject errors in memory reads in order to force errors and consequently update the indication and reporting registers. How the error injection addresses correspond to locations in the module memory map is shown in the ERRIAR description.

The injection is done by flipping the data and parity bits correspondent to the bits in 1 in ERRIDPR and ERRIPPR. Injection can be selected specifically for memory accesses requested by Host or by FlexCAN internal processes.

In case of accesses larger than 32-bits, the EXTERRIE bit in Memory Error Control Register (MECR) extends the injection pattern, replicating it in 32-bit words to fill the width of the access.

NOTE

> It is very unlikely, but error injection may correct a bit with error. This will not raise the error flags and reports as expected.

To ensure coherence among error injection registers and avoid spurious error injections, the HAERRIE and FAERRIE bits in Memory Error Control Register (MECR) must be cleared while configuring the memory injection registers.

45.5 Initialization/application information

This section provide instructions for initializing the FlexCAN module.

45.5.1 FlexCAN initialization sequence

The FlexCAN module may be reset as follows:

- Chip level hard reset, which resets all memory mapped registers asynchronously
- SOFTRST bit in MCR, which resets some of the memory mapped registers synchronously. See Table 45-2 to see what registers are affected by soft reset.
- Chip level soft reset, which has the same effect as the SOFTRST bit in MCR

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. The SOFTRST bit remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset can not be applied while clocks are shut down in a low power mode. The low power mode should be exited and the clocks resumed before applying soft reset.

The clock source (CLKSRC bit) should be selected while the module is in Disable mode. After the clock source is selected and the module is enabled (MDIS bit negated), FlexCAN automatically goes to Freeze mode. In Freeze mode, FlexCAN is un-synchronized to the CAN bus, the HALT and FRZ bits in MCR Register are set, the internal state machines are disabled and the FRZACK and NOTRDY bits in the MCR Register are set. The Tx pin is in recessive state and FlexCAN does not initiate any transmission or reception of CAN frames. Note that the Message Buffers and the Rx Individual Mask Registers are not affected by reset, so they are not automatically initialized.

For any configuration change/initialization it is required that FlexCAN is put into Freeze mode; see Freeze mode. The following is a generic initialization sequence applicable to the FlexCAN module:

- Initialize the Module Configuration Register
    - Enable the individual filtering per MB and reception queue features by setting the IRMQ bit
    - Enable the warning interrupts by setting the WRNEN bit
    - If required, disable frame self reception by setting the SRXDIS bit
    - Enable the Rx FIFO by setting the RFEN bit
    - Enable the abort mechanism by setting the AEN bit
    - Enable the local priority feature by setting the LPRIOEN bit
- Initialize the Control Register
    - Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, RJW
    - Determine the bit rate by programming the PRESDIV field
    - Determine the internal arbitration mode (LBUF bit)
- Initialize the Message Buffers
    - The Control and Status word of all Message Buffers must be initialized
    - If Rx FIFO was enabled, the ID filter table must be initialized
    - Other entries in each Message Buffer should be initialized as required
- Initialize the Rx Individual Mask Registers
- When ECC is enabled, follow the initialization note in Detection and Correction of Memory Errors
- Set required interrupt mask bits in the IMASK Registers (for all MB interrupts) and in CTRL Register (for Bus Off and Error interrupts)
- Negate the HALT bit in MCR

Starting with the last event, FlexCAN attempts to synchronize to the CAN bus.

Chapter 46
Zipwire

46.1 Overview

The SIPI and LFAST modules work together as a single unit called Zipwire. The LFAST portion of the two modules allows for high speed inter-device communications. The SIPI allows memory to be shared between devices which have SIPI and LFAST communication modules.

The LFAST can operate in either slave or master mode configurations. The node running in master mode controls the serial link, but SIPI, in both master and slave modes, can act as both initiator and target for SIPI commands simultaneously. Please see the SIPI and LFAST chapters for detailed information on module configuration and functionality.

46.2 Introduction

Zipwire is a group of modules that allow one MCU to have a fast, low pin count, serial communication link directly into the memory mapped peripherals and/or memories of another MCU or smart ASIC. Zipwire is implemented in hardware so there is no CPU load for the intitiator or target node. Zipwire supports 8-bit, 16-bit or 32-bit reads and writes to any 32-bit address at the target node.

Zipwire architecture is fully pipelined and support multiple outstanding commands to allow maximum use of the serial link bandwidth.

The serial link runs at 320 Mbaud using LVDS physical layer. One LVDS pair for Tx and another pair for Rx, with a separate 20 MHz reference clock for a total of five pins.

Zipwire also supports a streaming mode for the transfer of large blocks of data.

In streaming mode Zipwire has a high transfer rate. For single random access, 32-bit read, from any 32-bit address location, the latency is approximately 1 μs.

46.3 Zipwire Block Diagram

Figure 46-1 shows two MCUs with Zipwire connected using a five wire interface. Both MCUs support Target and Initiator modes of Zipwire. The SIPI Bus Master Interface is used for all Target mode transactions. The SIPI Register Interface is used for all Initiator Transactions and initial setup. The LFAST Register Interface is used for Initial Setup.

The diagram shows the LFAST reference clock coming from MCU B clock system. The Ref_Clock can come from either MCU. It is user configurable, but it must be the same clock that drives both LFAST modules.

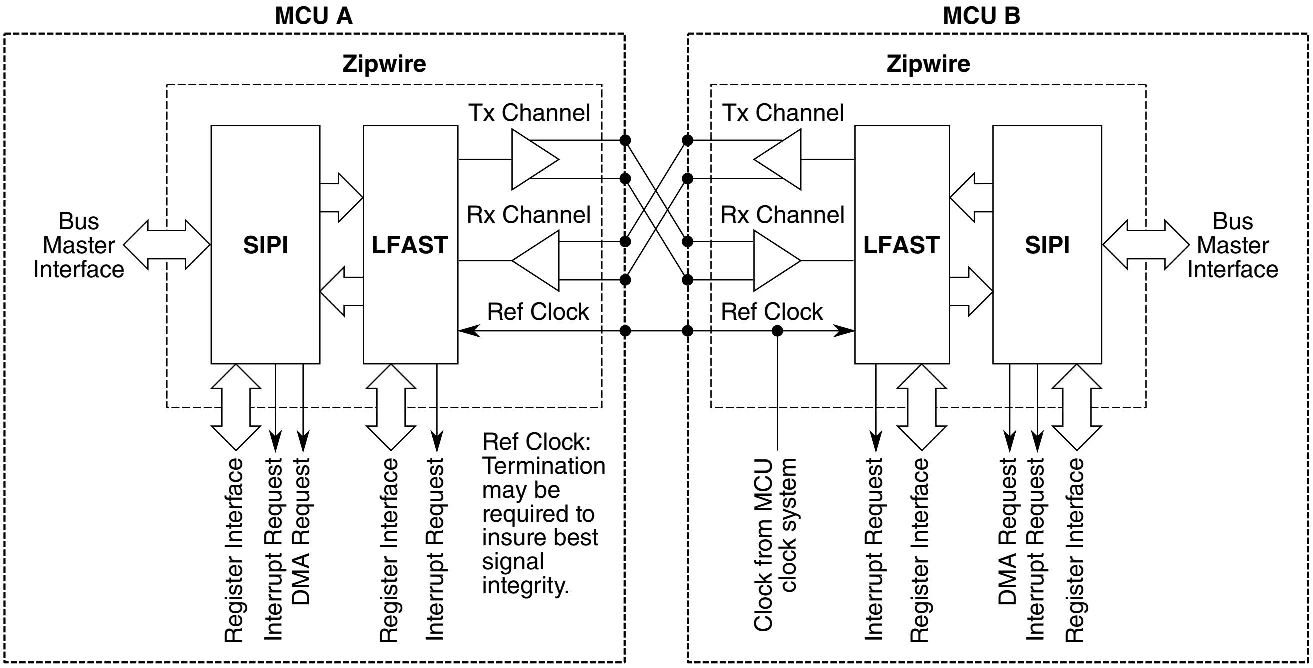

Figure 46-1. Zipwire connection diagram

46.4 Architecture

Zipwire is composed of several modules and system resources. The physical layer is LVDS with 1.2 V common mode voltage and 200mV swing.

The transport layer is a protocol called LFAST. LFAST is an asynchronous prototcol, using non-return to zero encoding. The LFAST protocol is composed of the following:

- A fixed 16-bit sync frame to allow the receiver to detect the optimal point to sample the incoming data.

- Followed by an 8-bit LFAST header, that defines the channel number and the size of the LFAST payload.
- Finally the payload, which can be between 8 and 288 bits.

The application layer protocol is called Serial Inter Processor Interface (SIPI). SIPI runs on top of LFAST and is fully encapsulated within the LFAST payload. SIPI uses four fixed sizes of LFAST payload in Zipwire:

- 32-bit
- 64-bit
- 96-bit
- 288-bit

The SIPI protocol implements a suite of commands initiated by one MCU, for reading and writing any 32-bit address location in another connected MCU. The SIPI protocol allows either or both MCUs to initiate commands. The protocol also supports interrupt requests from one MCU to the other.

The SIPI module implements both the initiator part of the protocol and the recipient part of the protocol. The module implements four SIPI Initiator channels that can run independently of each other and can run simultaneously. The SIPI module is a bus master on the low speed XBAR. As the target MCU for a command from the inititating MCU, SIPI can perform read and write accesses to any address location within the target MCU. The software running on the local MCU, should configure the system MPU to allow/deny memory accesses to MCU memory and resources as required.

The initiator part of the module is connected to the DMA controller and is able to generate DMA requests as a command is completed. This allows a series of read or write commands to be queued in the Inititator MCU and executed by DMA and SIPI without CPU intervention at either Initiator or Target MCU.

46.5 Zipwire interconnections

LFAST has the following connections:

- Tx and Rx configuration is controlled by LFAST Control registers.
- Peripheral Bridge interface (PBRIDGE) — Allows software to read and write configuration registers.

- Tx Data Port/Rx Data Port — Directly connected to the SIPI module. Allows received data to be efficiently transferred to SIPI and transmit data to be transferred from SIPI.
- Interrupt Request connections — Allows the module to flag to the CPU when it requires servicing.

SIPI has the following connections:

- Peripheral Bridge interface (PBRIDGE) — Allows software to read and write configuration registers and SIPI Interface Registers.
- DMA connections — Allows SIPI command sequences to be queues and initiated without CPU intervention.
- Crossbar master port — Allows SIPI to execute requested commands to read and write MCU address space.
- Tx Data Port/Rx Data Port — Directly connected to the LFAST module. Allows received data to be efficiently transferred from LFAST and transmit data to be transferred to LFAST.
- Interrupt Request connections — Allows the module to flag to the CPU when it requires servicing.

46.6 Zipwire performance

Two aspects of performance are considered:

- Bandwidth — The rate at which data can be read or written between two nodes. It assumes that read or write commands from the Inititator node, can be sent continuously at the highest speed the Target node can consume those commands.
- Latency — The time from the Initiator node sending a read or write command to the Initiator node receiving back the read data or write acknowledge.

46.6.1 Read performance

A Zipwire read operation consists of three stages:

- Inititator sends SIPI Read command to Target.

- Target parses the received command and runs a master bus cycle to read the data.
- Target sends the SIPI Read response back to the Initiator.

A SIPI Read command consists of:

- 16-bit header
- 32-bit read address
- 16-bit CRC
- 64 bits total

A SIPI Read response consists of:

- 16-bit header
- 32-bit read data
- 16-bit CRC
- 64 bits total

The SIPI message is encapsulated in a LFAST frame where the LFAST payload is the size of the SIPI message.

The LFAST frame consists of:

- 16-bit synchronisation header
- 8-bit header
- 64-bit payload
- 1-bit stop bit
- 89 bits total

LFAST Baud rate is 320 Mbaud which yields a bit time of 3.13 ns

Therefore, an 89-bit LFAST transmission of a SIPI 64-bit Read command or 64-bit Read response takes 278 ns (= 89 × 3.13 ns).

The SIPI module takes thirteen system clock cycles to parse a command and create a Read response, plus the time to run the master bus cycle. The time to run the master bus cycle will vary depending on the memory being read.

Assumptions:

- Average of 6 × XBAR cycles to read different memories.
- XBAR clocked at 100 MHz
- SIPI clocked at 50 MHz

Therefore, time for SIPI to read an address location is:

(13 × 50 MHz clocks) + (6 × 100 MHz clocks) = 320 ns

46.6.1.1 Read bandwidth

The Zipwire target node has a three message deep receive FIFO and a three message deep transmit FIFO. So, the Target node can simulataneously be receiving a command, processing a command, and sending the Read response.

The time to transmit a command or response is less than the time to process the command. Therefore, the bandwidth is limited by the time to process the message.

Read Bandwidth = 4 bytes in 320 ns = 12.5 MB/second

46.6.1.2 Read latency

The latency is the time taken to send a Read command, process the command, and send a Read response.

Read Latency = 278 ns + 320 ns + 278 ns = 876 ns

46.6.2 Write performance

A Zipwire write operation consists of three stages:

- Initiator sends SIPI Write command to Target.
- Target parses the received command and runs a master bus cycle to write the data.
- Target sends the SIPI Write response back to the Initiator.

A SIPI Write command consists of:

- 16-bit header
- 32-bit write address

- 32-bit write data
- 16-bit CRC
- 96 bits total

A SIPI Write acknowledge consists of:

- 16-bit header
- 16-bit CRC
- 32 bits total

The SIPI message is encapsulated in an LFAST frame where the LFAST payload is the size of the SIPI message.

The LFAST frame consists of:

- 16-bit synchronisation header
- 8-bit header
- 96-bit payload (command) or 32-bit (acknowledge)
- 1-bit stop bit
- 121 bits total (command) or 57 bits (acknowledge)

LFAST Baud rate is 320 Mbaud which yields a bit time of 3.13 ns

Therefore, the time for an LFAST transmission is:

- 121-bit LFAST transmission of a SIPI 96-bit Write Command takes 378 ns
- 57-bit LFAST transmission of a SIPI 32-bit Write Acknowledge takes 178 ns

The SIPI module takes thirteen system clock cycles to parse a command and create a Write response, plus the time to run the master bus cycle. The time to run the master bus cycle will vary depending on the memory being written.

Assumptions:

- Average of 5 × XBAR cycles to write different memories.
- XBAR clocked at 100 MHz
- SIPI clocked at 50 MHz

Therefore, the time for SIPI to write an address location is:

(13 × 50 MHz clocks) + (5 × 100 MHz clocks) = 310 ns

46.6.2.1 Write bandwidth

The Zipwire target node has a three message deep receive FIFO and a three message deep transmit FIFO. So, the Target node can simulataneously be receiving a command, processing a command, and sending the Write Acknowledge response.

The time to transmit the command is longer than the time to process the command, or the time to transmit the Write Acknowledge. Therefore, the bandwidth is limited by the time to transmit the command.

Write Bandwidth = 4 bytes in 378 ns = 10.6 MB/second

46.6.2.2 Write latency

The latency is the time taken to send a Write command, process the command, and send a Write Acknowledge.

Write Latency = 378 ns + 310 ns + 178 ns = 866 ns

Chapter 47
Serial Interprocessor Interface (SIPI)

47.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The Serial Interprocessor Interface (SIPI) is an application layer protocol which runs on top of the LFAST (LVDS Fast Asynchronous Serial Transmission) module. It is used by the local device to access the shared memory of a remote device. SIPI defines point-to-point full duplex communication between two devices, where LFAST works as a physical medium of communication between both the devices.

47.1.1 Scalability

The SIPI protocol is designed to provide a sophisticated, high bandwidth, multimaster, multi-channel memory interface between 2 devices using few interconnecting signals. But the protocol is designed in such a way that a subset of the protocol can be implemented, where die area is more important than features.

Main scalable features:

- Number of concurrent channels:
  - Full Implementation = 4
  - Minimum Implementation = 1
- Full implementation has a node both as Initiator and Target of commands. Minimum implementation either Initiator or Target.
- Full Implementation includes a block transfer feature, but this feature is optional.

The rest of this section describes a full implementation of SIPI which includes:

- Advanced High-Performance Bus (AHB-Lite) master interface
- Direct Memory Access (DMA) interface
- LFAST Tx/Rx (transmit/receive) interfaces along with Peripheral Bus Interface (IPS)

47.2 Overview

An instance of SIPI can act as initiator, or target or both. SIPI can access the shared memory directly through its AHB master interface or through its DMA interface. DMA interface is used when the node acts as an initiator while the AHB Master interface will be used when the node acts as target. SIPI has four channels, with one channel (Channel 2) having data streaming capability. Payload width for channel 0, 1 and 3 is 32 bits, and for channel 2 data widths can be 32 bits, or 256 bits when streaming. Any of these channels can be used for DMA access or bus interface access depending on the setting of the SIPI_CCR*n*. CRC encoder calculates the CRC on the command frame. Then the SIPI initiator appends the CRC to the end of the frame before transmission.

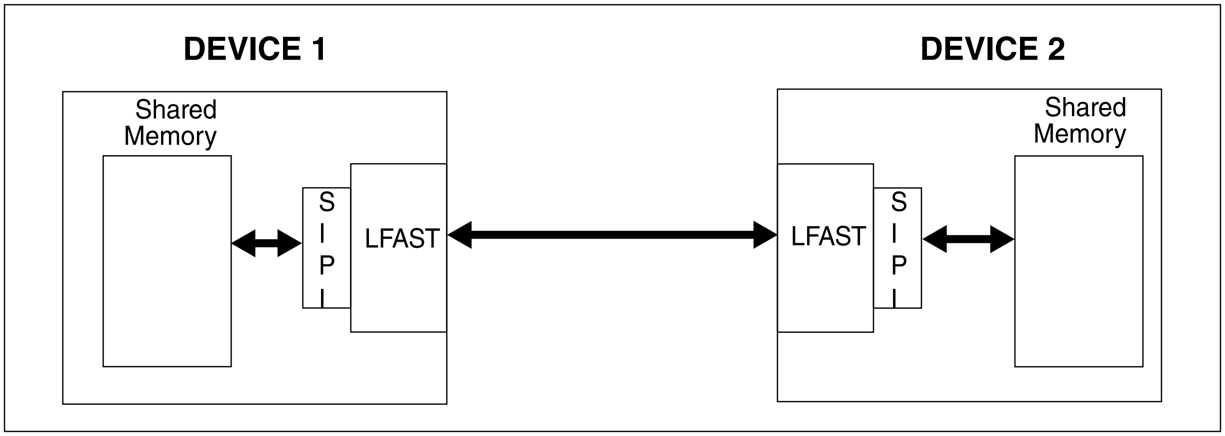

Figure 47-1. Interprocessor communication diagram

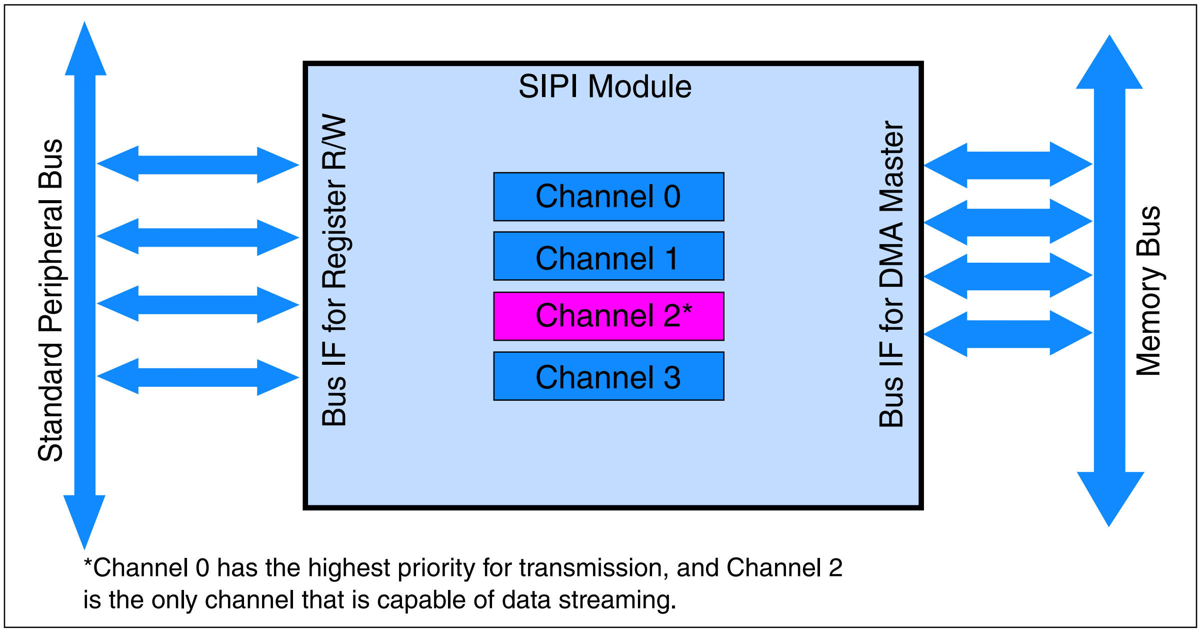

Figure 47-2. SIPI module

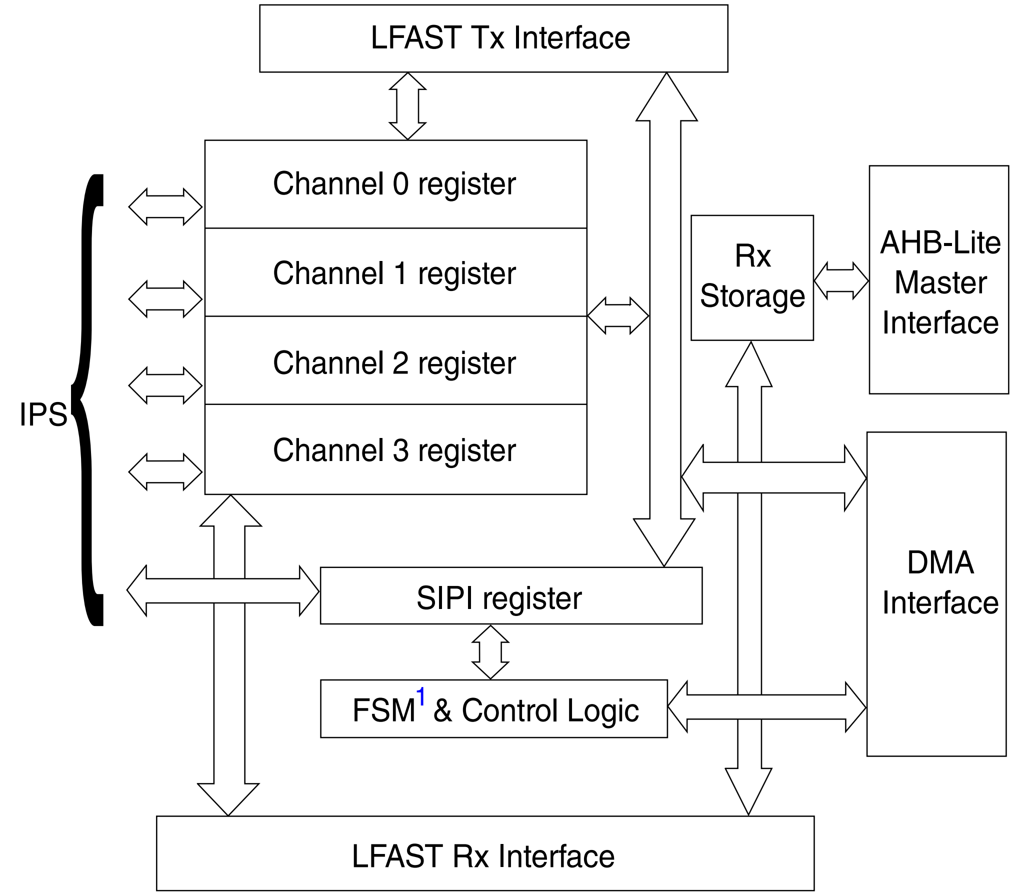
47.3 SIPI block diagram



[1] Finite State Machine

Figure 47-3. SIPI block diagram

47.4 Feature description

This section describes the features of the SIPI module.

47.4.1 Main features

- Point-to-point communication between two devices
- Full duplex communication
- Four channels, including one channel with data streaming capability

- Configurable DMA access for each channel
- CRC protection mechanism
- Timeout protection mechanism
- Fixed priority channel selection
- Data size up to 256 bits on streaming channel
- Common tag pool for assigning sequential transfer IDs to every new transfer
- AHB master interface which is used by target node to access shared memory
- Target node contains a set of nine 32-bit internal registers to store commands
- Up to two outstanding requests are supported at initiator

47.4.2 Standard features

- IPS bus interface (PBRIDGE)
- SPP DMA2x bus interface
- AHB Master Interface
- LFAST Tx/Rx interfaces
- Cyclic Redundancy Check error detection (CRC16)

47.5 SIPI operation from reset

When the SIPI module exits reset, it is operational and target mode is enabled without the need to configure the control registers.

47.6 Functional description

47.6.1 External signals

The SIPI has no chip external signals.

47.6.2 Frame format

All frames have the same general format:

- 16 bit header
- Address, Address and Data, or nothing
- 16-bit CRC

There are 2 main groups of command; read and write. Within those 2 groups are three read/write formats:

- 32-bit
- 16-bit
- 8-bit

Each command generates one of three different responses:

- Read data
- Write acknowledge
- Error

There is one additional command that requests the module ID from the Target node. The ID is a unique 32-bit ID that is specific to a particular device. It is normally the same as the JTAG ID. The sections below illustrate the four different frame formats that are used to implement all the commands and responses.

The number of frames depends on the data buffers (associated with every channel), the frame data is stored in data buffers at the initiator. Address and data are both transmitted in the same order in which they are stored.

47.6.2.1 Register read request

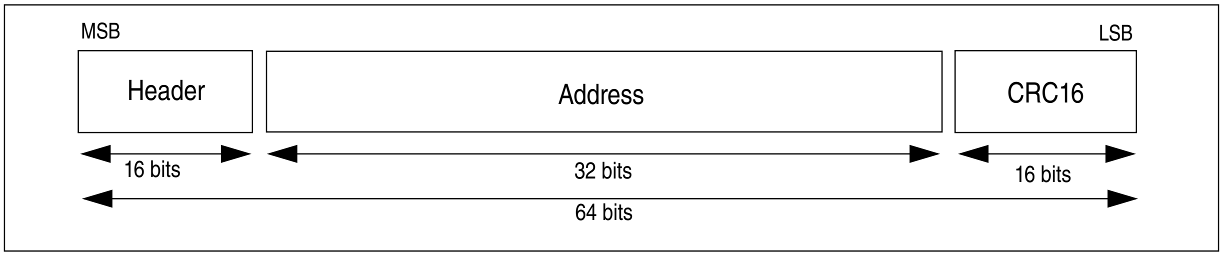


Figure 47-4. SIPI register read request

47.6.2.2 Register read response, ID request response

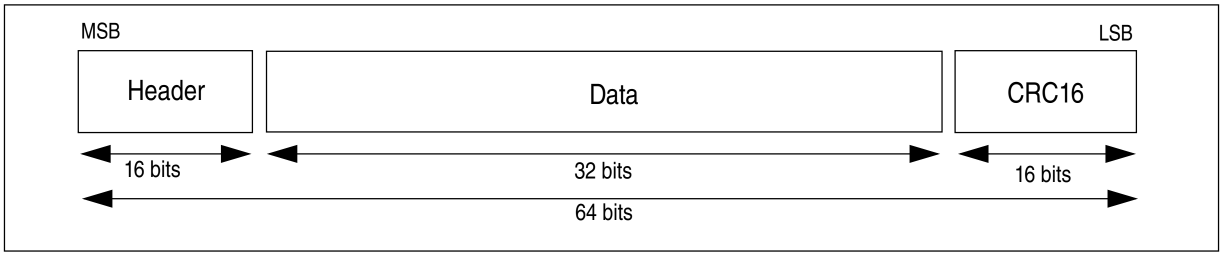

Figure 47-5. SIPI read response

47.6.2.3 Register write request

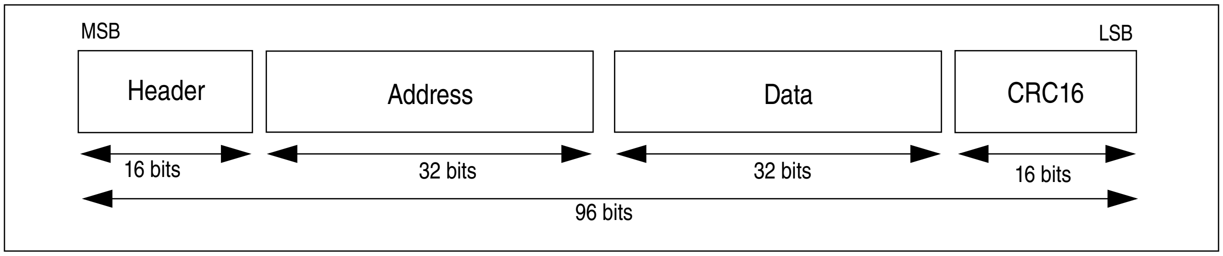

Figure 47-6. SIPI register write request

47.6.2.4 Trigger transfer, ID transfer, write acknowledge and streaming write acknowledge

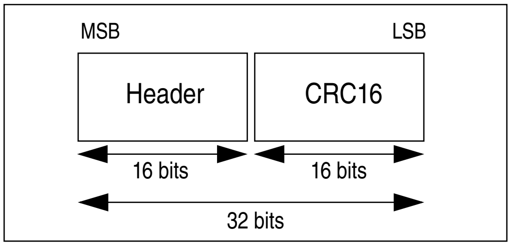

Figure 47-7. SIPI write acknowledge

47.6.2.5 Streaming write request

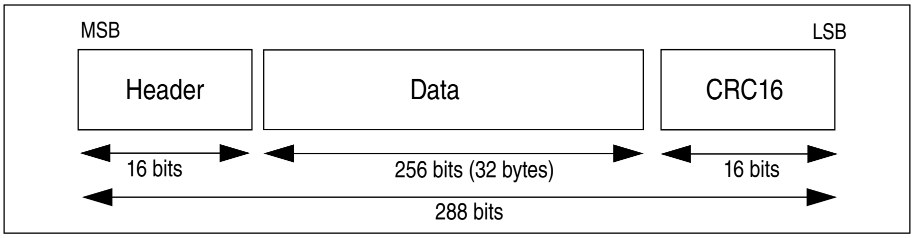

Figure 47-8. Streaming write request format

NOTE

Direct write operations are used to set the streaming address.

Streaming data write is performed using the format shown in Figure 47-8.

47.6.2.6 Header field

Header field contains 16 bits of configuration information. MSB will be transmitted first.

47.6.2.6.1 SIPI header coding

Figure 47-9, Table 47-1, Figure 47-10, and Table 47-2 show how the SIPI header bits are coded.

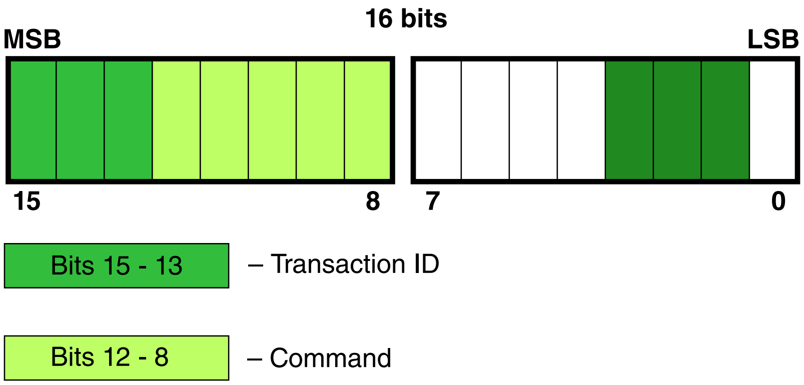

Figure 47-9. SIPI header coding

Table 47-1 shows the command coding for the bits[12:8] of the header.

Table 47-1. SIPI header command coding

b[12:8] (hex)	Command	Payload Size
00	Read 8 bits	64
01	Read 16 bits	64
02	Read 32 Bits	64
03	Reserved	—
04	Write 8 bits with ACK	96
05	Write 16 bits with ACK	96
06	Write 32 bits with ACK	96
07	Reserved	—
08	ACK – OK	32
09	ACK – Fault	32
0A	Read Answer – OK	64
0B	Reserved	—
0C	Trigger comm and with ACK	32
0D	Reserved	—
…	…	…
11	Reserved	—
12	ID Register Read Request	32
13	Reserved	—
…	…	…

18	Reserved	—
…	…	…
1F	Reserved	—

Figure 47-10 shows the channel number field in the header and Table 47-2 shows the channel number coding.

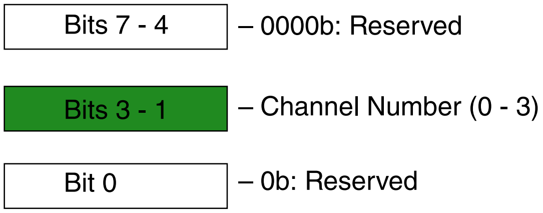

Figure 47-10. SIPI header channel field

Table 47-2. SIPI header channel number coding

SIPI channel name	Channel number coding in header(s)		Comment
	SIPI channel coding select field (SIPI_MCR[CHNSB])		
	Code table I (SIPI_MCR[CHNSB] = 1)	Code table II (SIPI_MCR[CHNSB] = 0)	
0 (Channel A)	000b	100b	In use
1 (Channel B)	001b	101b	In use
2 (Channel C)	010b	110b	In use
3 (Channel D)	011b	111b	In use
4 (Channel E)	100b	000b	Reserved
5 (Channel F)	101b	001b	Reserved
6 (Channel G)	110b	010b	Reserved
7 (Channel H)	111b	011b	Reserved

47.6.2.7 Address field

The address field is 32 bits wide with the MSB transmitted first.

47.6.2.8 Payload field

Table 47-3 shows the payload sizes of LFAST frames.

Table 47-3. Payload size of LFAST channel frame

LFAST Code	SIPI Code	LFAST Payload Size (bits)	LFAST Payload Size (bytes)
000b	—	8	1
001b	—	32	4
010b	010b	64	8
011b	011b	96	12
100b	100b	128	16

Table continues on the next page...

Table 47-3. Payload size of LFAST channel frame (continued)

LFAST Code	SIPI Code	LFAST Payload Size (bits)	LFAST Payload Size (bytes)
101b	101b	256	32
110b	110b	512	64
111b	111b	288	36

Table 47-4 shows the converted coding of LFAST for a given SIPI code.

Table 47-4. Converted coding of LFAST channel code for SIPI headers

LFAST Code	SIPI Code	Channel (hex)[1]
0100b	100b	A
0101b	101b	B
0110b	110b	C
0111b	111b	D
1000b	000b	E (not used by SIPI)
1001b	001b	F (not used by SIPI)
1010b	010b	G (not used by SIPI)
1011b	011b	H (not used by SIPI)

[1] SIPI channel 0 sends all commands on LFAST channel A, commands received on LFAST channel A, are processed and the response sent back on LFAST channel A.
SIPI channel 1 sends all commands on LFAST channel B, commands received on LFAST channel B, are processed and the response sent back on LFAST channel B.
SIPI channel 2 sends all commands on LFAST channel C, commands received on LFAST channel C, are processed and the response sent back on LFAST channel C.
SIPI channel 3 sends all commands on LFAST channel D, commands received on LFAST channel D, are processed and the response sent back on LFAST channel D.

47.6.2.9 CRC field

CRC field is 16 bits wide with calculation always enabled using CRC-16-CCITT syndrome (x16 + x12 + x5 + 1). MSB is sent first in the data stream.

47.6.2.9.1 CRC field examples

47.6.2.9.1.1 Example 1 – 32 bit write on channel 1 with ID1

- Header = 260Ah
- Address = 1122_3344h
- Data = CCDD_EEFFh
- CRC = BF7Dh

47.6.2.9.1.2 Example 2 – 32 bit read on channel 2 with ID2

- Header = 420Ch
- Address = 89AB_CDEFh
- CRC = 6B80h

47.6.2.9.1.3 Example 3 – Event command on channel 3 with ID3

- Header = 6C0Eh
- CRC = B286h

47.7 Transfer types

This section describes the available transfer types of the SIPI module. The SIPI frame is inserted inside the payload of the LFAST frame as shown in the figures of the following examples.

47.7.1 Read transfer

A Read transfer can be of two types:

- Read Request Transfer (at initiator node)
- Read Response Transfer (at target node)

47.7.1.1 Register read request transfer

If there is a read request transfer, the initiator node will send header, address and CRC bits as shown in Figure 47-11.

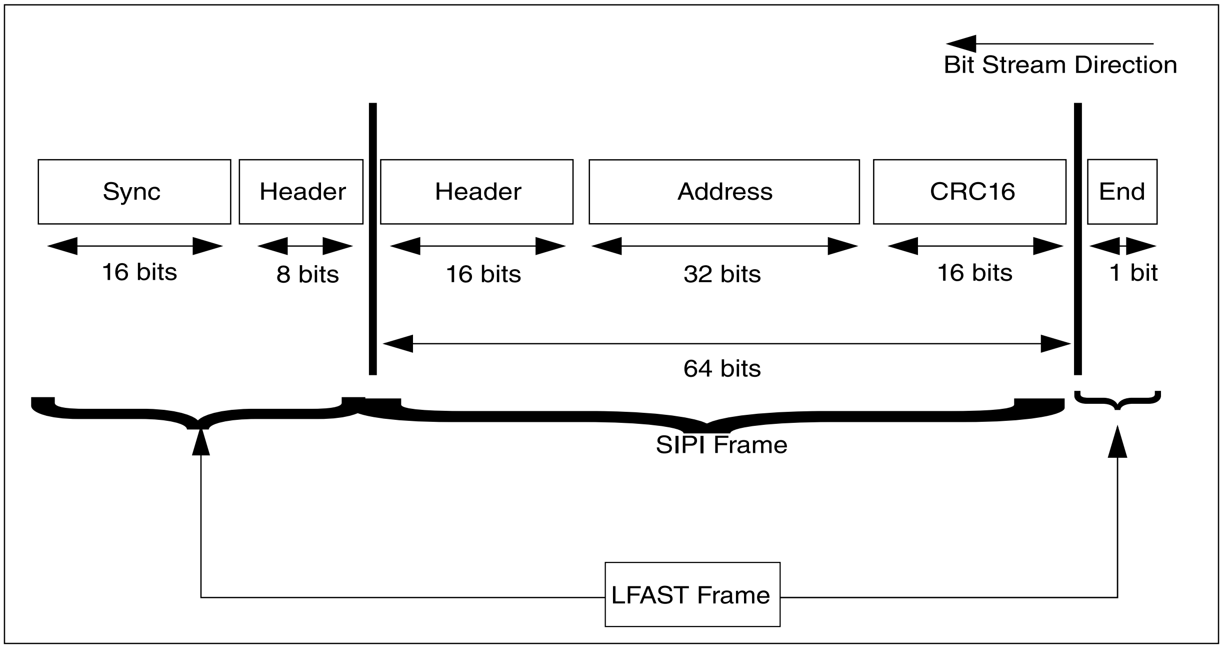

Figure 47-11. Read request transfer

47.7.2 Register read answer transfer

In response to a read request by the initiator node, the target node will send header, payload and CRC16. Data transfer could be in 8-bit, 16-bit or 32-bit modes (see Figure 47-12). In the case of 8-bit or 16-bit modes, copies of the SIPI data is sent in the payload (see Figure 47-13).

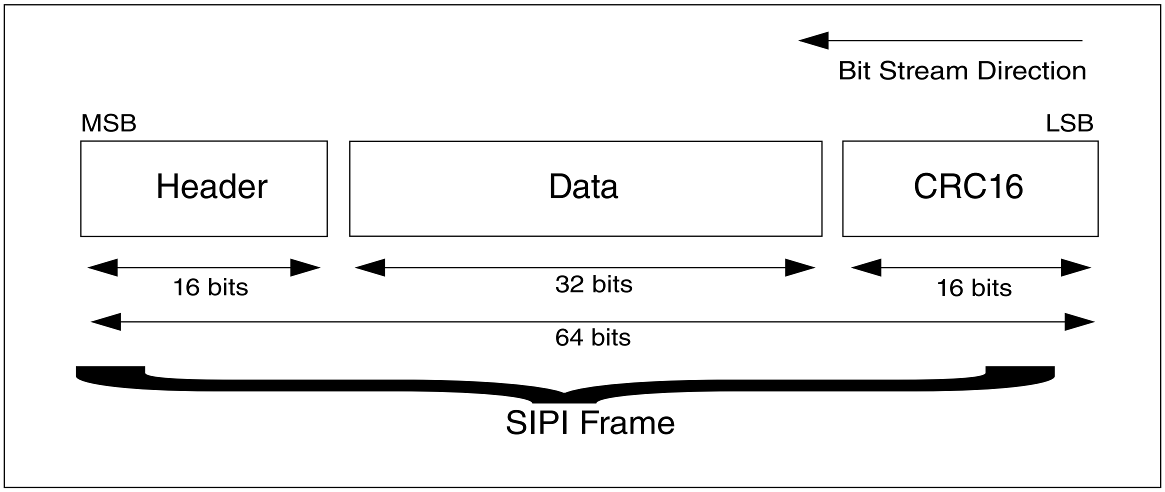

Figure 47-12. Read answer transfer

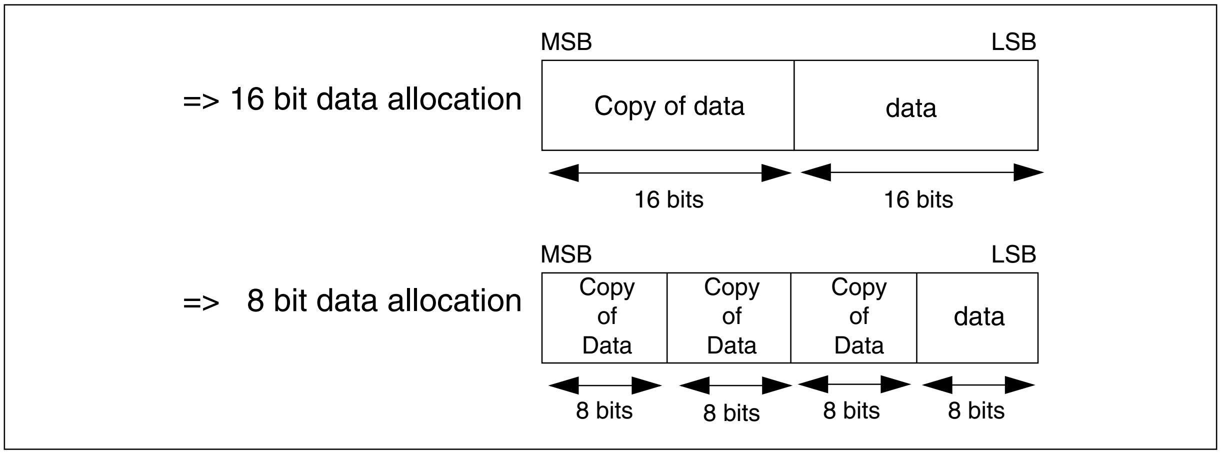

Figure 47-13. Data allocation

Note

- For an 8-bit transfer, address bits [31:2] are used as address and bits [1:0] are used as byte enables.
  - Bits[1:0]:
    - 00 - byte 3 enabled (MSB)
    - 01 - byte 2 enabled
    - 10 - byte 1 enabled
    - 11 - byte 0 enabled (LSB)
- For a 16-bit transfer, address bits [31:1] are used as address and bit [0] is used as halfword enable.
  - Bit[0]:
    - 0 - halfword 1 enabled (MSB)
    - 1 - halfword 0 enabled (LSB)

47.7.3 Register Write transfer

Register Write transfer can be of two types:

- Normal write transfer - channels 0, 1, 2 and 3
- Streaming data transfer - channel 2 only

A Register Write transfer can be done through Normal Write transfer on channels 0, 1, 2 and 3 (see Normal write transfer) as shown in Figure 47-14.

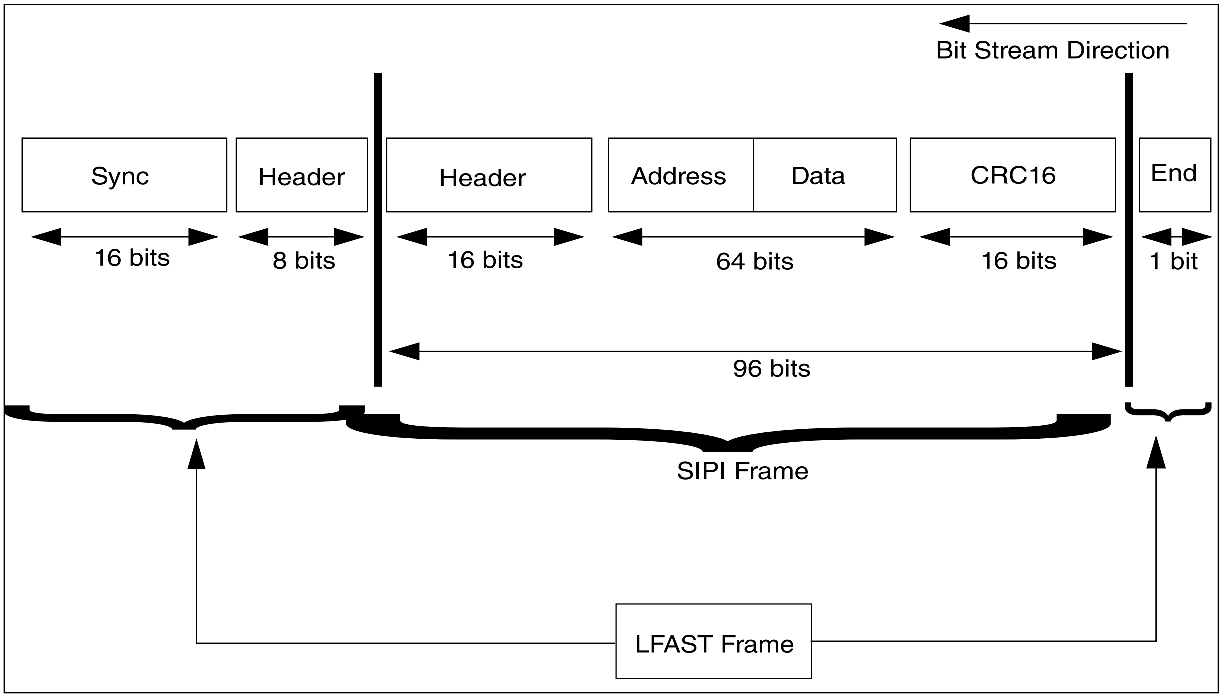

Figure 47-14. Register write transfer (showing LFAST frame encapsulation)

47.7.3.1 Normal write transfer

A normal write transfer contains header, address, data (32-bit) and CRC as shown in Figure 47-15.

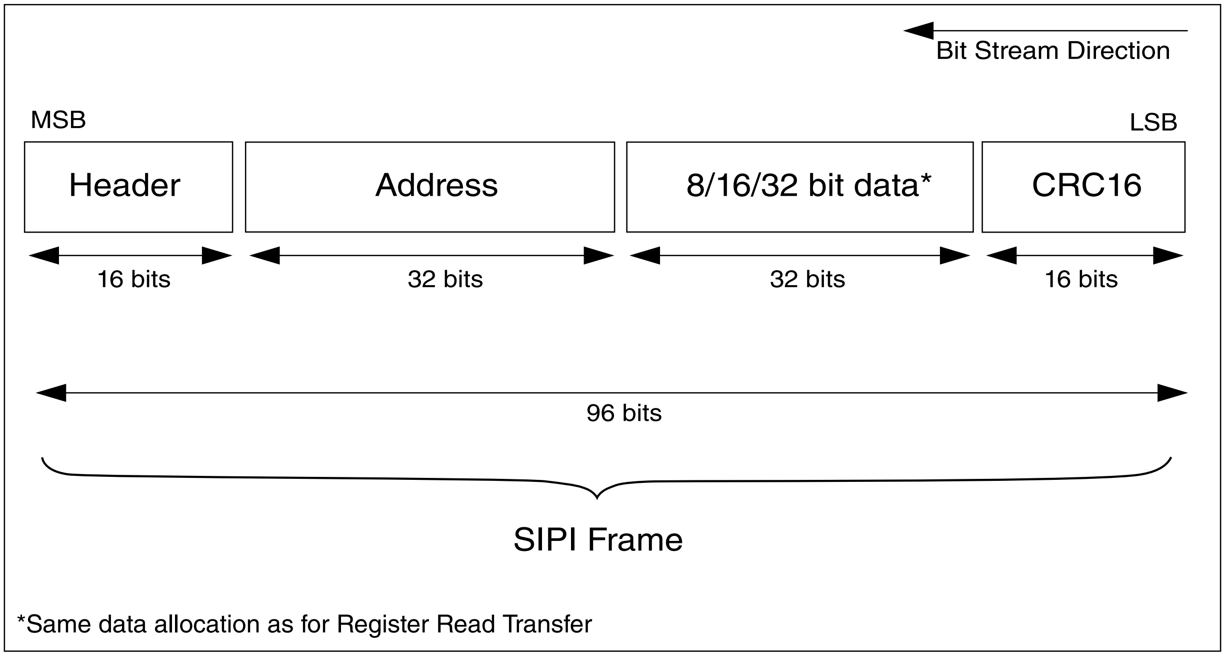

Figure 47-15. Write transfer (LFAST frame encapsulation is not shown)

Note

- For an 8-bit transfer, address bits [31:2] are used as address and bits [1:0] are used as byte enables.
  - Bits[1:0]:
    - 00 - byte 3 enabled (MSB)
    - 01 - byte 2 enabled
    - 10 - byte 1 enabled
    - 11 - byte 0 enabled (LSB)
- For a 16-bit transfer, address bits [31:1] are used as address and bit [0] is used as half word enable.
  - Bit[0]:
    - 0 - half-word 1 enabled (MSB)
    - 1 - half-word 0 enabled (LSB)

47.7.3.2 Streaming write transfer

Streaming write transfer has 256 bits of payload.

47.7.3.2.1 Streaming write transfer with address

Setting the address is performed using a direct write transfer. The SIPI Maximum Count Register (SIPI_MAXCR) and SIPI Address Reload Register (SIPI_ARR) are written before the SIPI Address Count Register (SIPI_ACR). This is to avoid unwanted behavior of the SIPI attempting to access non-shared memory. This is only true for the very first streaming command, subsequent streaming command(s) may not need to write the SIPI_MAXCR and SIPI_ARR (see SIPI Max Count Register (SIPI_MAXCR), SIPI Address Count Register (SIPI_ACR) and SIPI Address Reload Register (SIPI_ARR)).

47.7.3.2.2 Streaming transfer with data

Figure 47-16 shows the packet structure of the streaming transfer containing data.

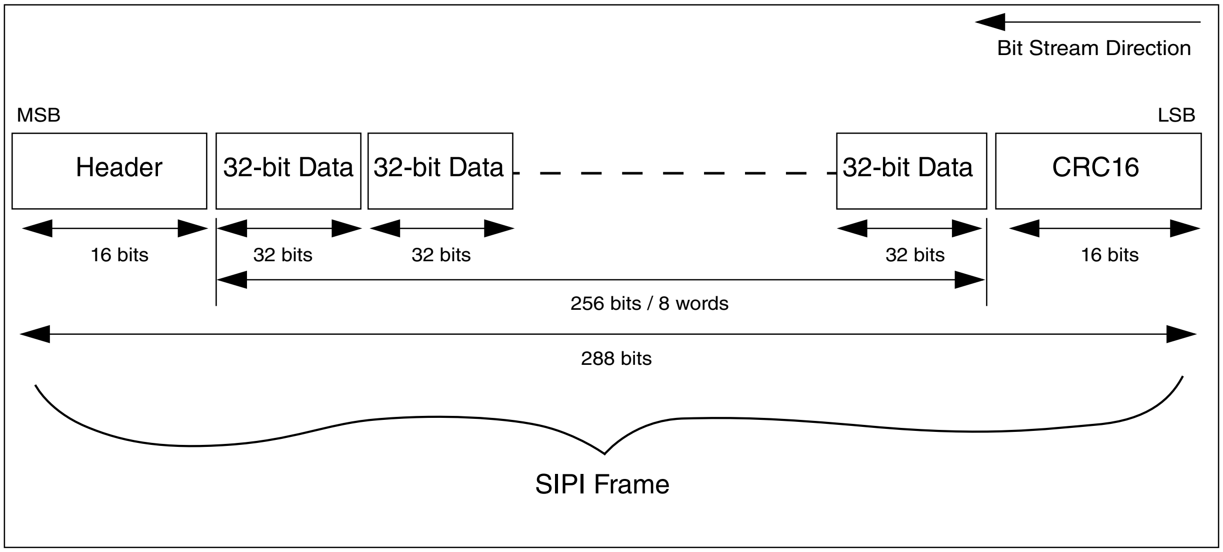

Figure 47-16. Streaming transfer with data

47.7.4 Write Acknowledge transfer

A Write Acknowledge transfer contains only header and CRC bits (see Write Aknowledge transfer. The CRC bits are calculated on the header field.

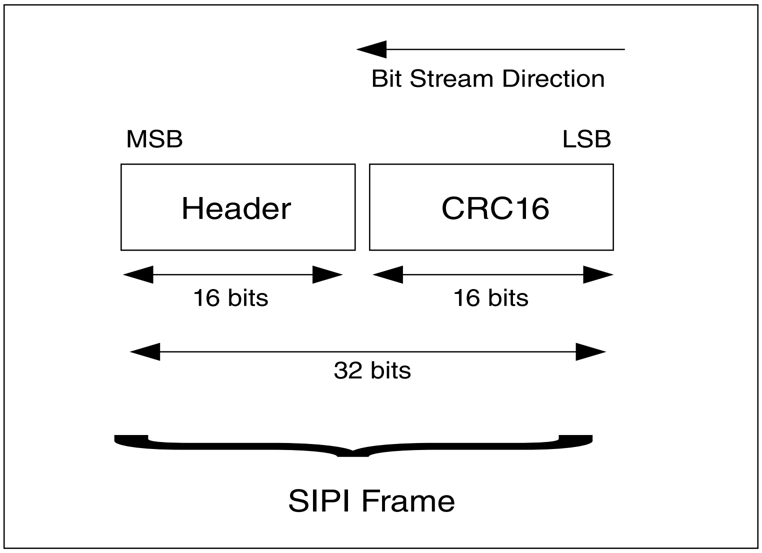

Figure 47-17. Write Aknowledge transfer (LFAST encapsulation is not shown)

47.7.5 ID request response

47.7.5.1 ID request transfer

An ID request is transmitted by the initiator node as shown in Figure 47-18.

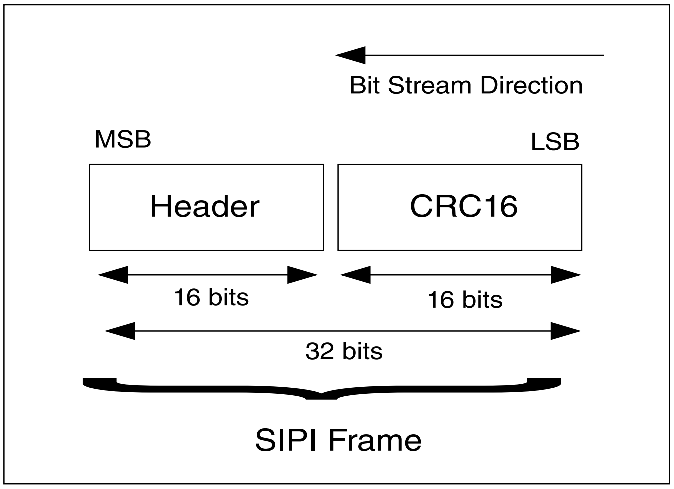

Figure 47-18. ID request transfer (LFAST encapsulation is not shown)

47.7.5.2 ID request response transfer

An ID request response is transmitted by the target node as shown in Figure 47-19.

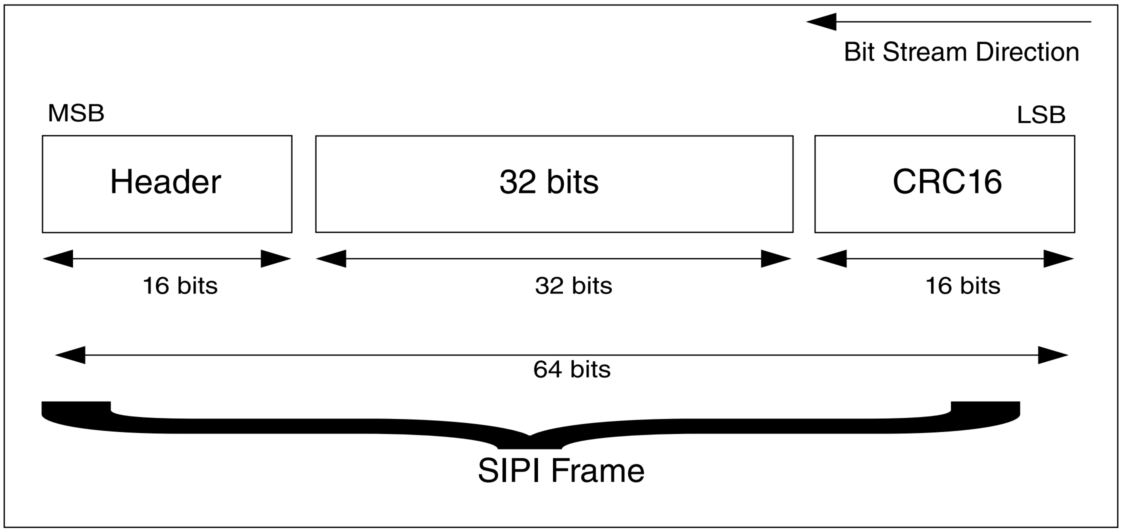

Figure 47-19. ID request response transfer

Note

The ID request response contains the value of the CHIP ID in place of data.

47.8 Transfer API and flow charts

Interrupt Generation Option
Channel Status
Channel Error
Time Out

*Note: TC = Transmit Command

Figure 47-20. SIPI single register write API

Implement the following steps to generate a single Write Transfer Request (Figure 47-20):

1. Configure data and SIPI_CCR*n* at the initiator node.
2. Configure SIPI_CAR*n* at the initiator node.

   As soon as the channel address register (SIPI_CAR*n*) is written and if CCR*n*[CHEN] = 1, the initiator SIPI will calculate the CRC on header, address and data field and will start transmitting data to LFAST.
3. Software polls the status register bits (SIPI_CSR*n*) to determine when the request completes, SIPI_CSR*n*[ACKR] = 1. An interrupt will be generated if the corresponding SIPI_CIR*n*[ACKIE] = 1.

On a single Write transfer request reception (Figure 47-21):

1. Target node will place the address, data and control information on its AHB master interface.
2. When the process in completed, the target node will generate an acknowledge frame and send it back to the LFAST.

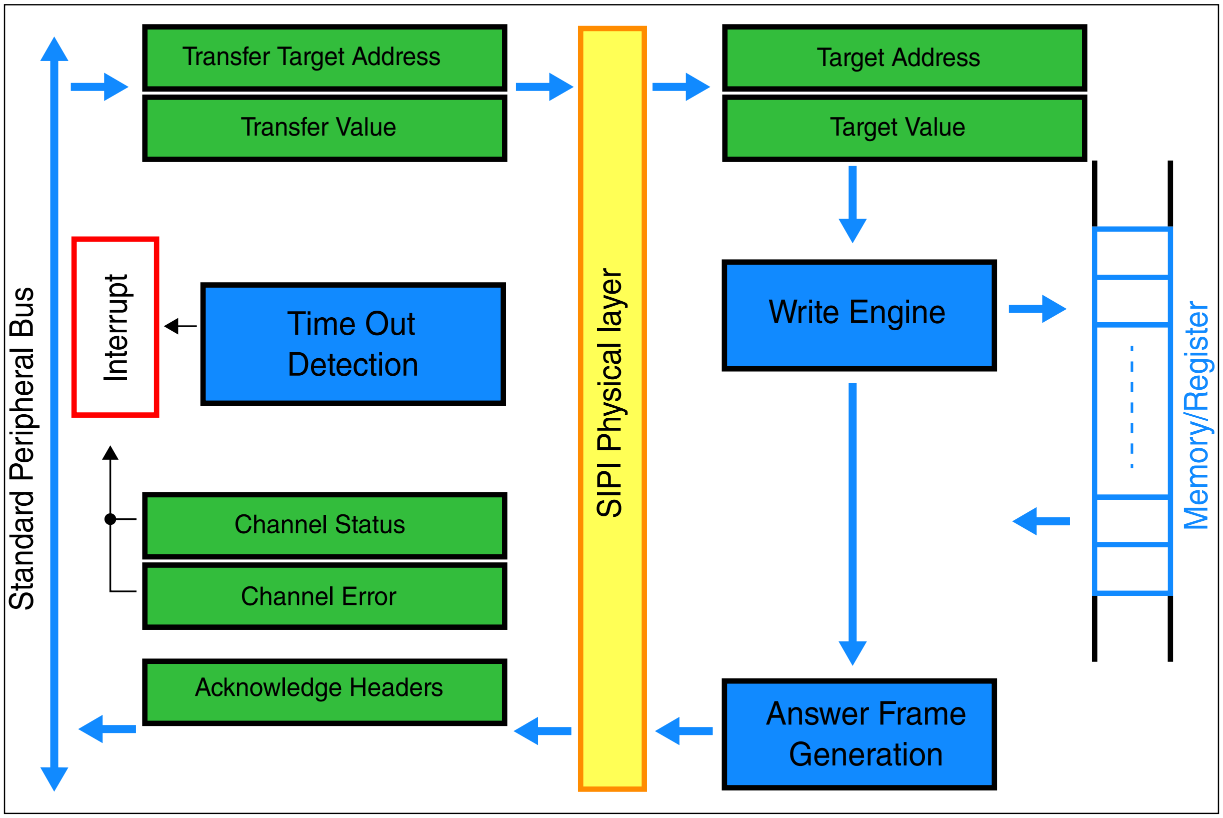

Figure 47-21. SIPI Single Register Write API – Flow Chart

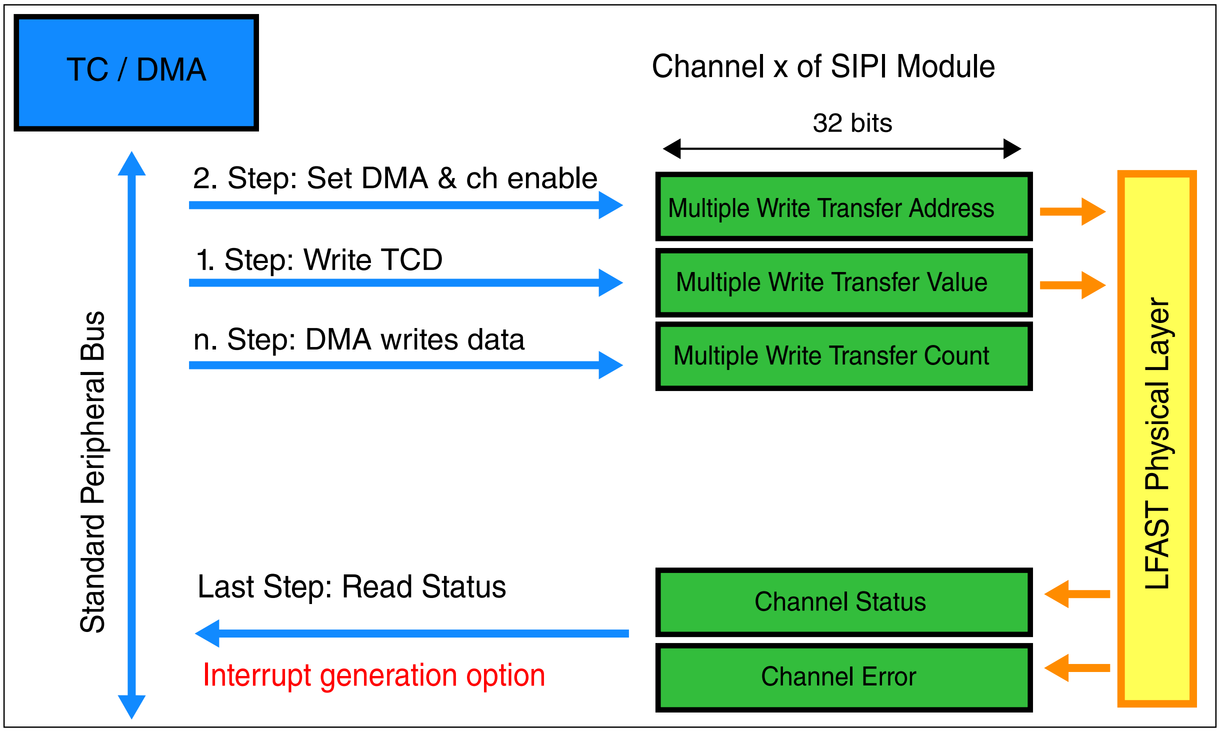

Figure 47-22. SIPI Multiple Register Write API

For multiple write transfer request generation (Figure 47-22):

1. Software will configure the Transfer Control Descriptor (TCD) of the DMA.
2. Software will write SIPI_CCR*n*[CHEN] = 1 and SIPI_CCR*n*[DAN] = 1.
3. SIPI will start copying data into the SIPI_CDR*n* through its DMA interface, depending on the transfer count and data registers size. SIPI_CDR2_0 should be written with the MSB.
4. When the copying process is completer, initiator SIPI will calculate CRC on header, address and data field and start transmitting data to LFAST.
5. Software should poll the SIPI_CSR*n* status register bits to determine if the request has completed. If SIPI_CSR*n*[ACKR] = 1, an interrupt will be generated (if the corresponding SIPI_CIR*n*[ACKIE] = 1).
6. If SIPI_CCR*n*[DEN] = 1, the SIPI request will transfer to the DMA controller. If not, the state machine go idle.
7. Steps 4–7 will be repeated.

On Multiple Write transfer request reception (Figure 47-22):

1. Target node will place the address, data and control information on its AHB Master Interface.
2. When the process in completed, target node will generate an acknowledge frame and send it back to the LFAST.

LFAST Physical Layer

Figure 47-23. SIPI Single Register Read API

For Single Read Transfer Request generation (Figure 47-23):

1. Software/DMA will configure SIPI_CCR*n* and SIPI_CDR*n*, with the last step by writing CAR*n*.
2. As soon as SIPI_CAR is written, the initiator SIPI will calculate CRC of the header and address fields and start transmitting data to the LFAST.
3. Software should poll CSR*n* to determine when the request has completed. If SIPI_CSR*n*[RAR] = 1, an interrupt will be generated (if SIPI_CIR*n*[RAIE] = 1). If SIPI_CSR*n*[RAR] does not set then SIPI_ERR[TOE*n*] = 1 which indicates a timeout has occured.
4. If SIPI_CSR*n*[RAR] = 1 then software can read the data register, or can other necessary action if SIPI_CSR*n*[RAR] = 0.

On Single Read transfer request reception (Figure 47-23):

1. Target node will place the address and control information on its AHB Master Interface.
2. When the process in completed, target node will send read response back to LFAST.

LFAST Physical Layer

Figure 47-24. SIPI multiple register read API

For multiple read transfer request generation (Figure 47-24):

1. Software/DMA will configure SIPI_CCR*n* and SIPI_CDR*n*, with the last step by writing SIPI_CAR*n*.
2. As soon as channel address register is written, initiator SIPI will calculate CRC on the header and address fields, then starts transmitting data to the LFAST.
3. Software should poll SIPI_CSR*n* to determine when the request has completed. If SIPI_CSR*n*[RAR] = 1 and SIPI_CIR*n*[RAIE] = 1 an interrupt will be generated. If SIPI_CSR*n*[RAR] does not set, then SIPI_ERR[TOE*n*] = 1 which indicates a timeout.
4. Steps 2–3 will be repeated for multiple requests.

On Multiple Read transfer request reception (Figure 47-24):

1. Target node then will start reading data through its AHB interface.
2. When the transfer is completed/all data registers are full, it will calculate CRC and send the response frame back to LFAST.

Figure 47-25, Figure 47-26, Figure 47-27 and Figure 47-28 show the SIPI data streaming of data.

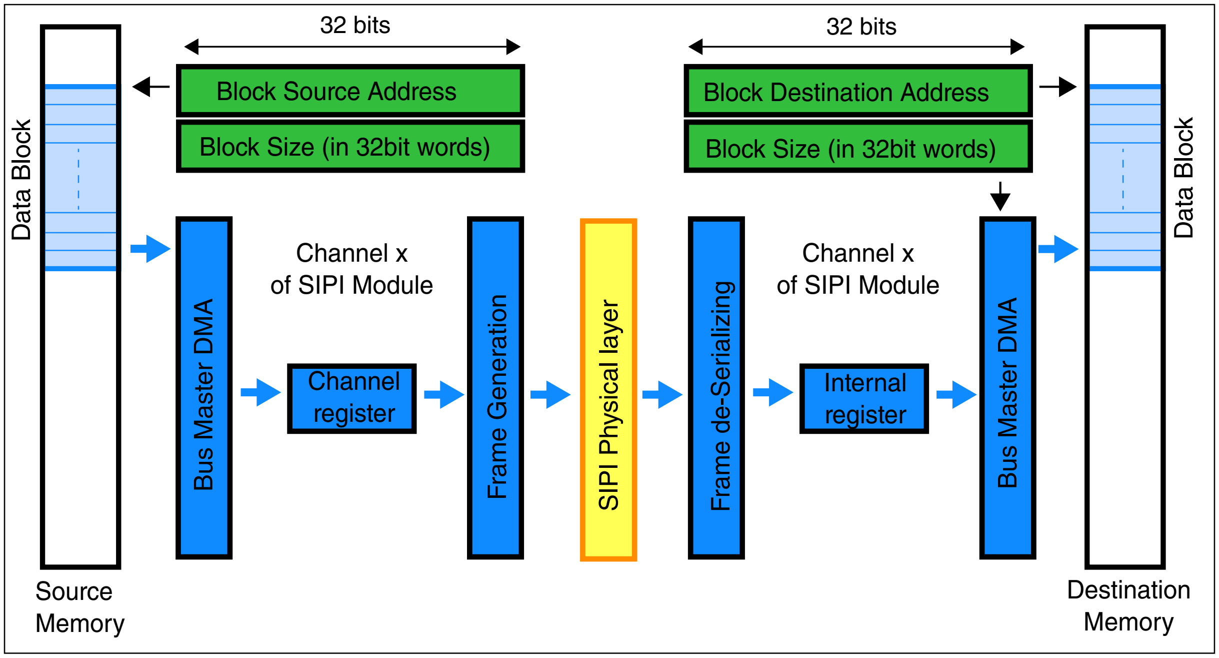

Figure 47-25. SIPI data stream model

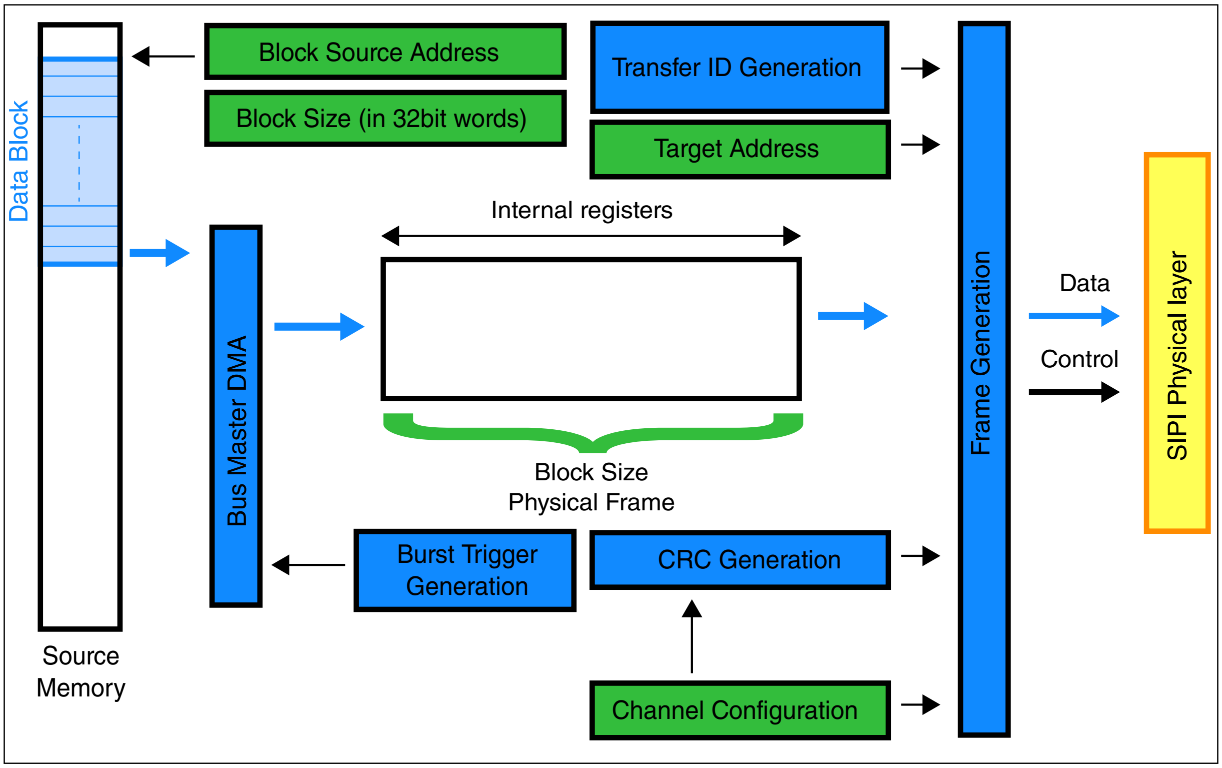

Figure 47-26. SIPI data stream model - Initiator

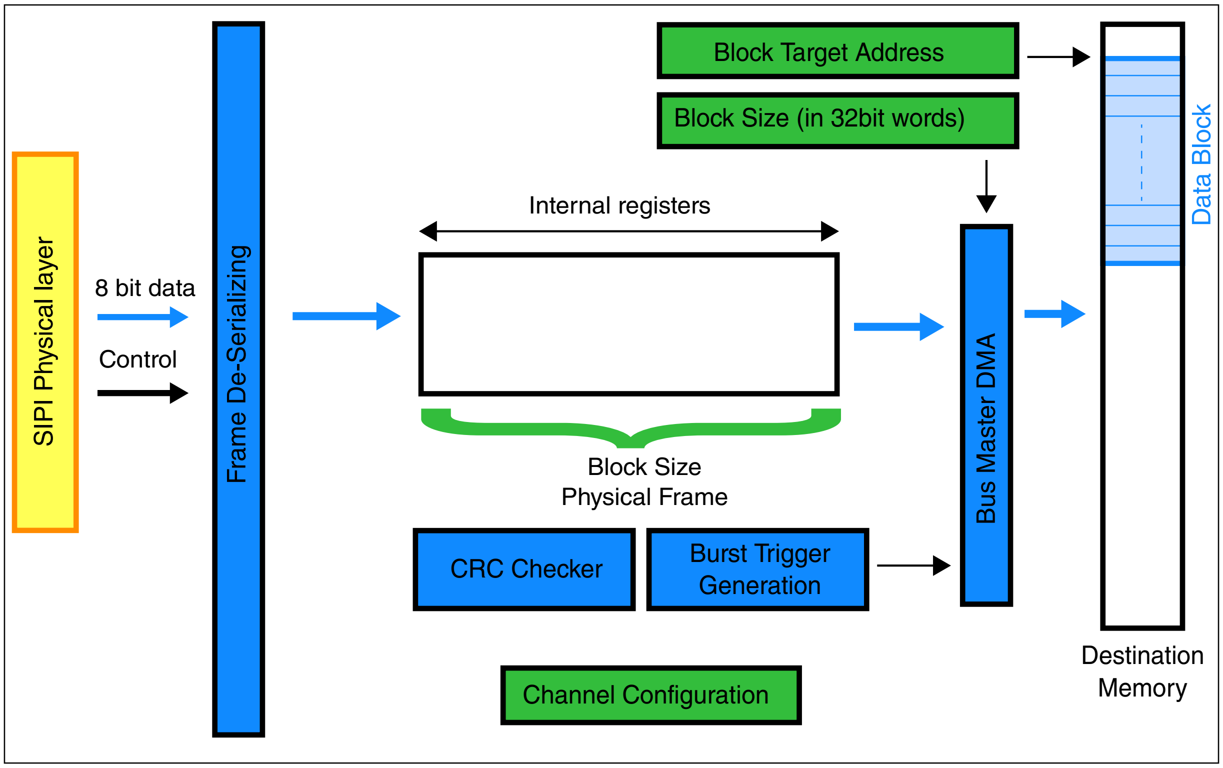

Figure 47-27. SIPI data stream model - Target

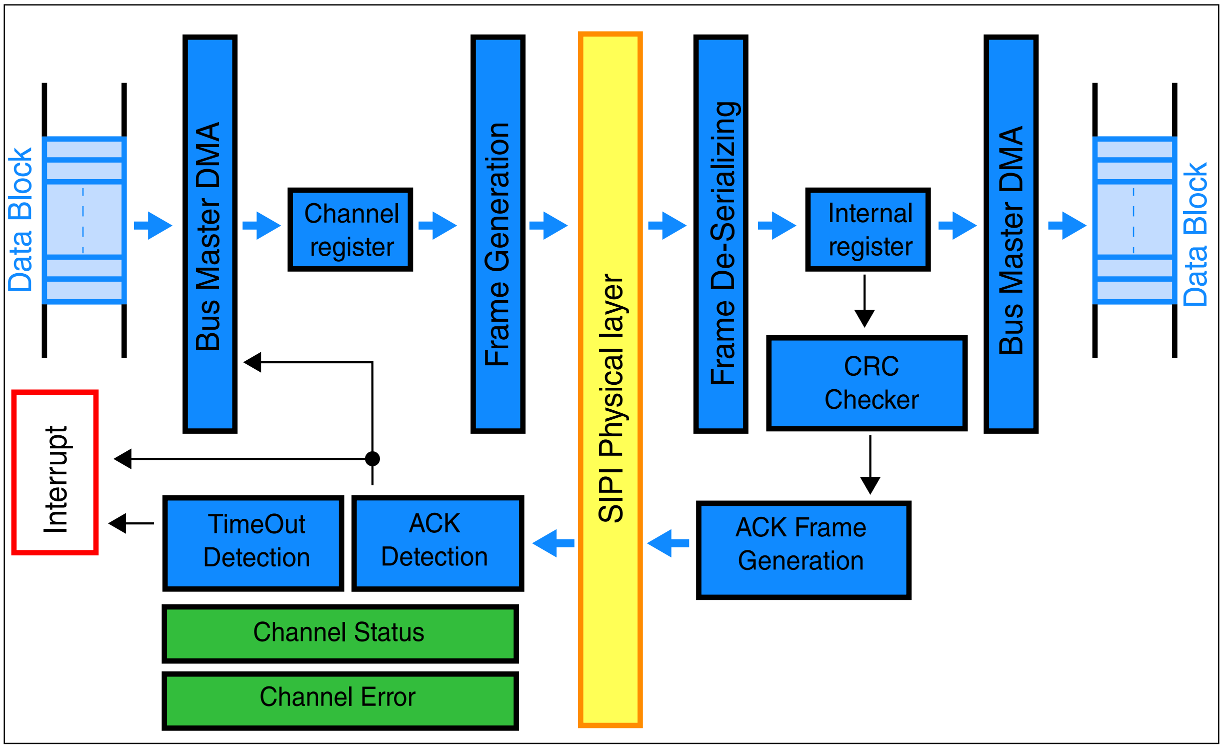

Figure 47-28. SIPI data stream with acknowledge trigger

47.9 DMA programming sequence

The DMA programming sequence is as follows:

1. Software configures TCD (DMA data).
2. DMA transfers from RAM to SIPI registers.
3. SIPI starts transferring the data through LFAST Tx ports.
4. If an acknowledge or fault response is received, SIPI will repeat the process. If any error response is received, SIPI will move to an idle state. An interrupt will be flagged by SIPI, and software will take control of the SIPI.
5. If SIPI has received a read response, and error flags are not set on the LFAST Rx port, SIPI will assert ipd_request. In case of error, move to Step 8.
6. As soon as ipd_request is asserted, DMA transfer starts between the SIPI registers and RAM.
7. If DMA transfer minor loop/major loop is complete, and the request is negated, ipd_request is negated.
8. If an error occurs:

- The SIPI generates an interrupt
- Software takes control of the SIPI

9. Steps 5 – 8 are repeated until the transfer is finished.

47.10 Modes of operation

SIPI has three operating modes:

- Initialization
- Normal
- Module Disable

After hardware reset the SIPI is in module disable mode, which helps reduce power consumption.

47.10.1 Initialization mode

To enter Initialization mode software writes SIPI_MCR[INIT]=1 SIPI_MCR[MOEN] must be set before attempting to write SIPI_MCR[INIT]). To exit Initialization mode software writes SIPI_MCR[INIT]=0 (see SIPI Module Configuration Register (SIPI_MCR)).

All message transfers are stopped when in Initialization mode. If software invokes Initialization mode when a bus transfer is in progress, the transfer will be aborted immediately even if the transfer has not completed.

Note

It is recommended that software checks the state of SIPI (SIPI_MCR[MOEN]) before setting SIPI_MCR[INIT].

47.10.2 Normal mode

Once software has completed initialization of SIPI (SIPI_MCR[INIT]=1), it can enter Normal mode by writing SIPI_MCR[INIT]=0. SIPI needs to be in Normal mode for all data transfers (see SIPI Module Configuration Register (SIPI_MCR)).

Note

SIPI must be enabled before a attempting to write SIPI_MCR[INIT] (SIPI_MCR[MOEN]=1).

47.10.3 Module Disable (MD)

MD mode in the SIPI is used to help reduce power consumption. By default, SIPI is in Disable mode, SIPI_MCR[MOEN]=0, and is exited by writing SIPI_MCR[MOEN]=1 (see SIPI Module Configuration Register (SIPI_MCR)). All the activities on the SIPI Tx and Rx ports are immediately stopped in Module Disable mode.

47.11 Errors

This section describes the potential errors that can occur during SIPI operation.

47.11.1 Timeout error

A timeout error is generated at the initiator node when the acknowledge/response is not received within the time configured in the corresponding CTOR*n*[TOR] field setting (see SIPI Channel Timeout Register 0 (SIPI_CTOR0), SIPI Channel Timeout Register 1 (SIPI_CTOR1), SIPI Channel Timeout Register 2 (SIPI_CTOR2) and SIPI Channel Timeout Register 3 (SIPI_CTOR3)). A timeout error is indicated when ERR[TOE*n*]=1 (see SIPI Error Register (SIPI_ERR)).

Note

SIPI should not drop the response even after a timeout occurs. Software will poll both error and status flags after the transfer to see if there was a timeout error. If there was a timeout error the response received may then be discarded.

47.11.2 CRC error

A CRC error is generated at the target nodes when the CRC received with the frame does not match the calculated CRC, and the SR[GCRCE] is set (see SIPI Status Register (SIPI_SR)). An interrupt will be asserted if MCR[CRCIE]=1 (see SIPI Module Configuration Register (SIPI_MCR)).

Note

The target node will not send an acknowledge to the initiator node when a CRC error is generated. An interrupt will be generated on the target side if the corresponding interrupt enable bit is set. The initiator node will detect a timeout and take necessary action.

47.11.3 Maximum count reached error

The maximum count reached error is only generated at the target node. It is generated when the value of the SIPI_ACR is equal to the SIPI_MAXCR (see SIPI Max Count Register (SIPI_MAXCR) and SIPI Address Count Register (SIPI_ACR)). When the maximum count is reached, SIPI_SR[MCR] = 1 (see SIPI Status Register (SIPI_SR)). An interrupt will be generated if SIPI_MCR[MCRIE] = 1 (see SIPI Module Configuration Register (SIPI_MCR)).

47.11.4 Transaction ID error

The Transaction ID (TID) error is always generated at the initiator node only. It is generated when header bits 15–13 do not match SIPI_CSR*n*[TID] (transaction ID bits, see SIPI Channel Status Register 0 (SIPI_CSR0), SIPI Channel Status Register 1 (SIPI_CSR1), SIPI Channel Status Register 2 (SIPI_CSR2), and SIPI Channel Status Register 3 (SIPI_CSR3)). SIPI_CSR*n*[TIDE] = 1 when a TID error is detected, and an interrupt will be generated if SIPI_CIR*n*[TIDIE] = 1 (see SIPI Channel Interrupt Register 0 (SIPI_CIR0), SIPI Channel Interrupt Register 1 (SIPI_CIR1), SIPI Channel Interrupt Register 2 (SIPI_CIR2), and SIPI Channel Interrupt Register 3 (SIPI_CIR3)).

47.11.5 Acknowledge error

An incorrect acknowledge is received only from the initiator. When the acknowledge received is incorrect, SIPI_ERR[ACKR*n*] will be set (see SIPI Error Register (SIPI_ERR)). An interrupt will be generated if SIPI_CIR*n*[WAIE]=1 (see SIPI Channel Interrupt Register 0 (SIPI_CIR0), SIPI Channel Interrupt Register 1 (SIPI_CIR1), SIPI Channel Interrupt Register 2 (SIPI_CIR2), and SIPI Channel Interrupt Register 3 (SIPI_CIR3)).

47.12 CRC calculation

Example: If header is AABBh, address is 1122_3344h and data is CCDD_EEFFh. Then CRC calculation will take place as follows:

1) The CRC seed is initialized by FFFF_FFFFh.

2) All the data will be mirrored before sending to CRC engine (for example, MSB will be sent as LSB).

3) So the header will be sent as DD55_0000h.

4) Address will be sent as 22CC_4488h.

5) Data will be sent as FF77_BB33h.

47.13 Interrupt logic

A description of the interrupt logic can be found in the following figure.

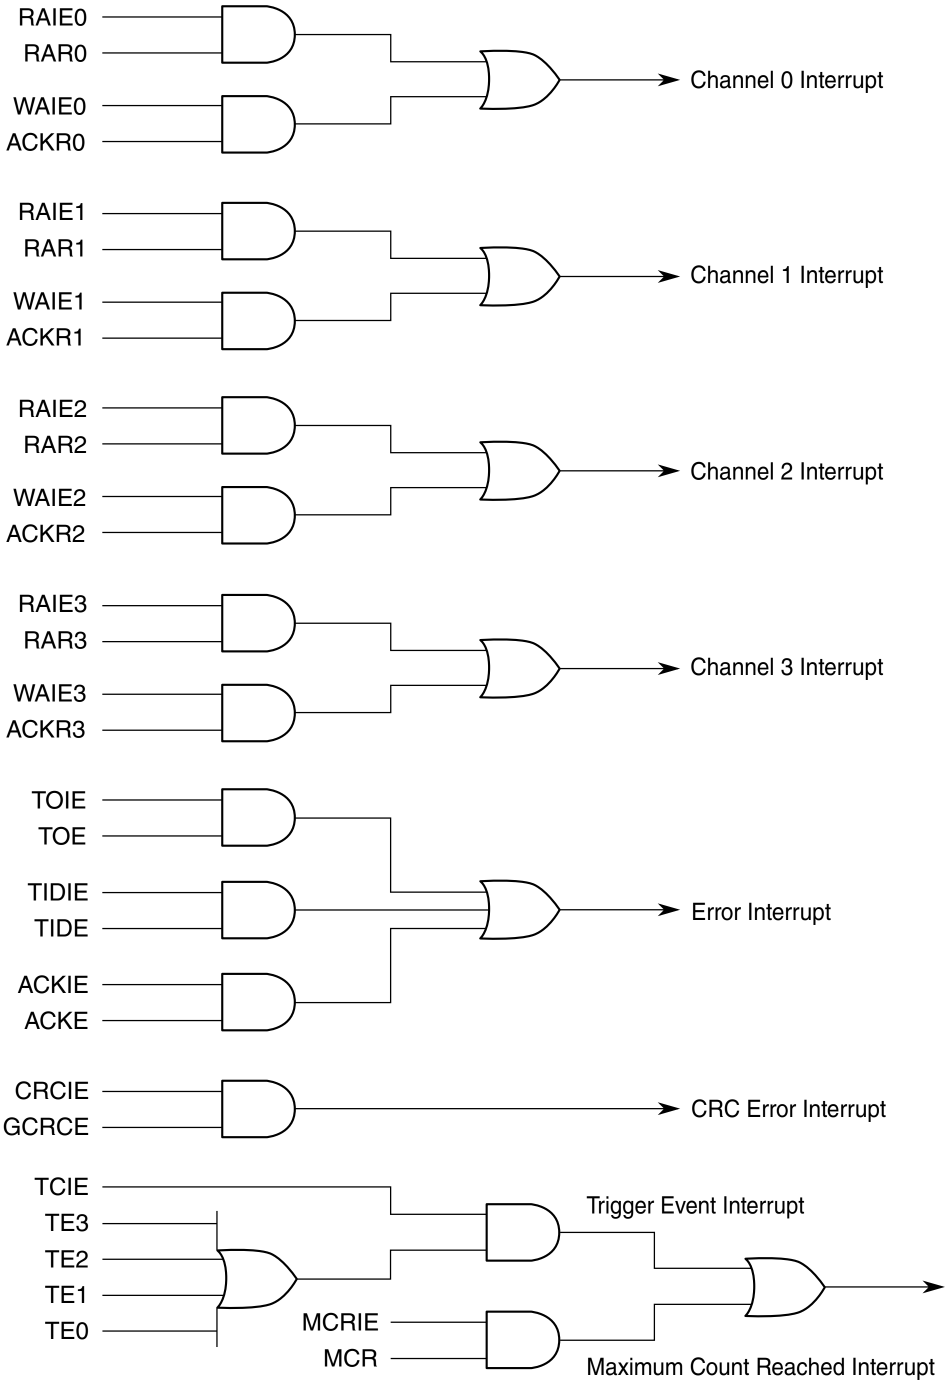

Figure 47-29. Interrupt description

47.14 SIPI control and status overview

The diagram below shows the relationship between transfers and the SIPI control and status registers.

47.15.1 SIPI Channel Control Register 0 (SIPI_CCR0)

NOTE

Back to back transactions are not supported on a single channel (for example, if the channel busy bit, SIPI_CSR0[CB] = 1, is configured for a channel, it cannot be triggered for another transfer until the data buffers are empty and the channel is free, SIPI_CSR0[CB] = 0).

PRIORITY SCHEDULING: The channel whose SIPI_CAR*n* is written first will gain access first irrespective of its priority at the start of the transfer. As more transfers are requested, priority will be resolved as per the priority scheme (for example, channel 0 – channel 1 – channel 2 – channel 3). Scheduling will occur each time the LFAST is not ready to receive data and no channel is pending for data transmission. The reason for the scheduling is that a common CRC module is shared by all channels. If the LFAST is ready to receive data during the entire process, it will happen only in the beginning and later on priority will be resolved as per the priority scheme.

NOTE

This register is only writable in Initialization mode (SIPI_MCR[INIT] = 1), except for command bits (for example, TC, WL, ST, IDT, RRT and WRT). Also, the command bits can be written only when the corresponding Channel busy bit is not asserted (SIPI_CSR*n*[CB] = 1 (see SIPI Channel Status Register 0 (SIPI_CSR0)). Software will need to poll the respective channel busy bits before attempting to change the command type.

Only one channel at a time can transmit. Therefore, only one channel can remain busy. Maximum time allowed to transmit a full command is nine clock cycles. The Command type of a channel can only be changed when it is no longer busy. Also, to send a command, we need to write to the corresponding SIPI_CAR*n* (see SIPI Channel Address Register 0 (SIPI_CAR0)).

Address: 0h base + 0h offset = 0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

SIPI_CCR0 field descriptions

Field	Description
0–14 Reserved	This field is reserved.
15 TC	Send Trigger Command. A Trigger Command requires that only this bit to be set by software, the trigger does not depend on settings in SIPI_CAR0. 0 Trigger command not sent 1 Trigger command sent
16–23 Reserved	This field is reserved.
24–25 WL	Word Length Transfer. For Streaming write, WL bits should be written 10. 00 8-bit 01 16-bit 10 32-bit 11 not used
26 CHEN	Channel Enable. If all channel enables are simultaneously written to enable the channels, channel 0 will be given the highest priority for transmission. For channels, the lowest channel number is given highest priority.

Table continues on the next page...

SIPI_CCR0 field descriptions (continued)

Field	Description
	0 Channel is disabled 1 Channel is enabled
27 ST	Streaming Transfer. This bit is hard-coded to 0. It can only be written for channel 2 (SIPI_CCR2). This bit can only be written when the corresponding SIPI_CCR*n*[WRT] = 1. **NOTE:** Only transfers with channel 2 can write 1 to this bit. All other channels force SIPI_CCR*n*[ST] = 0. The SIPI_CCR2[WRT] and SIPI_CCR2[ST] bits must be set for streaming. 0 Streaming transfer is disabled 1 Streaming transfer is enabled
28 IDT	ID Read Request Transfer. This request returns the value of the CHIP ID. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0 ID read request not sent 1 ID read request sent
29 RRT	Read Request Transfer. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0 Read request will not be sent 1 Read request transfer by the initiator. This bit can not be written if SIPI_CCR0[IDT] = 1.
30 WRT	Write Request Transfer. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0 No write request will be sent 1 Write request transfer by the initiator. This bit can not be written if SIPI_CCR0[IDT] = 1 or SIPI_CCR0[RRT] = 1.
31 DEN	DMA Enable. When enabling DMA mode, this bit should be set by software. It will then be cleared by hardware after one major loop has completed. 0 Channel will be used for bus interface access. 1 Channel will be used for DMA access

47.15.2 SIPI Channel Status Register 0 (SIPI_CSR0)

CSR0 contains the status bits for the current transfer.

Address: 0h base + 4h offset = 4h

SIPI_CTOR0 field descriptions

Field	Description
0–23 Reserved	This field is reserved.
24–31 TOR	Timeout value for transmitted requests. Timeout counter runs on the prescaled peripheral clock. Prescaler is defined by SIPI_MCR[PRSCLR]. **NOTE:** Field can only be written during Initialization mode (SIPI_MCR[INIT] = 1).

47.15.5 SIPI Channel CRC Register 0 (SIPI_CCRC0)

SIPI_CCRC*n* is a read only which returns the CRC calculated value on the header, address and data bits.

Address: 0h base + 14h offset = 14h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	CRCI																CRCT															
W

SIPI_CCRC0 field descriptions

Field	Description
0–15 CRCI	Reflects received CRC value at initiator
16–31 CRCT	Reflects received CRC value at target

47.15.6 SIPI Channel Address Register 0 (SIPI_CAR0)

SIPI_CAR0 is the address target for data transmission.

Address: 0h base + 18h offset = 18h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SIPI_CAR0 field descriptions

Field	Description
0–31 CAR	These bits contain the address of the target node.

47.15.7 SIPI Channel Data Register 0 (SIPI_CDR0)

SIPI_CDR0 contains the data to be transmitted, and can be written anytime by software or the DMA. The data can be written in 8, 16 or 32 bit formats.

Address: 0h base + 1Ch offset = 1Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SIPI_CDR0 field descriptions

Field	Description
0–31 CDR	Data register bits. Contains the data that will be transmitted, or received.

47.15.8 SIPI Channel Control Register 1 (SIPI_CCR1)

NOTE

Back to back transactions are not supported on a single channel (for example, if the channel busy bit, SIPI_CSR1[CB] = 1, is configured for a channel, it cannot be triggered for another transfer until the data buffers are empty and the channel is free, SIPI_CSR1[CB] = 0).

PRIORITY SCHEDULING: The channel whose SIPI_CAR*n* is written first will gain access first irrespective of its priority at the start of the transfer. As more transfers are requested, priority will be resolved as per the priority scheme (for example, channel 0 – channel 1 – channel 2 – channel 3). Scheduling will occur each time the LFAST is not ready to receive data and no channel is pending for data transmission. The reason for the scheduling is that a common CRC module is shared by all channels. If the LFAST is ready to receive data during the entire process, it will happen only in the beginning and later on priority will be resolved as per the priority scheme.

NOTE

This register is only writable in Initialization mode (SIPI_MCR[INIT] = 1), except for command bits (for example, TC, WL, ST, IDT, RRT and WRT). Also, the command bits can be written only when the corresponding Channel busy bit is not asserted (SIPI_CSR*n*[CB] = 1 (see SIPI Channel Status Register 1 (SIPI_CSR1)). Software will need to poll the respective channel busy bits before attempting to change the command type.

Only one channel at a time can transmit. Therefore, only one channel can remain busy. Maximum time allowed to transmit a full command is nine clock cycles. The Command type of a channel can only be changed when it is no longer busy. Also, to send a command, we need to write to the corresponding SIPI_CAR*n* (see SIPI Channel Address Register 1 (SIPI_CAR1)).

Address: 0h base + 20h offset = 20h

SIPI_CCR1 field descriptions

Field	Description
0–14 Reserved	This field is reserved.
15 TC	Send Trigger Command. A Trigger Command requires that only this bit to be set by software, the trigger does not depend on settings in SIPI_CAR1. 0 Trigger command not sent 1 Trigger command sent
16–23 Reserved	This field is reserved.
24–25 WL	Word Length Transfer. For Streaming write WL bits should be written 10. 00 8-bit 01 16-bit 10 32-bit 11 not used
26 CHEN	Channel Enable. If all channel enables are simultaneously written to enable the channels, channel 0 will be given the highest priority for transmission. For channels, the lowest channel number is given highest priority. 0 Channel is disabled 1 Channel is enabled
27 ST	This bit is hard-coded to 0. It can only be written for channel 2 (SIPI_CCR2). This bit can only be written when the corresponding SIPI_CCR*n*[WRT] = 1. **NOTE:** Only transfers with channel 2 can write 1 to this bit. All other channels force SIPI_CCR*n*[ST] = 0. The SIPI_CCR2[WRT] and SIPI_CCR2[ST] bits must be set for streaming. 0 Streaming transfer is disabled 1 Streaming transfer is enabled
28 IDT	ID Read Request Transfer. This request returns the value of the CHIP ID. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0 ID read request not sent 1 ID read request sent
29 RRT	Read Request Transfer. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT

Table continues on the next page...

SIPI_CCR1 field descriptions (continued)

Field	Description
	0 Read request will not be sent 1 Read request transfer by the initiator. This bit can not be written if SIPI_CCR1[IDT] = 1.
30 WRT	Write Request Transfer. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0 No write request will be sent 1 Write request transfer by the initiator. This bit can not be written if SIPI_CCR1[IDT] = 1 or SIPI_CCR1[RRT] = 1.
31 DEN	DMA Enable. When enabling DMA mode, this bit should be set by software. It will then be cleared by hardware after one major loop has completed. 0 Channel will be used for bus interface access. 1 Channel will be used for DMA access

47.15.9 SIPI Channel Status Register 1 (SIPI_CSR1)

CSR1 contains the status bits for the current transfer.

Address: 0h base + 24h offset = 24h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	Reserved															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SIPI_CTOR1 field descriptions

Field	Description
0–23 Reserved	This field is reserved.
24–31 TOR	Timeout value for transmitted requests. Timeout counter runs on the prescaled peripheral clock. Prescaler is defined by SIPI_MCR[PRSCLR]. **NOTE:** Field can only be written during Initialization mode (SIPI_MCR[INIT] = 1).

47.15.12 SIPI Channel CRC Register 1 (SIPI_CCRC1)

SIPI_CCRC*n* is a read only which returns the CRC calculated value on the header, address and data bits.

Address: 0h base + 34h offset = 34h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SIPI_CAR1 field descriptions

Field	Description
0–31 CAR	These bits contain the address of the target node.

47.15.14 SIPI Channel Data Register 1 (SIPI_CDR1)

SIPI_CDR1 contains the data to be transmitted, and can be written anytime by software or the DMA. The data can be written in 8, 16 or 32 bit formats.

Address: 0h base + 3Ch offset = 3Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R W	CDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SIPI_CDR1 field descriptions

Field	Description
0–31 CDR	Data register bits. Contains the data that will be transmitted, or received.

47.15.15 SIPI Channel Control Register 2 (SIPI_CCR2)

NOTE

> Back to back transactions are not supported on a single channel (for example, if the channel busy bit, SIPI_CSR2[CB] = 1, is configured for a channel, it cannot be triggered for another transfer until the data buffers are empty and the channel is free, SIPI_CSR2[CB] = 0).
>
> PRIORITY SCHEDULING: The channel whose SIPI_CAR*n* is written first will gain access first irrespective of its priority at the start of the transfer. As more transfers are requested, priority will be resolved as per the priority scheme (for example, channel 0 – channel 1 – channel 2 – channel 3). Scheduling will occur each time the LFAST is not ready to receive data and no channel is pending for data transmission. The reason for the scheduling is that a common CRC module is shared by all channels. If the LFAST is ready to receive data during the entire process, it will happen only in the beginning and later on priority will be resolved as per the priority scheme.

NOTE

This register is only writable in Initialization mode (SIPI_MCR[INIT] = 1), except for command bits (for example, TC, WL, ST, IDT, RRT and WRT). Also, the command bits can be written only when the corresponding Channel busy bit is not asserted (SIPI_CSR*n*[CB] = 1 (see SIPI Channel Status Register 2 (SIPI_CSR2)). Software will need to poll the respective channel busy bits before attempting to change the command type.

Only one channel at a time can transmit. Therefore, only one channel can remain busy. Maximum time allowed to transmit a full command is nine clock cycles. The Command type of a channel can only be changed when it is no longer busy. Also, to send a command, we need to write to the corresponding SIPI_CAR*n* (see SIPI Channel Address Register 2 (SIPI_CAR2)).

Address: 0h base + 40h offset = 40h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	Reserved															TC

SIPI_CCR2 field descriptions

Field	Description
0–14 Reserved	This field is reserved.
15 TC	Send Trigger Command. A Trigger Command requires that only this bit to be set by software, the trigger does not depend on settings in SIPI_CAR2. 0 Trigger command not sent 1 Trigger command sent
16–23 Reserved	This field is reserved.
24–25 WL	Word Length Transfer. For Streaming write, WL bits should be written 10. 00 8-bit 01 16-bit 10 32-bit 11 not used
26 CHEN	Channel Enable. If all channel enables are simultaneously written to enable the channels, channel 0 will be given the highest priority for transmission. For channels, the lowest channel number is given highest priority. 0 Channel is disabled 1 Channel is enabled
27 ST	This bit is hard-coded to 0. It can only be written for channel 2 (SIPI_CCR2). This bit can only be written when the corresponding SIPI_CCR*n*[WRT] = 1. **NOTE:** Only transfers with channel 2 can write 1 to this bit. All other channels force SIPI_CCR*n*[ST] = 0. The SIPI_CCR2[WRT] and SIPI_CCR2[ST] bits must be set for streaming. 0 Streaming transfer is disabled 1 Streaming transfer is enabled
28 IDT	ID Read Request Transfer. This request returns the value of the CHIP ID. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0 ID read request not sent 1 ID read request sent
29 RRT	Read Request Transfer. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT

Table continues on the next page...

SIPI_CCR2 field descriptions (continued)

Field	Description
	0 Read request will not be sent 1 Read request transfer by the initiator. This bit can not be written if SIPI_CCR2[IDT] = 1.
30 WRT	Write Request Transfer. **NOTE:** The order of priority for writing to IDT, WRT and RRT must be in this order: 1. IDT 2. RRT 3. WRT 0 No write request will be sent 1 Write request transfer by the initiator. This bit can not be written if SIPI_CCR2[IDT] = 1 or SIPI_CCR2[RRT] = 1.
31 DEN	DMA Enable. When enabling DMA mode, this bit should be set by software. It will then be cleared by hardware after one major loop has completed. 0 Channel will be used for bus interface access. 1 Channel will be used for DMA access

47.15.16 SIPI Channel Status Register 2 (SIPI_CSR2)

SIPI_CSR2 contains the status bits for the current transfer.

Address: 0h base + 44h offset = 44h

SIPI_CAR2 field descriptions

Field	Description
0–31 CAR	These bits contain the address of the target node.

47.15.21 SIPI Channel Data Register 2 (SIPI_CDR2_*n*)

SIPI_CDR2_*n*contains the data to be transmitted, and can be written anytime by software or the DMA. The data can be written in 8, 16 or 32 bit formats.

Address: 0h base + 5Ch offset + (4d × i), where i=0d to 7d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R W	CDR2

SIPI_CDR2_*n* field descriptions

Field	Description
0–31 CDR2	Data register bits. Contains the data that will be transmitted, or received.

47.15.22 SIPI Channel Control Register 3 (SIPI_CCR3)

NOTE

Back to back transactions are not supported on a single channel (for example, if the channel busy bit, SIPI_CSR3[CB] = 1, is configured for a channel, it cannot be triggered for another transfer until the data buffers are empty and the channel is free, SIPI_CSR3[CB] = 0).

PRIORITY SCHEDULING: The channel whose SIPI_CAR*n* is written first will gain access first irrespective of its priority at the start of the transfer. As more transfers are requested, priority will be resolved as per the priority scheme (for example, channel 0 – channel 1 – channel 2 – channel 3). Scheduling will occur each time the LFAST is not ready to receive data and no channel is pending for data transmission. The reason for the scheduling is that a common CRC module is shared by all channels. If the LFAST is ready to receive data during the entire process, it will happen only in the beginning and later on priority will be resolved as per the priority scheme.

NOTE

This register is only writable in Initialization mode (SIPI_MCR[INIT] = 1), except for command bits (for example, TC, WL, ST, IDT, RRT and WRT). Also, the command bits can be written only when the corresponding Channel busy bit is not asserted (SIPI_CSR*n*[CB] = 1 (see SIPI Channel Status Register 3 (SIPI_CSR3)). Software will need to poll the respective channel busy bits before attempting to change the command type.

Only one channel at a time can transmit. Therefore, only one channel can remain busy. Maximum time allowed to transmit a full command is nine clock cycles. The Command type of a channel can only be changed when it is no longer busy. Also, to send a command, we need to write to the corresponding SIPI_CAR*n* (see SIPI Channel Address Register 3 (SIPI_CAR3)).

Address: 0h base + 7Ch offset = 7Ch

Field	Description
0–23 Reserved	This field is reserved.
24–31 TOR	Timeout value for transmitted requests. Timeout counter runs on the prescaled peripheral clock. Prescaler is defined by SIPI_MCR[PRSCLR]. **NOTE:** Field can only be written during Initialization mode (SIPI_MCR[INIT] = 1).

47.15.26 SIPI Channel CRC Register 3 (SIPI_CCRC3)

SIPI_CCRC*n* is a read only which returns the CRC calculated value on the header, address and data bits.

Address: 0h base + 90h offset = 90h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	CRCI																CRCT															
W	▨																▨															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SIPI_CCRC3 field descriptions

Field	Description
0–15 CRCI	Reflects received CRC value at initiator
16–31 CRCT	Reflects received CRC value at target

47.15.27 SIPI Channel Address Register 3 (SIPI_CAR3)

SIPI_CAR3 is the address target for data transmission.

Address: 0h base + 94h offset = 94h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R W	CAR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SIPI_CAR3 field descriptions

Field	Description
0–31 CAR	These bits contain the address of the target node.

47.15.28 SIPI Channel Data Register 3 (SIPI_CDR3)

SIPI_CDR3 contains the data to be transmitted, and can be written anytime by software or the DMA. The data can be written in 8, 16 or 32 bit formats.

Address: 0h base + 98h offset = 98h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R W	CDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SIPI_CDR3 field descriptions

Field	Description
0–31 CDR	Data register bits. Contains the data that will be transmitted, or received.

47.15.29 SIPI Module Configuration Register (SIPI_MCR)

The SIPI_MCR is a global 32-bit configuration register.

Address: 0h base + 9Ch offset = 9Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	FRZ	Reserved	HALT	Reserved		PRSCLR										
W																
Reset	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

R	AID		Reserved			CRCIE	MCRIE	Reserved				CHNSB	TEN	INIT	MOEN	SR
W																
Reset	0*	0*	0	0	0	0*	0*	0	0	0	0	0*	0*	0*	0	0

* Notes:
- INIT field: Can only be written when SIPI_MCR[MOEN] = 1.
- TEN field: Can only be written when SIPI_MCR[MOEN] = 1.
- CHNSB field: Can be written only once after reset.
- MCRIE field: Can only be written when SIPI_MCR[MOEN] = 1.
- CRCIE field: Can only be written when SIPI_MCR[MOEN] = 1.
- AID field: Can be written in initialization mode only (SIPI_MCR[INIT] = 1).

SIPI_MCR field descriptions

Field	Description
0 FRZ	Freeze Enable The FRZ bit specifies the SIPI behavior when Debug mode is requested at the MCU level. When FRZ is asserted, the SIPI is enabled to enter Freeze mode. Negation of this bit field causes SIPI to exit Freeze mode. **NOTE:** Can only be written when SIPI_MCR[MOEN] = 1.

Table continues on the next page...

SIPI_MCR field descriptions (continued)

Field	Description
	0 Not enabled to enter Freeze mode 1 Enabled to enter Freeze mode
1 Reserved	This field is reserved. **Important:** Always write the default value to this field.
2 HALT	Halt Mode Enable Assertion of this bit puts SIPI into Freeze mode. No Rx or Tx is performed in the SIPI until this bit is cleared. If this bit is enabled in during Tx or Rx communications, the current activity will finish, then the SIPI will enter Freeze mode. **NOTE:** Can only be written when SIPI_MCR[MOEN] = 1. 0 No Freeze mode request 1 Enters Freeze mode if FRZ bit is asserted.
3–4 Reserved	This field is reserved.
5–15 PRSCLR	Timeout counter prescaler The timeout counter runs on the prescaled system clock. Default value is 64 (040h). The allowed programmable values are (all other values are ignored): 040h 64 (default) 080h 128 100h 256 200h 512 400h 1024 **NOTE:** This field should be programmed by software during initialization mode, SIPI_MCR[INIT] = 1. Writes during other times are ignored. **NOTE:** Writes to SIPI_MCR[PRSCLR] can only be accomplished with 16-bit or 32-bit writes.
16–17 AID	Address Increment/Decrement These bits define the type of address change at the target node. **NOTE:** This bits should be programmed by software in initialization mode, SIPI_MCR[INIT] = 1. Writes during other times are ignored. 00 no change. address stays same 01 address increments by 4 10 address decrements by 4 11 not used
18–20 Reserved	This field is reserved.
21 CRCIE	CRC Error Interrupt Enable 0 Interrupt is disabled 1 Interrupt is enabled
22 MCRIE	Max Count Reached Interrupt Enable

Table continues on the next page...

SIPI_MCR field descriptions (continued)

Field	Description
	0 Interrupt is disabled 1 Interrupt is enabled
23–26 Reserved	This field is reserved.
27 CHNSB	Channel coding select bit. 0 Code Table II (see Table 47-2) 1 Code Table I (see Table 47-2)
28 TEN	Target Enable Setting this bit enables the target functionality at SIPI. This bit can be read or written anytime. This bit is automatically negated by hardware when target detects an error in "streaming without ACK" mode. This bit has to be enabled for the transmission operations also.
29 INIT	Initialization Mode Setting this bit puts the module in initialization mode. This bit should be cleared by software. Most register bits are configured using this bit. The SIPI_MCR[MOEN] bit needs to be set first, and then the INIT bit can be set and both bits can't be enabled together. 0 Normal Mode 1 Initialization Mode
30 MOEN	Module Enable This bit should be set or cleared by software. When this bit is negated, all SIPI operations are immediately stopped.
31 SR	Soft Reset Setting this bit clears all status and error registers, and FSMs are moved to idle state. This bit is automatically cleared by hardware once the reset operation is complete.

47.15.30 SIPI Status Register (SIPI_SR)

The SIPI_SR is the global status register of SIPI.

Address: 0h base + A0h offset = A0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	FRZACK	LPMACK	Reserved													
W

W						w1c	w1c		w1c							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SIPI_SR field descriptions

Field	Description
0 FRZACK	Freeze Mode Acknowledge. This read-only bit indicates that SIPI is in Freeze mode. The Freeze mode request cannot be granted until current transmission or reception processes have finished. The software can poll the FRZACK bit to find when the SIPI has actually entered Freeze mode. If Freeze mode is requested while SIPI is in any of the low power modes, then the FRZACK bit will only be set when the low power mode is exited.

Table continues on the next page...

SIPI_SR field descriptions (continued)

Field	Description
	0 SIPI not in Freeze mode 1 SIPI in Freeze mode
1 LPMACK	Low Power Mode Acknowledge. This read-only bit indicates that SIPI is in Disable Mode. Disable mode can not be entered until all current transmission or reception processes have finished. The CPU can poll the LPMACK bit to know when SIPI has actually entered low power mode. 0 SIPI is not in low power mode 1 SIPI is in Disable Mode.
2–20 Reserved	This field is reserved.
21 GCRCE	Global CRC Error Bit. 0 No CRC error 1 CRC error occurred
22 MCR	Maximum Count Reached. This bit will be set whenever SIPI_ACR[ADCNT] = SIPI_MAXCR[MXCNT]. An interrupt will be generated when this bit is set only if SIPI_MCR[MCRIE] = 1. This it should be cleared by software.
23 Reserved	This field is reserved.
24–27 TE	Trigger Event on Respective Channels. This field enables interrupts for target nodes. xxx1 TE0 = 1 - Channel 0 trigger event xx1x TE1 = 1 - Channel 1 trigger event x1xx TE2 = 1 - Channel 2 trigger event 1xxx TE3 = 1 - Channel 3 trigger event
28–31 STATE	These bits reflect the transmit state machine status. They can be polled for determination of state machine status. 0000 IDLE 0001 HEADER_AND_ADDRESS_FIELD 0010 HEADER_AND_DATA_FIELD 0011 HEADER_AND_CRC_FIELD 0100 ADDRESS_AND_CRC_FIELD 0101 ADDRESS_AND_DATA_FIELD 0110 DATA_AND_CRC_FIELD 0111 DATA_FIELD

47.15.31 SIPI Max Count Register (SIPI_MAXCR)

SIPI_MAXCR contains the maximum address count value at target node. It is programmed via direct write request through the initiator. This register can be read or written by software anytime.

Address: 0h base + A4h offset = A4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	MXCNT															
W																
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

R	MXCNT														Reserved	
W																
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0

SIPI_MAXCR field descriptions

Field	Description
0–29 MXCNT	This field contains the maximum address count value at the target node. It should be programmed via direct write request through the initiator.
30–31 Reserved	This field is reserved.

47.15.32 SIPI Address Reload Register (SIPI_ARR)

The SIPI_ARR contains the reload value for the address counter at the target node. It should be configured by direct write request from the initiator.

NOTE

This register is writeable only when SIPI_MCR[INIT] = 1.

Address: 0h base + A8h offset = A8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	ADRLD															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	ADRLD														Reserved	
W															▨	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SIPI_ARR field descriptions

Field	Description
0–29 ADRLD	ADRLD contains the reload value for the address counter at the target node. It should be configured by direct write request from the initiator.
30–31 Reserved	This field is reserved.

47.15.33 SIPI Address Count Register (SIPI_ACR)

This register reflects the count value of address counter at target node. It should be configured by direct write request from initiator. This register can be read/written by software anytime.

NOTE

SIPI_ARR, SIPI_ACR and SIPI_MAXCR will be configured by direct write operation through the initiator.

NOTE

When a streaming write command is received, the target will start the write operation from the address present in SIPI_ACR (address count register).

NOTE

After each 32-bit write has completed, SIPI_ACR[ADCNT] is compared against SIPI_MAXCR[MXCNT]. If they are equal, SIPI_ACR[ADCNT] is loaded with the value stored in SIPI_ARR[ADRLD]. If they are not equal, the SIPI_ACR[ADCNT] will increment by 4, decrement by 4 or remain the same (depending on configuration). In both cases, the SIPI_ACR[ADCNT] will contain the address at which the next streaming write will occur.

Address: 0h base + ACh offset = ACh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

SIPI_ACR field descriptions

Field	Description
0–29 ADCNT	Feflects the count value of address counter at target node. It should be configured by direct write request from the initiator. This register can be read/written by software anytime. At the end of the streaming operation, SIPI_ACR will point to the next address to be written.
30–31 Reserved	This field is reserved.

47.15.34 SIPI Error Register (SIPI_ERR)

This register contains the error bits for the last transaction(s) for all the channels. Communication errors are generated only for out of range address accesses, areas that are read only and where accesses do not lead to generation of transfer errors. Also, writing to read only registers will not generate errors.

Address: 0h base + B0h offset = B0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

31 ACKE0	Acknowledge Error for Channel 0. 0 Acknowledge received is correct. 1 Acknowledge received is not correct.

Chapter 48
LVDS Fast Asynchronous Serial Transmission (LFAST) – Interprocessor Communications

48.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

This chapter describes the specifications of the LFAST module, which implements the LVDS Fast Asynchronous Serial Transmission (LFAST) module. LFAST is used in dual mode (software configurable master/slave operation) for interprocessor communications.

48.2 Block diagram

The following figure depicts LFAST interaction with other modules on the device.

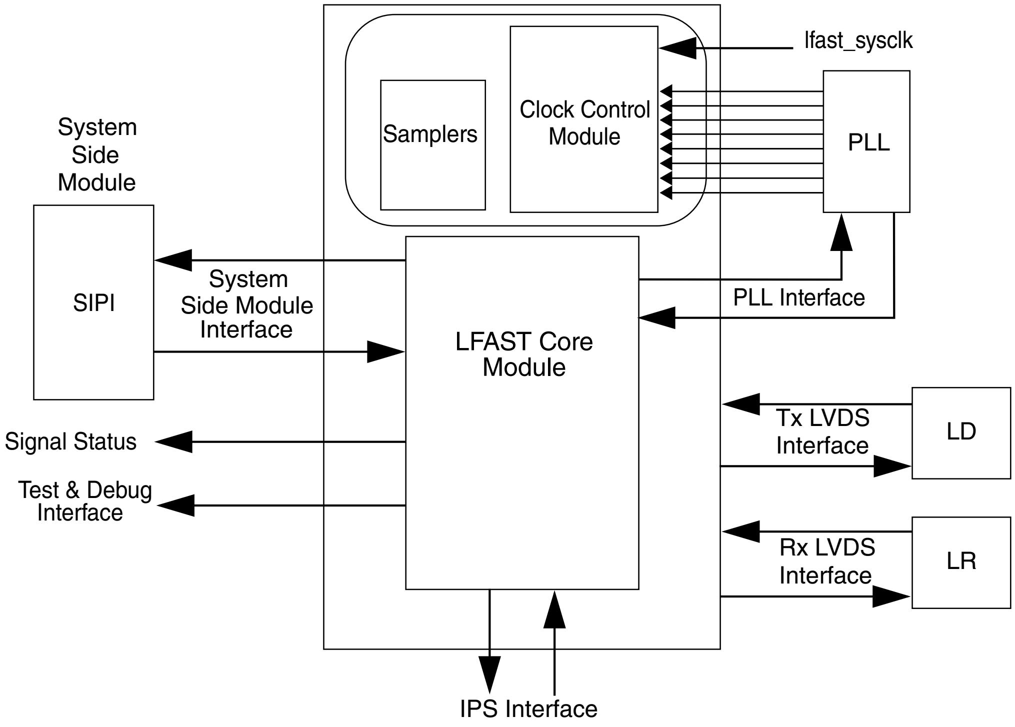

Figure 48-1. LFAST block diagram

48.3 External signals

LFAST is a five pin interface with the following signals :

- lfast_sysclk
  - Reference clock of the LFAST master and slave
- txdatap/txdatan
  - Differential transmit (Tx) interface pair
- rxdatap/rxdatan
  - Differential receive (Rx) interface pair

LFAST interface is an asynchronous high speed LVDS interface.

48.3.1 LFAST operating data rates

The change of data rate is controlled by the LFAST master by issuing appropriate Interface Control Logical Channel (ICLC) packets to the LFAST slave. Henceforth, the data rate 6.5 Mbps/5 Mbps (lfast_sysclk ÷ 4 or lfast_sysclk ÷ 2) is referred to as low data rate, and the high data rate is in the Data Sheet.

48.4 LFAST frame structure

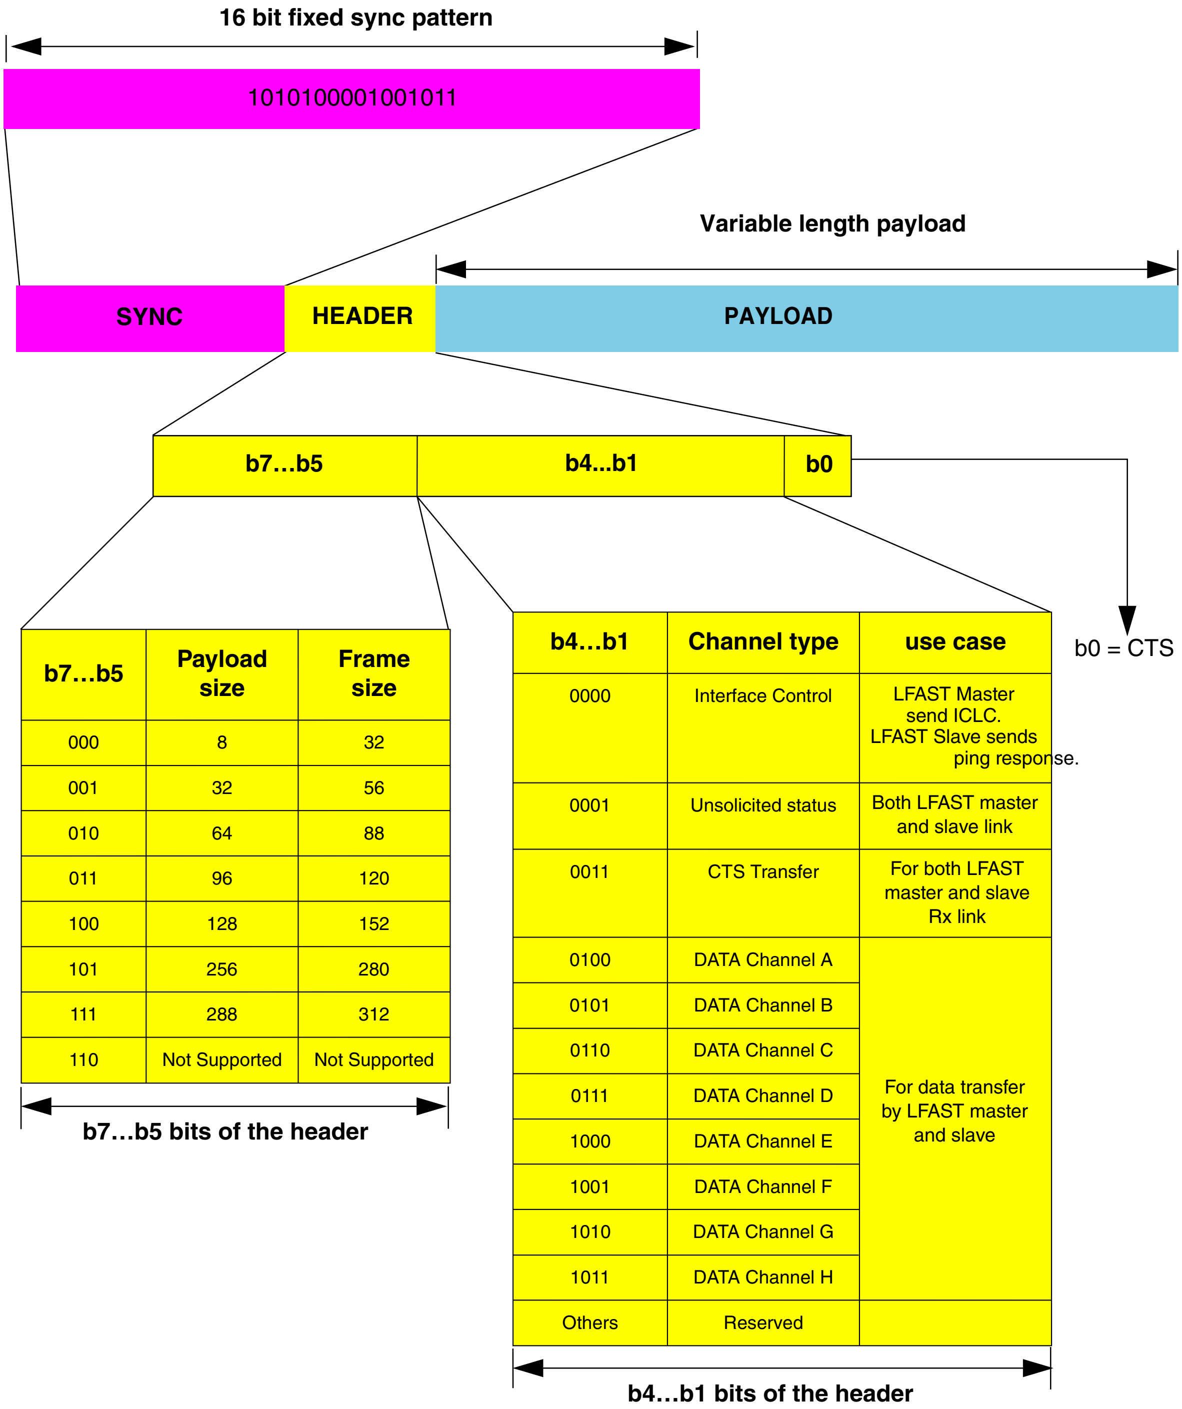
A LFAST frame is made up of three fields:

- Sync pattern
- Header
- Payload

Sync pattern and header fields are of fixed length.

Sync pattern is used to synchronize incoming data stream in LFAST module.

Header field of the frame distinguishes various types of data and control transferred and also contains information about the length of the payload. The payload field is the actual data that is transferred across the channel. See Figure 48-2 for details of the LFAST frame.

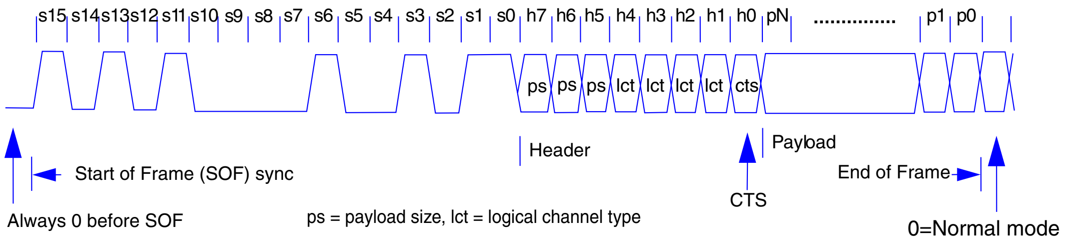


b7…b5	Payload size	Frame size
000	8	32
001	32	56
010	64	88
011	96	120
100	128	152
101	256	280
111	288	312
110	Not Supported	Not Supported

b4…b1	Channel type	use case
0000	Interface Control	LFAST Master send ICLC. LFAST Slave sends ping response.
0001	Unsolicited status	Both LFAST master and slave link
0011	CTS Transfer	For both LFAST master and slave Rx link
0100	DATA Channel A	For data transfer by LFAST master and slave
0101	DATA Channel B	
0110	DATA Channel C	
0111	DATA Channel D	
1000	DATA Channel E	
1001	DATA Channel F	
1010	DATA Channel G	
1011	DATA Channel H	
Others	Reserved	

Figure 48-2. LFAST frame structure

The same protocol is used on both transmit and receive interfaces for communications of data, control and status information. A synchronization pattern (16 bits) and header (8 bits) are present in every frame.



s15 s14 s13 s12 s11 s10 s9 s8 s7 s6 s5 s4 s3 s2 s1 s0 h7 h6 h5 h4 h3 h2 h1 h0 pN p1 p0
ps ps ps lct lct lct lct cts
Header
Payload
CTS
Start of Frame (SOF) sync
Always 0 before SOF
ps = payload size, lct = logical channel type
End of Frame
0=Normal mode

Figure 48-3. Serial frame structure

The frame structure is shown in Figure 48-3 and consists of the following:

- **16-bit synchronization pattern:** Used for clock synchronization and pattern recognition. The frame synchronization code at the start of every frame is a unique reserved word that is used to identify whether the data received is the start of the frame and for synchronization (clock phase extraction) with the stream data. A synchronous sequence is used to give a high quality auto correlation. The LFAST 16-bit synchronization sequence = 1010_1000_0100_1011b = A84Bh.
- **Header - 3 MSB (b7 - b5):** Defines the payload size as shown in Table 48-1 :

Table 48-1. Header payload sizes

b7-b5(bin)	Payload Size	Frame Size
000	8	32
001	32	56
010	64	88
011	96	120
100	128	152
101	256	280
110	—	—
111	288	312

- **Header - (b4 - b1):** Defines the logical channel types, which indicate the type of payload that the frame carries. How the payload field of a frame is used for any other logical channel type is system side module specific except in the case of the interface control logical channel type and clear to send (CTS) frame.
- **Header - (b0):** CTS on the both LFAST master and slave devices.
- **Payload:** Content dependent upon frame type.
- **Bit after frame:** This bit determines entry into Sleep mode (1 = Sleep mode, 0 = normal mode)

48.5 Features

- Supports dual mode (register configurable Master/Slave).
- Supports asynchronous data transfer up to the maximum data rate shown in the product Data Sheet.
- Transmits and receives data, CTS, ICLC and unsolicited frames.
- Receives ICLC frames
- Provision of five interrupts for Tx and Rx channels.
- Supports processor controlled transfer of ICLC frame with 8-bit payload size to implement the data rate changes and test modes.
- Supports LFAST defined CTS controlled data transfer. No dependency between data transmission and reception unless CTS mode is enabled.
- Supports flow control using sliding window protocol.
- Provides configurable frame length for data frame with variable payload sizes of 32, 64, 96, 128, 256 or 288 bits.
- Provides transmit of data frame length with 96 bits of payload size and reception of data frame with 128 bits of payload size.
- Provides configurable frame length for unsolicited frame with variable payload sizes of 8, 32, 64, 96, 128, 256 or 288 bits.
- Supports PLL configuration (for example, feedback loop divider, etc.) through registers.
- Supports LVDS configuration through registers.
- Supports multiple loopback modes for checking the physical interface.
- Supports automatic ping response generation in slave mode.
- Supports for detection of unsupported channel number and unsupported payload size.

48.6 Memory map and register definition

All registers are 32 bits wide.

NOTE

Read/Write accesses to all unimplemented registers and write accesses to Read only register will return a Transfer Error.

LFAST memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

- DRFRST field: Set by user software and then cleared by system hardware.
- CTSEN field: Only writable when MCR[DRFEN] = 0.
- MSEN field: Writable only once after the asynchronous reset.

LFAST_MCR field descriptions

Field	Description
0 MSEN	LFAST Master or Slave mode Enable. This bit selects either the LFAST master or slave functionality. 0 Enable the modules LFAST Slave functionality only. 1 Enable the modules LFAST Master functionality only.
1–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 IPGDBG	Control bit to enable support for IPG Debug mode. This mode is indicated by assertion of IPG debug mode signal. 0 IPG debug mode enable signal will be ignored. 1 IPG debug mode enable signal will not be ignored.
8–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15 LSSEL	Selects the fraction of sysclk in Low Speed Select mode (see Slow speed clock for details). 0 Low Speed Mode in which the lfast_sysclk input is used to generate 4 phases of lfast_sysclk/2. 1 Low Speed Mode in which the lfast_sysclk input is used to generate 4 phases of lfast_sysclk/4.
16 DRFEN	LFAST Enable. This bit enables/disables the reception and transfer of LFAST device. 0 LFAST is immediately disabled. All current/pending requests are terminated and the Tx and Rx data FIFOs are flushed. If this bit is cleared in the middle of a transmit/receive operation, then that operation is terminated immediately and nothing is transmitted/received further. All the programmable

Table continues on the next page...

LFAST_MCR field descriptions (continued)

Field	Description
	registers retain their values and status registers are cleared to their reset values. Registers read/write operations can be performed through the IPS Bus. 1 LFAST is Enabled.
17 RXEN	LFAST Receiver Enable. This bit controls the reception of the frames and decoding on the LFAST device. This bit also disables the Rx LVDS Line Receiver (LR). 0 Receiver Interface is disabled. If this bit is cleared during a data transfer, the current frame is received and then the Rx block is disabled. After the Rx block is disabled, all new frames from LFAST peer device are ignored. System Side Module Rx interface isn't disabled by this bit. 1 Receiver Interface is Enabled.
18 TXEN	LFAST Transmitter Enable. This bit controls the transmission of frames from the LFAST device and disables the Tx LVDS LD. This bit can also be modified by LFAST slave H/W on reception of an ICLC command frame. This field can only be written in dual mode (LFAST_GSR[DUALMD] = 1). 0 LFAST transmitter Interface is disabled. No new request is accepted but ongoing request is served. 1 LFAST transmitter Interface is enabled. New requests are accepted.
19–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 TXARBD	Tx Arbiter Disable. This bit enables/disables the Tx block arbiter. Current frame transfer is completed, but new frame requests are ignored. 0 Enable Tx arbiter and framer. When enabled it takes all the frame request and services based on priority. 1 Disable Tx arbiter and framer. All frame requests are ignored.
28 CTSEN	CTS Enable. This bit defines the Push-Pull mode of the LFAST devices receiver. This bit is used to enable/disable CTS mode of the Tx block. This bit is only writable when MCR[DRFEN] = 0. 0 CTS mode is disabled. Indicates that the device is in Push mode. The CTS bit of frames transmitted is 1. The CTS bit doesn't represent the status of Rx FIFO. 1 CTS mode is enabled. The CTS bit of all transmit frames is set when the Rx FIFO empty space is on or above higher threshold, and cleared when the Rx FIFO empty space is on or below lower threshold.
29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 DRFRST	LFAST Soft Reset. This bit is automatically cleared after Reset.. 0 No Soft Reset 1 Soft Reset to LFAST is asserted. When set it causes a reset of the LFAST module; all the registers will be reset to their default values and all the FIFOs will be flushed.
31 DATAEN	DATA Frame Enable. This bit enables/disables the transmission and reception of data frames between the LFAST master and slave devices. 0 Data frame transmission and reception is disabled. Tx data frame requests are ignored by the transmitter. Frame with LCT of data frame is ignored by the receiver. 1 Data frame transmission and reception is enabled. Tx data frame requests are serviced by the transmitter. Frame with LCT of data frame is received and placed into the Rx data FIFO.

48.6.2 LFAST Speed Control Register (LFAST_SCR)

The SCR is used to configure the Rx and Tx data rate of the LFAST.

Address: 0h base + 4h offset = 4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															DRMD
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

LFAST_SCR field descriptions

Field	Description
0–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15 DRMD	Data Rate Controller mode. Defines the mode setting for LFAST slave device by S/W or LFAST master. 0 S/W controls the Data Rate controller mode. In LFAST Slave the ICLC frames for rate change have no affect on the Data rate. 1 In LFAST Slave the reception of ICLC frame for rate change sets appropriate speed mode. In LFAST Master the SCR[DRMD] should be 0.
16–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 RDR	Receiver Data Rate. This bit defines the receiver data rate. For LFAST Master: • S/W should program this bit only after transmission of an ICLC frame changing the speed mode of the slaves Tx interface. For LFAST Slave: • When SCR[DRMD] = 1, the H/W programs this bit on reception of ICLC frame for changing speed mode of Slaves Rx interface. • The S/W can program this bit when SCR[DRMD] = 0. • This bit is cleared on MCR[DRFEN] negation. 0 Data rate of Rx block is low speed. 1 Data rate of Rx block is high speed.

Table continues on the next page...

LFAST_SCR field descriptions (continued)

Field	Description
24–30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 TDR	Transmit Data Rate. This bit defines the transmitter data rate. For LFAST Master: • S/W should program this bit only after transmission of an ICLC frame changing the speed mode of the slaves Rx interface. For LFAST Slave: • When SCR[DRMD] = 1, the H/W programs this bit on reception of ICLC frame for changing speed mode of Slaves Tx interface. • The S/W can program this bit when SCR[DRMD] = 0. • This bit is cleared on MCR[DRFEN] negation. 0 Data rate of Tx block is low speed. 1 Data rate of Tx block is high speed.

48.6.3 LFAST Correlator Control Register (LFAST_COCR)

The COCR is used to select the sampler data path and the number of bits of correlation to be used.

Address: 0h base + 8h offset = 8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	SMPSEL								0						0	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0												CORRTH			PHSSEL
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

LFAST_COCR field descriptions

Field	Description
0–7 SMPSEL	Sampler Data Path Selector (overrides the correlator selection). Defines the sampler data path to be activated at all the times. All the bits should be 0 (00h) for Sampler Data Path to be selected by the correlator. In Low Speed mode only Sampler Data Paths 0-3 are valid. This field can only be written when MCR[RXEN] = 0.

Table continues on the next page...

LFAST_COCR field descriptions (continued)

Field	Description
	00h Sampler Data Path selected by correlator 01h Sampler Data Path 0 selected 02h Sampler Data Path 1 selected 04h Sampler Data Path 2 selected 08h Sampler Data Path 3 selected 10h Sampler Data Path 4 selected 20h Sampler Data Path 5 selected 40h Sampler Data Path 6 selected others Sampler Data Path 7 selected
8–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–27 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28–30 CORRTH	Correlator threshold level. Defines the correlation threshold level. This field can only be written when MCR[RXEN] = 0. 000 9 Bits of correlation 001 10 Bits of correlation ... 110 15 Bits of correlation 111 16 Bits of correlation
31 PHSSEL	Polyphase 8 or 4 phase selection. Defines the number of phases for the polyphase generator used. This bit is ignored in low speed mode since only 4 Phases are used in low speed mode. In High Speed mode phase 0, 2, 4 and 6 are used when 4 phase mode is selected. This field can only be written when MCR[RXEN] = 0 0 8 phases 1 4 phases

48.6.4 LFAST Test Mode Control Register (LFAST_TMCR)

The TMCR enables and configures the LFAST clock test and loopback modes.

Address: 0h base + Ch offset = Ch

LFAST_ICR field descriptions

Field	Description
0–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 ICLCSEQ	ICLC enabled. This bit should be set whenever the S/W is performing a series of ICLC frame transfers. This bit ensures only ICLC frame transmission request is serviced, other pending frames request are ignored. 0 Single ICLC frame transfer. 1 S/W is performing ICLC frame transfers. Only the ICLC frames will be scheduled during this period. All the other frames will be scheduled only after ICR[ICLCSEQ] = 0.
15 SNDICLC	ICLC frame request. This bit is set to initiate the transfer of ICLC frame by LFAST master. This bit should be set (ICR[SNDICLC] = 1) after writing the required ICLC payload to be transmitted in the ICLCPLD field of the register. This bit is self clearing, which will be cleared when ICLC frame transfer is complete. Set by user software and cleared by system hardware. 0 No Valid ICLC frame for transfer. 1 Valid ICLC frame for transfer.
16–23 Reserved	This field is reserved.
24–31 ICLCPLD	ICLC Payload. This field is used to program the payload of the ICLC frame to be transmitted. New ICLC payload should be set when ICR[SNDICLC] = 0. This field can only be written when ICR[SNDICLC] = 0 (see Table 48-8 for supported ICLC payloads).

48.6.9 LFAST Ping Control Register (LFAST_PICR)

Address: 0h base + 20h offset = 20h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

LFAST_RFCR field descriptions

Field	Description
0–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–15 RCTSMX	Rx FIFO Maximum Threshold. Defines the condition for CTS bit of frames to be negated. This field can only be written when LFAST_MCR[DRFEN] = 0.
16–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26–31 RCTSMN	Rx FIFO Minimum Threshold. Defines the condition for CTS bit of frames to be set. This field can only be written when LFAST_MCR[DRFEN] = 0.

48.6.11 LFAST Tx Interrupt Enable Register (LFAST_TIER)

Address: 0h base + 30h offset = 30h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0														TXIIE	TXOVIE
W

LFAST_LCR field descriptions

Field	Description
0–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 SWWKLD	SW signal to take LVDS LD out of Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LD will be taken out of sleep (provided no other source is trying to put it in sleep)
9 SWSLPLD	SW signal to put LVDS LD into Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LD will be put in sleep

Table continues on the next page...

LFAST_LCR field descriptions (continued)

Field	Description
10 SWWKLR	SW signal to take LVDS LR out of Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LR will be taken out of sleep (provided no other source is trying to put it in sleep)
11 SWSLPLR	SW signal to put LVDS LR into Sleep mode. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LR will be put in sleep (provided no other source is trying to wake it up)
12 SWOFFLD	SW signal to turn OFF the LVDS LD. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LD will be turned OFF(provided no other source is trying to turn the LD ON)
13 SWONLD	SW signal to turn ON the LVDS LD. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LD will be turned ON
14 SWOFFLR	SW signal to turn OFF the LVDS LR. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LR will be turned OFF (provided no other source is trying to turn the LR ON)
15 SWONLR	SW signal to turn ON the LVDS LR. This field can only be written when LFAST_MCR[DRFEN] = 1. **NOTE:** Writes are not reflected in the read of this field. 0 No effect 1 LVDS LR will be turned ON
16 LVRXOFF	Indicates the value driven onto LVDS LR output when in shutdown mode
17 LVTXOE	LVDS LD output buffer enable. 0 LVDS LD output buffer enable is disabled. 1 LVDS LD output buffer enabled
18 TXCMUX	Tx and Clock Mux. The bit can be used to bring out PLL Phase 0 clock on Tx LVDS pad. 0 No effect 1 PLL Phase 0 clock will be brought out to Tx LVDS pad
19 LVRFEN	LVDS pad reference enable 0 LVDS reference pad disabled 1 LVDS reference pad enabled

Table continues on the next page...

LFAST_LCR field descriptions (continued)

Field	Description
20 LVLPEN	Tx LVDS internal loopback enable The bit is reflected by output signal ipp_digrf_lvds_lpbk_en.The internal loopback is not intended for board level functionality, so this feature should not be implemented. 0 Tx LVDS normal mode enabled 1 Tx LVDS internal loopback mode enabled
21–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 LVRXOP_TR	Used to enable or disable the on-chip receiver termination resistor in LFAST mode (applies to LVDS pad use for LFAST only): 0 Disable on-chip LFAST receiver termination 1 Enable on-chip LFAST receiver termination
27 Reserved	This field is reserved.
28 LVRXOP_BR	Used to set the bias current for the receiver in LFAST mode. It is recommended to always write 1 to this bit when using the LFAST interface. Writing 0 will allow for a small power savings during lower baud rates (applies to LVDS pad use for LFAST only): 0 Use for LFAST receiver baud rates less than the maximum baud rate. 1 Required for LFAST receiver maximum baud rate.
29 LVTXOP	Control signal for LFAST selection. **NOTE:** This field must be written 1 for correct operation. 0 Reserved 1 LFAST Bus selection
30 LVCKSS	LVDS Clock Sync Select This bit is used to adjust the LVDS data sampling to the duty cycle of the clock. It is recommended that a value of zero is used in all cases. A value of one is reserved for specific devices/revisions with different clock timing. 0 normal clock used to sample the LVDS data 1 adjusted clock used to sample the LVDS data
31 LVCKP	LVDS clock select. This bit is used for selecting use of direct pll clock or inverted pll clock in LVDS. 0 Direct pll clock to be used inside the LVDS 1 Inverted pll clock to be used inside the LVDS

48.6.16 LFAST Unsolicited Tx Control Register (LFAST_UNSTCR)

Address: 0h base + 44h offset = 44h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

LFAST_GSR field descriptions

Field	Description
0 DUALMD	Indicates the LFAST module is in Dual mode 0 LFAST Module in Slave only mode 1 LFAST Module in Dual mode
1–12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 LRMD	Indicates if the Rx Controller is idle/active and that the Rx clocks are enabled. In functional mode this will always be active.

Table continues on the next page...

LFAST_GSR field descriptions (continued)

Field	Description
	0 Rx Controller is in Idle state 1 Rx Controller is active
14 LDSM	Transmit Interface Data Rate Status. Indicates the current speed rate of the Tx controller 0 Data rate of LOW speed mode 1 Data rate of HIGH speed mode
15 DRSM	Receive Interface Data Rate Status. Indicates the current speed rate of the Rx controller 0 Data rate of LOW speed mode 1 Data rate of HIGH speed mode
16–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 LPTXDN	Auto loopback frame transmission count reached. The Count of frame is defined by LFAST_ALCR[LPFMCNT]. 0 Auto loopback frame transmission count not reached. 1 Auto loopback frame transmission count reached.
28 LPFPDV	Loopback frame pass threshold reached. 0 Pass frame threshold not reached. 1 Pass frame threshold achieved
29 LPCPDV	Valid payload received during loopback check mode. Indicates whether the Loop back frame received payload is CBh. 0 Payload received is not CBh 1 Payload received is CBh
30 LPCHDV	Valid header received during loopback check mode. Indicates whether the Loop back frame received header is 13h. 0 Header received is not 13h 1 Header received is 13h
31 LPCSDV	Valid synchronization received. 0 Valid Synchronization pattern not detected 1 Valid Synchronization pattern detected

48.6.19 LFAST Ping Status Register (LFAST_PISR)

Address: 0h base + 84h offset = 84h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LFAST_UNSRDR*n* field descriptions

Field	Description
0–31 UNRXD	Unsolicited Receive Data. This represents 9 registers for Unsolicited received data.It is read only register. The first bit received as part of the payload will be stored at UNRXD8[31], second bit at UNRXD8[30], and so on. So the last bit will be stored at UNRXD0[0] in case of 288 bit payload.

48.7 Functional description

48.7.1 Startup procedure

The LFAST requires a sequence of operations before it can be used for communication. The procedure to enable LFAST for proper operation is listed below.

48.7.1.1 LFAST master interface startup procedure

1. After reset the SLCR and RCDCR are programed according to the LVDS parameters in the device data sheet.
2. The PLLCR is programmed with configuration parameters for the PLL.

3. The LCR is programed with configuration parameters of the LVDS.
4. Write MCR[MSEN] = 1. Then select LFAST modes by configuring MCR[CTSEN]and MCR[DATAEN].
5. Write MCR[DRFEN] = 1 to enable the LFAST.
6. Write MCR[RXEN] = 1 and MCR[TXEN] = 1 to negate the LD powerdown, LR disable and LR powerdown signals.
7. Write ICR[ICLCPLD] = 31h to enable the Slaves Tx Interface.
8. Write ICR[SNDICLC] = 1 and ICR[ICLCSEQ] = 1.
9. Write MCR[TXARBD] = 0.
10. The ICLC transmission is confirmed by verifying one of the following:
    - ICR[SNDICLC] = 0.
    - TISR[TXICLCF] = 1.
11. Write ICR[ICLCPLD] = 00h to check the LFAST slaves status.
12. Write ICR[SNDICLC] = 1.
13. The LFAST slave status is confirmed by occurrence of one of the following:
    - LFAST slave is enabled if RIISR[ICPSF] = 1. Proceed to step 14.
    - LFAST slave is disabled if RIISR[ICPFF] = 1. The LFAST master must wait and restart from Step 7.

    Speed mode change:

14. Write PLLCR[SWPON] = 1 to enable the LFAST masters PLL.
15. Write ICLC start PLL frame, ICR[ICLCPLD] = 02h.
16. Write ICR[SNDICLC] = 1.
17. The ICLC transmission is confirmed by occurrence of one of the following:
    - ICR[SNDICLC] = 0.
    - TISR[TXICLCF] = 1.
18. To change LFAST masters Tx interface speed both of the following operations are performed:

Note

(The slaves Rx interface speed should be changed first.)

- Write ICR[ICLCPLD] = 10h for Tx data fast frame.
- Write ICR[SNDICLC] = 1.

19. Both of the following operations are performed to change the LFAST masters Rx interface speed:

Note

(The slaves Tx interface speed mode should be changed first)

- Write ICR[ICLCPLD] = 80h to select Rx data fast frame.
- Write ICR[SNDICLC] = 1.

20. The ICLC transmission is confirmed by the occurrence of one of the following:
    - ICR[SNDICLC] = 0
    - TISR[TXICLCF] = 1.
21. Write SCR[TDR] = 1 to change the LFAST masters Tx interface speed.
22. Write SCR[RDR] = 1 to change the LFAST masters Rx interface speed.
23. Write ICR[ICLCPLD] = 00h to confirm the change in speed of the LFAST slave. This frame should be written after waiting for the expected delay in the start of the PLL and speed mode change delay at the LFAST slave.
24. Write ICR[SNDICLC] = 1
25. Write MCR[TXARBD] = 1, after some delay to ensure the step 24 ICLC frame is send but no other frame is sent to arbitation.
26. The LFAST slaves speed mode is confirmed by the occurrence of the following:
    - If RIISR[ICPSF] = 1. The LFAST slave is in High Speed mode.
    - If RIISR[ICPFF] = 1. The LFAST slave is in Low Speed mode.
27. If RIISR[ICPSF] = 1, then all frame arbitration is enabled by both of the following operations:

- Write ICR[ICLCSEQ] = 0.
- Write MCR[TXARBD] = 0.

28. If RIISR[ICPFF] = 1 modifying the LFAST slaves speed needs to be repeated by:
    - Write SCR[TDR] = 0 to return the Tx interface to Low Speed mode.
    - Write MCR[TXARBD] = 0, to enable frame transmission.
    - The operations from step 14 need to be executed again.

48.7.1.2 LFAST slave interface startup procedure

1. After reset the SLCR and RCDCR are programed according to the LVDS datasheet.
2. The PLLCR is programed with the configuration parameters for the PLL.
3. The LCR is programed with the configuration parameters for the LVDS.
4. Write MCR[MSEN] = 0. Then select LFAST modes by configuring MCR[CTSEN] and MCR[DATAEN].
5. Write MCR[DRFEN] = 1 to enable the LFAST.
6. The LR is enabled by writing MCR[RXEN] = 1. This negates the LR disable signaland LR's power down signal.
7. The LD enable signal needs to be asserted. This is done when one of the following are true:
    - When an ICLC frame with payload 31h is received the H/W will write RIISR[ICTEF] = 1 and MCR[TXEN] = 1.
    - MCRMCR[TXEN] = 1.
8. After a write to MCR[TXARBD] = 0, a ping frame will be sent on one of the following conditions:
    - When PICR[PNGAUTO] = 1 and an ICLC frame with payload 00h frame is received. H/W writes [ICRPF] = 1.
    - PICR[PNGREQ] = 1.

    Speed mode change:

9. The PLL will start when one of the following conditions is met:

- When an ICLC frame with payload 02h is received. H/W writes RIISR[IPONF] = 1.
- Write PLLCR[SWPON] = 1.

10. The speed of the Tx interface is changed on one of the following conditions:
    - When SCR[DRMD] = 1 and an ICLC frame with payload 80h is received. H/W writes RIISR[ICTFF] = 1 and SCR[TDR] = 1.
    - SCR[TDR] = 1, when SCR[DRMD] = 0.
11. The speed of the Rx interface is changed on one of the following conditions:
    - When SCR[DRMD] = 1 and an ICLC frame with payload 10h is received. H/W writes RIISR[ICRFF] = 1 and SCR[RDR] = 1.
    - SCR[RDR] = 1, when SCR[DRMD] = 0.
12. A Ping Frame is sent on one of the following conditions:
    - When PICR[PNGAUTO] = 1 and an ICLC frame with payload 00h is received. H/W writes RIISR[ICRPF] = 1.
    - Write PICR[PNGREQ] = 1.
    - Write PICR[PNGREQ] = .

48.7.2 Line Receiver

This section describes the Line Receiver.

48.7.2.1 Introduction

The LR detects the voltage swing on the differential pair and converts it to a CMOS logic level that feeds the adaptive auto correlation block. The received data is sampled using the best of the 8 (default) or 4 (alternative setting) possible sampling edges from the high speed clock or 4 phases using the low speed clock. The sampling edge is chosen by checking which of the 8/4 Correlators provide the maximum correlation. If more than one sampling edge provides the maximum then the state machine will choose the sampling edge based on a defined selection algorithm.

After the correct sampling edge is chosen, the remaining unused sampling edges are turned off. Once the header is received the length of the frame (payload size) and logical channel definition can be obtained. The logical channel definition will determine the data type of the payload and therefore will determine the destination for the payload. Decoding of the ICLC commands from the payload is required in order to extract the interface control, rate mode and PLL commands.

Figure 48-4 shows the block diagram of Uplink Controller.

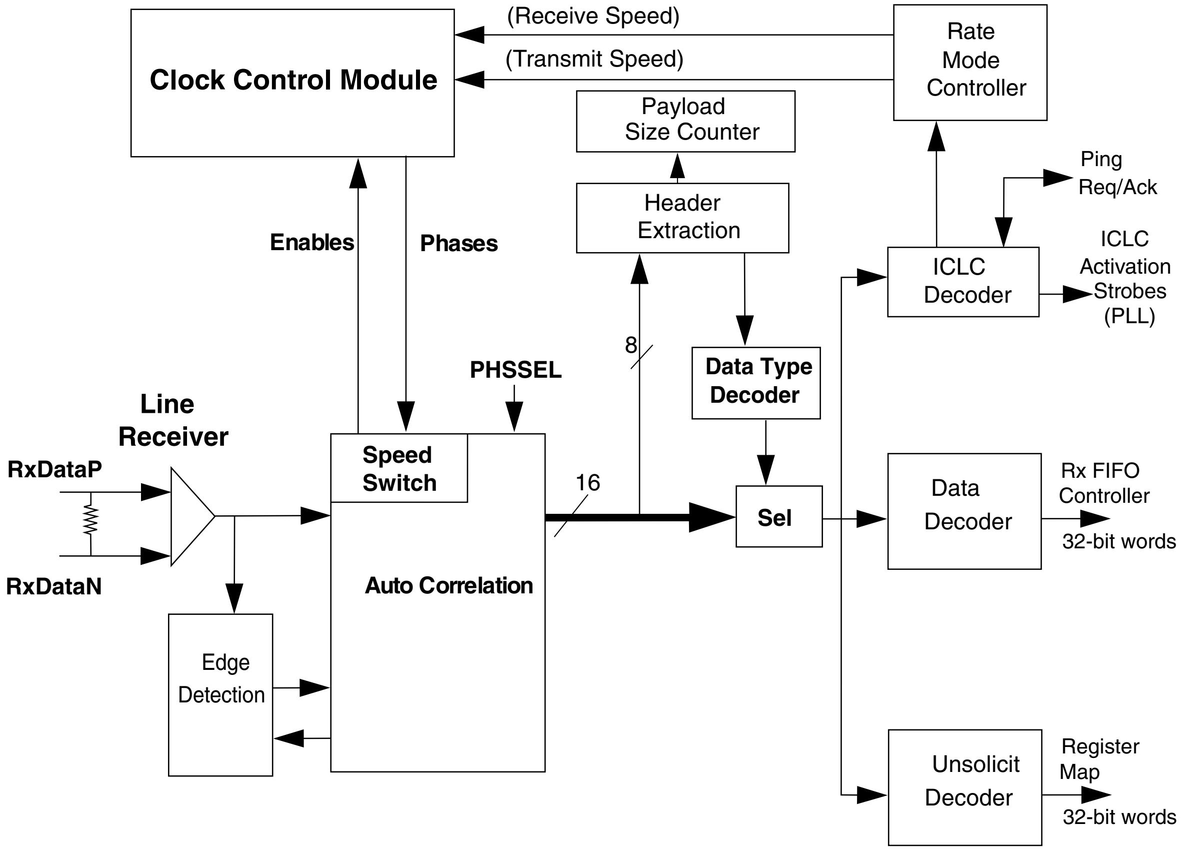

Figure 48-4. Top Level Receive Controller

48.7.2.2 Edge detection and auto-correlation

The edge detection and auto correlation are described together, as the mode setting of the auto-correlation block impacts largely on whether the edge detection circuitry is used or not. The edge detection will be performed first if required before auto-correlation.

48.7.2.2.1 Auto-Correlation modes

This section describes the Auto-Correlation modes.

48.7.2.2.1.1 Hunt Correlation mode

On reset the Receive Controller will always come up in Hunt Correlation mode. In this mode all the Correlators are enabled and the Receive Controller is always hunting for the synchronization pattern. The phase enables (either 8 or 4) to the external clock control module are always high. There is no edge detection for the first bit of the synchronization pattern. Hunt Correlation mode is considered the safest mode as the Receive Controller is always checking for the synchronization pattern, but it is the mode that consumes the most power. In Hunt Correlation mode the correlation is performed over all 16 bits of the synchronization pattern.

Figure 48-5 shows the block diagram of Hunt Correlation mode.

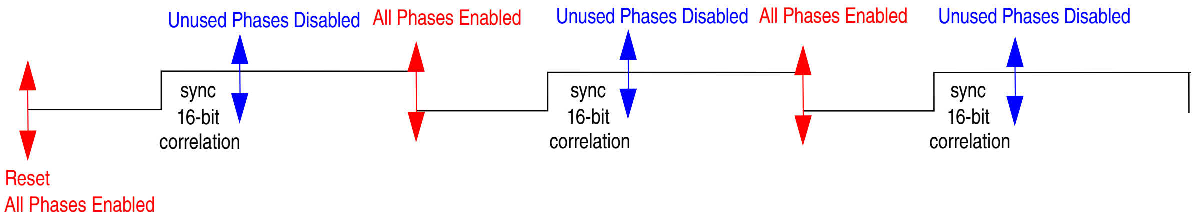

Figure 48-5. Hunt Correlation mode

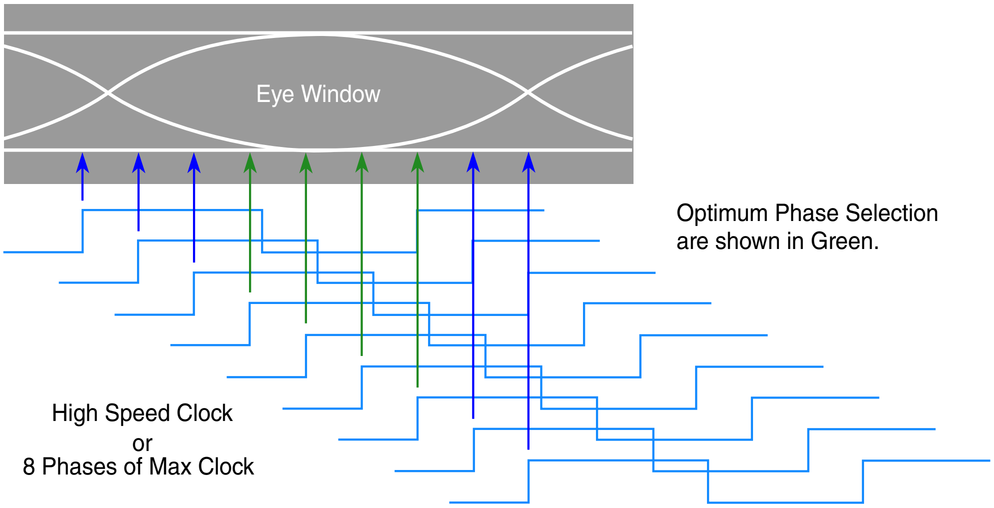
48.7.2.2.2 Edge Detection

The edge detector is disabled in Hunt Correlation mode.

48.7.2.2.3 Auto correlation

The data transmission between the 2 devices LD and LR is asynchronous in nature. Hence the Receive Controller does not have the knowledge about the correct clock phase to be used for extracting the data. The task of the auto correlation (or synchronization) scheme is to estimate the best clock phase (8 or 4) for extraction of data as shown in the following figure.



Eye Window
Optimum Phase Selection are shown in Green.
High Speed Clock or 8 Phases of Max Clock

Figure 48-6. High Speed 8 Phase Selection

The objective of the auto correlation is to select the clock phase that occurs closest to the center of the eye diagram window. For 8 Phase clock alignment the worst case selection is when the clock edge is just after the LR output transition. The 8 clock phases will sample the correct value but the middle clock phases are the ideal selection. If one of the middle phases are selected then the minimum distance to the LR transition is 3 clock phases as shown in the following figure.

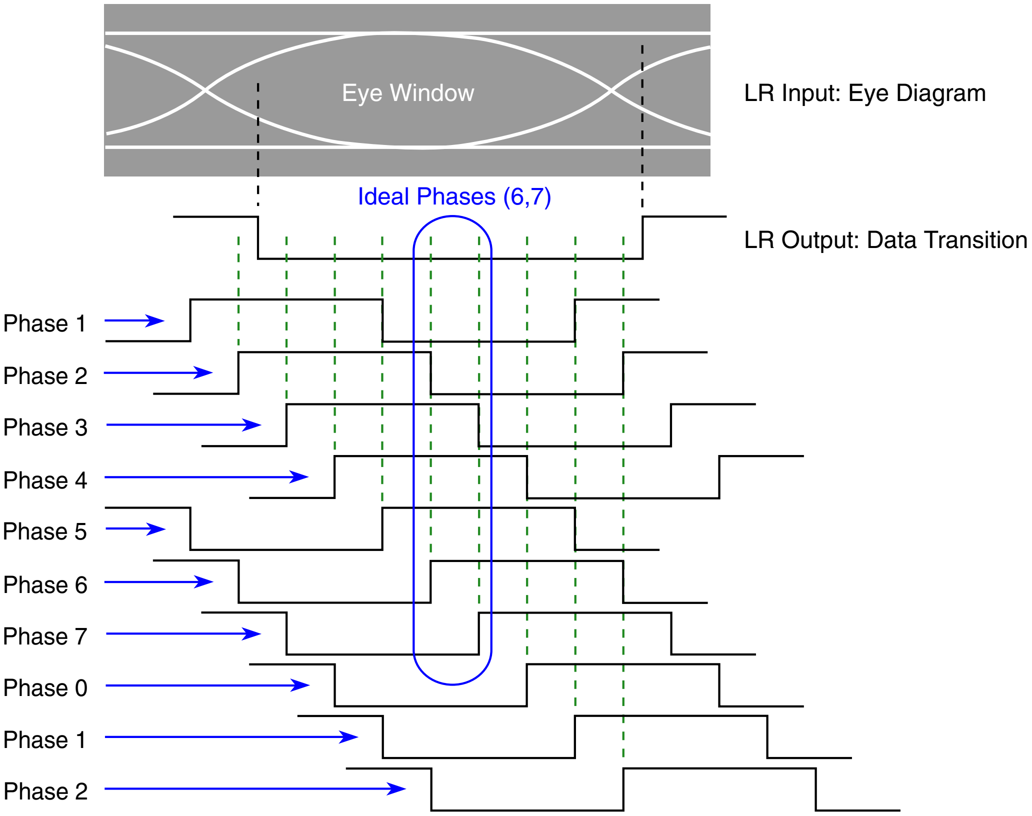


Figure 48-7. High Speed 8 Phase Clock Alignment Example

Each of the 8 high speed phases are 45 degrees separated. For 4 phases, whether high or low speed, the phases are 90 degrees separated but can have different phases enabled as shown in Figure 48-8 and Figure 48-9.

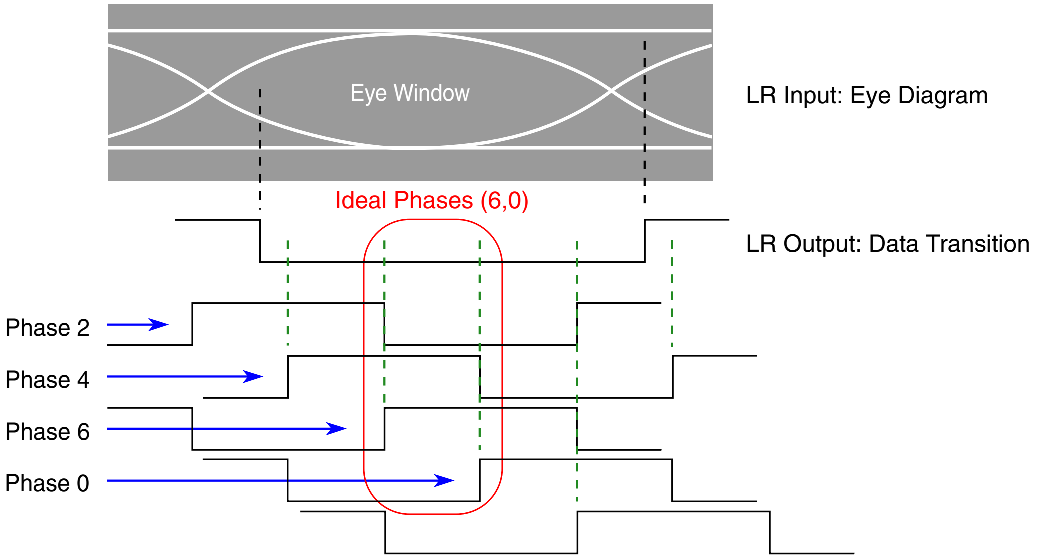

Figure 48-8. High Speed 4 Phase Clock Alignment Example

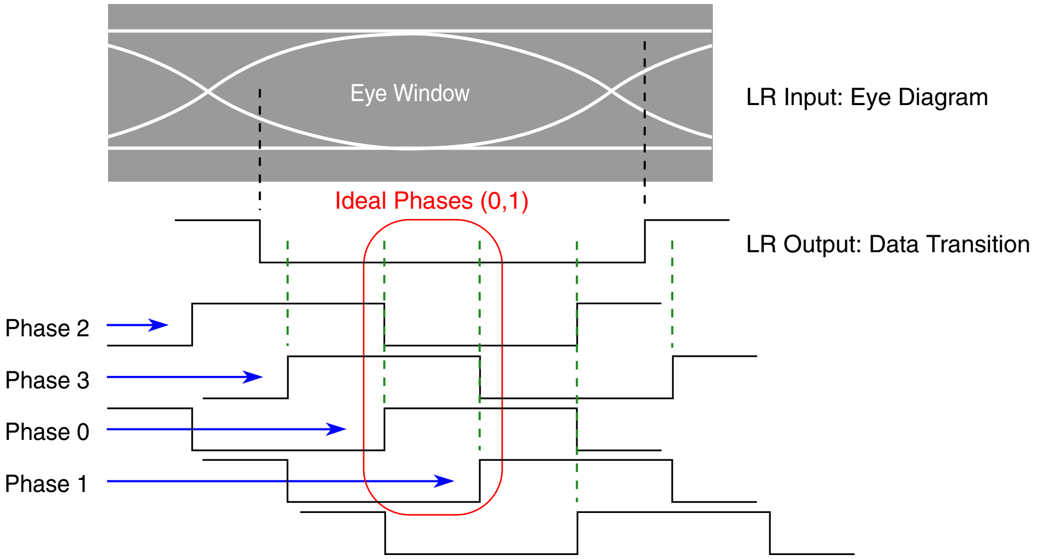

Figure 48-9. Low speed 4 phase clock alignment example

The auto correlation and selection of the correct clock phase starts after the edge detection finds a 0 to 1 transition. The high speed 8 or 4 phases from the PLL and the low speed 4 phases (generated inside the Clocking Module) are muxed inside the clocking module. The LFAST interface block will determine which phases are to be enabled and disabled. The only time the interface does not choose the phases is when the Clocking Module overrides the phase enables using COCR[SMPSEL].

The input data path can be sampled by different samplers depending on the configuration:

- High speed 8-phases: Samplers 0,1,2,3,4,5,6,7
- High speed 4-phases: Samplers 0,2,4,6
- Low Speed 4-phases: Samplers 0,1,2,3

Each sampler block samples the data path with a different clock phase from the Clocking Module, and resamples it to a intermediate phase as shown in Table 48-2, Table 48-3, and Table 48-4 before resampling it to Phase 0. The intermediate phase is used to make static timing between the initial phase and the final phase 0. The final phase, Phase 0 is chosen so all the clock trees after the sampler are clocked by the same clock.

Table 48-2. High speed 8 phase selection - sampling procedure

Samplers	InitialSample	Intermediate Sample	Final Sample
0	Phase 0	Phase 0	Phase 0
1	Phase 1	Phase 0	Phase 0
2	Phase 2	Phase 0	Phase 0
3	Phase 3	Phase 0	Phase 0
4	Phase 4	Phase 2	Phase 0
5	Phase 5	Phase 2	Phase 0
6	Phase 6	Phase 4	Phase 0
7	Phase 7	Phase 4	Phase 0

Table 48-3. High speed 4 phase selection - sampling procedure

Samplers	InitialSample Phase	Intermediate Sample Phase	Final Sample Phase
0	Phase 0	Phase 0	Phase 0
1	Disabled	Disabled	Disabled
2	Phase 2	Phase 0	Phase 0
3	Disabled	Disabled	Disabled
4	Phase 4	Phase 2	Phase 0
5	Disabled	Disabled	Disabled
6	Phase 6	Phase 4	Phase 0
7	Disabled	Disabled	Disabled

For High speed 4 Phase selection, See Table 48-3, Samplers 1, 3, 5, 7 are disabled. In the Phase Select algorithm Phase 1 is mapped to Phase0, Phase 3 is mapped to Phase 2, Phase 5 is mapped to Phase 4, Phase 7 is mapped to Phase 6 so it simplifies the algorithm and allows the algorithm to be the same independent of 4 or 8 Phases in high speed.

Table 48-4. Low speed 4 phase selection - sampling procedure

Samplers	InitialSample Phase	Intermediate Sample Phase	Final Sample Phase
0	Phase 0	Phase 0	Phase 0

Table continues on the next page...

Table 48-4. Low speed 4 phase selection - sampling procedure (continued)

Samplers	InitialSample Phase	Intermediate Sample Phase	Final Sample Phase
1	Phase 1	Phase 0	Phase 0
2	Phase 2	Phase 0	Phase 0
3	Phase 3	Phase 0	Phase 0
4	Disabled	Disabled	Disabled
5	Disabled	Disabled	Disabled
6	Disabled	Disabled	Disabled
7	Disabled	Disabled	Disabled

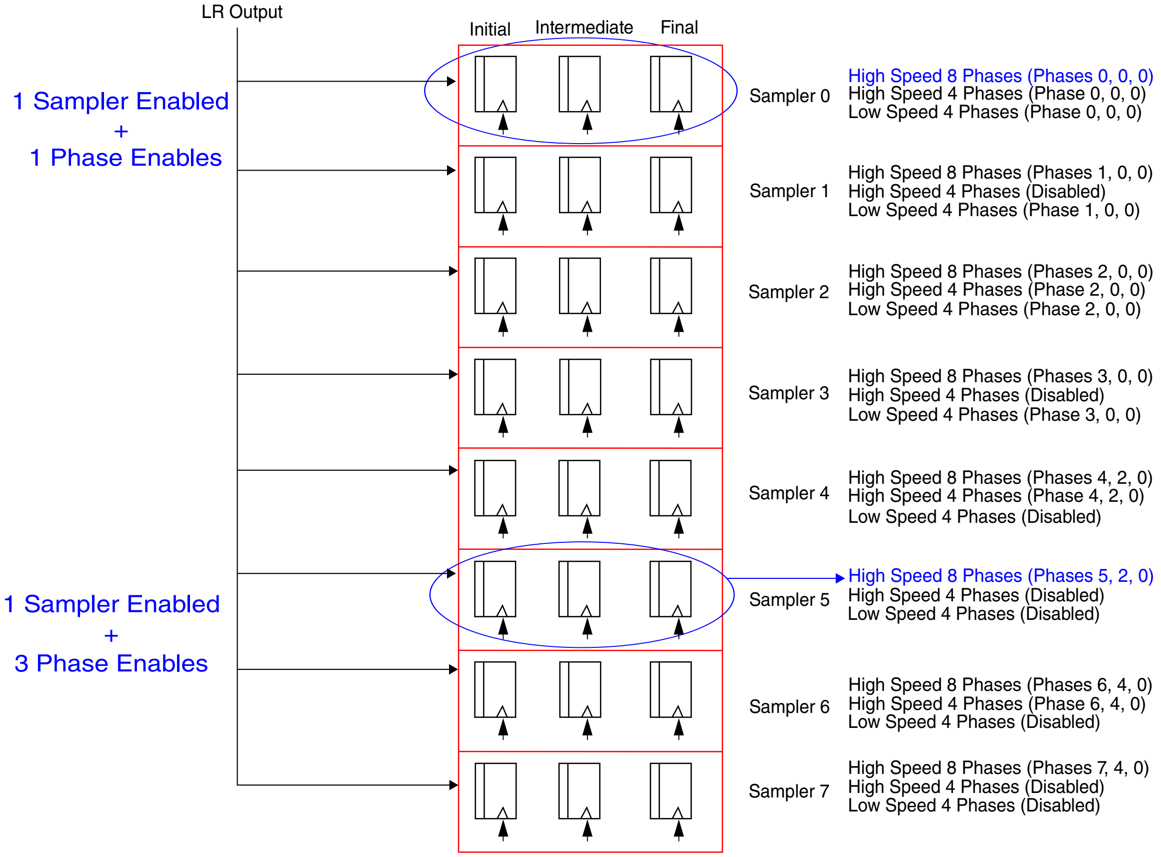
For low speed 4 Phase selection, See Table 48-4, Samplers 4, 5, 6, 7 are disabled.The first four Samplers (0,1,2,3) of the low 4 phase speed selection algorithm are the same as the four samplers required for the high 8 phase speed. Therefore the same architecture can be used for both high speed and low speed with the other four data paths disabled for low speed.

48.7.2.2.4 Sampler block and phase enable and disable

There are 8 data sampler paths in total inside the auto correlation block, each data sampler has 3 sampling registers with the possibility of each register being clocked by a different phase (in example, Sampler 5 for high speed can have Phases 5, 2 and 0). Therefore, after the correct data sampler has been selected for either high or low speed, the block can turn off all the sampler paths except for one, therefore 3 out of 24 registers will remain enabled while the others are disabled, as shown in the following figure.

After correlation and the correct data sampler has been selected all the other data samplers whose initial phase does not match the select phase are disabled. The selected sampler will then keep the required phases needed enabled, this can be max 3 phases (for example, Sampler 5 has Phases 5, 2, 0) or min 1 phase (in example below, Sampler 0 has all Phase 0 content).

The end result is that the Rx Controller can disable the required number of unused sampler registers and disable any unnecessary phases from the Clocking Module by deasserting the respective phase enables.



LR Output

Figure 48-10. 8 Samplers, each Sampler has 3 Registers

In order to achieve the sampler and phase enable requirements each Sampler block will require the logic as shown in the following figure.

The Clock Gating Element resides inside the Clocking Module block. The interface will provide the enables to the Clocking Module and the Clocking Module will in return provide the individual clocks to the sampling registers.

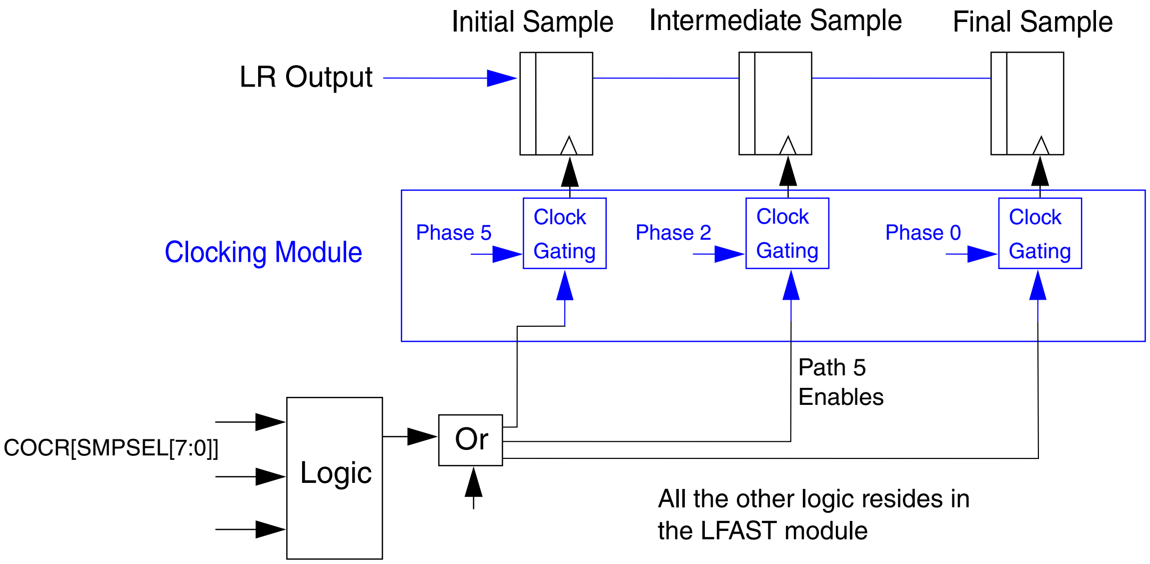

Figure 48-11. Sampler 5 Logic

48.7.2.3 Header and Payload Extraction

Once the Phases/Samplers are chosen after Synchronization and Correlation the next part of the flow is the header extraction. The Receive Controller will output a 16 bit word, bit shifted every Phase 0 clock as shown in the Figure 48-12.

48.7.3 Transmit Controller

This section describes the Transmit Controller.

48.7.3.1 Introduction

The Transmit Controller uses Rx information, status information and error control data and codes them into the appropriate frame structure for transmission to the LD. This includes the synchronization and header, in preparation for the LD, which transmits the frame to peer LFAST IC at either low or high speed. The Transmit Controller creates a frame structure that is converted to a serial format for the LD.

An arbitration block will determine which message has higher priority data, unsolicited, ICLC, CTS, ping, and so on. The data frames are extracted from the FIFO controller, the unsolicited message from the register block, the CTS messages from the Receive Controller and the ping response from the register block.

The Tx interface has two speed modes:

- Low Speed
- Fast Speed

The Transmit Controller consists of the following blocks as shown in the following figure.

- Arbitrator
- Framer
- Request Clock Control

The arbitrator will grant access to the framer from the request that has the highest priority. The framer block will extract the payload data from the granted request source and build the frame (adding synchronization or header if required). The frame is fed into a PISO (Parallel In Serial Out) and eventually sent to the LD.

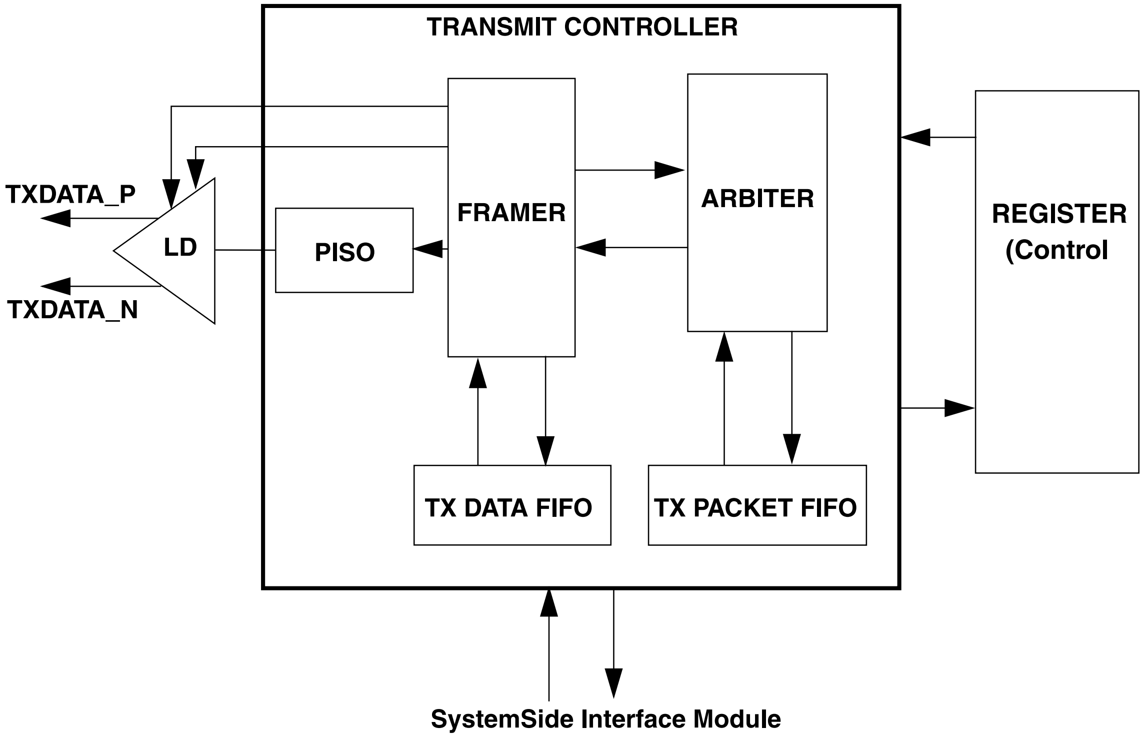

Figure 48-13. Transmit Controller Connections

48.7.3.2 Arbitration

The arbitration block prioritizes between requests from multiple sources like

- S/W programmable registers
- System side interface FIFO
- Rx interface controller

The level of priority for each request is shown in Table 48-5

Table 48-5. Priority Levels for the Transmit Controller

Request	LFAST MasterPriority	LFAST SlavePriority	Triggering Conditions *(at least one of the listed)*
LFAST interface enable	1	1	• LFAST interface enable is asserted • LFAST interface enable is negated
Tx Interface disabled	2	2	• MCR[DRFEN] = 0 • MCR[TXEN] = 0 • MCR[DRFRST] = 1 • MCR[TXARBD] = 1 • LFAST Slave: ICLC frame with payload for "Disable Rx interface" received
Tx Interface speedmode change	3	3	• SCR[TDR] is modified • LFAST Slave: ICLC frame with payload for changing Rx interface speed received
Loopback frame in Loopback mode	4	4	• TMCR[LPON] = 1Dig • RF Slave: ICLC frame with payload for loopback mode enable received **Note:** Valid only for following TMCR[LPMOD] settings: LPMOD[2:0] = 011b LPMOD[2:0] = 100b
ICLC frame request	5	-	• LFAST Master: ICR[SNDICLC] = 1 • LFAST Master: ICR[ICLCSEQ] = 1
Ping response request	-	5	• LFAST Slave: ICLC frame with payload for ping request received and PICR[PNGAUTO] = 1 • LFAST Slave: PICR[PNGREQ] = 1

Table continues on the next page...

Table 48-5. Priority Levels for the Transmit Controller (continued)

Request	LFAST MasterPriority	LFAST SlavePriority	Triggering Conditions *(at least one of the listed)*
Unsolicited frame request	6	6	• Last Frame with CTS = 1 received from the peer LFAST device • UNSTCR[USNDRQ] = 1
Data frame from Tx FIFO	7	7	• Tx FIFO contains one or more frames • Last Frame with CTS = 1 received from the peer LFAST device • MCR[DATAEN] = 1
CTSFrame	8	8	• MCR[CTSEN] = 1 • Rx FIFO reaches High/Low threshold, defined by TISR and no frame pending
Clock mode test	9	9	• TMCR[CLKTST] = 0 • LFAST Slave: ICLC frame with payload for clock test mode enable received

Once the arbitrator has granted access to a request, the Framer will commence building the frame. Any new requests for frame or data rate change will not be granted access until the framer has finished transmitting the current frame. If a data rate change request for the Tx interface is received while the Transmit controller is in the middle of sending a frame then the rate change request to the Clocking Module will be delayed. This allows for the frame to be completed before the change in speed mode. This prevents any speed mode change during the transmission of a frame. Once the speed mode request is sent to the Clocking Module by the Tx Interface Controller, it will then not allow any new requests to be processed for a specific time period defined by the bit field RCDCR[DRCNT].

48.7.3.3 Line Driver digital connections

48.7.3.3.1 Line Driver states

The LD has the following states:

- Shutdown

The LD enters the Shutdown state when the LD powerdown signal and the output buffer enable is high. In this state, the LD regulator is not supplying power and the LD outputs are connected to ground. Once LD powerdown signal is negated, a settling time is required before the LD may be used for communication.The settling time is defined by the SLCR[LWKCNT] and SLCR[HWKCNT] bitfields.

- Sleep

  The LD enters in sleep state when the signal is asserted. In this state, the LD is enabled, but held in a power-saving state. Sleep mode may be used during inter-frame gaps that are long compared to the frame durations but not long enough to allow the interface(s) or high-speed clock generators to be powered down completely. In the sleep state the LD outputs are connected to Vcm (common mode voltage). To exit from Sleep mode the LD sleep signal is negated. The LD is required to transmit a logic 0 level on the interface for a pre-defined minimum time. The minimum time is the summation of settling time of LD after negation of LD sleep signal and the wakeup time of the LR on the other side. This delay is programed in the SLCR[HSCNT] and SLCR[LSCNT] bitfields.

Figure 48-14. Example of Sleep mode

As shown in Figure 48-14 before every normal mode burst on the txdatap line there is one guard bit period (minimum inter-frame gap) where a logic 0 will be transmitted.

- Normal

  In the Normal state the LD is primed for transmission. The LD shall drive the interface as dictated by the input data bit that is supplied by a shift register under the control of a finite state machine. If the LD is not enabled, and the framer is activated, and has a frame to transmit, an interrupt (TISR[TXIEF]) will be generated. The LD moves back to the shutdown state when the LFAST master sends an ICLC Rx data off command.

Table 48-6. Line Driver States

LD State	LFAST Master Triggers	LFAST Slave Triggers
Shutdown	• Programing LVDS[SWOFFLD] and LVDS[SWONLD] • Programing MCR[TXEN] and MCR[DRFEN]	• LFAST interface enable negation/assertion • Programing LVDS[SWOFFLD] and LVDS[SWONLD] • ICLC command from LFAST master • Programing MCR[TXEN] and MCR[DRFEN]

Normal	Absence of above mentioned conditions	Absence of above mentioned conditions

48.7.4 CTS mode support

LFAST module supports flow control methods. The CTS (Clear to send) is a protocol defined method to ensure no loss of frame, due to Rx FIFO unavailability. The optimal use of bandwidth of LFAST, without losing frames, is ensured by proper programing of the Rx FIFO Lower threshold (RFCR[CTSMN]) and Higher threshold (RFCR[CTSMX]). The CTS is supported by both the LFAST Master and Slave.

CTS Transmission:

The LFAST device sends CTS information with each frame to the peer LFAST device.

If the CTS mode is enabled by write MCR[CTSEN] = 1 then:

- Sends CTS bit as 0 in LFAST frame (bit[0] of Header field) whenever the Rx FIFO reaches the higher threshold defined by the bitfield TISR[CTSMX]. This indicates that the LFAST device doesn't want the peer device to send data. The CTS bit of all frame are sent 0 untill the Rx FIFO pointer reaches the lower threshold, as described below.

- Sends CTS bit as 1 in LFAST frame (bit[0] of Header field) whenever the Rx FIFO reaches the Lower threshold defined by the bitfield TISR[CTSMN]. This indicates that the LFAST device is ready to receive data from the peer device. The CTS bit of all frame are sent 1 untill the Rx FIFO pointer reaches the Higher threshold, as described above.
- The CTS bit can be sent through any type of frame (data, unsolicited or ICLC). When there are no frames available in LFAST to send to the peer device, a CTS frame is sent. In this frame, bit[4-1] of Header field are sent as 0011b and 8-bit payload of 0.

If the CTS mode is not enabled (for example, bit MCR[CTSEN] = 0) then:

- All the frame sent will have CTS bit as 1 in LFAST frame (bit[0] of Header field).

CTS Reception:

The reception of a LFAST frame with CTS bit 0 indicates that the peer device is not ready to receive data frames. The transmission of all pending data and unsolicited frames are postponed untill a frame with CTS bit 1 is received.

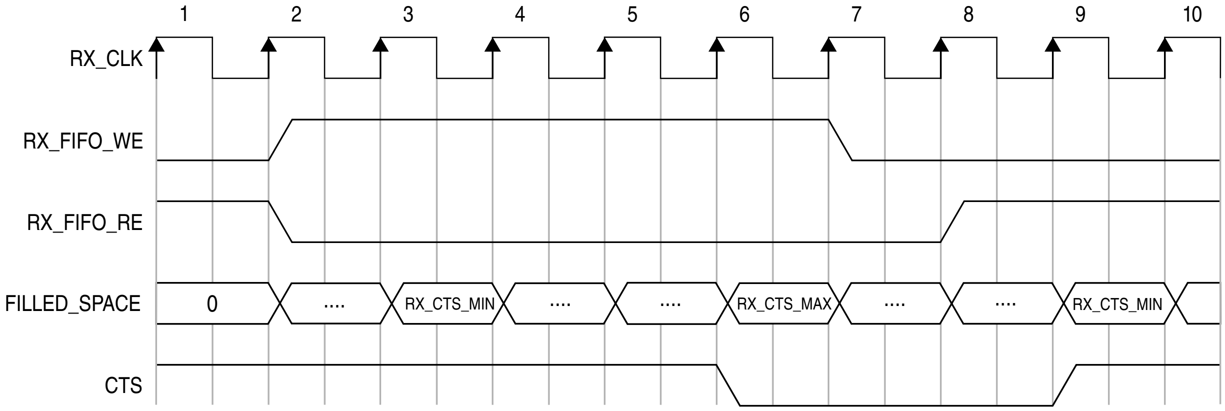

Figure 48-15. CTS generation

48.7.5 Frames supported

Table 48-7 provides the frames supported and their permissible payload sizes

Table 48-7. Frames supported by LFAST interfaces

Frame Type	LCT Code	Supported by 1. LFAST Master Tx2. LFAST Slave Rx	Supported by1. LFAST Slave Tx2. LFAST Master Rx	Payload Size (bits)
Data Frame	0100b – 1011b	YES	YES	32, 64, 96, 128, 256, 288
Unsolicited Frame	0001b	YES	YES	8, 32, 64, 96, 128, 256 and 288
ICLC Frame	0000b	YES	NO[1]	8
CTS Frame	0011b	YES	YES	8
Reserved	All others	—	—	—

[1] Except the ICLC PING response frame.

If logical channel type (LCT) code other than the above mentioned are received then the interrupt flag RISR[RXLCEF] = 1. If the payload size received does not match any value in Table 48-7 then the flag RISR[RXSZF] = 1. In both these error conditions the received frame is ignored. The S/W may have to take the necessary steps to recover from such an error.

48.7.6 Frame flow

Following sections describe Data Frame Flow, ICLC Flow and Rx Unsolicited Data Flow.

48.7.6.1 Data flow

LFAST supports the transfer of data between master and slave LFAST devices.

48.7.6.1.1 Data transmit

System Side Module is the initiator of all the Tx data frame to LFAST peer device. Data frame transmit is triggered whenever the Tx Data FIFO has at least one valid frame. The MCR[DATAEN], MCR[DRFEN] and MCR[TXEN] bits, should be set to enable the transfer of Tx data.

If MCR[DATAEN] = 0, then the valid frames in the in Tx data FIFO will be ignored for transmission. The Payload Size and channel type of each frame is specified by the System Side Module interface during transfer of the frame to the LFAST interface. The frame header is stored in the Tx packet FIFO and the payload in the Tx data FIFO.Whenever the Tx FIFO has at least one frame then a data transmit request is made to the Tx arbiter of the LFAST. Tx block arbitrates the data transmit request and schedules it depending on the priority of all the pending transmit requests. When data request is scheduled by Tx block, the required data is fetched from Tx data FIFO. The number of frames present in the Tx FIFO for transmission is indicated by the bitfield DFSR[TXFCNT].

48.7.6.1.1.1 Programing model for Tx data transmit

1. Program MCR[DATAEN] = 1, MCR[TXEN] = 1 and MCR[DRFEN] = 1 to enable the Tx path of LFAST device
2. Select the desired clock rate at which data should be transmitted, using ICLC transfers and appropriate programing of SCR[TDR] bits.
3. Frame present in TX FIFO (Data and Packet FIFO) are sent.
4. TISR[TXDTF] = 1 after each frame transfer
5. CTS is set depending on the push/pull mode setting defined by MCR[CTSEN].

48.7.6.1.2 Data receive

LFAST master and slave supports reception of data frame. The received frame is determined to be of data frame type by decoding channel type field of the header present in the received frame. The MCR[DATAEN], MCR[RXEN] and MCR[DRFEN] bits should be set to enable the data frame reception.When MCR[DATAEN] = 0 the received data frames will be ignored and will not be placed in the Rx data FIFO.

The Rx data frames received by Rx block are stored in the Rx FIFO. Whenever the frame is received in the Rx FIFO the System Side Module is indicated by assertion of LFAST Rx FIFO ready signal. The frame size and the Channel type is passed to the LFAST. The frame boundaries are indicated by start of frame and end of frame signals. The number of unread frames in the Rx Data FIFO are indicated by DFSR[RXFCNT]. When Rx DATA FIFO is full and cannot accommodate current frame completely, then the remaining data of the Rx frame is discarded. In this case, UNSRSR[RXOF] = 1 and an interrupt is generated if the RIER[RXOFIE] = 1.

48.7.6.2 Unsolicited flow

48.7.6.2.1 Unsolicited frame transmit flow

The S/W is the initiator for unsolicited frames to the LFAST peer device. The unsolicited frame header and payload is programed into the Unsolicited Data and Control registers. Once the Payload is programed UNSTCR[USNDRQ] is set, generating a request for unsolicited frame transfer to the Tx arbiter.

48.7.6.2.1.1 Programing model for unsolicited frame transmit

1. Program MCR[TXEN] = 1 and MCR[DRFEN] = 1 in the Mode Configuration Register (MCR) to enable the Tx path
2. Select the desired clock rate at which data should be transmitted, using ICLC transfers and appropriate programing of SCR[TDR].
3. Read the UNSTCR[USNDRQ].
    - If UNSTCR[USNDRQ] = 1 then wait for either of the following:
        - UNSTCR[USNDRQ] = 0
        - TISR[TXUNSF] = 1
    - If UNSTCR[USNDRQ] = 0 then:
        - Program the unsolicited payload in UNSTDR0–UNSTDR8, and can be written up to a payload of frame of a maximum of 288 bits.
        - Program the unsolicited frame header in UNSTCR[UNSHDR].
        - Program UNSTCR[USNDRQ] = 1.
4. UNSTCR[USNDRQ] is cleared by the Tx Block after the frame transfer.
5. TISR[TXUNSF] = 1 when the frame is transmitted.
6. CTS is set depending on the Push-Pull mode setting defined by MCR[CTSEN].

48.7.6.2.2 Unsolicited frame receive flow

Whenever an Unsolicited frame is received from the peer device, the following steps are performed:

If UNSRSR[URXDV] = 0 then:

1. The payload size field of the header is first saved into the UNSRSR[URPCNT].
2. The payload is stored in the UNSTDR0–UNSTDR8.

3. UNSRSR[URXDV] = 1 and the RISR[RXUNSF] = 1 indicating the successful reception of the frame.

If UNSRSR[URXDV] = 1 then:

1. The current unsolicited frame is ignored.
2. RISR[RXUOF] = 1.

Typical steps by the processor after RISR[RXUNSF] = 1 is as follows:

1. The processor reads UNSRSR to get the payload size of the frame.
2. It then reads the complete frame by reading UNSRDR8–UNSRDR0 for the payload size as received in the frame.
3. Then it clears the interrupt (write RISR[RXUNSF] = 1) and also the UNSRSR[URXDV] bit.

48.7.6.3 ICLC flow

The ICLC (Interface Control Logical Channel) is a separate logical channel type, which is mainly meant for implementing the data rate change in the LFAST interface and initiating the test modes.

48.7.6.3.1 ICLC data transmit flow

Whenever the processor intends to transfer an ICLC frame to the LFAST slave then the following steps are to be followed.

1. Write the ICLC frame payload in the ICR[ICLCPLD] (see Table 48-8 for payloads as defined by the standard).
2. Program ICR[SNDICLC] = 1 to initiate the ICLC frame transfer. This bit clears itself when the ICLC frame has been transmitted. The processor needs to poll this bit to make sure it is cleared before setting this bit again (even when ICR[ICLCSEQ] = 1).
3. TISR[TXICLCF] = 1 after the transfer of the ICLC frame.
4. CTS is set depending on the Push-Pull mode setting defined by MCR[CTSEN].

To determine whether the ICLC frame has been sent or not, either the ICR[SNDICLC] bit can be polled, or wait for TISR[TXICLCF] = 1.

Table 48-8. Supported ICLC Payloads

ICLC Code(hex)	ICLC Function
00	Ping Request from LFAST Master to LFAST Slave
01	Reserved
02	Start PLLIn preparation for High Speed mode
04	Stop PLL Fallback to low speed mode
08	Select TxData Slow (LFAST Slave Rx Interface)
10	Select TxData Fast (LFAST Slave Rx Interface)
20	Select RxData Slow (LFAST Slave Tx Interface)
40	Not Supported
80	Select RxData Fast (LFAST Slave Tx Interface)
31	Enable RxData Interface (LFAST Slave Tx Interface)
32	Disable RxData Interface (LFAST Slave Tx Interface)
34	Clock Test mode Send 101010… continuously using the currently configured clock rate (slow, fast);
FF	Turn payload loopback on
38	Turn Test mode (Loopback and Clock Test) off

Programing model for ICLC frame transmit:

1. Set the ICR[ICLCSEQ] bit (optional)
2. Write the ICLC frame payload in the ICR[ICLCPLD], corresponding to the desired Tx/Rx data rate change, as described in the Table 48-8.
3. Write ICR[SNDICLC] = 1 to initiate the ICLC frame transfer.
4. LFAST master will schedule the ICLC transfer. Data present in ICR[ICLCPLD] is transmitted to the LFAST slave at the old Tx data rate. LFAST slave will configure its Tx/Rx interface data rate accordingly.
5. Reset the ICR[ICLCSEQ] to allow the scheduling of other types of frames, which will be sent at the new data rate.

When ICR[ICLCSEQ] = 0, though the ICLC frame transfer still has highest arbitration priority, other frames may be scheduled if no valid ICLC frame request exist.

Note

ICLC frame transmit will not trigger the internal data rate change of LFAST Master Tx/Rx interface. LFAST master Tx/Rx interface data rate will only be changed, when corresponding SCR[TDR] and SCR[RDR] bits are appropriately configured.

Processor requires to take care that no data frames are to be transmitted while data rate change is happening or ICLC is transmitting frames by setting ICR[ICLCSEQ] bit in Table 48-8.

48.7.6.3.2 ICLC data receive flow

When the bits 4 to 1 of a receive frame are 0000b it indicates that the payload is an ICLC. ICLC payloads are always 8 bits.

The reception of an ICLC frame is indicated by an interrupt to the system. The ICLC status register RISR indicates the type of the ICLC frame received. The Rx block will decode and generate the appropriate signals. An invalid ICLC code besides the ones listed in Table 48-8 will cause RISR[RXICF] = 1.

48.7.6.3.2.1 Ping request ICLC

The LFAST slaves ICLC decoder will decode the ping request and set RIISR[ICPRF]. The S/W can also write to PICR[PNGREQ] to indicate to the Tx block that a ping response frame needs to be transmitted. The PICR[PNGAUTO] indicates whether Tx block can respond automatically to the request by the LFAST master ICLC Ping Request frame. The Tx block will arbitrate the ping response frame request and send a ping frame with ping data defined by bitfield PICR[PNGPLYD]. Once the ping response frame has been sent the Tx block will set TISR[TXPNGF] and clear PICR[PNGREQ], if set.

48.7.6.3.2.2 LFAST Slaves RxData Interface Slow/Fast ICLC

The LFAST Slaves Rx Interface has two speed modes supported: slow (Low speed) and fast (High speed). The ICLC command will write RIISR[ICRSF] = 1 (Low speed) or RIISR[ICRFF] = 1 (High speed).

48.7.6.3.2.3 LFAST Slaves TxData Interface Slow/Fast ICLC

The LFAST slaves Tx Interface Controller has two speed modes: slow (Low speed), and fast (High speed). The ICLC command will write RIISR[ICTSF] = 1 (Low speed) or RIISR[ICTFF] = 1 (High speed).

48.7.6.3.2.4 Enable/Disable LFAST Slaves TxData Interface ICLC

The ICLC commands, Enable RxData Interface and Disable RxData Interface are decoded and the appropriate enable/disable signal sent to the Tx block Controller. These ICLC command writes RIISR[ICTEF] = 1 and RIISR[ICTDF] = 1. The ICLC Tx enable command will write MCR[TXEN] = 1.

No frames can be sent on the LFAST Slave Tx interface until the either LFAST master has enabled it via an ICLC frame or S/W programs MCR[TXEN] = 1.

48.7.6.3.2.5 Clock Test mode ICLC

This ICLC command is decoded, and then is used to write TMCR[CLKTST] = 1. This indicates to the Tx interface to output an alternating pattern of 1 and 0 at the currently configured clock rate. The Rx interface generates RIISR[ICCTF] = 1 on reception of this ICLC command.

The exit from this mode happens on reception of Test mode off ICLC command.

48.7.6.3.2.6 Loopback payload on ICLC

This ICLC command is decoded and TMCR[LPON] = 1 to indicate to the Tx Block that the received payload is to be sent back. The exit from this mode happens on reception of Test mode off ICLC command. The Rx interface causes RIISR[ICLPF] = 1 on reception of this ICLC command.

48.7.6.3.2.7 Test mode off ICLC

This ICLC command is decoded and TMCR[LPON] and TMCR[CLKTST] are cleared to indicate to the Tx block to exit from loopback mode or clock test mode.

Another option is for the payload loopback option to remain enabled until negated on the toggling of LFAST interface enable.

48.7.6.3.2.8 Ping response ICLC

The LFAST master considers any ICLC frame payload as ping response data. The LFAST masters Rx block will store the received ping data in PISR[RXPNGD] and match it with PICR[PNGPYLD]. RIISR[ICPSF] = 1 if the Ping received matches with the one stored in PICR[PNGPYLD], or RIISR[ICPFF] = 1.

48.7.6.4 CTS flow

48.7.6.4.1 CTS Tx flow

The CTS frame, if enabled by the S/W, indicates the status of the Receive Data FIFO. CTS frame is triggered whenever Rx Data FIFO reaches either the High/Low threshold and no data, ICLC or unsolicited frame is ready for transmission.

Programing model for CTS frame transmit:

- Program RFCR[CTSMX] and RFCR[CTSMN].
- Enable the CTS frame Transmission by programming MCR[CTSEN] = 1.
- Program MCR[TXEN] = 1 and MCR[DRFEN] = 1 to enable the Tx path.
- The CTS bit sent with a valid frame (for example, data, ICLC and unsolicited) is 1 until the Rx Data FIFO reaches High Threshold.
- When the Rx Data FIFO reaches higher threshold and no valid frame (data, ICLC and unsolicited) is pending for transmission, then the CTS frame is triggered, with CTS bit of header = 0 and the status bit RISR[RXMXF] = 1.
- When the Rx Data FIFO reaches Low Threshold, due to system side reads and no valid frame (data, ICLC and unsolicited) is pending for transmission, then the CTS frame is triggered, with CTS bit of header = 1, and status bit RISR[RXMNF] = 1.

48.7.6.4.2 CTS Rx flow

Whenever a CTS frame header or any other frame with valid header is received with CTS bit = 0, then RISR[RXCTSF] = 1. The Tx Interface arbitration for unsolicited frame and data frame transmit request is turned off on reception of frame with CTS bit 0. The arbitration for unsolicited frame and data frame is enabled on reception of frame with CTS bit 1. Frame with LCT type CTS are not stored in the LFAST.

48.7.7 Test and Debug Support

The test and debug interface helps to debug the LFAST module. These signals can be brought out for ease of validation.

48.7.7.1 Loopback Test mode

The loopback function allows to verify the correct operation of the physical interface and the basic checks for the LFAST module without a peer device.

There are certain prerequisites before entering the Loopback mode:

- LD and LR should be turned on.
- Tx and Rx mode should be enabled.
- Interrupts needed for S/W should be enabled.
- Both Tx and Rx interface should be in same speed mode.
- For Automatic Test mode TMCR[LPFRMTH] should be programed.

The LFAST module supports four loopback modes, defined by TMCR[LPMOD].

Table 48-9. Loopback modes

LPMOD[2:0]	Mode Selected
000	Rx Loopback (default)
001	Rx LVDS Loopback
010	Tx Loopback without Automatic frame generation
011	Tx Loopback with Automatic frame generation
100	Tx LVDS Loopback (external) with Automatic frame generation

The TMCR[LPON] bit controls the state of the loopback function, and the default setting is 0 (off). This can be written by S/W, or in the case of the LFAST slave, the TMCR[LPON] bit can be modified by the Rx interface controller on decoding of a valid ICLC loopback on or Test mode off commands. The LPMOD should not be changed when the LPON bit is set.

In all loopback modes, except Tx loopback without automatic frame generation, the decoding of frame and error flags is stopped. Only decoding of following is done:

- ICLC Turn Test mode Off frame.

- CTS bit of all frames.
- Automatic Loopback frame decoding (only in Automatic frame generation mode).

48.7.7.1.1 Rx Loopback mode

For Rx loopback mode the output of the LR is passed to the LD with manipulation via the Rx and Tx Interface controllers. CTS bit (Bit 0) of the header is guaranteed to be asserted when the incoming data from the other device is looped back. In Rx Loopback mode the Rx Interface controller operates in normal mode, decoding the frames (header, payloads). This allows the LFAST Master to control the Loopback mode on and off by sending ICLC commands.

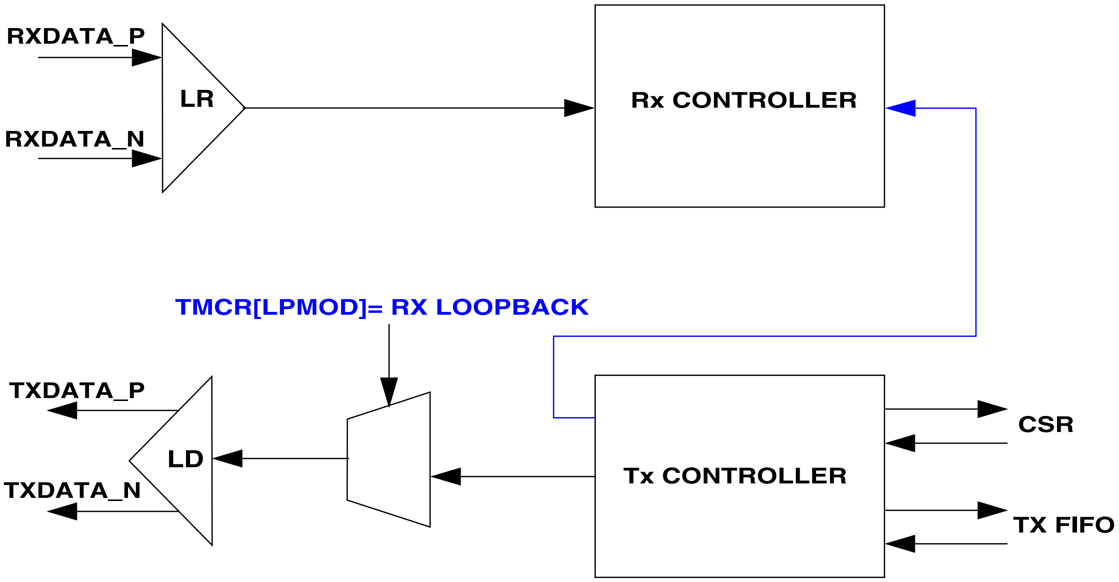

Figure 48-16. Rx LoopBack mode

Entry to Rx Loopback mode:

1. S/W programs TMCR[LPMOD] = 000b.
2. Loopback can be turned on by either of the following methods:
   - S/W programs TMCR[LPON] = 1.
   - For Slave Only: - Reception of ICLC Frame with Payload FFh (Loopback mode on), from LFAST Master

Exit from Rx Loopback mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0
- For LFAST Slave: - Transmission of ICLC Frame with payload 38h (Test mode off), from LFAST Master

The peer LFAST device is required to maintain at least 2-bit IFG between two Loopback frames in this mode.

48.7.7.1.2 Rx LVDS LoopBack mode

This loopback mode is provided to verify and characterize the LVDS pads. In this loopback mode the data received by LFAST on Rx LVDS input is loopback to Tx LVDS output, bypassing LFAST. For LVDS loopback the output of the LR is passed to the LD via "Rx LVDS LoopBack Mux". Bit 0 of the header cannot be guaranteed to be asserted when the incoming data from the other device is looped back. In this loopback, the Rx Interface Controller operates in normal mode, decoding the frames (header, payloads) but the Tx Interface Controller is ignored.

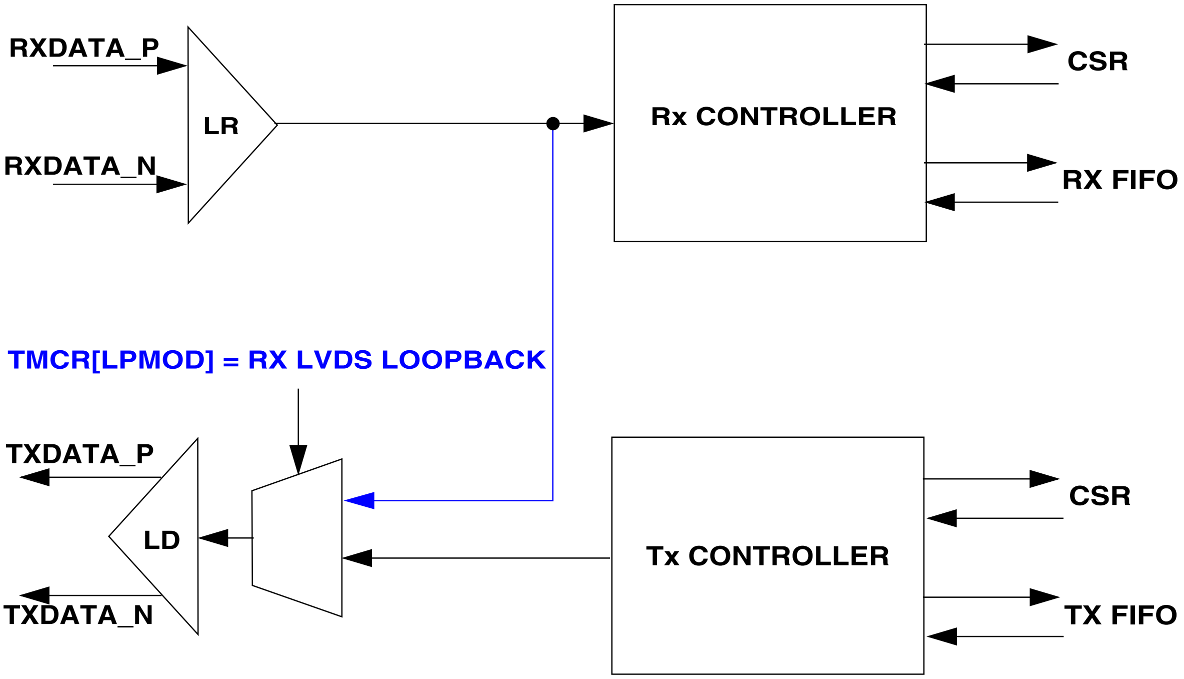

Figure 48-17. Rx LVDS LoopBack mode

Entry to Rx LVDS Loopback mode:

1. S/W programs TMCR[LPMOD] = 001b.
2. Loopback can be turned ON by either of the following methods:

  - S/W writes TMCR[LPON] = 1.
  - For Slave Only: - Reception of ICLC Frame with Payload = FFh (Loopback mode ON), from LFAST Master.

Exit from Rx LVDS Loopback mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0.
- For LFAST Slave:
  - Transmission of ICLC frame with payload 38h (Test mode off), from LFAST Master.

48.7.7.1.3 Tx loopback mode without automatic frame generation

This loopback mode is provided to verify the LFAST functionality, if LVDS pads are not functional. In this loopback mode the data transmitted by LFAST on Tx LVDS output is loopbacked internally on Rx LVDS input, bypassing LVDS pads.

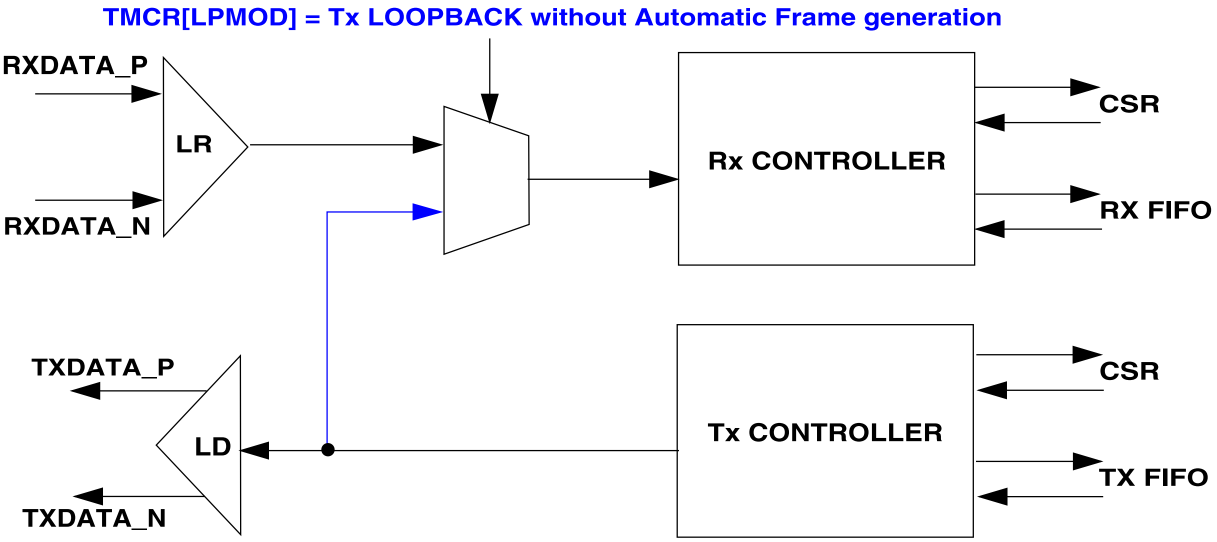

Figure 48-18. Tx LoopBack mode without automatic frame generation

Entry to Tx Loopback without Automatic frame generation mode:

1. S/W programs TMCR[LPMOD] = 010b.
2. Loopback can be turned on by either of the following methods:
   - S/W programs TMCR[LPON] = 1.
   - For Slave Only: Reception of ICLC frame with payload FFh (Loopback mode on), from LFAST Master

Exit from Tx Loopback without Automatic frame generation mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0.
- For LFAST Slave: Reception of ICLC frame with payload 38h (Test mode off), from Tx interface (using unsolicited frame).

All frames and error flags are decoded in this mode.

48.7.7.1.4 Automatic frame generation

The LFAST module supports two Loopback modes where pre-defined frames are generated automatically by the Tx Interface and Rx Interface indicates its successful reception by dedicated signals and status registers. These modes are defined for BIST like check for the LFAST, with minimal S/W intervention.

The Control register used for these modes are:

- ALCR[LPCNTEN] defines whether fixed number of auto loopback frames to be transmitted
- ALCR[LPFMCNT] defines the number of loopback frames to be transmitted if ALCR[LPCNTEN] = 1.

The Status signals and register used for these modes are:

- GSR[LPCSDV]: Valid Synchronization received.
- GSR[LPCHDV]: Frame with Header of 13h received.
- GSR[LPCPDV]: Frame with Payload of CBh received.
- GSR[LPTXDN]: Number of Auto Loopback frame transmitted with valid Synchronization, Header (13h) and Payload (CBh) is equal to ALCR[LPFMCNT].

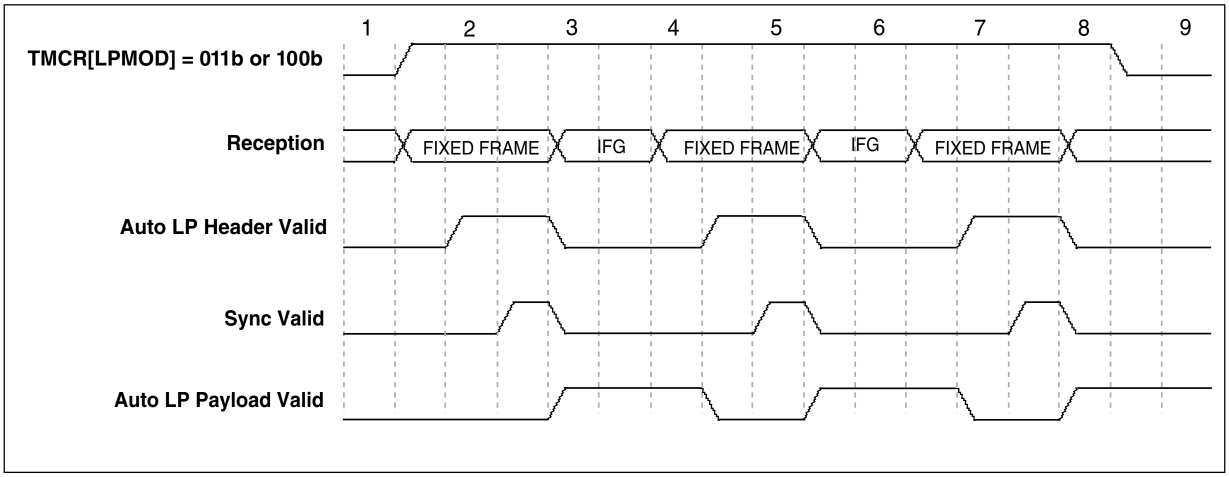

Figure 48-19. Automatic Loopback Test status signal timings

The two Loopback with automatic frame generation modes are:

1. Tx Loopback with Automatic frame generation
2. Tx LVDS (external) with Automatic frame generation

48.7.7.1.4.1 Tx loopback mode with automatic frame generation

When TMCR[LPMOD] = 011b (Tx Loopback mode with Automatic frame generation) the frames are generated by the Tx Interface. This mode helps to validate the Tx and Rx Path with minimal intervention from the S/W. The frames generated have fixed header of 13h and payload of CBh. The successful reception of this frame is indicated by the status signals and registers.

Figure 48-20. Tx LoopBack mode with automatic frame generation

Entry to Tx Loopback with automatic frame generation mode:

1. S/W programs TMCR[LPMOD] = 011b.
2. Loopback can be turned on by either of the following methods:
    - S/W programs TMCR[LPON] = 1.
    - For Slave Only: Reception of ICLC frame with payload FFh (Loopback mode on), from LFAST Master

Exit from Tx Loopback with Automatic frame generation mode can be done by any of the following methods:

- S/W programs TMCR[LPON] = 0.

48.7.7.1.4.2 Tx LVDS loopback (external) mode with automatic frame generation

In this mode the LD/Tx Controller is used to test the LR/Rx Controller. The idea is to use a test frame (predefined) from the Tx Controller out through the LD, loopback completed on the DUT-board (LD connected to LR via a transmission line), back into the LR, synchronized and correlated in the Rx Controller and compared to what was sent in the Downlink controller.

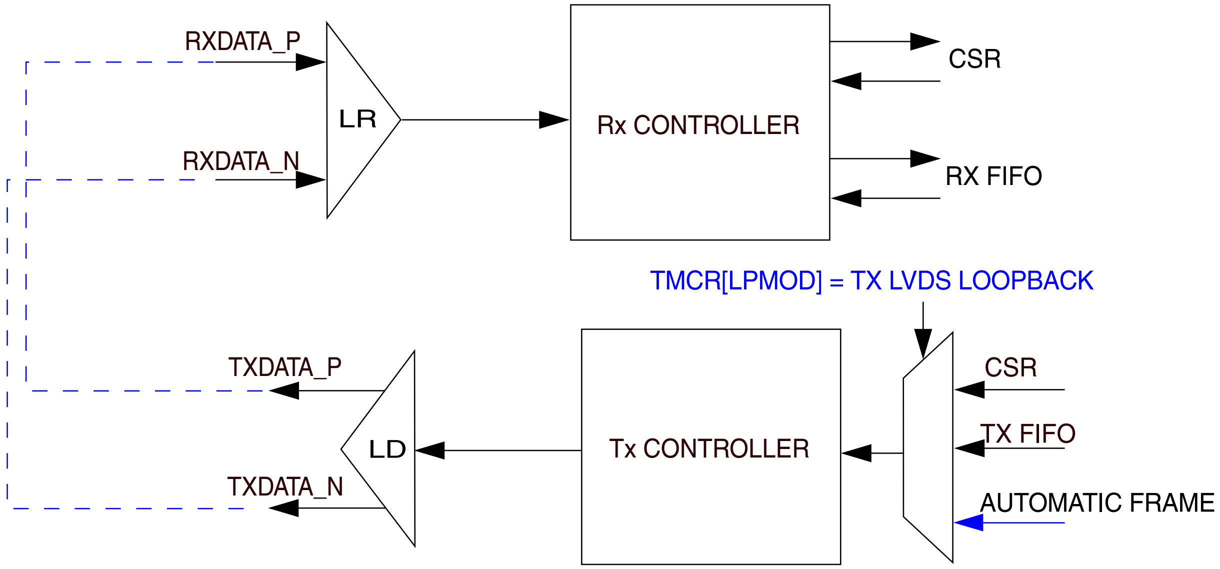

Figure 48-21. Tx LVDS loopback (external) mode with automatic frame generation

Entry to Tx LVDS loopback with automatic frame generation mode:

1. S/W programs TMCR[LPMOD] = 100b.
2. Loopback can be turned on by either of the following methods:
    - S/W programs TMCR[LPON] = 1.
    - For Slave Only: Reception of ICLC frame with payload FFh (Loopback mode on), from LFAST Master

Exit from Tx LVDS loopback with automatic frame generation mode can be done by the following method:

- S/W programs TMCR[LPON] = 0.

48.7.7.2 Clock test mode

The bit TMCR[CLKTST] enables or disables the Clock Test mode of the LFAST module. In this mode the LFAST sends fixed pattern out on the LD at the current configured RxData clock rate. It is a RWM bitfield and the default setting is 0 (off). This bit can be set under one of the following conditions:

- S/W programs TMCR[CLKTST].

The Tx Controller will send out a pattern of alternating 1 and 0 (pattern 101010...). This provides a divide by 2 test clock of the current Tx clock.

The Clock Test mode can be cancelled by either of the following methods:

- S/W programs TMCR[CLKTST] = 0.
- For LFAST Slave: Reception of ICLC frame with payload 38h (Test mode off) from LFAST Master

In clock test mode the Tx Controller does not output any synchronization pattern or header, just a pattern of alternating 1's and 0's.

This mode doesn't affect the functionality of the Rx Interface.

48.7.8 Interrupts

The LFAST module generates five interrupts to the processor:

- Transmit complete interrupt
- Transmit exception interrupt
- Receive complete interrupt
- Receive exception interrupt
- ICLC recieve interrupt

Each interrupt is asserted when any one of their status conditions is met.

48.7.8.1 Transmit complete interrupt

This interrupt indicates a transfer compeletion of a frame. This interrupt is asserted whenever any of the following bits are set in the TISR and also the corresponding mask bits are set in the TIER.

- TXDTF
- TXICLCF
- TXUNSF
- TXPNGF

Each of these bits can be individually maskable. So, those bits that are not required to generate an interrupt to the processor can be masked. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the TISR.

48.7.8.2 Transmit exception interrupt

This interrupt indicates occurrence of an exception condition in the Tx block. This interrupt is asserted whenever any of the following bits are set in the TISR along with the corresponding mask bits in the TIER.

- TXOVF
- TXIEF

Each of these bits can be individually masked. So, those bits that are not required to generate an interrupt to the processor can be masked. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the TISR.

Table 48-10. Recommended transmit exception handling

Exception	Recommendation
TXOVF	• MCR[TXEN] = 0 • The system level interfaces transmit is reseted and enabled again • For Slave: After reception of ICLC Ping Response Request the MCR[TXEN] may be set • For Master: The MCR[TXEN] should be set and an ICLC frame Ping Response Request should be sent
TXIEF	• The MCR[TXEN] should be set

48.7.8.3 Receive complete interrupt

This interrupt indicates a reception of a frame. This interrupt is asserted whenever any of the following bits is set in the RISR along with the corresponding interrupt enable bit is also set in the RIER.

- RXCTSF
- RXDF
- RXUNSF

Each of these bits are individually maskable. So, the bits that are not required to generate an interrupt to the processor can be masked by clearing its bit in the RIER. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the RISR.

48.7.8.4 Receive exception interrupt

This interrupt indicates occurrence of an exception condition in Rx block. This interrupt is asserted whenever any of the following bits is set in the RISR and corresponding enable mask bit is also set in the RIER.

- RXLCEF
- RXICF
- RXSZF
- RXUOF
- RXUFF
- RXMXF
- RXMNF
- RXOFF

Each of these bits are individually maskable. So, those bits that are not required to generate an interrupt to the processor can be masked by clearing the appropriate bit in the RIER. For details on the cause of assertion of each bit refer to the RISR description. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in the RISR.

Table 48-11. Recommended receive exception handling mechanism

Exception	Recommendation
RXLCEF	The MCR[RXEN] may be set and cleared, as this exception can result in loss of subsequent packet
RXICF	No action required
RXSZF	The MCR[RXEN] may be set and cleared, as this exception can result in loss of subsequent packet
RXOFF	• The MCR[RXEN] may be cleared • The system level interfaces receive may be reset and enabled, as current transfer may be corrupted
RXUFF	No action required
RXMXF	The system level interfaces receive should be enabled, if not enabled
RXMNF	No action required
RXUNSF	No action required

48.7.8.5 ICLC receive interrupt

This interrupt indicates reception of a valid ICLC frame. This interrupt is asserted whenever any of the following bits is set in the RIISR along with the corresponding enable bit mask bit is set in the RIIER.

- ICPONF
- ICPOFF
- ICTSF
- ICTFF
- ICRSF
- ICRFF
- ICTEF
- ICTDF
- ICCTF
- ICLPF
- ICTOF
- ICPRF
- ICPSF
- ICPFF

Each of these bits are individually maskable. So those bits that are not required to generate an interrupt to the processor can be masked. For details on the cause of assertion of each bit, refer RIISR. Once the interrupt is asserted, it can be negated by clearing the corresponding flag bit in RIISR.

48.8 Packet memory

The LFAST stores packet frames for transmission, and reads packet frames after reception. The transmitter has its own dedicated buffer and the receiver has it own dedicated buffer, and they are not shared between each other.

Table 48-12. Frames Supported by LFAST interfaces

Frame Type	Tx Buffer(in bits)	Rx Buffer(in bits)	Memory Type
Data Frame	38 × 32 max 6 packets	38 × 32 max 6 packets	FIFO
Unsolicited Frame	9 × 32 max 1 packet	9 × 32 max 1 packet	Registers UNSTD[8-0], UNSRDR[8-0]
ICLC Frame	1 × 7 max 1 packet[1]	1 × 8 max 1 packet[2]	Registers ICR, PISR
CTS Frame	N/A	N/A	N/A

[1] Only for MCR[MSEN] = 1

[2] Only for ping response data when MCR[MSEN] = 1

48.9 Resets

The various blocks in LFAST are reset as described in the table below.

Table 48-13. Recommended receive exception handling mechanism

Reset	Blocks Reset
Asynchronous Hardware reset	Polarity: Active Low • Clock control module (CCM) • LFAST Domain Logic (Rx and Tx block) • System Side Module Interface FIFOs • LFAST Register Space
DRFRST bit of Mode Configuration Register (MCR)	Polarity: Active High • Clock control module (CCM) • LFAST Domain Logic (Rx and Tx block) • System Side Module Interface FIFOs • LFAST Register Space
DRFEN bit of Mode Configuration Register (MCR)	Polarity: Active Low • Clock control module (CCM) • LFAST Domain Logic (Rx and Tx block) • System Side Module Interface FIFOs • LFAST Status Registers • SCR[RDR] and SCR[TDR] • TMCR[CLKTST] and TMCR[LPON] • ICR[ICLCSEQ] and ICR[SNDICLC] • PICR[PNGREQ] • UNSTCR[USNDRQ]

48.10 Clocks

The LFAST mainly works on three clocks:

- System Bus Clock used to program the registers.
- Protocol clock, which is either High Speed PLL clock or Low Speed clock depending on the speed mode, used for LFAST protocol operation.
- System Side Module clock, which is synchronous to the System Bus clock.

48.10.1 Clocking strategy

The following figure shows the clock domain in which each module functions. The PLL provides eight phases of the high speed clock to the Clock Muxing portion of the Clock Control Module. The Clock Module will then generate four phases of slow speed clock using both the edges of lfast_sysclk, muxes high speed and low speed clocks and provides a muxed clock to the Sampler Module.

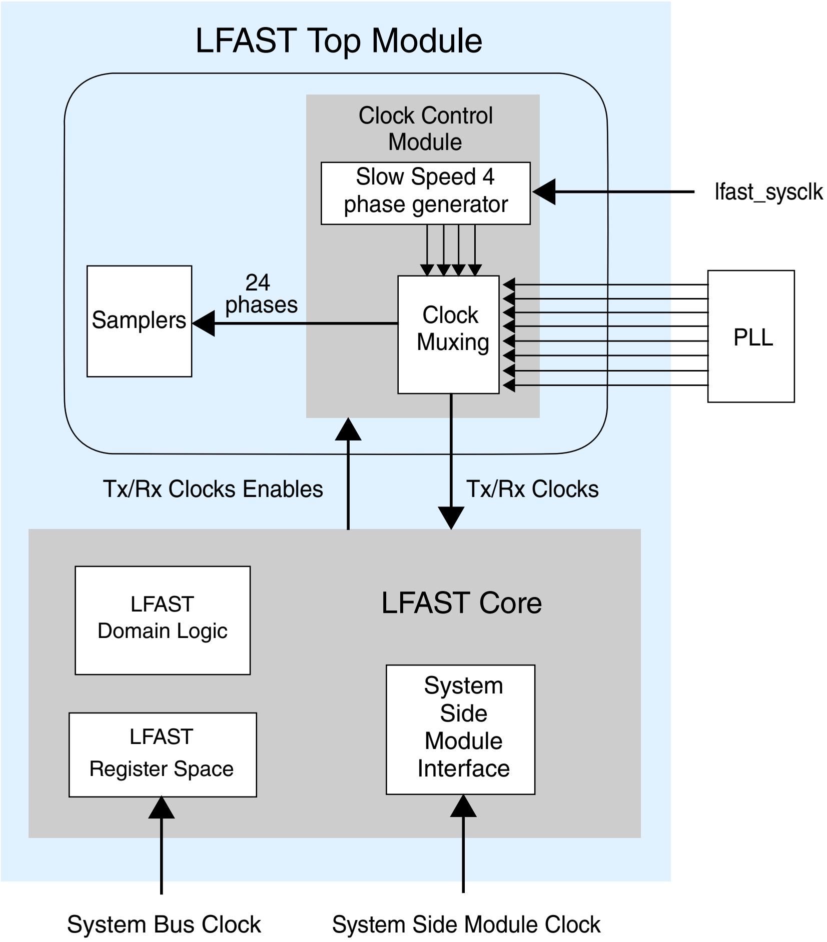

Figure 48-22. LFAST module clock domains

48.10.2 Slow speed clock

48.10.2.1 External muxing

The Clock Control Module will receive lfast_sysclk from the clocking subsystem as shown in Figure 48-23, Figure 48-24 and Figure 48-25.

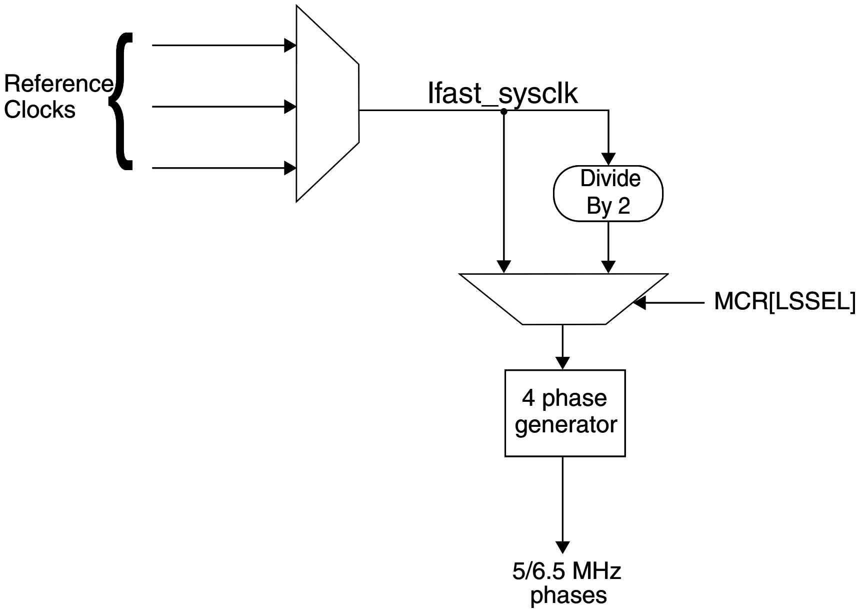

Figure 48-23. External clock muxing of lfast_sysclk

All the reference clocks will be muxed first to provide lfast_sysclk to the module and then either div/2 or direct muxed clock will be used to generate 4 slow speed phases in the Clock Control Module of LFAST as shown in Figure 48-23.

The lfast_sysclk could be either 20/26 MHz or 10/13 MHz. When lfast_sysclk is 20/26 MHz frequency, the clock control module will generate 4 phases of slow speed clock of frequency lfast_sysclk/4 when MCR[LSSEL] = 1. If lfast_sysclk is 20/26 MHz it needs to be first divided by 2 before using it for 4 phase generation in LFAST Clock Module, which generates 4 phases of half of the input frequency as shown in Figure 48-24 (selected clock path shown in green).

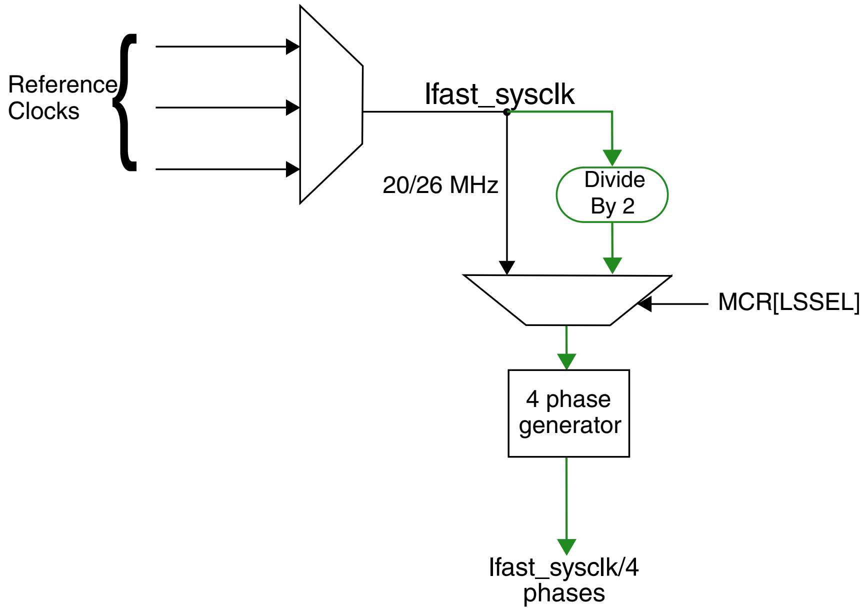

Figure 48-24. External clock muxing of lfast_sysclk of 20/26 MHz

In this case, lfast_sysclk is 10/13 MHz frequency, the clock control module will generate 4 phases of slow speed clock of frequency lfast_sysclk/2 when MCR[LSSEL] = 0. If lfast_sysclk is 10/13 MHz then it does not need to be first divided by 2 before using it for 4 phase generation in LFAST Clock Module, which generates 4 phases of half of the input frequency as shown in Figure 48-25 (selected clock path selected shown in magenta).

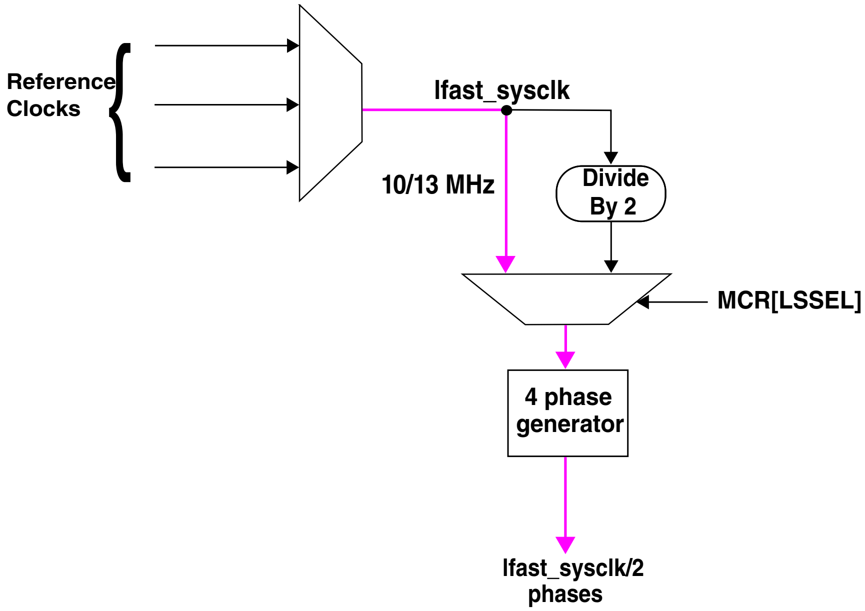

Figure 48-25. External clock muxing of lfast_sysclk of 10 MHz

48.10.2.2 Slow Speed 4 phase generator

Clock control module will generate 4 phases of slow speed clock of frequency of 10/13 MHz. For instance, if lfast_sysclk is 10 MHz then 4 phases of 5 MHz will be generated. The following figure shows 4 phases getting generated using lfast_sysclk.

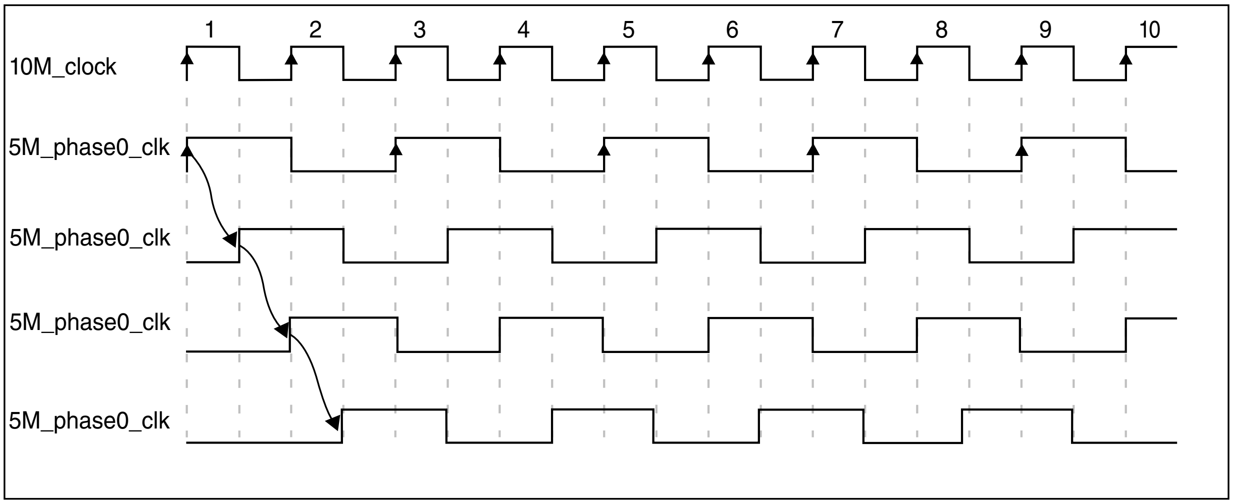

Figure 48-26. Slow speed 4 phases generation

48.10.3 Rx Controller Clocks

48.10.4 Clocking Module Requirements for High Speed Phases

The high speed phases are obtained from the PLL via the Clocking Module as shown in the following figure.

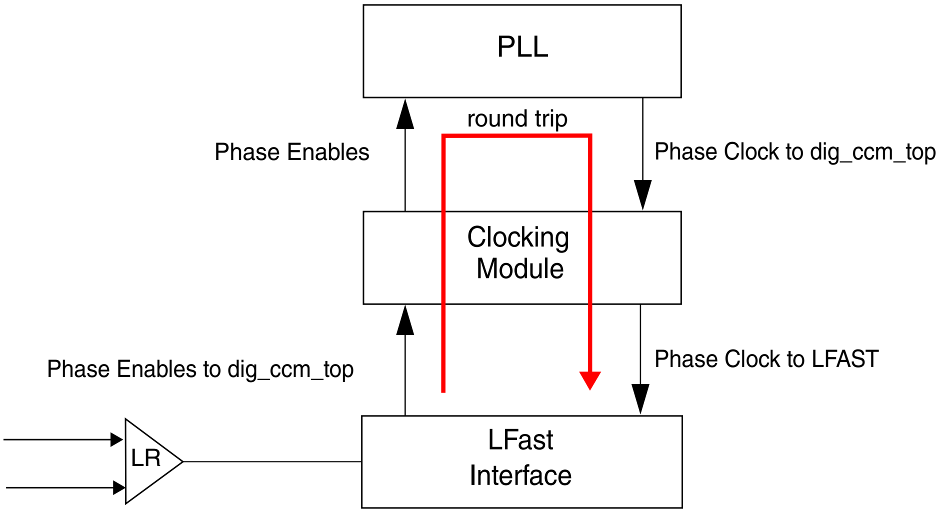

Figure 48-27. Clock enables and clock paths

The LFAST block will know which of the phases will be required for the different modes of operations. Therefore the LFAST block will provide enables and speed mode switches to the Clocking Module. The Clocking Module will use these signals to control the enables to the clock phases to reduce the power consumption.

The 8 phases of clocks signal are fed to the Clocking Module and muxed with the low speed phases. Depending on enables and data rate speed modes, the selected clocks are passed to the Sampler block and interface block.

COCR[PHSSEL] is connected to the Clocking Module, which selects whether 8 or 4 phases are selected for High Speed mode. It is only valid for high speed.

The routing of the 8 high speed phases to the interface is critical. Each clock phase will need to have the same routing track length from the PLL to the interface of Clocking Module. Each of the 8 high speed phases are separated by 45 degrees. This separation needs to be maintained from the phase generator to the interface.

48.10.5 Clock module requirements for low speed phases

48.10.5.1 Low speed

The low speed clock phases are generated in Clocking Module. These four phases are required to sample the data correctly at Low Speed mode. The LFAST block will provide the enable for the phases. The clock source for the low speed phases is SYSCLK. The Clocking Module block will need to generate the 4 phases of low speed clock 90 degrees apart.

Using the Low Speed mode on the interface allows the polyphase generation logic to be turned off and the requirement of high-speed-freq × 8 MHz clock from the PLL is not needed.

Table 48-14. Rx clocks summary

Rx Speed mode	Source
Low Speed	lfast_sysclk
High Speed	PLL

48.10.6 Tx Controller Clocks

48.10.6.1 Clocking Module Requirements for Speed Phases

The low speed phase 0 clock is sourced from the lfast_sysclk and the high speed phase 0 clock is sourced from the PLL. See the following table.

Table 48-15. Tx clocks summary

Tx Speed mode	Source
Low Speed	lfast_sysclk
High Speed	PLL

48.10.6.2 Transmit Clock Muxing

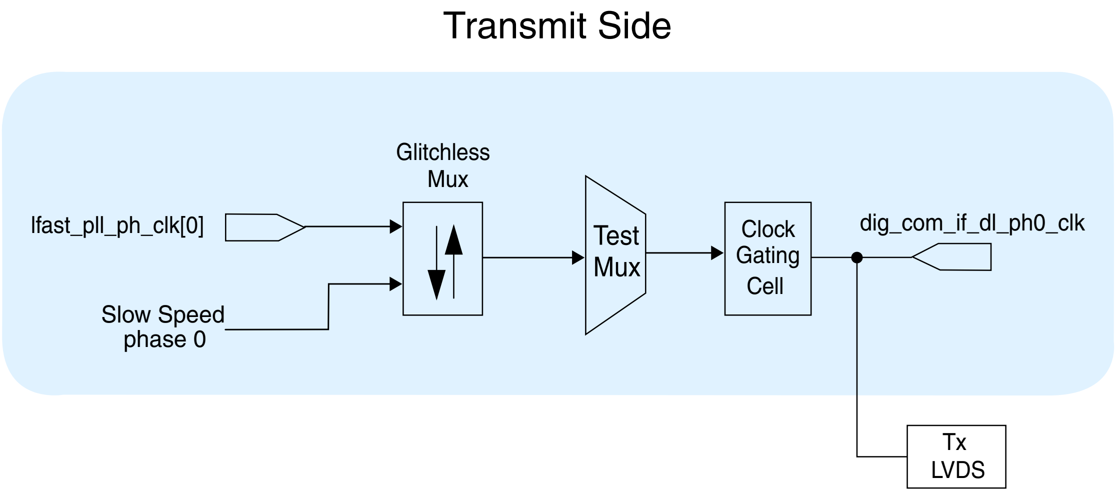

Figure 48-28. Transmit Clocks Muxing

48.10.6.3 Tx Request Clock Control

The Tx phase 0 clock is enabled when all the resets are negated.

Chapter 49
Serial Peripheral Interface (SPI)

49.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The serial peripheral interface (SPI) module provides a synchronous serial bus for communication between a chip and an external peripheral device.

49.1.1 Block Diagram

The block diagram of this module is as follows:

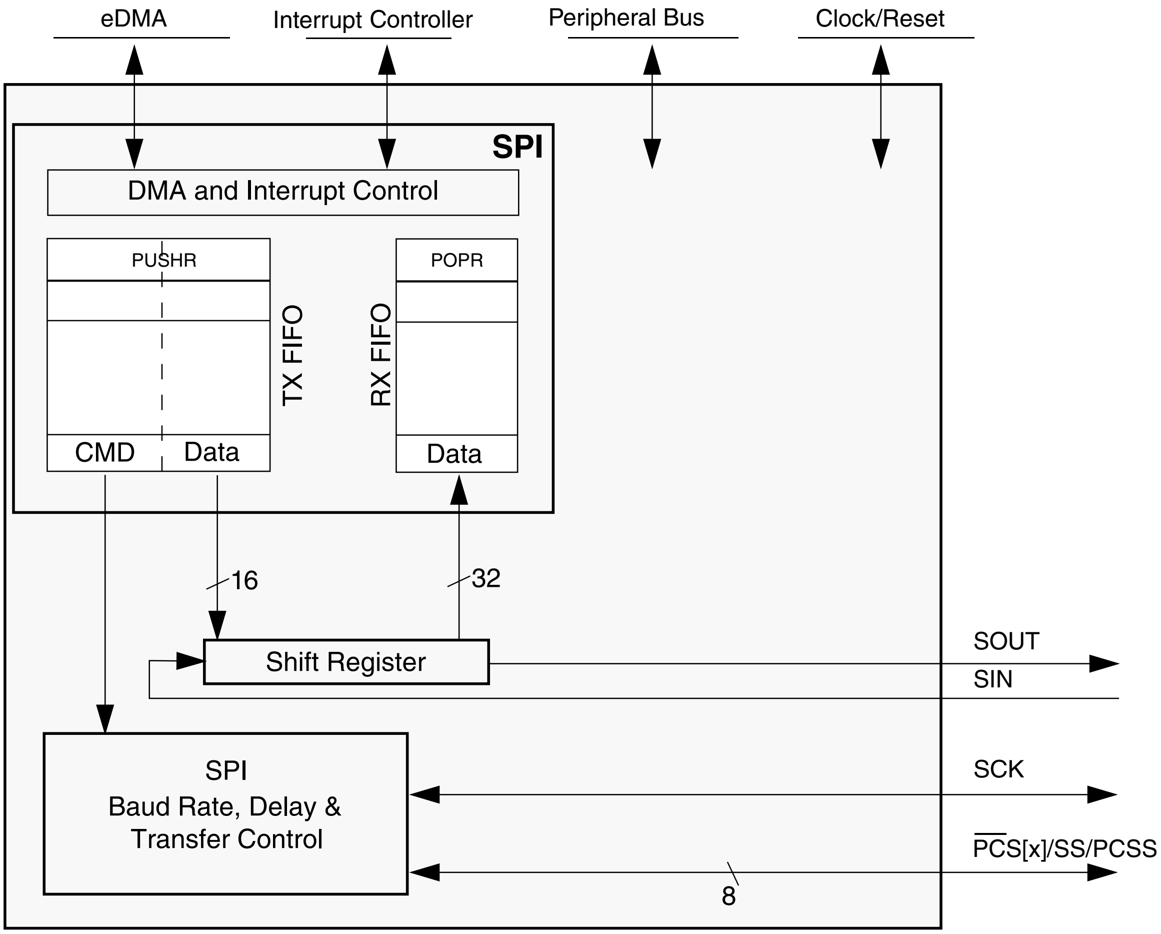

Figure 49-1. SPI Block Diagram

49.1.2 Features

The module supports the following features:

- Full-duplex, three-wire synchronous transfers
- Master mode
- Slave mode
- Data streaming operation in Slave mode with continuous slave selection
- Buffered transmit operation using the transmit first in first out (TX FIFO) with depth of 5 entries
- Buffered receive operation using the receive FIFO (RX FIFO) with depth of 5 entries
- TX and RX FIFOs can be disabled individually for low-latency updates to SPI queues

- Visibility into TX and RX FIFOs for ease of debugging
- Programmable transfer attributes on a per-frame basis:
    - four transfer attribute registers
    - Serial clock (SCK) with programmable polarity and phase
    - Various programmable delays
    - Programmable serial frame size: 4 to 16 bits
        - SPI frames longer than 16 bits can be supported using the continuous selection format.
    - Continuously held chip select capability
- 8 peripheral chip selects (PCSes), expandable to 256 with external demultiplexer
- Deglitching support for up to 128 peripheral chip selects (PCSes) with external demultiplexer
- DMA support for adding entries to TX FIFO and removing entries from RX FIFO:
    - TX FIFO is not full (TFFF)
    - RX FIFO is not empty (RFDF)
- Interrupt conditions:
    - End of Queue reached (EOQF)
    - TX FIFO is not full (TFFF)
    - Transfer of current frame complete (TCF)
    - Attempt to transmit with an empty Transmit FIFO (TFUF)
    - RX FIFO is not empty (RFDF)
    - Frame received while Receive FIFO is full (RFOF)
- Global interrupt request line
- Modified SPI transfer formats for communication with slower peripheral devices
- Power-saving architectural features:
    - Support for Stop mode

49.1.3 Interface configurations

49.1.3.1 SPI configuration

The Serial Peripheral Interface (SPI) configuration allows the module to send and receive serial data. This configuration allows the module to operate as a basic SPI block with internal FIFOs supporting external queue operation. Transmitted data and received data reside in separate FIFOs. The host CPU or a DMA controller read the received data from the Receive FIFO and write transmit data to the Transmit FIFO.

For queued operations, the SPI queues can reside in system RAM, external to the module. Data transfers between the queues and the module FIFOs are accomplished by a DMA controller or host CPU. The following figure shows a system example with DMA, SPI, and external queues in system RAM.

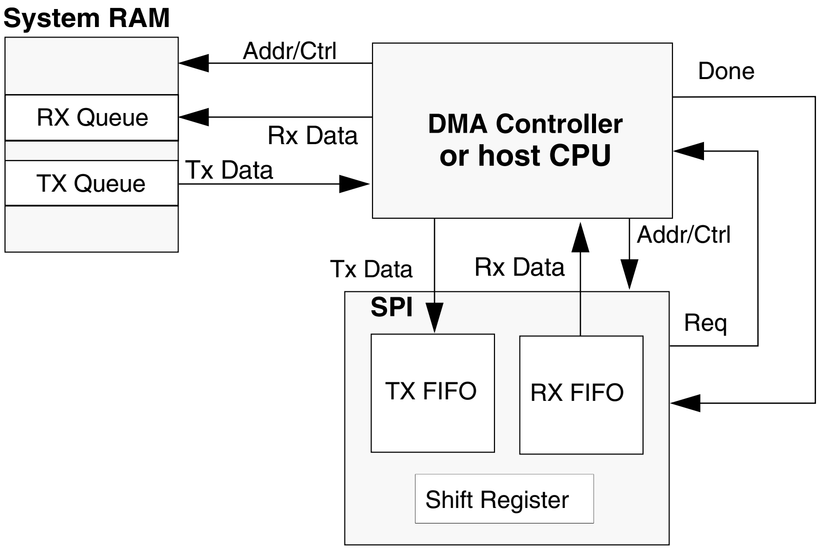

Figure 49-2. SPI with queues and DMA

49.1.4 Modes of Operation

The module supports the following modes of operation that can be divided into two categories:

- Module-specific modes:
  - Master mode

    - Slave mode
    - Module Disable mode
- Chip-specific modes:
    - External Stop mode
    - Debug mode

The module enters module-specific modes when the host writes a module register. The chip-specific modes are controlled by signals external to the module. The chip-specific modes are modes that a chip may enter in parallel to the block-specific modes.

49.1.4.1 Master Mode

Master mode allows the module to initiate and control serial communication. In this mode, these signals are controlled by the module and configured as outputs:

- SCK
- SOUT
- PCS[*x*]

49.1.4.2 Slave Mode

Slave mode allows the module to communicate with SPI bus masters. In this mode, the module responds to externally controlled serial transfers. The SCK signal and the PCS[0]/$\overline{\text{SS}}$ signals are configured as inputs and driven by an SPI bus master.

49.1.4.3 Module Disable Mode

The Module Disable mode can be used for chip power management. The clock to the non-memory mapped logic in the module can be stopped while in the Module Disable mode.

49.1.4.4 External Stop Mode

External Stop mode is used for chip power management. The module supports the Peripheral Bus Stop mode mechanism. When a request is made to enter External Stop mode, it acknowledges the request and completes the transfer that is in progress. When the module reaches the frame boundary, it signals that the protocol clock to the module may be shut off.

49.1.4.5 Debug Mode

Debug mode is used for system development and debugging. The MCR[FRZ] bit controls module behavior in the Debug mode:

- If the bit is set, the module stops all serial transfers, when the chip is in debug mode.
- If the bit is cleared, the chip debug mode has no effect on the module.

49.2 Module signal descriptions

This table describes the signals on the boundary of the module that may connect off chip (in alphabetical order).

Table 49-1. Module signal descriptions

Signal	Master mode	Slave mode	I/O
PCS0/$\overline{\text{SS}}$	Peripheral Chip Select 0 (O)	Slave Select (I)	I/O
PCS[1:3]	Peripheral Chip Selects 1–3	(Unused)	O
PCS4	Peripheral Chip Select 4	(Unused)	O
PCS5/ $\overline{\text{PCSS}}$	Peripheral Chip Select 5 /Peripheral Chip Select Strobe	(Unused)	O
PCS[6:7]	Peripheral Chip Selects 6–7	(Unused)	O
SCK	Serial Clock (O)	Serial Clock (I)	I/O
SIN	Serial Data In	Serial Data In	I
SOUT	Serial Data Out	Serial Data Out	O

49.2.1 PCS0/$\overline{\text{SS}}$—Peripheral Chip Select/Slave Select

Master mode: Peripheral Chip Select 0 (O)—Selects an SPI slave to receive data transmitted from the module.

Slave mode: Slave Select (I)—Selects the module to receive data transmitted from an SPI master.

49.2.2 PCS1–PCS3—Peripheral Chip Selects 1–3

Master mode: Peripheral Chip Selects 1–3 (O)—Select an SPI slave to receive data transmitted by the module.

Slave mode: Unused

49.2.3 PCS4—Peripheral Chip Select 4

Master mode: Peripheral Chip Select 4 (O)—Selects an SPI slave to receive data transmitted by the module.

Slave mode: Unused

49.2.4 PCS5/$\overline{\text{PCSS}}$—Peripheral Chip Select 5/Peripheral Chip Select Strobe

Master mode:

- Peripheral Chip Select 5 (O)—Used only when the peripheral-chip-select strobe is disabled (MCR[PCSSE]). Selects an SPI slave to receive data transmitted by the module.
- Peripheral Chip Select Strobe (O)—Used only when the peripheral-chip-select strobe is enabled (MCR[PCSSE]). Strobes an off-module peripheral-chip-select demultiplexer, which decodes the module's PCS signals other than PCS5, preventing glitches on the demultiplexer outputs.

Slave mode: Unused

49.2.5 PCS6–PCS7—Peripheral Chip Selects 6–7

Master mode: Peripheral Chip Selects 6–7 (O)—Select an SPI slave to receive data transmitted by the module.

Slave mode: Unused

49.2.6 SCK—Serial Clock

Master mode: Serial Clock (O)—Supplies a clock signal from the module to SPI slaves.

Slave mode: Serial Clock (I)—Supplies a clock signal to the module from an SPI master.

49.2.7 SIN—Serial Input

Master mode: Serial Input (I)—Receives serial data.

Slave mode: Serial Input (I)—Receives serial data.

49.2.8 SOUT—Serial Output

Master mode: Serial Output (O)—Transmits serial data.

Slave mode: Serial Output (O)—Transmits serial data.

NOTE

Serial Data Out output buffers are controlled through SIU (or SIUL) and cannot be controlled through the module.

49.3 Memory Map/Register Definition

Register accesses to memory addresses that are reserved or undefined result in a transfer error. Write access to the POPR and RXFRn also results in a transfer error.

SPI memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	Module Configuration Register (SPI_MCR)	32	R/W	0000_4001h	49.3.1/1584
8	Transfer Count Register (SPI_TCR)	32	R/W	0000_0000h	49.3.2/1587
C	Clock and Transfer Attributes Register (In Master Mode) (SPI_CTAR0)	32	R/W	7800_0000h	49.3.3/1587
C	Clock and Transfer Attributes Register (In Slave Mode) (SPI_CTAR0_SLAVE)	32	R/W	7800_0000h	49.3.4/1592
10	Clock and Transfer Attributes Register (In Master Mode) (SPI_CTAR1)	32	R/W	7800_0000h	49.3.3/1587
14	Clock and Transfer Attributes Register (In Master Mode) (SPI_CTAR2)	32	R/W	7800_0000h	49.3.3/1587
18	Clock and Transfer Attributes Register (In Master Mode) (SPI_CTAR3)	32	R/W	7800_0000h	49.3.3/1587
2C	Status Register (SPI_SR)	32	R/W	0200_0000h	49.3.5/1594
30	DMA/Interrupt Request Select and Enable Register (SPI_RSER)	32	R/W	0000_0000h	49.3.6/1597

Table continues on the next page...

SPI memory map (continued)

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
34	PUSH TX FIFO Register In Master Mode (SPI_PUSHR)	32	R/W	0000_0000h	49.3.7/1599
34	PUSH TX FIFO Register In Slave Mode (SPI_PUSHR_SLAVE)	32	R/W	0000_0000h	49.3.8/1600
38	POP RX FIFO Register (SPI_POPR)	32	R	0000_0000h	49.3.9/1601
3C	Transmit FIFO Registers (SPI_TXFR0)	32	R	0000_0000h	49.3.10/ 1602
40	Transmit FIFO Registers (SPI_TXFR1)	32	R	0000_0000h	49.3.10/ 1602
44	Transmit FIFO Registers (SPI_TXFR2)	32	R	0000_0000h	49.3.10/ 1602
48	Transmit FIFO Registers (SPI_TXFR3)	32	R	0000_0000h	49.3.10/ 1602
4C	Transmit FIFO Registers (SPI_TXFR4)	32	R	0000_0000h	49.3.10/ 1602
7C	Receive FIFO Registers (SPI_RXFR0)	32	R	0000_0000h	49.3.11/ 1602
80	Receive FIFO Registers (SPI_RXFR1)	32	R	0000_0000h	49.3.11/ 1602
84	Receive FIFO Registers (SPI_RXFR2)	32	R	0000_0000h	49.3.11/ 1602
88	Receive FIFO Registers (SPI_RXFR3)	32	R	0000_0000h	49.3.11/ 1602
8C	Receive FIFO Registers (SPI_RXFR4)	32	R	0000_0000h	49.3.11/ 1602

49.3.1 Module Configuration Register (SPI_MCR)

Contains bits to configure various attributes associated with the module operations. The HALT and MDIS bits can be changed at any time, but the effect takes place only on the next frame boundary. Only the HALT and MDIS bits in the MCR can be changed, while the module is in the Running state.

Address: 0h base + 0h offset = 0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	MSTR	CONT_SCKE	DCONF		FRZ	MTFE	PCSSE	ROOE	PCSIS							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	Reserved	MDIS	DIS_ TXF	DIS_ RXF	0	0	SMPL_PT		0					Reserved	Reserved	HALT
W					CLR_TXF	CLR_RXF										
Reset	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	1

SPI_MCR field descriptions

Field	Description
0 MSTR	Master/Slave Mode Select Enables either Master mode (if supported) or Slave mode (if supported) operation. 0 Enables Slave mode 1 Enables Master mode
1 CONT_SCKE	Continuous SCK Enable Enables the Serial Communication Clock (SCK) to run continuously.

Table continues on the next page...

SPI_MCR field descriptions (continued)

Field	Description
	0 Continuous SCK disabled. 1 Continuous SCK enabled.
2–3 DCONF	SPI Configuration. Selects among the different configurations of the module. 00 SPI 01 Reserved 10 Reserved 11 Reserved
4 FRZ	Freeze Enables transfers to be stopped on the next frame boundary when the device enters Debug mode. 0 Do not halt serial transfers in Debug mode. 1 Halt serial transfers in Debug mode.
5 MTFE	Modified Transfer Format Enable Enables a modified transfer format to be used. 0 Modified SPI transfer format disabled. 1 Modified SPI transfer format enabled.
6 PCSSE	Peripheral Chip Select Strobe Enable Enables the PCS5/ $\overline{\text{PCSS}}$ to operate as a PCS Strobe output signal. 0 PCS5/ $\overline{\text{PCSS}}$ is used as the Peripheral Chip Select[5] signal. 1 PCS5/ $\overline{\text{PCSS}}$ is used as an active-low PCS Strobe signal.
7 ROOE	Receive FIFO Overflow Overwrite Enable In the RX FIFO overflow condition, configures the module to ignore the incoming serial data or overwrite existing data. If the RX FIFO is full and new data is received, the data from the transfer, generating the overflow, is ignored or shifted into the shift register. 0 Incoming data is ignored. 1 Incoming data is shifted into the shift register.
8–15 PCSIS	Peripheral Chip Select x Inactive State Determines the inactive state of PCSx when the module is in Master Mode. This field has no effect when the module is in Slave Mode. The Slave Select input to the module in slave mode is always Active Low. **NOTE:** The effect of this bit only takes place when module is enabled. Ensure that this bit is configured correctly before enabling the DSPI interface. 0 The inactive state of PCSx is low. 1 The inactive state of PCSx is high.
16 Reserved	This field is reserved.
17 MDIS	Module Disable Allows the clock to be stopped to the non-memory mapped logic in the module effectively putting it in a software-controlled power-saving state. The reset value of the MDIS bit is parameterized, with a default

Table continues on the next page...

SPI_MCR field descriptions (continued)

Field	Description
	reset value of 1. When the module is used in Slave Mode, it is recommended to leave this bit 0, because a slave doesn't have control over master transactions. 0 Enables the module clocks. 1 Allows external logic to disable the module clocks.
18 DIS_TXF	Disable Transmit FIFO When the TX FIFO is disabled, the transmit part of the module operates as a simplified double-buffered SPI. This bit can be written only when the MDIS bit is cleared. 0 TX FIFO is enabled. 1 TX FIFO is disabled.
19 DIS_RXF	Disable Receive FIFO When the RX FIFO is disabled, the receive part of the module operates as a simplified double-buffered SPI. This bit can only be written when the MDIS bit is cleared. 0 RX FIFO is enabled. 1 RX FIFO is disabled.
20 CLR_TXF	Clear TX FIFO Flushes the TX FIFO. Writing a 1 to CLR_TXF clears the TX FIFO Counter. The CLR_TXF bit is always read as zero. 0 Do not clear the TX FIFO counter. 1 Clear the TX FIFO counter.
21 CLR_RXF	CLR_RXF Flushes the RX FIFO. Writing a 1 to CLR_RXF clears the RX Counter. The CLR_RXF bit is always read as zero. 0 Do not clear the RX FIFO counter. 1 Clear the RX FIFO counter.
22–23 SMPL_PT	Sample Point Controls when the module master samples SIN in Modified Transfer Format. This field is valid only when CPHA bit in CTARn[CPHA] is 0. 00 0 protocol clock cycles between SCK edge and SIN sample 01 1 protocol clock cycle between SCK edge and SIN sample 10 2 protocol clock cycles between SCK edge and SIN sample 11 Reserved
24–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
29 Reserved	This field is reserved.
30 Reserved	This field is reserved.
31 HALT	Halt The HALT bit starts and stops frame transfers. See Start and Stop of Module transfers

Table continues on the next page...

SPI_MCR field descriptions (continued)

Field	Description
	0 Start transfers. 1 Stop transfers.

49.3.2 Transfer Count Register (SPI_TCR)

TCR contains a counter that indicates the number of SPI transfers made. The transfer counter is intended to assist in queue management. Do not write the TCR when the module is in the Running state.

Address: 0h base + 8h offset = 8h

</table>

SPI_TCR field descriptions

Field	Description
0–15 SPI_TCNT	SPI Transfer Counter Counts the number of SPI transfers the module makes. The SPI_TCNT field increments every time the last bit of an SPI frame is transmitted. A value written to SPI_TCNT presets the counter to that value. SPI_TCNT is reset to zero at the beginning of the frame when the CTCNT field is set in the executing SPI command. The Transfer Counter wraps around; incrementing the counter past 65535 resets the counter to zero.
16–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

49.3.3 Clock and Transfer Attributes Register (In Master Mode) (SPI_CTAR*n*)

CTAR registers are used to define different transfer attributes. Do not write to the CTAR registers while the module is in the Running state.

In Master mode, the CTAR registers define combinations of transfer attributes such as frame size, clock phase and polarity, data bit ordering, baud rate, and various delays. In slave mode, a subset of the bitfields in CTAR0 are used to set the slave transfer attributes.

When the module is configured as an SPI master, the CTAS field in the command portion of the TX FIFO entry selects which of the CTAR registers is used. When the module is configured as an SPI bus slave, it uses the CTAR0 register.

Address: 0h base + Ch offset + (4d × i), where i=0d to 3d

SPI_CTAR*n* field descriptions

Field	Description
0 DBR	Double Baud Rate Doubles the effective baud rate of the Serial Communications Clock (SCK). This field is used only in master mode. It effectively halves the Baud Rate division ratio, supporting faster frequencies, and odd division ratios for the Serial Communications Clock (SCK). When the DBR bit is set, the duty cycle of the Serial Communications Clock (SCK) depends on the value in the Baud Rate Prescaler and the Clock Phase bit as listed in the following table. See the BR field description for details on how to compute the baud rate. **Table 49-2. SPI SCK Duty Cycle** (see below) 0 The baud rate is computed normally with a 50/50 duty cycle. 1 The baud rate is doubled with the duty cycle depending on the Baud Rate Prescaler.
1–4 FMSZ	Frame Size

Table 49-2. SPI SCK Duty Cycle

DBR	CPHA	PBR	SCK Duty Cycle
0	any	any	50/50
1	0	00	50/50
1	0	01	33/66
1	0	10	40/60
1	0	11	43/57
1	1	00	50/50
1	1	01	66/33
1	1	10	60/40
1	1	11	57/43

Table continues on the next page...

SPI_CTAR*n* field descriptions (continued)

Field	Description
	The number of bits transferred per frame is equal to the FMSZ value plus 1. Regardless of the transmission mode, the minimum valid frame size value is 4. There is a constraint on the minimum allowable Frame size, which depends on the ratio of the Register Read/Write clock to the Protocol clock. The minimum Frame size (FMSZ + 1) is determined by the following equation. Upper Ceiling must be applied for non-integer values. Minimum Frame Size = ((4 x f_p) + (3 x f_r)) / (n x f_r) f_p = Protocol clock frequency f_r = Register interface clock frequency n = (PBR x BR) / (1 + DBR) = Multiple of protocol clock required to get Baud (SCK) Clock However, the minimum frame size can never be less than 4. There is no constraint on the maximum programmable frame size. Also note that \`fp' can be equal to, less than or greater than \`fr' purely based on user requirement.
5 CPOL	Clock Polarity Selects the inactive state of the Serial Communications Clock (SCK). This bit is used in both master and slave mode. For successful communication between serial devices, the devices must have identical clock polarities. When the Continuous Selection Format is selected, switching between clock polarities without stopping the module can cause errors in the transfer due to the peripheral device interpreting the switch of clock polarity as a valid clock edge. **NOTE:** In case of Continuous SCK mode, when the module goes in low power mode(disabled), inactive state of SCK is not guaranted. 0 The inactive state value of SCK is low. 1 The inactive state value of SCK is high.
6 CPHA	Clock Phase Selects which edge of SCK causes data to change and which edge causes data to be captured. This bit is used in both master and slave mode. For successful communication between serial devices, the devices must have identical clock phase settings. In Continuous SCK mode, the bit value is ignored and the transfers are done as if the CPHA bit is set to 1. 0 Data is captured on the leading edge of SCK and changed on the following edge. 1 Data is changed on the leading edge of SCK and captured on the following edge.
7 LSBFE	LSB First Specifies whether the LSB or MSB of the frame is transferred first. 0 Data is transferred MSB first. 1 Data is transferred LSB first.
8–9 PCSSCK	PCS to SCK Delay Prescaler Selects the prescaler value for the delay between assertion of PCS and the first edge of the SCK. See the CSSCK field description for information on how to compute the PCS to SCK Delay. Refer PCS to SCK Delay (t_{CSC}) for more details. 00 PCS to SCK Prescaler value is 1. 01 PCS to SCK Prescaler value is 3. 10 PCS to SCK Prescaler value is 5. 11 PCS to SCK Prescaler value is 7.

Table continues on the next page...

SPI_CTAR*n*_SLAVE field descriptions

Field	Description
0 Reserved	Always write the reset value to this field. This field is reserved.
1–4 FMSZ	Frame Size The number of bits transfered per frame is equal to the FMSZ field value plus 1. Note that the minimum valid value of frame size is 4.
5 CPOL	Clock Polarity Selects the inactive state of the Serial Communications Clock (SCK). **NOTE:** In case of Continuous SCK mode, when the module goes in low power mode(disabled), inactive state of SCK is not guaranted. 0 The inactive state value of SCK is low. 1 The inactive state value of SCK is high.
6 CPHA	Clock Phase Selects which edge of SCK causes data to change and which edge causes data to be captured. This bit is used in both master and slave mode. For successful communication between serial devices, the devices must have identical clock phase settings. In Continuous SCK mode, the bit value is ignored and the transfers are done as if the CPHA bit is set to 1. 0 Data is captured on the leading edge of SCK and changed on the following edge. 1 Data is changed on the leading edge of SCK and captured on the following edge.
7–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 Reserved	This field is reserved.
10–31 Reserved	This field is reserved.

49.3.5 Status Register (SPI_SR)

SR contains status and flag bits. The bits reflect the status of the module and indicate the occurrence of events that can generate interrupt or DMA requests. Software can clear flag bits in the SR by writing a 1 to them. Writing a 0 to a flag bit has no effect. This register may not be writable in Module Disable mode due to the use of power saving mechanisms.

Address: 0h base + 2Ch offset = 2Ch

SPI_SR field descriptions

Field	Description
0 TCF	Transfer Complete Flag Indicates that all bits in a frame have been shifted out. TCF remains set until it is cleared by writing a 1 to it. 0 Transfer not complete. 1 Transfer complete.
1 TXRXS	TX and RX Status Reflects the run status of the module. 0 Transmit and receive operations are disabled (The module is in Stopped state). 1 Transmit and receive operations are enabled (The module is in Running state).

Table continues on the next page...

SPI_SR field descriptions (continued)

Field	Description
2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 EOQF	End of Queue Flag Indicates that the last entry in a queue has been transmitted when the module is in Master mode. The EOQF bit is set when the TX FIFO entry has the EOQ bit set in the command halfword and the end of the transfer is reached. The EOQF bit remains set until cleared by writing a 1 to it. When the EOQF bit is set, the TXRXS bit is automatically cleared. 0 EOQ is not set in the executing command. 1 EOQ is set in the executing SPI command.
4 TFUF	Transmit FIFO Underflow Flag Indicates an underflow condition in the TX FIFO. The transmit underflow condition is detected only for SPI blocks operating in Slave mode and SPI configuration. TFUF is set when the TX FIFO of the module operating in SPI Slave mode is empty and an external SPI master initiates a transfer. The TFUF bit remains set until cleared by writing 1 to it. 0 No TX FIFO underflow. 1 TX FIFO underflow has occurred.
5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6 TFFF	Transmit FIFO Fill Flag Provides a method for the module to request more entries to be added to the TX FIFO. The TFFF bit is set while the TX FIFO is not full. The TFFF bit can be cleared by writing 1 to it or by acknowledgement from the DMA controller to the TX FIFO full request. 0 TX FIFO is full. 1 TX FIFO is not full.
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 RFOF	Receive FIFO Overflow Flag Indicates an overflow condition in the RX FIFO. The field is set when the RX FIFO and shift register are full and a transfer is initiated. The bit remains set until it is cleared by writing a 1 to it. 0 No Rx FIFO overflow. 1 Rx FIFO overflow has occurred.
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

SPI_SR field descriptions (continued)

Field	Description
14 RFDF	Receive FIFO Drain Flag Provides a method for the module to request that entries be removed from the RX FIFO. The bit is set while the RX FIFO is not empty. The RFDF bit can be cleared by writing 1 to it or by acknowledgement from the DMA controller when the RX FIFO is empty. 0 RX FIFO is empty. 1 RX FIFO is not empty.
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–19 TXCTR	TX FIFO Counter Indicates the number of valid entries in the TX FIFO. The TXCTR is incremented every time the PUSHR is written. The TXCTR is decremented every time an SPI command is executed and the SPI data is transferred to the shift register.
20–23 TXNXTPTR	Transmit Next Pointer Indicates which TX FIFO entry is transmitted during the next transfer. The TXNXTPTR field is updated every time SPI data is transferred from the TX FIFO to the shift register.
24–27 RXCTR	RX FIFO Counter Indicates the number of entries in the RX FIFO. The RXCTR is decremented every time the POPR is read. The RXCTR is incremented every time data is transferred from the shift register to the RX FIFO.
28–31 POPNXTPTR	Pop Next Pointer Contains a pointer to the RX FIFO entry to be returned when the POPR is read. The POPNXTPTR is updated when the POPR is read.

49.3.6 DMA/Interrupt Request Select and Enable Register (SPI_RSER)

RSER controls DMA and interrupt requests. Do not write to the RSER while the module is in the Running state.

Address: 0h base + 30h offset = 30h

13 Reserved	Always write the reset value to this field. This field is reserved.
14 RFDF_RE	Receive FIFO Drain Request Enable Enables the RFDF flag in the SR to generate a request. The RFDF_DIRS bit selects between generating an interrupt request or a DMA request. 0 RFDF interrupt or DMA requests are disabled. 1 RFDF interrupt or DMA requests are enabled.
15 RFDF_DIRS	Receive FIFO Drain DMA or Interrupt Request Select

Table continues on the next page...

SPI_RSER field descriptions (continued)

Field	Description
	Selects between generating a DMA request or an interrupt request. When the RFDF flag bit in the SR is set, and the RFDF_RE bit in the RSER is set, the RFDF_DIRS bit selects between generating an interrupt request or a DMA request. 0 Interrupt request. 1 DMA request.
16 Reserved	Always write the reset value to this field. This field is reserved.
17 Reserved	Always write the reset value to this field. This field is reserved.
18–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

49.3.7 PUSH TX FIFO Register In Master Mode (SPI_PUSHR)

Specifies data to be transferred to the TX FIFO. An 8- or 16-bit write access transfers all 32 bits to the TX FIFO. In Master mode, the register transfers 16 bits of data and 16 bits of command information. A read access of PUSHR returns the topmost TX FIFO entry.

When the module is disabled, writing to this register does not update the FIFO. Therefore, any reads performed while the module is disabled return the last PUSHR write performed while the module was still enabled.

Address: 0h base + 34h offset = 34h

SPI_PUSHR field descriptions

Field	Description
0 CONT	Continuous Peripheral Chip Select Enable Selects a continuous selection format. The bit is used in SPI Master mode. The bit enables the selected PCS signals to remain asserted between transfers. 0 Return PCSn signals to their inactive state between transfers. 1 Keep PCSn signals asserted between transfers.
1–3 CTAS	Clock and Transfer Attributes Select Selects which CTAR to use in master mode to specify the transfer attributes for the associated SPI frame. In SPI Slave mode, CTAR0 is used. See the chip specific section for details to determine how many CTARs this device has. You should not program a value in this field for a register that is not present. 000 CTAR0 001 CTAR1 010 CTAR2 011 CTAR3 100 Reserved 101 Reserved 110 Reserved 111 Reserved
4 EOQ	End Of Queue Host software uses this bit to signal to the module that the current SPI transfer is the last in a queue. At the end of the transfer, the EOQF bit in the SR is set. 0 The SPI data is not the last data to transfer. 1 The SPI data is the last data to transfer.
5 CTCNT	Clear Transfer Counter Clears the TCNT field in the TCR register. The TCNT field is cleared before the module starts transmitting the current SPI frame. 0 Do not clear the TCR[TCNT] field. 1 Clear the TCR[TCNT] field.
6–7 Reserved	Always write the reset value to this field. This field is reserved.
8–15 PCS	PCS Select which PCS signals are to be asserted for the transfer. Refer to the chip-specific SPI information for the number of PCS signals used in this chip. 0 Negate the PCS[x] signal. 1 Assert the PCS[x] signal.
16–31 TXDATA	Transmit Data Holds SPI data to be transferred according to the associated SPI command.

49.3.8 PUSH TX FIFO Register In Slave Mode (SPI_PUSHR_SLAVE)

Specifies data to be transferred to the TX FIFO in slave mode. An 8- or 16-bit write access to PUSHR transfers the 16-bit TXDATA field to the TX FIFO.

Address: 0h base + 34h offset = 34h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPI_PUSHR_SLAVE field descriptions

Field	Description
0–15 Reserved	This field is reserved.
16–31 TXDATA	Transmit Data Holds SPI data to be transferred according to the associated SPI command.

49.3.9 POP RX FIFO Register (SPI_POPR)

POPR is used to read the RX FIFO. Eight- or sixteen-bit read accesses to the POPR have the same effect on the RX FIFO as 32-bit read accesses. A write to this register will generate a Transfer Error.

Address: 0h base + 38h offset = 38h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPI_POPR field descriptions

Field	Description
0–31 RXDATA	Received Data Contains the SPI data from the RX FIFO entry to which the Pop Next Data Pointer points.

49.3.10 Transmit FIFO Registers (SPI_TXFR*n*)

TXFRn registers provide visibility into the TX FIFO for debugging purposes. Each register is an entry in the TX FIFO. The registers are read-only and cannot be modified. Reading the TXFRx registers does not alter the state of the TX FIFO.

Address: 0h base + 3Ch offset + (4d × i), where i=0d to 4d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPI_TXFR*n* field descriptions

Field	Description
0–15 TXCMD_ TXDATA	Transmit Command or Transmit Data In Master mode the TXCMD field contains the command that sets the transfer attributes for the SPI data. In Slave mode, this field is reserved.
16–31 TXDATA	Transmit Data Contains the SPI data to be shifted out.

49.3.11 Receive FIFO Registers (SPI_RXFR*n*)

RXFRn provide visibility into the RX FIFO for debugging purposes. Each register is an entry in the RX FIFO. The RXFR registers are read-only. Reading the RXFRx registers does not alter the state of the RX FIFO. The field MCR[MDIS] must be 0 when RXFR is read.

NOTE

Accessing the SPI_RXFRn register will cause all subsequent SPI register accesses to be incorrect. Hence, the user should only read received data through, SPI_POPR.

Address: 0h base + 7Ch offset + (4d × i), where i=0d to 4d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPI_RXFR*n* field descriptions

Field	Description
0–31 RXDATA	Receive Data Contains the received SPI data.

49.4 Functional description

The module supports full-duplex, synchronous serial communications between chips and peripheral devices. The SPI configuration transfers data serially using a shift register and a selection of programmable transfer attributes.

The module has the following configuration

- The SPI Configuration in which the module operates as a basic SPI or a queued SPI.

The DCONF field in the Module Configuration Register (MCR) determines the module Configuration. SPI configuration is selected when DCONF within SPIx_MCR is 0b00.

The CTARn registers hold clock and transfer attributes. The SPI configuration allows to select which CTAR to use on a frame by frame basis by setting a field in the SPI command.

See Clock and Transfer Attributes Register (In Master Mode) (SPI_CTAR*n*) for information on the fields of CTAR registers.

Typical master to slave connections are shown in the following figure. When a data transfer operation is performed, data is serially shifted a predetermined number of bit positions. Because the modules are linked, data is exchanged between the master and the slave. The data that was in the master shift register is now in the shift register of the slave, and vice versa. At the end of a transfer, the Transfer Control Flag(TCF) bit in the Shift Register(SR) is set to indicate a completed frame transfer.

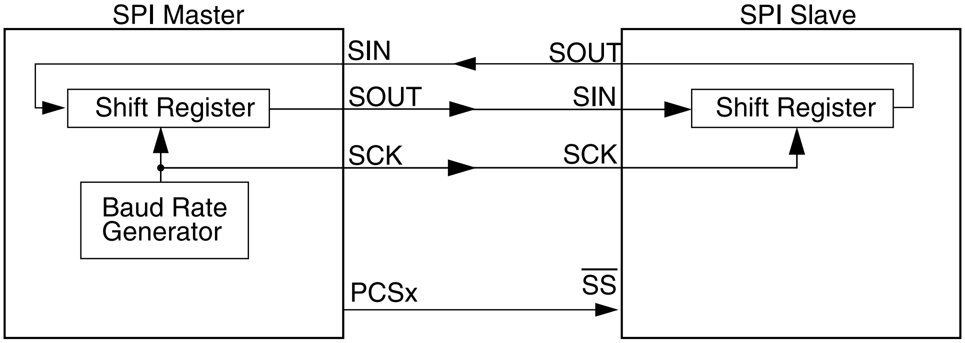

Figure 49-3. Serial protocol overview

Generally, more than one slave device can be connected to the module master. 8 Peripheral Chip Select (PCS) signals of the module masters can be used to select which of the slaves to communicate with. Refer to the chip specific section for details on the number of PCS signals used in this chip.

The SPI configuration shares transfer protocol and timing properties which are described independently of the configuration in Transfer formats. The transfer rate and delay settings are described in Module baud rate and clock delay generation.

49.4.1 Start and Stop of module transfers

The module has two operating states: Stopped and Running. Both the states are independent of it's configuration. The default state of the module is Stopped. In the Stopped state, no serial transfers are initiated in Master mode and no transfers are responded to in Slave mode. The Stopped state is also a safe state for writing the various configuration registers of the module without causing undetermined results. In the Running state serial transfers take place.

The TXRXS bit in the SR indicates the state of module. The bit is set if the module is in Running state.

The module starts or transitions to Running when all of the following conditions are true:

- SR[EOQF] bit is clear
- Chip is not in the Debug mode or the MCR[FRZ] bit is clear
- MCR[HALT] bit is clear

The module stops or transitions from Running to Stopped after the current frame when any one of the following conditions exist:

- SR[EOQF] bit is set
- Chip in the Debug mode and the MCR[FRZ] bit is set
- MCR[HALT] bit is set

State transitions from Running to Stopped occur on the next frame boundary if a transfer is in progress, or immediately if no transfers are in progress.

49.4.2 Serial Peripheral Interface (SPI) configuration

The SPI configuration transfers data serially using a shift register and a selection of programmable transfer attributes. The module is in SPI configuration when the DCONF field in the MCR is 0b00. The SPI frames can be 32 bits long. The host CPU or a DMA controller transfers the SPI data from the external to the module RAM queues to a TX FIFO buffer. The received data is stored in entries in the RX FIFO buffer. The host CPU or the DMA controller transfers the received data from the RX FIFO to memory external to the module. The operation of FIFO buffers is described in the following sections:

- Transmit First In First Out (TX FIFO) buffering mechanism
- Transmit First In First Out (TX FIFO) buffering mechanism
- Receive First In First Out (RX FIFO) buffering mechanism

The interrupt and DMA request conditions are described in Interrupts/DMA requests.

The SPI configuration supports two block-specific modes—Master mode and Slave mode.In Master mode the module initiates and controls the transfer according to the fields of the executing SPI Command. In Slave mode, the module responds only to transfers initiated by a bus master external to it and the SPI command field space is reserved.

49.4.2.1 Master mode

In SPI Master mode, the module initiates the serial transfers by controlling the SCK and the PCS signals. The executing SPI Command determines which CTARs will be used to set the transfer attributes and which PCS signals to assert. The command field also contains various bits that help with queue management and transfer protocol. See PUSH TX FIFO Register In Master Mode (SPI_PUSHR) for details on the SPI command fields. The data in the executing TX FIFO entry is loaded into the shift register and shifted out on the Serial Out (SOUT) pin. In SPI Master mode, each SPI frame to be transmitted has a command associated with it, allowing for transfer attribute control on a frame by frame basis.

49.4.2.2 Slave mode

In SPI Slave mode the module responds to transfers initiated by an SPI bus master. It does not initiate transfers. Certain transfer attributes such as clock polarity, clock phase, and frame size must be set for successful communication with an SPI master. The SPI Slave mode transfer attributes are set in the CTAR0. The data is shifted out with MSB first. Shifting out of LSB is not supported in this mode.

49.4.2.3 FIFO disable operation

The FIFO disable mechanisms allow SPI transfers without using the TX FIFO or RX FIFO. The module operates as a double-buffered simplified SPI when the FIFOs are disabled. The Transmit and Receive side of the FIFOs are disabled separately. Setting the MCR[DIS_TXF] bit disables the TX FIFO, and setting the MCR[DIS_RXF] bit disables the RX FIFO.

The FIFO disable mechanisms are transparent to the user and to host software. Transmit data and commands are written to the PUSHR and received data is read from the POPR.

When the TX FIFO is disabled:

- SR[TFFF], SR[TFUF] and SR[TXCTR] behave as if there is a one-entry FIFO
- The contents of TXFRs, SR[TXNXTPTR] are undefined

Similarly, when the RX FIFO is disabled, the RFDF, RFOF, and RXCTR fields in the SR behave as if there is a one-entry FIFO, but the contents of the RXFR registers and POPNXTPTR are undefined.

49.4.2.4 Transmit First In First Out (TX FIFO) buffering mechanism

The TX FIFO functions as a buffer of SPI data for transmission. The TX FIFO holds 5 words, each consisting of SPI data. The number of entries in the TX FIFO is device-specific. SPI data is added to the TX FIFO by writing to the Data Field of module PUSH FIFO Register (PUSHR). TX FIFO entries can only be removed from the TX FIFO by being shifted out or by flushing the TX FIFO.

The TX FIFO Counter field (TXCTR) in the module Status Register (SR) indicates the number of valid entries in the TX FIFO. The TXCTR is updated every time a 8- or 16-bit write takes place to PUSHR[TXDATA] or SPI data is transferred into the shift register from the TX FIFO.

The TXNXTPTR field indicates the TX FIFO Entry that will be transmitted during the next transfer. The TXNXTPTR field is incremented every time SPI data is transferred from the TX FIFO to the shift register. The maximum value of the field is equal to the maximum implemented TXFR number and it rolls over after reaching the maximum.

49.4.2.4.1 Filling the TX FIFO

Host software or other intelligent blocks can add (push) entries to the TX FIFO by writing to the PUSHR. When the TX FIFO is not full, the TX FIFO Fill Flag (TFFF) in the SR is set. The TFFF bit is cleared when TX FIFO is full and the DMA controller indicates that a write to PUSHR is complete. Writing a '1' to the TFFF bit also clears it. The TFFF can generate a DMA request or an interrupt request. See Transmit FIFO Fill Interrupt or DMA Request for details.

The module ignores attempts to push data to a full TX FIFO, and the state of the TX FIFO does not change and no error condition is indicated.

49.4.2.4.2 Draining the TX FIFO

The TX FIFO entries are removed (drained) by shifting SPI data out through the shift register. Entries are transferred from the TX FIFO to the shift register and shifted out as long as there are valid entries in the TX FIFO. Every time an entry is transferred from the TX FIFO to the shift register, the TX FIFO Counter decrements by one. At the end of a transfer, the TCF bit in the SR is set to indicate the completion of a transfer. The TX FIFO is flushed by writing a '1' to the CLR_TXF bit in MCR.

If an external bus master initiates a transfer with a module slave while the slave's TX FIFO is empty, the Transmit FIFO Underflow Flag (TFUF) in the slave's SR is set. See Transmit FIFO Underflow Interrupt Request for details.

49.4.2.5 Receive First In First Out (RX FIFO) buffering mechanism

The RX FIFO functions as a buffer for data received on the SIN pin. The RX FIFO holds 5 received SPI data frames. The number of entries in the RX FIFO is device-specific. SPI data is added to the RX FIFO at the completion of a transfer when the received data in the shift register is transferred into the RX FIFO. SPI data are removed (popped) from the RX FIFO by reading the module POP RX FIFO Register (POPR). RX FIFO entries can only be removed from the RX FIFO by reading the POPR or by flushing the RX FIFO.

The RX FIFO Counter field (RXCTR) in the module's Status Register (SR) indicates the number of valid entries in the RX FIFO. The RXCTR is updated every time the POPR is read or SPI data is copied from the shift register to the RX FIFO.

The POPNXTPTR field in the SR points to the RX FIFO entry that is returned when the POPR is read. The POPNXTPTR contains the positive offset from RXFR0 in a number of 32-bit registers. For example, POPNXTPTR equal to two means that the RXFR2 contains the received SPI data that will be returned when the POPR is read. The POPNXTPTR field is incremented every time the POPR is read. The maximum value of the field is equal to the maximum implemented RXFR number and it rolls over after reaching the maximum.

49.4.2.5.1 Filling the RX FIFO

The RX FIFO is filled with the received SPI data from the shift register. While the RX FIFO is not full, SPI frames from the shift register are transferred to the RX FIFO. Every time an SPI frame is transferred to the RX FIFO, the RX FIFO Counter is incremented by one.

If the RX FIFO and shift register are full and a transfer is initiated, the RFOF bit in the SR is set indicating an overflow condition. Depending on the state of the ROOE bit in the MCR, the data from the transfer that generated the overflow is either ignored or shifted in to the shift register. If the ROOE bit is set, the incoming data is shifted in to the shift register. If the ROOE bit is cleared, the incoming data is ignored.

49.4.2.5.2 Draining the RX FIFO

Host CPU or a DMA can remove (pop) entries from the RX FIFO by reading the module POP RX FIFO Register (POPR). A read of the POPR decrements the RX FIFO Counter by one. Attempts to pop data from an empty RX FIFO are ignored and the RX FIFO Counter remains unchanged. The data, read from the empty RX FIFO, is undetermined.

When the RX FIFO is not empty, the RX FIFO Drain Flag (RFDF) in the SR is set. The RFDF bit is cleared when the RX_FIFO is empty and the DMA controller indicates that a read from POPR is complete or by writing a 1 to it.

49.4.3 Module baud rate and clock delay generation

The SCK frequency and the delay values for serial transfer are generated by dividing the protocol clock frequency by a prescaler and a scaler with the option for doubling the baud rate. The following figure shows conceptually how the SCK signal is generated.

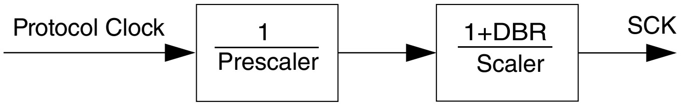

Figure 49-4. Communications clock prescalers and scalers

49.4.3.1 Baud rate generator

The baud rate is the frequency of the SCK. The protocol clock is divided by a prescaler (PBR) and scaler (BR) to produce SCK with the possibility of halving the scaler division. The DBR, PBR, and BR fields in the CTARs select the frequency of SCK by the formula in the BR field description. The following table shows an example of how to compute the baud rate.

Table 49-5. Baud rate computation example

f_P	PBR	Prescaler	BR	Scaler	DBR	Baud rate
100 MHz	0b00	2	0b0000	2	0	25 Mb/s
20 MHz	0b00	2	0b0000	2	1	10 Mb/s

NOTE

The clock frequencies mentioned in the preceding table are given as an example. Refer to the clocking chapter for the frequency used to drive this module in the device.

49.4.3.2 PCS to SCK Delay (t_{CSC})

The PCS to SCK delay is the length of time from assertion of the PCS signal to the first SCK edge. See Figure 49-6 for an illustration of the PCS to SCK delay. The PCSSCK and CSSCK fields in the CTAR*x* registers select the PCS to SCK delay by the formula in the CSSCK field description. The following table shows an example of how to compute the PCS to SCK delay.

Table 49-6. PCS to SCK delay computation example

f_{SYS}	PCSSCK	Prescaler	CSSCK	Scaler	PCS to SCK Delay
100 MHz	0b01	3	0b0100	32	0.96 µs

NOTE

The clock frequency mentioned in the preceding table is given as an example. Refer to the clocking chapter for the frequency used to drive this module in the device.

49.4.3.3 After SCK Delay (t_{ASC})

The After SCK Delay is the length of time between the last edge of SCK and the negation of PCS. See Figure 49-6 and Figure 49-7 for illustrations of the After SCK delay. The PASC and ASC fields in the CTAR*x* registers select the After SCK Delay by the formula in the ASC field description. The following table shows an example of how to compute the After SCK delay.

Table 49-7. After SCK Delay computation example

f_P	PASC	Prescaler	ASC	Scaler	After SCK Delay
100 MHz	0b01	3	0b0100	32	0.96 μs

NOTE

The clock frequency mentioned in the preceding table is given as an example. Refer to the clocking chapter for the frequency used to drive this module in the device.

49.4.3.4 Delay after Transfer (t_{DT})

The Delay after Transfer is the minimum time between negation of the PCS signal for a frame and the assertion of the PCS signal for the next frame. See Figure 49-6 for an illustration of the Delay after Transfer. The PDT and DT fields in the CTAR*x* registers select the Delay after Transfer by the formula in the DT field description. The following table shows an example of how to compute the Delay after Transfer.

Table 49-8. Delay after Transfer computation example

f_P	PDT	Prescaler	DT	Scaler	Delay after Transfer
100 MHz	0b01	3	0b1110	32768	0.98 ms

NOTE

The clock frequency mentioned in the preceding table is given as an example. Refer to the clocking chapter for the frequency used to drive this module in the device.

When in Non-Continuous Clock mode the t_{DT} delay is configured according to the equation specified in the CTAR[DT] field description. When in Continuous Clock mode, the delay is fixed at 1 SCK period.

49.4.3.5 Peripheral Chip Select Strobe Enable ($\overline{\text{PCSS}}$)

The $\overline{\text{PCSS}}$ signal provides a delay to allow the PCS signals to settle after a transition occurs thereby avoiding glitches. When the Module is in Master mode and the PCSSE bit is set in the MCR, $\overline{\text{PCSS}}$ provides a signal for an external demultiplexer to decode peripheral chip selects other than PCS5 into glitch-free PCS signals. The following figure shows the timing of the $\overline{\text{PCSS}}$ signal relative to PCS signals.

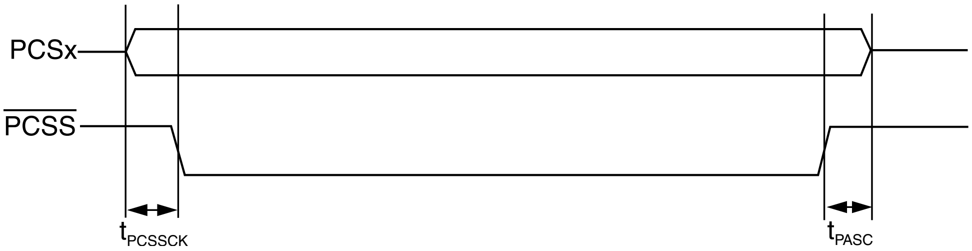

Figure 49-5. Peripheral Chip Select Strobe timing

The delay between the assertion of the PCS signals and the assertion of $\overline{\text{PCSS}}$ is selected by the PCSSCK field in the CTAR based on the following formula:

$$t_{\text{PCSSCK}} = \frac{1}{f_{\text{P}}} \times \text{PCSSCK}$$

At the end of the transfer, the delay between $\overline{\text{PCSS}}$ negation and PCS negation is selected by the PASC field in the CTAR based on the following formula:

$$t_{\text{PASC}} = \frac{1}{f_{\text{P}}} \times \text{PASC}$$

The following table shows an example of how to compute the t_{pcssck} delay.

Table 49-9. Peripheral Chip Select Strobe Assert computation example

f_P	PCSSCK	Prescaler	Delay before Transfer
100 MHz	0b11	7	70.0 ns

The following table shows an example of how to compute the t_{pasc} delay.

Table 49-10. Peripheral Chip Select Strobe Negate computation example

f_P	PASC	Prescaler	Delay after Transfer
100 MHz	0b11	7	70.0 ns

The $\overline{\text{PCSS}}$ signal is not supported when Continuous Serial Communication SCK mode is enabled.

NOTE

The clock frequency mentioned in the preceding tables is given as an example. Refer to the clocking chapter for the frequency used to drive this module in the device.

49.4.4 Transfer formats

The SPI serial communication is controlled by the Serial Communications Clock (SCK) signal and the PCS signals. The SCK signal provided by the master device synchronizes shifting and sampling of the data on the SIN and SOUT pins. The PCS signals serve as enable signals for the slave devices.

In Master mode, the CPOL and CPHA bits in the Clock and Transfer Attributes Registers (CTARn) select the polarity and phase of the serial clock, SCK.

- CPOL - Selects the idle state polarity of the SCK
- CPHA - Selects if the data on SOUT is valid before or on the first SCK edge

Even though the bus slave does not control the SCK signal, in Slave mode the values of CPOL and CPHA must be identical to the master device settings to ensure proper transmission. In SPI Slave mode, only CTAR0 is used.

The module supports four different transfer formats:

- Classic SPI with CPHA=0
- Classic SPI with CPHA=1
- Modified Transfer Format with CPHA = 0
- Modified Transfer Format with CPHA = 1

A modified transfer format is supported to allow for high-speed communication with peripherals that require longer setup times. The module can sample the incoming data later than halfway through the cycle to give the peripheral more setup time. The MTFE bit in the MCR selects between Classic SPI Format and Modified Transfer Format.

In the interface configurations, the module provides the option of keeping the PCS signals asserted between frames. See Continuous Selection Format for details.

49.4.4.1 Classic SPI Transfer Format (CPHA = 0)

The transfer format shown in following figure is used to communicate with peripheral SPI slave devices where the first data bit is available on the first clock edge. In this format, the master and slave sample their SIN pins on the odd-numbered SCK edges and change the data on their SOUT pins on the even-numbered SCK edges.

t_{CSC}
MSB first (LSBFE = 0): MSB Bit 6 Bit 5 Bit 4 Bit 3 Bit 2 Bit 1 LSB
MSB first (LSBFE = 1): LSB Bit 1 Bit 2 Bit 3 Bit 4 Bit 5 Bit 6 MSB
t_{CSC} = PCS to SCK delay
t_{ASC} = After SCK delay
t_{DT} = Delay after Transfer (Minimum CS idle time)

Figure 49-6. Module transfer timing diagram (MTFE=0, CPHA=0, FMSZ=8)

The master initiates the transfer by placing its first data bit on the SOUT pin and asserting the appropriate peripheral chip select signals to the slave device. The slave responds by placing its first data bit on its SOUT pin. After the t_{CSC} delay elapses, the master outputs the first edge of SCK. The master and slave devices use this edge to sample the first input data bit on their serial data input signals. At the second edge of the SCK, the master and slave devices place their second data bit on their serial data output signals. For the rest of the frame the master and the slave sample their SIN pins on the odd-numbered clock edges and changes the data on their SOUT pins on the even-numbered clock edges. After the last clock edge occurs, a delay of t_{ASC} is inserted before the master negates the PCS signals. A delay of t_{DT} is inserted before a new frame transfer can be initiated by the master.

49.4.4.2 Classic SPI Transfer Format (CPHA = 1)

This transfer format shown in the following figure is used to communicate with peripheral SPI slave devices that require the first SCK edge before the first data bit becomes available on the slave SOUT pin. In this format, the master and slave devices change the data on their SOUT pins on the odd-numbered SCK edges and sample the data on their SIN pins on the even-numbered SCK edges.

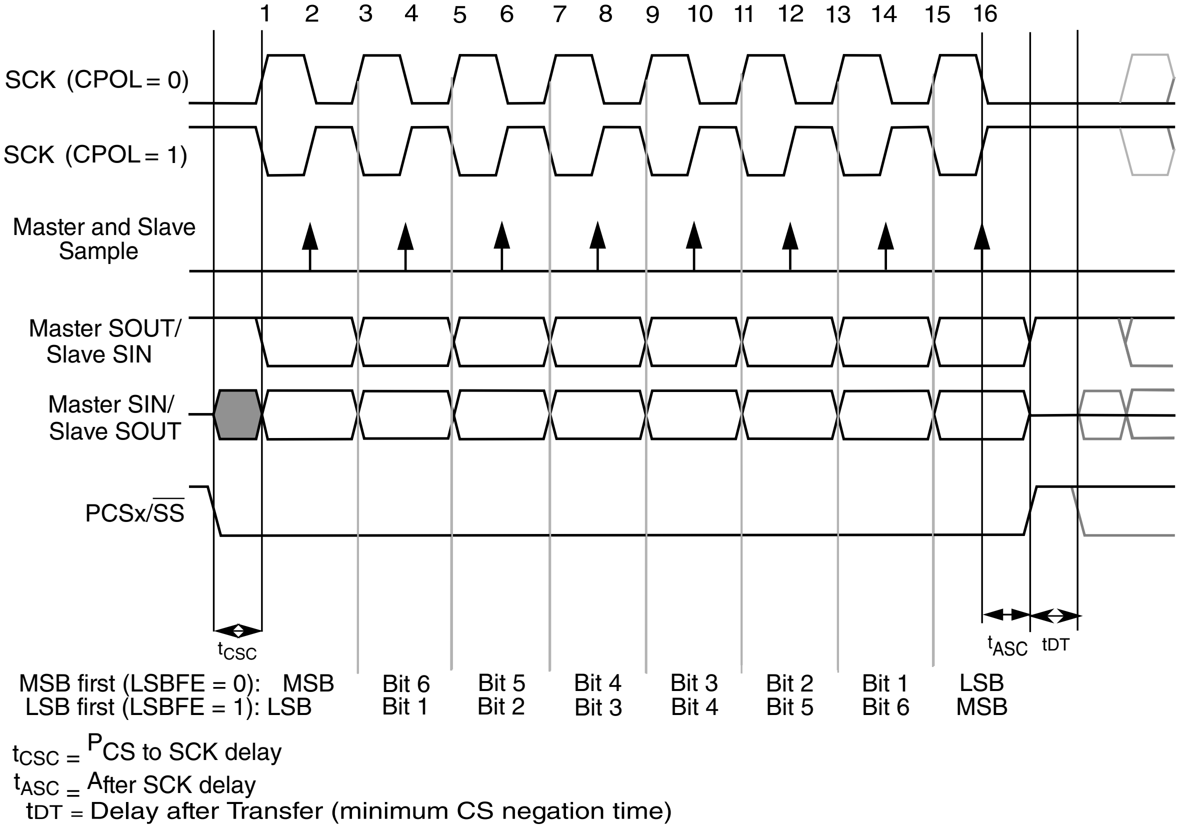

Figure 49-7. Module transfer timing diagram (MTFE=0, CPHA=1, FMSZ=8)

The master initiates the transfer by asserting the PCS signal to the slave. After the t_{CSC} delay has elapsed, the master generates the first SCK edge and at the same time places valid data on the master SOUT pin. The slave responds to the first SCK edge by placing its first data bit on its slave SOUT pin.

At the second edge of the SCK the master and slave sample their SIN pins. For the rest of the frame the master and the slave change the data on their SOUT pins on the odd-numbered clock edges and sample their SIN pins on the even-numbered clock edges. After the last clock edge occurs, a delay of t_{ASC} is inserted before the master negates the PCS signal. A delay of t_{DT} is inserted before a new frame transfer can be initiated by the master.

49.4.4.3 Modified SPI Transfer Format (MTFE = 1, CPHA = 0)

In this Modified Transfer Format both the master and the slave sample later in the SCK period than in Classic SPI mode to allow the logic to tolerate more delays in device pads and board traces. These delays become a more significant fraction of the SCK period as the SCK period decreases with increasing baud rates.

The master and the slave place data on the SOUT pins at the assertion of the PCS signal. After the PCS to SCK delay has elapsed the first SCK edge is generated. The slave samples the master SOUT signal on every odd numbered SCK edge. The DSPI in the slave mode when the MTFE bit is set also places new data on the slave SOUT on every odd numbered clock edge. Regular external slave, configured with CPHA=0 format drives its SOUT output at every even numbered SCK clock edge.

The DSPI master places its second data bit on the SOUT line one protocol clock after odd numbered SCK edge if the protocol clock frequency to SCK frequency ratio is higher than three. If this ratio is below four the master changes SOUT at odd numbered SCK edge. The point where the master samples the SIN is selected by the DSPI_MCR[SMPL_PT] field. The master sample point can be delayed by one or two protocol clock cycles. The SMPL_PT field should be set to 0 if the protocol to SCK frequency ratio is less than 4. However if this ratio is less than 4, the actual sample point is delayed by one protocol clock cycle automatically by the design.

The following timing diagrams illustrate the DSPI operation with MTFE=1. Timing delays shown are:

- T_{csc} - PCS to SCK assertion delay
- T_{acs} - After SCK PCS negation delay
- T_{su_ms} - master SIN setup time
- T_{hd_ms} - master SIN hold time
- T_{vd_sl} - slave data output valid time, time between slave data output SCK driving edge and data becomes valid.
- T_{su_sl} - data setup time on slave data input
- T_{hd_sl} - data hold time on slave data input
- T_{sys} - protocol clock period.

The following figure shows the modified transfer format for CPHA = 0 and Fsys/Fsck = 4. Only the condition where CPOL = 0 is illustrated. Solid triangles show the data sampling clock edges. The two possible slave behavior are shown.

- Signal, marked "SOUT of Ext Slave", presents regular SPI slave serial output.
- Signal, marked "SOUT of DSPI Slave", presents DSPI in the slave mode with MTFE bit set.

Other MTFE = 1 diagrams show DSPI SIN input as being driven by a regular external SPI slave, configured according DSPI master CPHA programming.

Note

In the following diagrams, f_{sys} represents the protocol clock frequency from which the Baud frequency f_{sck} is derived.

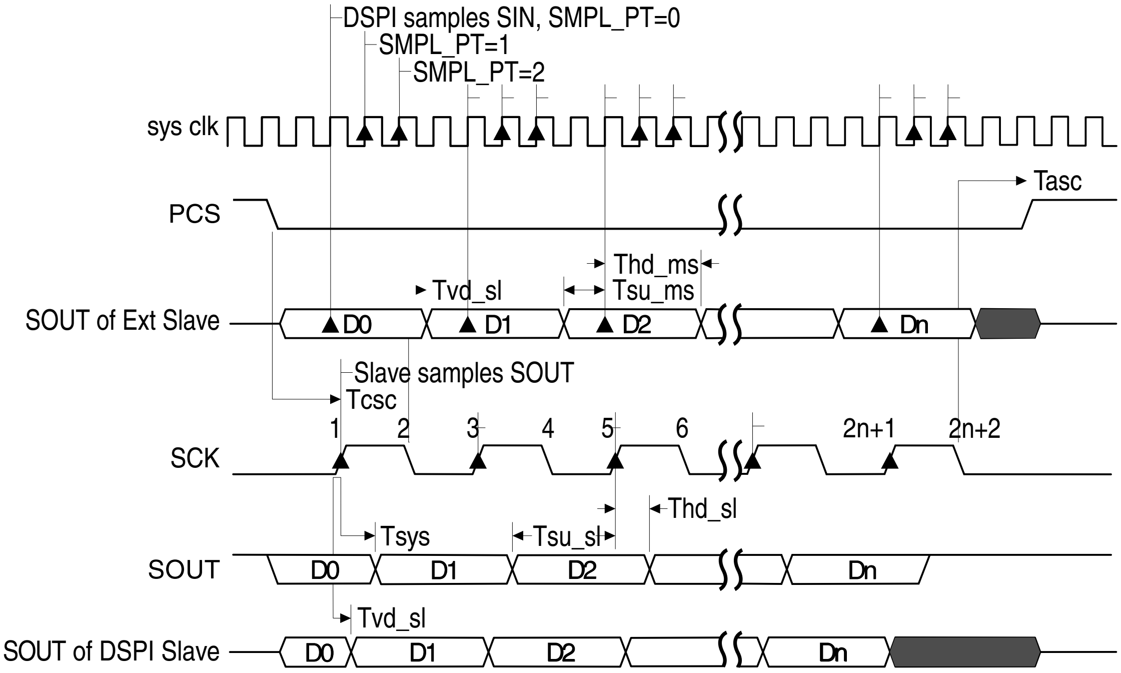

Figure 49-8. DSPI Modified Transfer Format (MTFE=1, CPHA=0, $f_{sck} = f_{sys}/4$)

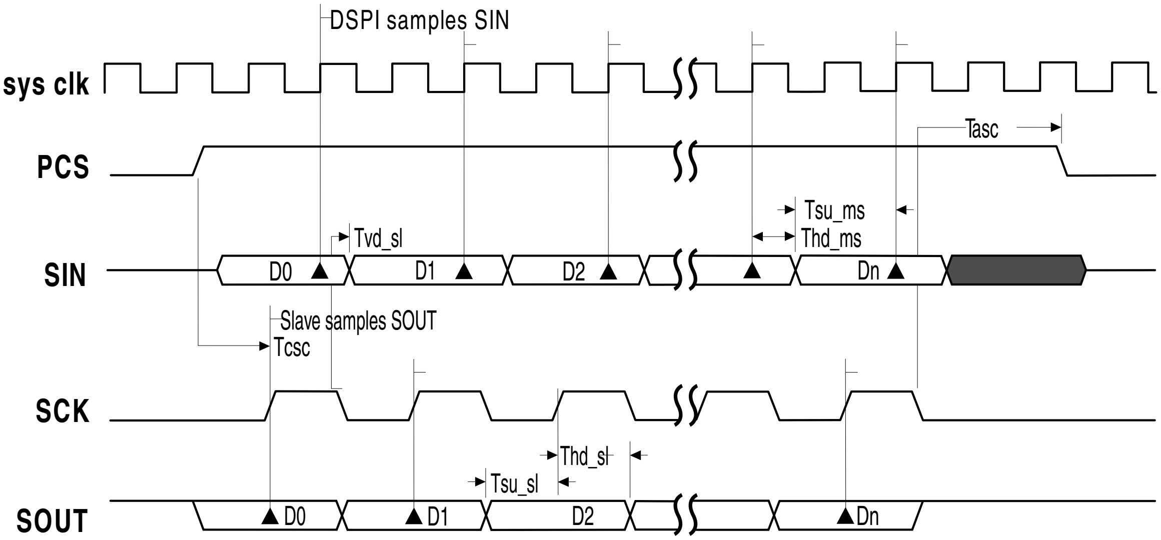

Figure 49-9. DSPI Modified Transfer Format (MTFE=1, CPHA=0, f_{sck} = f_{sys}/2)

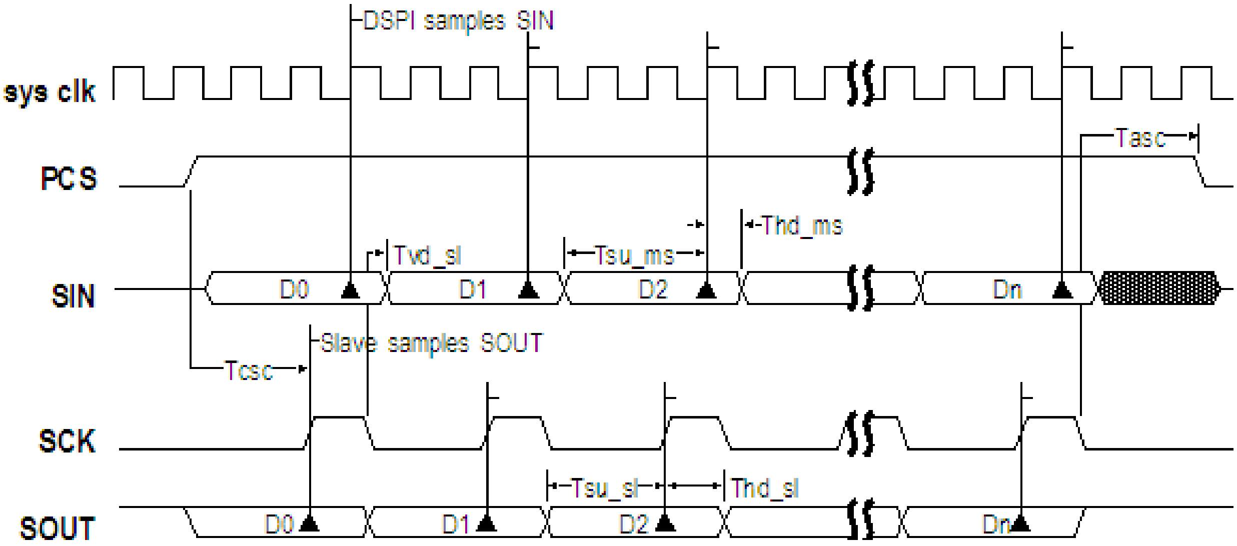

Figure 49-10. DSPI Modified Transfer Format (MTFE=1, CPHA=0, f_{sck} = f_{sys}/3)

49.4.4.4 Modified SPI Transfer Format (MTFE = 1, CPHA = 1)

The following figures show the Modified Transfer Format for CPHA = 1. Only the condition, where CPOL = 0 is shown. At the start of a transfer the DSPI asserts the PCS signal to the slave device. After the PCS to SCK delay has elapsed the master and the slave put data on their SOUT pins at the first edge of SCK . The slave samples the master SOUT signal on the even numbered edges of SCK. The master samples the slave SOUT signal on the odd numbered SCK edges starting with the third SCK edge. The slave samples the last bit on the last edge of the SCK. The master samples the last slave SOUT bit one half SCK cycle after the last edge of SCK. No clock edge will be visible on the master SCK pin during the sampling of the last bit. **The SCK to PCS delay and the After SCK delay must be greater or equal to half of the SCK period.**

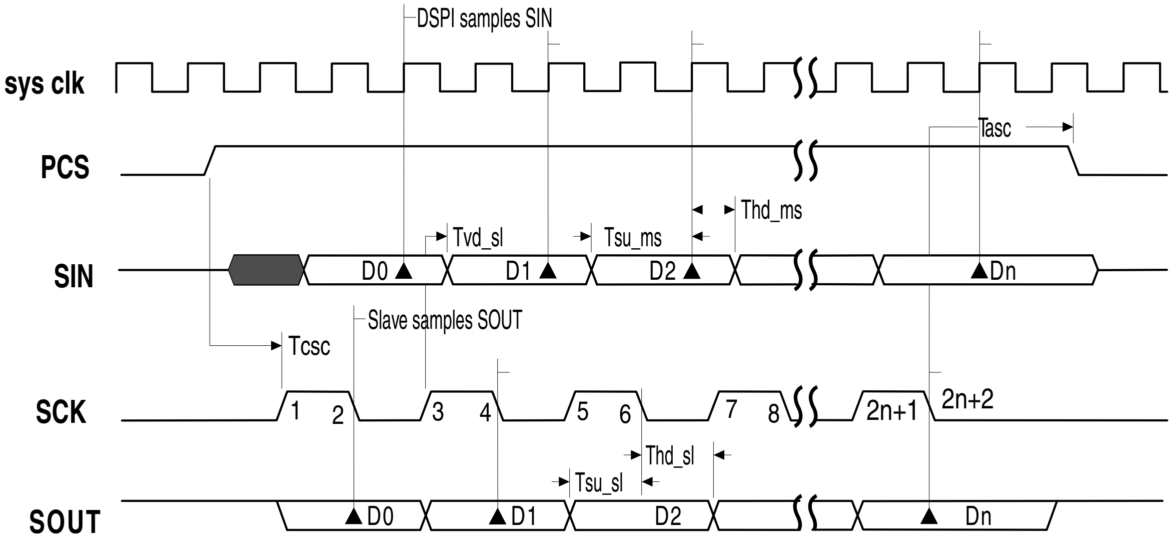

Figure 49-11. DSPI Modified Transfer Format (MTFE=1, CPHA=1, $f_{sck} = f_{sys}/2$)

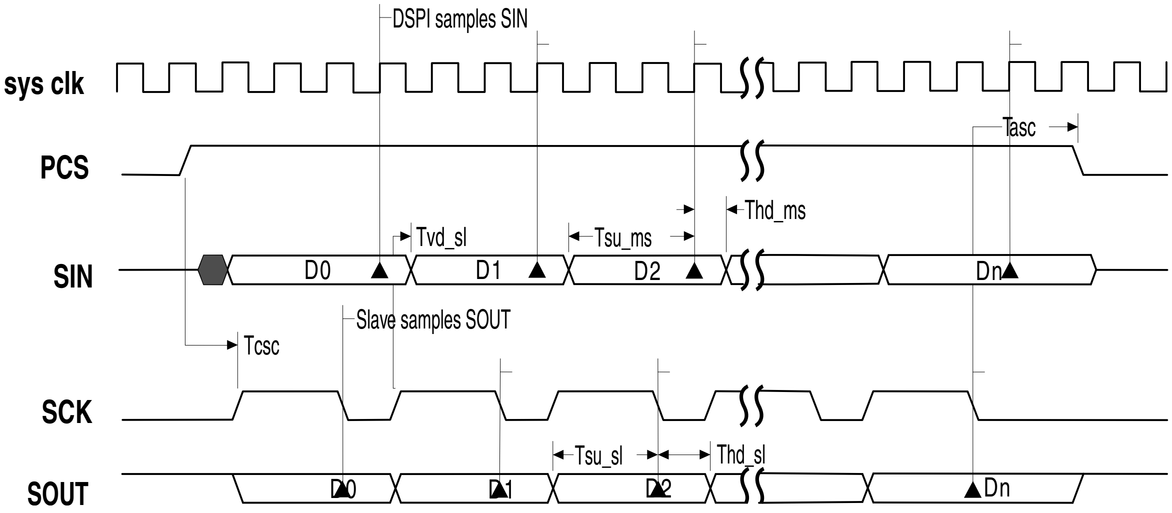

Figure 49-12. DSPI Modified Transfer Format (MTFE=1, CPHA=1, $f_{sck} = f_{sys}/3$)

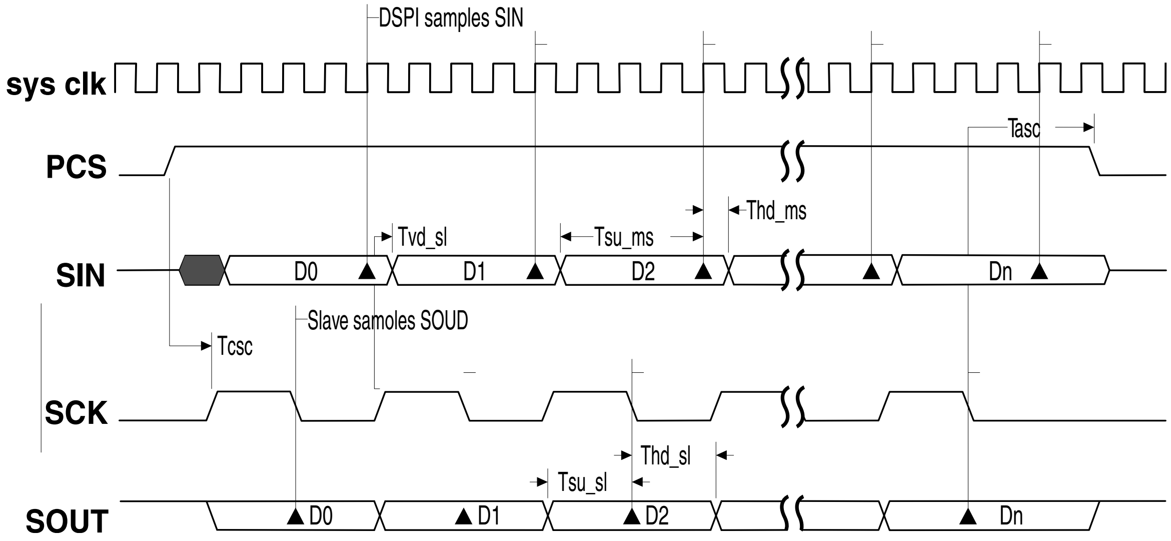

Figure 49-13. DSPI Modified Transfer Format (MTFE=1, CPHA=1, $f_{sck} = f_{sys}/4$)

49.4.4.5 Continuous Selection Format

Some peripherals must be deselected between every transfer. Other peripherals must remain selected between several sequential serial transfers. The Continuous Selection Format provides the flexibility to handle the following case. The Continuous Selection Format is enabled for the SPI configuration by setting the CONT bit in the SPI command.

When the CONT bit = 0, the module drives the asserted Chip Select signals to their idle states in between frames. The idle states of the Chip Select signals are selected by the PCSISn bits in the MCR. The following timing diagram is for two four-bit transfers with CPHA = 1 and CONT = 0.

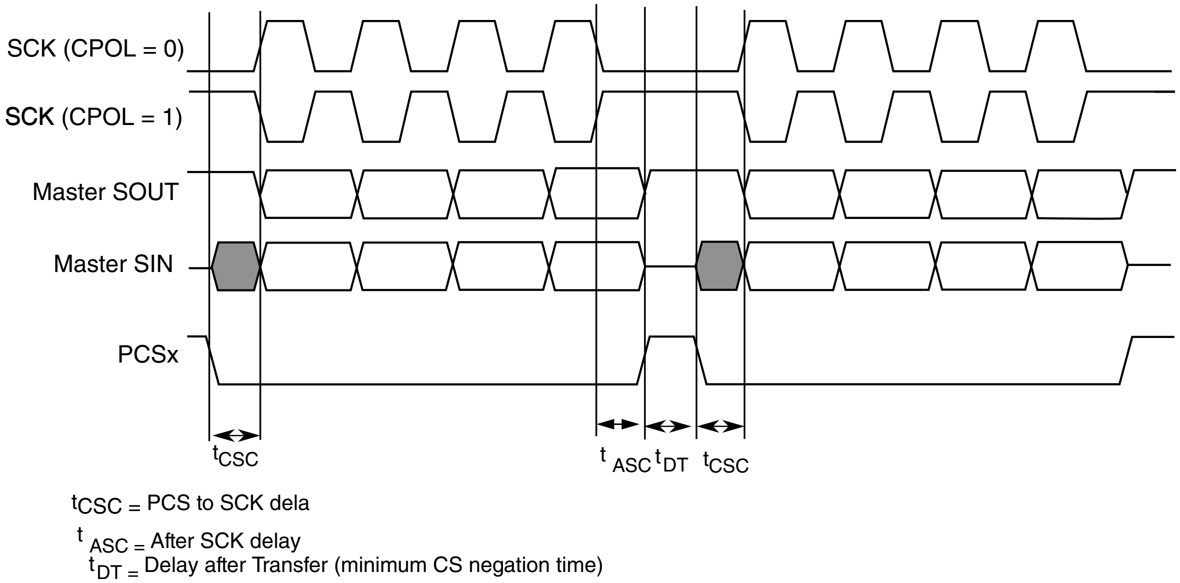

Figure 49-14. Example of non-continuous format (CPHA=1, CONT=0)

When the CONT bit = 1, the PCS signal remains asserted for the duration of the two transfers. The Delay between Transfers (t_{DT}) is not inserted between the transfers. The following figure shows the timing diagram for two four-bit transfers with CPHA = 1 and CONT = 1.

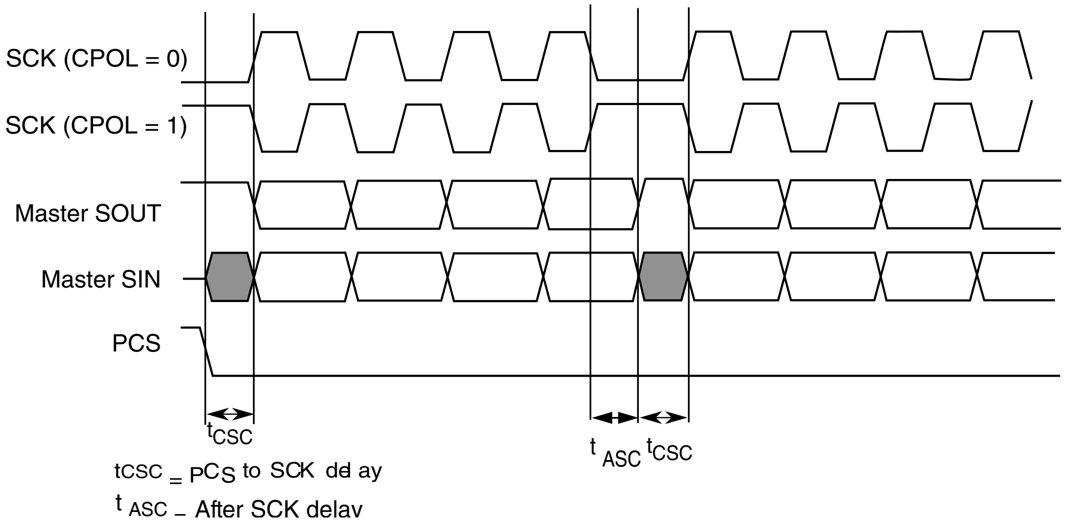

Figure 49-15. Example of continuous transfer (CPHA=1, CONT=1)

When using the module with continuous selection follow these rules:

- All transmit commands must have the same PCSn bits programming.
- The CTARs, selected by transmit commands, must be programmed with the same transfer attributes. Only FMSZ field can be programmed differently in these CTARs.

- When transmitting multiple frames in this mode, the user software must ensure that the last frame has the PUSHR[CONT] bit deasserted in Master mode and the user software must provide sufficient frames in the TX_FIFO to be sent out in Slave mode and the master deasserts the PCSn at end of transmission of the last frame.
- PUSHR[CONT] must be deasserted before asserting MCR[HALT] in master mode. This will make sure that the PCSn signals are deasserted. Asserting MCR[HALT] during continuous transfer will cause the PCSn signals to remain asserted and hence Slave Device cannot transition from Running to Stopped state.

NOTE

User must fill the TX FIFO with the number of entries that will be concatenated together under one PCS assertion for both master and slave before the TX FIFO becomes empty.

When operating in Slave mode, ensure that when the last entry in the TX FIFO is completely transmitted, that is, the corresponding TCF flag is asserted and TXFIFO is empty, the slave is deselected for any further serial communication; otherwise, an underflow error occurs.

49.4.5 Continuous Serial Communications Clock

The module provides the option of generating a Continuous SCK signal for slave peripherals that require a continuous clock.

Continuous SCK is enabled by setting the CONT_SCKE bit in the MCR. Enabling this bit generates the Continuous SCK only if MCR[HALT] bit is low. Continuous SCK is valid in all configurations.

Continuous SCK is only supported for CPHA=1. Clearing CPHA is ignored if the CONT_SCKE bit is set. Continuous SCK is supported for Modified Transfer Format.

Clock and transfer attributes for the Continuous SCK mode are set according to the following rules:

- When the module is in SPI configuration, CTAR0 is used initially. At the start of each SPI frame transfer, the CTAR specified by the CTAS for the frame is used.
- In all configurations, the currently selected CTAR remains in use until the start of a frame with a different CTAR specified, or the Continuous SCK mode is terminated.

It is recommended to keep the baud rate the same while using the Continuous SCK. Switching clock polarity between frames while using Continuous SCK can cause errors in the transfer. Continuous SCK operation is not guaranteed if the module is put into the External Stop mode or Module Disable mode.

Enabling Continuous SCK disables the PCS to SCK delay and the Delay after Transfer (t_{DT}) is fixed to one SCK cycle. The following figure is the timing diagram for Continuous SCK format with Continuous Selection disabled.

NOTE

In Continuous SCK mode, for the SPI transfer CTAR0 should always be used, and the TX FIFO must be cleared using the MCR[CLR_TXF] field before initiating transfer.

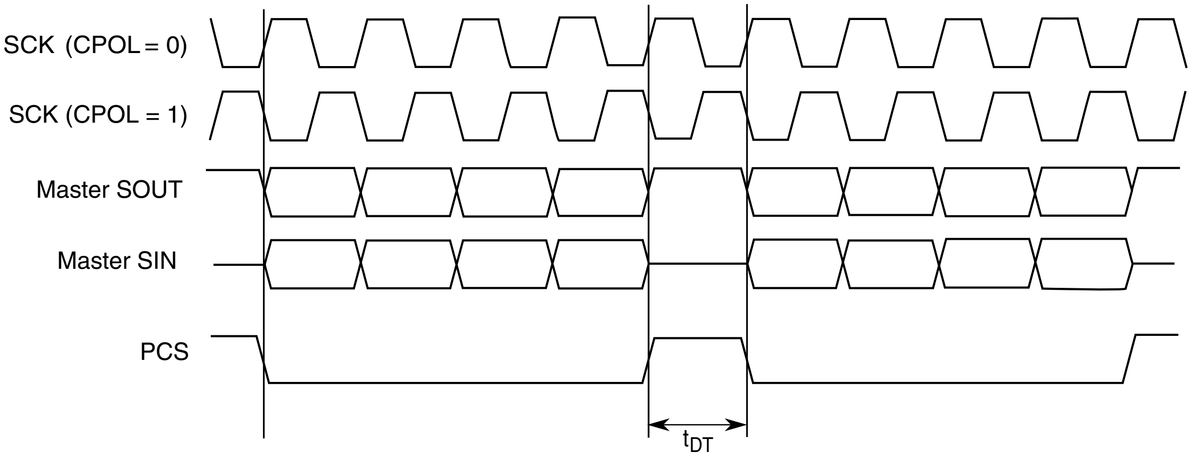

Figure 49-16. Continuous SCK Timing Diagram (CONT=0)

If the CONT bit in the TX FIFO entry is set, PCS remains asserted between the transfers. Under certain conditions, SCK can continue with PCS asserted, but with no data being shifted out of SOUT, that is, SOUT pulled high. This can cause the slave to receive incorrect data. Those conditions include:

- Continuous SCK with CONT bit set, but no data in the TX FIFO.
- Continuous SCK with CONT bit set and entering Stopped state (refer to Start and Stop of module transfers).
- Continuous SCK with CONT bit set and entering Stop mode or Module Disable mode.

The following figure shows timing diagram for Continuous SCK format with Continuous Selection enabled.

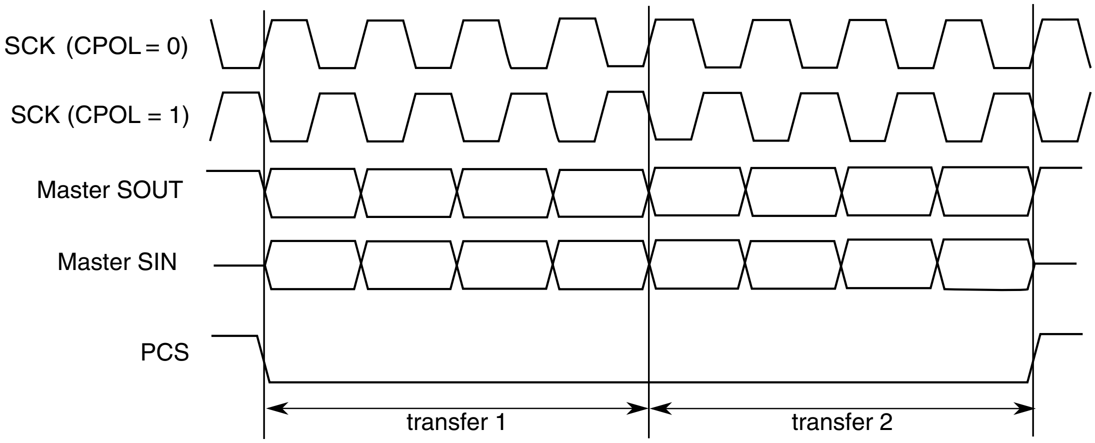

Figure 49-17. Continuous SCK timing diagram (CONT=1)

49.4.6 Slave Mode Operation Constraints

Slave mode logic shift register is buffered. This allows data streaming operation, when the module is permanently selected and data is shifted in with a constant rate.

The transmit data is transferred at second SCK clock edge of the each frame to the shift register if the $\overline{\text{SS}}$ signal is asserted and any time when transmit data is ready and $\overline{\text{SS}}$ signal is negated.

Received data is transferred to the receive buffer at last SCK edge of each frame, defined by frame size programmed to the CTAR0/1 register. Then the data from the buffer is transferred to the RXFIFO or DDR register.

If the $\overline{\text{SS}}$ negates before that last SCK edge, the data from shift register is lost.

49.4.7 Interrupts/DMA requests

The module has several conditions that can generate only interrupt requests and two conditions that can generate interrupt or DMA requests. The following table lists these conditions.

Table 49-11. Interrupt and DMA request conditions

Condition	Flag	Interrupt	DMA
End of Queue (EOQ)	EOQF	Yes	-
TX FIFO Fill	TFFF	Yes	Yes
Transfer Complete	TCF	Yes	-
TX FIFO Underflow	TFUF	Yes	-

Table continues on the next page...

Table 49-11. Interrupt and DMA request conditions (continued)

Condition	Flag	Interrupt	DMA
RX FIFO Drain	RFDF	Yes	Yes
RX FIFO Overflow	RFOF	Yes	-

Each condition has a flag bit in the module Status Register (SR) and a Request Enable bit in the DMA/Interrupt Request Select and Enable Register (RSER). Certain flags (as shown in above table) generate interrupt requests or DMA requests depending on configuration of RSER register.

The module also provides a global interrupt request line, which is asserted when any of individual interrupt requests lines is asserted.

49.4.7.1 End Of Queue interrupt request

The End Of Queue (EOQ) interrupt request indicates that the end of a transmit queue is reached. The module generates the interrupt request when EOQ interrupt requests are enabled (RSER[EOQF_RE]) and the EOQ bit in the executing SPI command is 1.

The module generates the interrupt request when the last bit of the SPI frame with EOQ bit set is transmitted.

49.4.7.2 Transmit FIFO Fill Interrupt or DMA Request

The Transmit FIFO Fill Request indicates that the TX FIFO is not full. The Transmit FIFO Fill Request is generated when the number of entries in the TX FIFO is less than the maximum number of possible entries, and the TFFF_RE bit in the RSER is set. The TFFF_DIRS bit in the RSER selects whether a DMA request or an interrupt request is generated.

NOTE

> TFFF flag clears automatically when DMA is used to fill TX FIFO.
>
> To clear TFFF when not using DMA, follow these steps for every PUSH performed using CPU to fill TX FIFO:
>
> 1. Wait until TFFF = 1.
> 2. Write data to PUSHR using CPU.
> 3. Clear TFFF by writing a 1 to its location. If TX FIFO is not full, this flag will not clear.

49.4.7.3 Transfer Complete Interrupt Request

The Transfer Complete Request indicates the end of the transfer of a serial frame. The Transfer Complete Request is generated at the end of each frame transfer when the TCF_RE bit is set in the RSER.

49.4.7.4 Transmit FIFO Underflow Interrupt Request

The Transmit FIFO Underflow Request indicates that an underflow condition in the TX FIFO has occurred. The transmit underflow condition is detected only for the module operating in Slave mode and SPI configuration . The TFUF bit is set when the TX FIFO of the module is empty, and a transfer is initiated from an external SPI master. If the TFUF bit is set while the TFUF_RE bit in the RSER is set, an interrupt request is generated.

49.4.7.5 Receive FIFO Drain Interrupt or DMA Request

The Receive FIFO Drain Request indicates that the RX FIFO is not empty. The Receive FIFO Drain Request is generated when the number of entries in the RX FIFO is not zero, and the RFDF_RE bit in the RSER is set. The RFDF_DIRS bit in the RSER selects whether a DMA request or an interrupt request is generated.

49.4.7.6 Receive FIFO Overflow Interrupt Request

The Receive FIFO Overflow Request indicates that an overflow condition in the RX FIFO has occurred. A Receive FIFO Overflow request is generated when RX FIFO and shift register are full and a transfer is initiated. The RFOF_RE bit in the RSER must be set for the interrupt request to be generated.

Depending on the state of the ROOE bit in the MCR, the data from the transfer that generated the overflow is either ignored or shifted in to the shift register. If the ROOE bit is set, the incoming data is shifted in to the shift register. If the ROOE bit is cleared, the incoming data is ignored.

49.4.8 Power saving features

The module supports following power-saving strategies:

- External Stop mode
- Module Disable mode – Clock gating of non-memory mapped logic

49.4.8.1 Stop mode (External Stop mode)

This module supports the Stop mode protocol. When a request is made to enter External Stop mode, the module acknowledges the request . If a serial transfer is in progress, then this module waits until it reaches the frame boundary before it is ready to have its clocks shut off . While the clocks are shut off, this module's memory-mapped logic is not accessible. This also puts the module in STOPPED state. The SR[TXRXS] bit is cleared to indicate STOPPED state. The states of the interrupt and DMA request signals cannot be changed while in External Stop mode.

49.4.8.2 Module Disable mode

Module Disable mode is a block-specific mode that the module can enter to save power. Host CPU can initiate the Module Disable mode by setting the MDIS bit in the MCR. The Module Disable mode can also be initiated by hardware.

When the MDIS bit is set, the module negates the Clock Enable signal at the next frame boundary. Once the Clock Enable signal is negated, it is said to have entered Module Disable Mode. This also puts the module in STOPPED state. The SR[TXRXS] bit is cleared to indicate STOPPED state.If implemented, the Clock Enable signal can stop the clock to the non-memory mapped logic. When Clock Enable is negated, the module is in a dormant state, but the memory mapped registers are still accessible. Certain read or write operations have a different effect when the module is in the Module Disable mode. Reading the RX FIFO Pop Register does not change the state of the RX FIFO. Similarly, writing to the PUSHR Register does not change the state of the TX FIFO. Clearing either of the FIFOs has no effect in the Module Disable mode. Changes to the DIS_TXF and DIS_RXF fields of the MCR have no effect in the Module Disable mode. In the Module Disable mode, all status bits and register flags in the module return the correct values when read, but writing to them has no effect. Writing to the TCR during Module Disable mode has no effect. Interrupt and DMA request signals cannot be cleared while in the Module Disable mode.

49.5 Initialization/application information

This section describes how to initialize the module.

49.5.1 How to manage queues

The queues are not part of the module, but it includes features in support of queue management. Queues are primarily supported in SPI configuration.

1. When module executes last command word from a queue, the EOQ bit in the command word is set to indicate it that this is the last entry in the queue.
2. At the end of the transfer, corresponding to the command word with EOQ set is sampled, the EOQ flag (EOQF) in the SR is set.
3. The setting of the EOQF flag disables serial transmission and reception of data, putting the module in the Stopped state. The TXRXS bit is cleared to indicate the Stopped state.
4. The DMA can continue to fill TX FIFO until it is full or step 5 occurs.
5. Disable DMA transfers by disabling the DMA enable request for the DMA channel assigned to TX FIFO and RX FIFO. This is done by clearing the corresponding DMA enable request bits in the DMA Controller.
6. Ensure all received data in RX FIFO has been transferred to memory receive queue by reading the RXCNT in SR or by checking RFDF in the SR after each read operation of the POPR.
7. Modify DMA descriptor of TX and RX channels for new queues
8. Flush TX FIFO by writing a 1 to the CLR_TXF bit in the MCR. Flush RX FIFO by writing a '1' to the CLR_RXF bit in the MCR.
9. Clear transfer count either by setting CTCNT bit in the command word of the first entry in the new queue or via CPU writing directly to SPI_TCNT field in the TCR.
10. Enable DMA channel by enabling the DMA enable request for the DMA channel assigned to the module TX FIFO, and RX FIFO by setting the corresponding DMA set enable request bit.
11. Enable serial transmission and serial reception of data by clearing the EOQF bit.

49.5.2 Switching Master and Slave mode

When changing modes in the module, follow the steps below to guarantee proper operation.

1. Halt it by setting MCR[HALT].
2. Clear the transmit and receive FIFOs by writing a 1 to the CLR_TXF and CLR_RXF bits in MCR.
3. Set the appropriate mode in MCR[MSTR] and enable it by clearing MCR[HALT].

49.5.3 Initializing Module in Master/Slave Modes

Once the appropriate mode in MCR[MSTR] is configured, the module is enabled by clearing MCR[HALT]. It should be ensured that module Slave is enabled before enabling it's Master. This ensures the Slave is ready to be communicated with, before Master initializes communication.

49.5.4 Baud rate settings

The following table shows the baud rate that is generated based on the combination of the baud rate prescaler PBR and the baud rate scaler BR in the CTARs. The values calculated assume a 100 MHz protocol frequency and the double baud rate DBR bit is cleared.

NOTE

> The clock frequency mentioned above is given as an example in this chapter. See the clocking chapter for the frequency used to drive this module in the device.

Table 49-12. Baud rate values (bps)

		Baud rate divider prescaler values			
		2	3	5	7
Baud Rate Scaler Values	2	25.0M	16.7M	10.0M	7.14M
	4	12.5M	8.33M	5.00M	3.57M
	6	8.33M	5.56M	3.33M	2.38M
	8	6.25M	4.17M	2.50M	1.79M
	16	3.12M	2.08M	1.25M	893k
	32	1.56M	1.04M	625k	446k
	64	781k	521k	312k	223k
	128	391k	260k	156k	112k
	256	195k	130k	78.1k	55.8k
	512	97.7k	65.1k	39.1k	27.9k
	1024	48.8k	32.6k	19.5k	14.0k
	2048	24.4k	16.3k	9.77k	6.98k

Table continues on the next page...

Table 49-12. Baud rate values (bps) (continued)

		Baud rate divider prescaler values			
		2	3	5	7
	4096	12.2k	8.14k	4.88k	3.49k
	8192	6.10k	4.07k	2.44k	1.74k
	16384	3.05k	2.04k	1.22k	872
	32768	1.53k	1.02k	610	436

49.5.5 Delay settings

The following table shows the values for the Delay after Transfer (t_{DT}) and CS to SCK Delay (T_{CSC}) that can be generated based on the prescaler values and the scaler values set in the CTARs. The values calculated assume a 100 MHz protocol frequency.

NOTE

The clock frequency mentioned above is given as an example in this chapter. See the clocking chapter for the frequency used to drive this module in the device.

Table 49-13. Delay values

		Delay prescaler values			
		1	3	5	7
Delay scaler values	2	20.0 ns	60.0 ns	100.0 ns	140.0 ns
	4	40.0 ns	120.0 ns	200.0 ns	280.0 ns
	8	80.0 ns	240.0 ns	400.0 ns	560.0 ns
	16	160.0 ns	480.0 ns	800.0 ns	1.1 μs
	32	320.0 ns	960.0 ns	1.6 μs	2.2 μs
	64	640.0 ns	1.9 μs	3.2 μs	4.5 μs
	128	1.3 μs	3.8 μs	6.4 μs	9.0 μs
	256	2.6 μs	7.7 μs	12.8 μs	17.9 μs
	512	5.1 μs	15.4 μs	25.6 μs	35.8 μs
	1024	10.2 μs	30.7 μs	51.2 μs	71.7 μs
	2048	20.5 μs	61.4 μs	102.4 μs	143.4 μs
	4096	41.0 μs	122.9 μs	204.8 μs	286.7 μs
	8192	81.9 μs	245.8 μs	409.6 μs	573.4 μs
	16384	163.8 μs	491.5 μs	819.2 μs	1.1 ms
	32768	327.7 μs	983.0 μs	1.6 ms	2.3 ms
	65536	655.4 μs	2.0 ms	3.3 ms	4.6 ms

49.5.6 Calculation of FIFO pointer addresses

Complete visibility of the FIFO contents is available through the FIFO registers, and valid entries can be identified through a memory-mapped pointer and counter for each FIFO. The pointer to the first-in entry in each FIFO is memory mapped. For the TX FIFO the first-in pointer is the Transmit Next Pointer (TXNXTPTR). For the RX FIFO the first-in pointer is the Pop Next Pointer (POPNXTPTR). The following figure illustrates the concept of first-in and last-in FIFO entries along with the FIFO Counter. The TX FIFO is chosen for the illustration, but the concepts carry over. See Transmit First In First Out (TX FIFO) buffering mechanism and Receive First In First Out (RX FIFO) buffering mechanism for details on the FIFO operation.

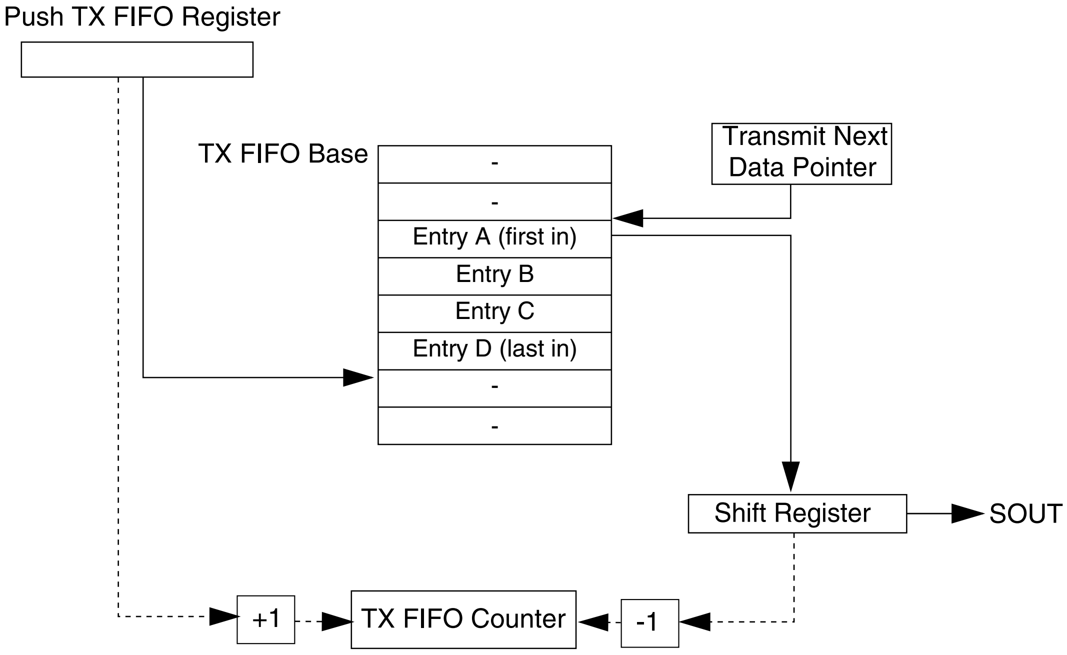

Figure 49-18. TX FIFO pointers and counter

49.5.6.1 Address Calculation for the First-in Entry and Last-in Entry in the TX FIFO

The memory address of the first-in entry in the TX FIFO is computed by the following equation:

$$\text{First-in EntryAddress} = \text{TXFIFOBase} + (4 \times \text{TXNXTPTR})$$

The memory address of the last-in entry in the TX FIFO is computed by the following equation:

$$\text{Last-inEntryaddress} = \text{TXFIFOBase} + 4 \times (\text{TXCTR} + \text{TXNXTPTR} - 1)\text{mod}(\text{TXFIFOdepth})$$

TX FIFO Base - Base address of TX FIFO
TXCTR - TX FIFO Counter
TXNXTPTR - Transmit Next Pointer
TX FIFO Depth - Transmit FIFO depth, implementation specific

49.5.6.2 Address Calculation for the First-in Entry and Last-in Entry in the RX FIFO

The memory address of the first-in entry in the RX FIFO is computed by the following equation:

$$\text{First-in EntryAddress} = \text{RX FIFOBase} + (4 \times \text{POPNXTPTR})$$

The memory address of the last-in entry in the RX FIFO is computed by the following equation:

$$\text{Last-inEntryaddress} = \text{RX FIFO Base} + 4 \times (\text{RXCTR} + \text{POPNXTPTR} - 1)\text{mod}(\text{RXFIFOdepth})$$

RX FIFO Base - Base address of RX FIFO
RXCTR - RX FIFO counter
POPNXTPTR - Pop Next Pointer
RX FIFO Depth - Receive FIFO depth, implementation specific

Chapter 50
FlexRay Communication Controller (FlexRay)

50.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

This section provides a high-level summary of module features.

50.1.1 Reference

The following documents are referenced.

- *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*[1]
  - Refer to this document for the all of the FlexRay related informaton including the configuration parameters and the allowed parameter ranges.
- *FlexRay Communications System Electrical Physical Layer Specification, Version 3.0*

50.1.2 Glossary

This section provides a list of terms used in this chapter.

[1] The FlexRay Specifications have been developed for automotive applications.The FlexRay Specifications have been neither developed nor tested for non-automotive applications.

Table 50-1. List of terms

Term	Definition
BCU	Buffer Control Unit. Handles message buffer access.
BMIF	Bus Master Interface. Provides master access to FlexRay memory area.
CC	Communication Controller
CDC	Clock Domain Crosser
CHI	Controller Host Interface
Cycle length in µT	The actual length of a cycle in µT for the ideal controller (+/- 0 ppm)
EBI	External Bus Interface
FlexRay Memory Area	Memory area to store the physical message buffer payload data, frame header, frame and slot status, and synchronization frame related tables.
FSS	Frame Start Sequence
HIF	Host Interface. Provides host access to controller.
Host	The FlexRay CC host MCU
Keyslot	Key slot is used to transmit the startup frame, sync frame, or designated single slot frame.
LUT	Look Up Table. Stores message buffer header index value.
LRAM	Look Up Table RAM. Module internal memory to store message buffer configuration data and data field offsets for individual message buffers and receive shadow buffers.
MB	Message Buffer
Mini-slot	An interval of time within the dynamic segment of the communication cycle that is of constant duration (in terms of macroticks) and that is used by the synchronized FTDMA media access scheme to manage media arbitration
MBIDX	Message Buffer Index: the position of a header field entry within the header area. If the header area is accessed as an array, this is the same as the array index of the entry.
MBNum	Message Buffer Number: Position of message buffer configuration registers within the register map. For example, Message Buffer Number 5 corresponds to the MBCCS5 register.
MCU	Microcontroller Unit
µT	Microtick
MT	Macrotick
MTS	Media Access Test Symbol
message frame	Frame with *Null Frame Indicator* set to 1
normal frame	null frame or message frame with both *Sync Frame Indicator* and *Startup Frame Indicator* set to 0
null frame	frame with *Null Frame Indicator* set to 0
NIT	Network Idle Time
PE	Protocol Engine
POC	Protocol Operation Control. Each state of the POC is denoted by POC:state
Rx	Reception
Slot	An interval of time during which access to a communication channel is granted exclusively to a specific node for the transmission of a frame with a frame ID corresponding to the slot.
SEQ	Sequencer Engine
SU	Status update

Table continues on the next page...

Table 50-1. List of terms (continued)

Term	Definition
SECDED	Single-bit error correction, double-bit error detection
System Memory	Memory that contains the FlexRay Memory Area.
System Bus	Bus that connects the controller and System Memory
sync frame	null frame or message frame with *Sync Frame Indicator* set to 1
startup frame	null frame or message frame with both *Sync Frame Indicator* and *Startup Frame Indicator* set to 1
TCU	Time Control Unit
Tx	Transmission

50.1.3 Overview

The CC is a FlexRay communication controller that implements the FlexRay Communications System Protocol Specification, Version 2.1 Rev A.

The CC has three main components:

- *Controller host interface (CHI)*
- *Protocol engine (PE)*
- *Clock domain crossing unit (CDC)*

A block diagram of the CC with its surrounding modules is given in the below figure.

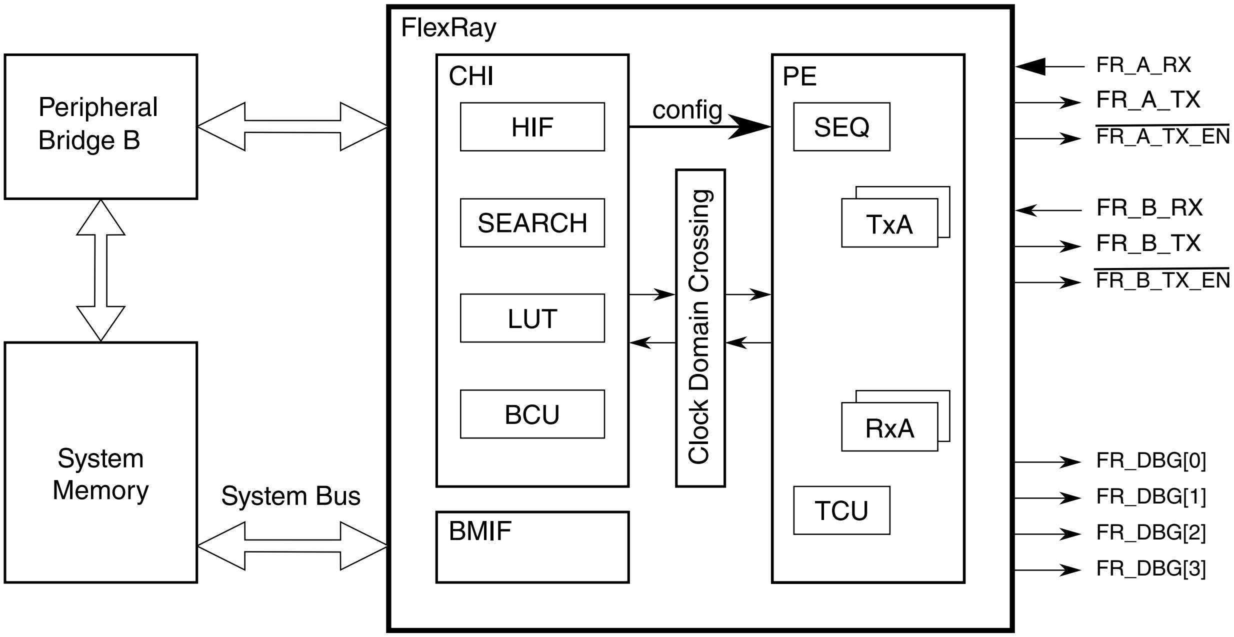

Figure 50-1. FlexRay block diagram

The protocol engine has two transmitter units TxA and TxB and two receiver units RxA and RxB for sending and receiving frames through the two FlexRay channels. The time control unit (TCU) is responsible for maintaining global clock synchronization to the FlexRay network. The overall activity of the PE is controlled by the sequencer engine (SEQ).

The controller host interface provides host access to the module's configuration, control, and status registers, as well as to the message buffer configuration, control, and status registers. The message buffers themselves, which contain the frame header and payload data received or to be transmitted, and the slot status information, are stored in the FlexRay memory area.

The clock domain crossing unit implements signal crossing from the CHI clock domain to the PE clock domain and vice versa, to allow for asynchronous PE and CHI clock domains.

The CC stores the frame header and payload data of frames received or of frames to be transmitted in the FlexRay memory area. The application accesses the FlexRay memory area to retrieve and provide the frames to be processed by the CC. In addition to the frame header and payload data, the CC stores the synchronization frame related tables in the FlexRay memory area for application processing.

The FlexRay memory area is located in the system memory of the MCU. The CC has access to the FlexRay memory area via its bus master interface (BMIF). The host provides the start address of the FlexRay memory area within the system memory by programming the System Memory Base Address Register (FR_SYMBADHR and

FR_SYMBADLR). All FlexRay memory area related offsets are stored in offset registers. The physical address pointer into the FlexRay memory area is calculated using the offset values the FlexRay memory base address.

Note

> The CC does not provide a memory protection scheme for the FlexRay memory area.

50.1.4 Features

The CC provides the following features:

- *FlexRay Communications System Protocol Specification, Version 2.1 Rev A compliant protocol implementation*
- *FlexRay Communications System Electrical Physical Layer Specification, Version 3.0 compliant bus driver interface*
- Single channel support
  - FlexRay Port A can be configured to be connected either to physical FlexRay channel A or physical FlexRay channel B.
- Dual channel support
- FlexRay bus data rates of 10 Mbit/s, 8 Mbit/s, 5 Mbit/s, and 2.5 Mbit/s supported
- 64 configurable message buffers with
  - individual frame ID filtering
  - individual channel ID filtering
  - individual cycle counter filtering
- Message buffer header, status and payload data stored in dedicated FlexRay memory area
  - allows for flexible and efficient message buffer implementation
  - consistent data access ensured by means of buffer locking scheme
  - application can lock multiple buffers at the same time
- Size of message buffer payload data section configurable from 0 up to 254 bytes
- Two independent message buffer segments with configurable size of payload data section

    - each segment can contain message buffers assigned to the static segment and message buffers assigned to the dynamic segment at the same time
- Zero padding for transmit message buffers in static segment
    - applied when the frame payload length exceeds the size of the message buffer data section
- Transmit message buffers configurable with state/event semantics
- Message buffers can be configured as
    - receive message buffer
    - transmit message buffer
- Individual message buffer reconfiguration supported
    - means provided to safely disable individual message buffers
    - disabled message buffers can be reconfigured
- Two independent receive FIFOs
    - one receive FIFO per channel
    - up to 255 entries for each FIFO
    - global frame ID filtering, based on both value/mask filters and range filters
    - global channel ID filtering
    - global message ID filtering for the dynamic segment
- 4 configurable slot error counters
- 4 dedicated slot status indicators
    - used to observe slots without using receive message buffers
- Measured value indicators for the clock synchronization
    - internal synchronization frame ID and synchronization frame measurement tables can be copied into the FlexRay memory area
- Fractional macroticks are supported for clock correction
- Maskable interrupt sources provided via individual and combined interrupt lines
- 1 absolute timer
- 1 timer that can be configured to absolute or relative

- Error correction and error detection (SECDED ECC) for protocol engine data RAM
- Error detection (SECDED ECC) for CHI lookup table RAM

50.1.5 Modes of Operation

This section describes the basic operational power modes of the CC.

50.1.5.1 Disabled Mode

The CC enters the Disabled Mode during hard reset or when the host clears the ‘MEN’ field in the Module Configuration Register (FR_MCR). The host can clear this field by writing ‘0’ and only when the module is in POC:default config mode. The Disabled mode can be checked by reading the module enable field, MEN, in the Module Configuration Register (FR_MCR).

No communication is performed on the FlexRay bus.

All registers with the write access conditions *Any Time* and *Disabled Mode* can be accessed for writing as stated in the Memory Map and Register Description section.

The application configures the CC by accessing the configuration bits and fields in the Module Configuration Register (FR_MCR) as described in Module Initialization .

50.1.5.1.1 Leave Disabled Mode

The CC leaves the Disabled Mode and enters the Normal Mode, when the application writes 1 to the module enable bit MEN in the Module Configuration Register (FR_MCR)

Note

> Once the CC is enabled, it can only be disabled during POC: default config.

50.1.5.2 Normal Mode

In this mode the CC is fully functional. The CC indicates that it is in Normal Mode by asserting the module enable bit MEN in the Module Configuration Register (FR_MCR).

50.1.5.2.1 Enter Normal Mode

This mode is entered when the application requests the CC to leave the Disabled Mode. If the Normal Mode was entered by leaving the Disabled Mode, the application has to perform the protocol initialization described in Protocol Initialization to achieve full FlexRay functionality.

Depending on the values of the SCM, CHA, and CHB bits in the Module Configuration Register (FR_MCR), the corresponding FlexRay bus driver ports are enabled and driven.

50.2 External Signal Description

This section lists and describes the CC signals connected to external pins. These signals are summarized in the following table and described in detail in the Detailed Signal Descriptions section below.

NOTE

Please refer the device configuration of the reference manual for the exact module pin names.

NOTE

The off chip signals FR_A_RX, FR_A_TX, and $\overline{\mathrm{FR\_A\_TX\_EN}}$ are available on each package option. The availability of the other off-chip signals depends on the package option and is chip-specific.

Table 50-2. External Signal Properties

Name	Direction	Active	Reset	Function
FR_A_RX	Input	—	—	Receive Data Channel A
FR_A_TX	Output	—	1	Transmit Data Channel A
$\overline{\mathrm{FR\_A\_TX\_EN}}$	Output	Low	1	Transmit Enable Channel A
FR_B_RX	Input	—	—	Receive Data Channel B
FR_B_TX	Output	—	1	Transmit Data Channel B
$\overline{\mathrm{FR\_B\_TX\_EN}}$	Output	Low	1	Transmit Enable Channel B
FR_DBG[0]	Output	—	0	Debug Strobe Signal 0

FR_DBG[2]	Output	—	0	Debug Strobe Signal 2
FR_DBG[3]	Output	—	0	Debug Strobe Signal 3

50.2.1 Detailed Signal Descriptions

This section provides a detailed description of the CC signals, connected to external pins.

50.2.1.1 FR_A_RX — Receive Data Channel A

The FR_A_RX signal carries the receive data for channel A from the corresponding FlexRay bus driver.

50.2.1.2 FR_A_TX — Transmit Data Channel A

The FR_A_TX signal carries the transmit data for channel A to the corresponding FlexRay bus driver.

50.2.1.3 $\overline{\text{FR\_A\_TX\_EN}}$ — Transmit Enable Channel A

The $\overline{\text{FR\_A\_TX\_EN}}$ signal indicates to the FlexRay bus driver that the CC is attempting to transmit data on channel A.

50.2.1.4 FR_B_RX — Receive Data Channel B

The FR_B_RX signal carries the receive data for channel B from the corresponding FlexRay bus driver.

50.2.1.5 FR_B_TX — Transmit Data Channel B

The FR_B_TX signal carries the transmit data for channel B to the corresponding FlexRay bus driver

50.2.1.6 $\overline{\text{FR\_B\_TX\_EN}}$ — Transmit Enable Channel B

The $\overline{\text{FR\_B\_TX\_EN}}$ signal indicates to the FlexRay bus driver that the CC is attempting to transmit data on channel B.

50.2.1.7 FR_DBG[3], FR_DBG[2], FR_DBG[1], FR_DBG[0] — Strobe Signals

These signals provide the selected debug strobe signals. For details on the debug strobe signal selection refer to the Strobe Signal Support.

50.3 Controller Host Interface Clocking

The clock for the CHI is derived from the system bus clock and has the same phase and frequency as the system bus clock. There are two constraints for the minimum CHI clock frequency.

The first constraint corresponds to the number of utilized message buffers and is specified in Number of Usable Message Buffers.

The second constraint corresponds to the value of the TIMEOUT field in the System Memory Access Time-Out Register (FR_SYMATOR) and is specified in Configure System Memory Access Time-Out Register (FR_SYMATOR).

50.4 Protocol Engine Clocking

The clock for the protocol engine can be generated by two sources. The first source is the internal crystal oscillator and the second source is an internal PLL. The clock source to be used is selected by the clock source select bit CLKSEL in the Module Configuration Register (FR_MCR).

Note

See the Device clocking details for the exact clock sources used.

50.4.1 Oscillator Clocking

If the protocol engine is clocked by the internal crystal oscillator, a crystal or CMOS compatible clock must be connected to the oscillator pins. The crystal or clock must fulfill the requirements given by the *FlexRay Communications System Protocol Specification, Version* 2.1 Rev A.

50.4.2 PLL Clocking

If the protocol engine is clocked by the internal PLL, the PLL clock should be divided down appropriately and provided to the PE.

For more details, see the clocking chapter of the device reference manual.

50.5 Register Descriptions

This section provides detailed descriptions of all registers in ascending address order, presented as 16-bit wide entities.

Table 50-3. Register Access Conventions

Convention	Description
▨	Depending on its placement in the read or write row, indicates that the bit is not readable or not writeable.
R*	Reserved bit or field, will not be changed. Application must not write any value different from the reset value.
FIELDNAME	Identifies the field. Its presence in the read or write row indicates that it can be read or written.

Table 50-4. Register Field Types

Convention	Description
rwm	A read/write bit that may be modified by a hardware in some fashion other than by a reset.
w1c	Write one to clear. A flag bit that can be read, is cleared by writing a one, writing 0 has no effect.
Reset Value	
0	Resets to zero.
1	Resets to one.
-	Not defined after reset and not affected by reset.

50.5.1 Register Reset

All registers except the Message Buffer Cycle Counter Filter Register (FR_MBCCFR*n*), Message Buffer Frame ID Register (FR_MBFIDR*n*), and Message Buffer Index Register (FR_MBIDXR*n*) are reset to their reset value on system reset. The registers mentioned above are located in physical memory blocks and, thus, they are not affected by reset. For some register fields, additional reset conditions exist. These additional reset conditions are mentioned in the detailed description of the register. The additional reset conditions are explained in the table below.

Table 50-5. Additional Register Reset Conditions

Condition	Description
Protocol RUN Command	The register field is reset when the application writes to RUN command "0101" to the POCCMD field in the Protocol Operation Control Register (FR_POCR).
Message Buffer Disable	The register field is reset when the application has disabled the message buffer. This happens when the application writes 1 to the message buffer disable trigger bit FR_MBCCSRn[EDT] while the message buffer is enabled (FR_MBCCSRn[EDS] = 1) and the CC grants the disable to the application by clearing the FR_MBCCSRn[EDS] bit.

50.5.2 Register Write Access

This section describes the write access restriction terms that apply to all registers.

50.5.2.1 Register Write Access Restriction

For each register bit and register field, the write access conditions are specified in the detailed register description. A description of the write access conditions is given in the table below. If, for a specific register bit or field, none of the given write access conditions is fulfilled, any write attempt to this register bit or field is ignored without any notification. The values of the bits or fields are not changed. The condition term [A or B] indicates that the register or field can be written to if at least one of the conditions is fulfilled. The condition term [A and B] indicates that the register or field can be written to if both conditions are fulfilled.

Table 50-6. Register Write Access Restrictions

Condition	Indication	Description
Any Time	-	No write access restriction.
Disabled Mode	FR_MCR[MEN] = 0	Write access only when CC is in Disabled Mode.
Normal Mode	FR_MCR[MEN] = 1	Write access only when CC is in Normal Mode.
POC:config	FR_PSR0[PROTSTATE] = *POC:config*	Write access only when Protocol is in the *POC:config* state.
MB_DIS	FR_MBCCSR[EDS] = 0	Write access only when related Message Buffer is disabled.
MB_LCK	FR_MBCCSRn[LCKS] = 1	Write access only when related Message Buffer is locked.
IDL	FR_EEIRICR[BSY] = 0	Write access only when ECC configuration is idle.

50.5.2.2 Register Write Access Requirements

All registers can be accessed with 8-bit, 16-bit and 32-bit wide operations.

For some of the registers, at least a 16-bit wide write access is required to ensure correct operation. This write access requirement is described in the Memory map and register definition section. If an 8-bit wide write access is performed to any of these registers, this access is ignored without notification.

50.5.2.3 Internal Register Access

The following memory mapped registers are used to access multiple internal registers.

- *Strobe Signal Control Register (FR_STBSCR)*
- *Slot Status Selection Register (FR_SSSR)*
- *Slot Status Counter Condition Register (FR_SSCCR)*
- *Receive Shadow Buffer Configuration Data*

Each of these memory mapped registers provides a SEL field and a WMD bit. The SEL field is used to select the internal register. The WMD bit controls the write mode. If the WMD bit is set to 0 during the write access, all fields of the internal register are updated. If the WMD bit set to 1, only the SEL field is changed. All other fields of the internal register remain unchanged. This allows for reading back the values of the selected internal register in a subsequent read access.

50.6 Memory map and register definition

The CC occupies 8 KB (8192 bytes) of address space starting at the CC base address defined by the memory map of the MCU. Address offset - 0x0Ah,0xDEh-0xE0h should not be accessed by application as corresponding feature/s are not available. Therefore, transfer error will not be generated at these offset/s.

NOTE

The following registers are 16-bit write accessible only.

Strobe Signal Control Register (FR_STBSCR)

PE DRAM Access Register (FR_PEDRAR)

PE DRAM Data Register (FR_PEDRDR)

Sync Frame ID Rejection Filter Register (FR_SFIDRFR)

Slot Status Selection Register (FR_SSSR)

Slot Status Counter Condition Register (FR_SSCCR)

Receive Shadow Buffer Index Register (FR_RSBIR)

Receive FIFO Range Filter Configuration Register (FR_RFRFCFR)

Message Buffer Cycle Counter Filter Register (FR_MBCCFRn)

Message Buffer Frame ID Register (FR_MBFIDRn)

Message Buffer Index Register (FR_MBIDXRn)

Message Buffer Data Field Offset Register (FR_MBDORn)

LRAM ECC Error Test Register (FR_LEETRn)

1096	LRAM ECC Error Test Register (FR_LEETR3)	16	R/W	See section	50.6.117/ 1772
1098	LRAM ECC Error Test Register (FR_LEETR4)	16	R/W	See section	50.6.117/ 1772
109A	LRAM ECC Error Test Register (FR_LEETR5)	16	R/W	See section	50.6.117/ 1772

50.6.1 Module Version Register (FR_MVR)

This register provides the CC version number. The module version number is derived from the CHI version number and the PE version number.

Address: 0h base + 0h offset = 0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	CHIVER								PEVER							
Write																
Reset	1	0	1	0	0	1	0	0	0	1	1	0	1	0	0	0

FR_MVR field descriptions

Field	Description
0–7 CHIVER	CHI Version Number. This field provides the version number of the controller host interface.
8–15 PEVER	PE Version Number. This field provides the version number of the protocol engine.

50.6.2 Module Configuration Register (FR_MCR)

This register defines the global configuration of the CC.

Address: 0h base + 2h offset = 2h

Bit	0	1	2	3	4	5	6	7
Read Write	MEN	SBFF	SCM	CHB	CHA	SFFE	ECCE	Reserved
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	FUM	FAM	0	CLKSEL	BITRATE			0
Write								
Reset	0	0	0	0	0	0	0	0

FR_MCR field descriptions

Field	Description
0 MEN	Module Enable. This bit indicates whether or not the CC is in the Disabled Mode. The application requests the CC to leave the Disabled Mode by writing 1 to this bit Before leaving the Disabled Mode, the application must configure the SCM, SBFF, CHB, CHA, TMODE, BITRATE values. For details see Modes of Operation. **NOTE:** If the CC is enabled it can only be disabled during mode: POC:default config. 0 Write: only during POC:default config, CC disable Read: CC disabled 1 Write: enable CC Read: CC enabled
1 SBFF	System Bus Failure Freeze This bit controls the behavior of the CC in case of a system bus failure. 0 Continue normal operation 1 Transition to freeze mode
2 SCM	Single Channel Device Mode. This control bit defines the channel device mode of the CC as described in Channel Device Modes. 0 CC works in dual channel device mode 1 CC works in single channel device mode
3 CHB	Channel B Enable. protocol related parameter: pChannels The semantic of these control bits depends on the channel device mode controlled by the SCM bit and is given in the following table.

Table 50-7. FlexRay channel selection

SCM	CHB	CHA	Description
Dual Channel Device Modes			
0	0	0	ports FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC ports FR_B_RX, FR_B_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC
	0	1	ports FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ driven by CC - connected to FlexRay channel A

Table continues on the next page...

FR_MCR field descriptions (continued)

Field	Description

Table 50-7. FlexRay channel selection (continued)

SCM	CHB	CHA	Description
			ports FR_B_RX, FR_B_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC
	1	0	ports FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC ports FR_B_RX, FR_B_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ driven by CC - connected to FlexRay channel B
	1	1	ports FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ driven by CC - connected to FlexRay channel A ports FR_B_RX, FR_B_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ driven by CC - connected to FlexRay channel B
Single Channel Device Mode			
1	0	0	ports FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC ports FR_B_RX, FR_B_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC
	0	1	ports FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ driven by CC - connected to FlexRay channel A ports FR_B_RX, FR_B_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC
	1	0	ports FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ driven by CC - connected to FlexRay channel B ports FR_B_RX, FR_B_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ not driven by CC
	1	1	reserved

Field	Description
4 CHA	Channel A Enable. protocol related parameter: pChannels The semantic of these control bits depends on the channel device mode controlled by the SCM bit and is given in the FlexRay channel selection table as seen above.
5 SFFE	Synchronization Frame Filter Enable. This bit controls the filtering for received synchronization frames. For details see Sync Frame Filtering . 0 Synchronization frame filtering disabled 1 Synchronization frame filtering enabled
6 ECCE	ECC Functionality Enable. This bit controls the ECC memory error detection functionality. For details see Memory Content Fault Detection . 0 ECC functionality (injection, detection, reporting, response) disabled 1 ECC functionality enabled
7 Reserved	Reserved bit, will not be changed. Application must not write any value different from the reset value. This field is reserved.
8 FUM	FIFO Update Mode. This bit controls the FIFO update behavior when the interrupt flags FR_GIFER[FAFAIF] and FR_GIFER[FAFBIF] are written by the application (see FIFO Update) 0 FIFOA/FIFOB is updated on writing 1 to FR_GIFER[FAFAIF] /FR_GIFER[FAFBIF] 1 FIFOA/FIFOB) is not updated on writing 1 to FR_GIFER[FAFAIF]/FR_GIFER[FAFBIF]
9 FAM	FIFO Address Mode. This bit controls the location of the system memory base address for the FIFOs. (see FIFO Configuration)

Table continues on the next page...

FR_MCR field descriptions (continued)

Field	Description
	0 FIFO Base Address located in System Memory Base Address High Register (FR_SYMBADHR)) 1 FIFO Base Address located in Receive FIFO System Memory Base Address High Register (FR_RFSYMBADHR)
10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 CLKSEL	Protocol Engine Clock Source Select. This bit is used to select the clock source for the protocol engine. 0 PE clock source is generated by on-chip crystal oscillator. 1 PE clock source is generated by on-chip PLL.
12–14 BITRATE	FlexRay Bus Bit Rate. This bit field defines the FlexRay Bus Bit Rate. 000 10.0 Mbit/sec 001 5.0 Mbit/sec 010 2.5 Mbit/sec 011 8.0 Mbit/sec 100 reserved 101 reserved 110 reserved 111 reserved
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

50.6.3 System Memory Base Address High Register (FR_SYMBADHR)

NOTE

> The system memory base address must be set before the CC is enabled.

The system memory base address registers (FR_SYMBADHR) define the base address of the FlexRay memory area within the system memory. The base address is used by the BMIF to calculate the physical memory address for system memory accesses.

The FR_SYMBADHR register contains the most significant bits of the base address.

Address: 0h base + 4h offset = 4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	SMBA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SYMBADHR field descriptions

Field	Description
0–15 SMBA	System Memory Base Address high. This is the value of the system memory base address for the individual message buffers and sync frame table. This is the value of the system memory base address for the receive FIFO if the FIFO address mode bit FR_MCR[FAM] is set to 1. It is defines as a byte address.

50.6.4 System Memory Base Address Low Register (FR_SYMBADLR)

NOTE

> The system memory base address must be set before the CC is enabled.

The system memory base address registers (FR_SYMBADLR) define the base address of the FlexRay memory area within the system memory. The base address is used by the BMIF to calculate the physical memory address for system memory accesses.

The FR_SYMBADLR register contains the least significant bits of the base address.

Address: 0h base + 6h offset = 6h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	SMBA												0 ▨			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SYMBADLR field descriptions

Field	Description
0–11 SMBA	System Memory Base Address low. This is the value of the system memory base address for the individual message buffers and sync frame table. This is the value of the system memory base address for the receive FIFO if the FIFO address mode bit FR_MCR[FAM] is set to 1. It is defines as a byte address.
12–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

50.6.5 Strobe Signal Control Register (FR_STBSCR)

This register is used to assign the individual protocol timing related strobe signals given in Table 50-8 to the external strobe ports. Each strobe signal can be assigned to at most one strobe port . Each write access to registers overwrites the previously written ENB and STBPSEL values for the signal indicated by SEL . If more than one strobe signal is assigned to one strobe port, the current values of the strobe signals are combined with a binary OR and presented at the strobe port . If no strobe signal is assigned to a strobe port, the strobe port carries logic 0 . For more detailed and timing information refer to Strobe Signal Support .

NOTE

In single channel device mode, channel B related strobe signals are undefined and should not be assigned to the strobe ports.

Address: 0h base + 8h offset = 8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0	0			SEL				0			ENB	0		STBPSEL	
Write	WMD															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_STBSCR field descriptions

Field	Description
0 WMD	Write Mode. This control bit defines the write mode of this register. 0 Write to all fields in this register on write access. 1 Write to SEL field only on write access.
1–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4–7 SEL	Strobe Signal Select. This control field selects one of the strobe signals given in Table 50-8 to be enabled or disabled and assigned to one of the four strobe ports given in the following table.

Table 50-8. Strobe Signal Mapping

SEL		Description	Channel	Type	Offset (Given in PE clock cycles)	Reference
dec	hex					
0	0x0	arm	-	value	+1	MT start
1	0x1	mt	-	value	+1	MT start
2	0x2	cycle start	-	pulse	0	MT start
3	0x3	minislot start	-	pulse	0	MT start

50.6.6 Message Buffer Data Size Register (FR_MBDSR)

This register defines the size of the message buffer data section for the two message buffer segments in a number of two-byte entities.

The CC provides two independent segments for the individual message buffers. All individual message buffers within one segment have to have the same size for the message buffer data section. This size can be different for the two message buffer segments.

Address: 0h base + Ch offset = Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0	MBSEG2DS							0	MBSEG1DS						
Write	▨								▨							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_MBDSR field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1–7 MBSEG2DS	Message Buffer Segment 2 Data Size. The field defines the size of the message buffer data section in two-byte entities for message buffers within the second message buffer segment.
8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–15 MBSEG1DS	Message Buffer Segment 1 Data Size. The field defines the size of the message buffer data section in two-byte entities for message buffers within the first message buffer segment.

50.6.7 Message Buffer Segment Size and Utilization Register (FR_MBSSUTR)

This register is used to define the last individual message buffer that belongs to the first message buffer segment and the number of the last used individual message buffer.

Address: 0h base + Eh offset = Eh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0		LAST_MB_SEG1						0		LAST_MB_UTIL					
Write	▨	▨							▨	▨						
Reset	0	0	1	1	1	1	1	1	0	0	1	1	1	1	1	1

FR_MBSSUTR field descriptions

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–7 LAST_MB_SEG1	Last Message Buffer In Segment 1. This field defines the message buffer number of the last individual message buffer that is assigned to the first message buffer segment. The individual message buffers in the first segment correspond to the message buffer control registers FR_MBCCSRn, FR_MBCCFRn, FR_MBFIDRn, FR_MBIDXRn with n <= LAST_MB_SEG1. The first message buffer segment contains LAST_MB_SEG1+1 individual message buffers. **NOTE:** The first message buffer segment contains at least one individual message buffer. The individual message buffers in the second message buffer segment correspond to the message buffer control registers FR_MBCCSRn, FR_MBCCFRn, FR_MBFIDRn, FR_MBIDXRn with LAST_MB_SEG1 < n < 64 256. **NOTE:** If LAST_MB_SEG1 = 63 255 all individual message buffers belong to the first message buffer segment and the second message buffer segment is empty.

Table continues on the next page...

FR_MBSSUTR field descriptions (continued)

Field	Description
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–15 LAST_MB_UTIL	Last Message Buffer Utilized. This field defines the message buffer number of last utilized individual message buffer. The message buffer search engine examines all individual message buffer with a message buffer number n <= LAST_MB_UTIL. **NOTE:** If LAST_MB_UTIL=LAST_MB_SEG1 all individual message buffers belong to the first message buffer segment and the second message buffer segment is empty.

50.6.8 PE DRAM Access Register (FR_PEDRAR)

The PEDRAR register is used to trigger write and read operations on the PE data memory (PE DRAM). These operations are used for memory error injection and memory error observation.

Each write access to this registers initiates a read or write operation on the PE DRAM. The access done status bit DAD is cleared after the write access and is set if the PE DRAM access has been finished.

In case of an PE DRAM write access, the data provided in FR_PEDRDR are written into the PE DRAM, read back from the PE DRAM and are stored into the FR_PEDRDR.

In case of an PE DRAM read access, the requested data are read from PE DRAM and stored into the FR_PEDRDR.

For a detailed description refer to Memory Content Fault Detection

Address: 0h base + 10h offset = 10h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	INST				ADDR											DAD
Write																▨
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PEDRAR field descriptions

Field	Description
0–3 INST	PE DRAM Access Instruction. This field defines the operation to be executed on the PE DRAM. 0011 PE DRAM write: Write FR_PEDRDR[DATA] to PE DRAM address ADDR (16 bit) 0101 PE DRAM read: Read Data from PE DRAM address ADDR (16 bit) into FR_PEDRDR[DATA] other reserved
4–14 ADDR	PE DRAM Access Address. This field defines the address in the PE DRAM to be written to or read from.

Table continues on the next page...

FR_PEDRAR field descriptions (continued)

Field	Description
15 DAD	PE DRAM Access Done. This status bit is cleared when the application has written to this register and is set when the PE DRAM access has finished. 0 PE DRAM access running 1 PE DRAM access done

50.6.9 PE DRAM Data Register (FR_PEDRDR)

This register provides the data to be written to or read from the PE DRAM by the access initiated by write access to the FR_PEDRAR.

Address: 0h base + 12h offset = 12h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	DATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PEDRDR field descriptions

Field	Description
0–15 DATA	Data to be written to or read from the PE DRAM by the access initiated by write access to the FR_PEDRAR.

50.6.10 Protocol Operation Control Register (FR_POCR)

The application uses this register to issue

- protocol control commands
- external clock correction commands

Protocol control commands are issued by writing to the POCCMD field. For more information on protocol control commands, see Protocol Control Command Execution .

External clock correction commands are issued by writing to the EOC_AP and ERC_AP fields. For more information on external clock correction, refer to External Clock Synchronization .

Address: 0h base + 14h offset = 14h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0	0			EOC_AP		ERC_AP		BSY_ WMC	0			POCCMD			
Write	WME															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_POCR field descriptions

Field	Description
0 WME	Write Mode External Correction. This bit controls the write mode of the EOC_AP and ERC_AP fields. 0 Write to EOC_AP and ERC_AP fields on register write. 1 No write to EOC_AP and ERC_AP fields on register write.
1–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4–5 EOC_AP	External Offset Correction Application. This field is used to trigger the application of the external offset correction value defined in the Protocol Configuration Register 29 (FR_PCR29). 00 do not apply external offset correction value 01 reserved 10 subtract external offset correction value 11 add external offset correction value
6–7 ERC_AP	External Rate Correction Application. This field is used to trigger application of the external rate correction value defined in the Protocol Configuration Register 21 (FR_PCR21) 00 do not apply external rate correction value 01 reserved 10 subtract external rate correction value 11 add external rate correction value
8 BSY_WMC	**NOTE:** The name and function of this field varies depending on whether it is being read or written. BSY (Read-Only). Protocol Control Command Busy. This status bit indicates the acceptance of the protocol control command issued by the application via the POCCMD field. The CC sets this status bit when the application has issued a protocol control command via the POCCMD field. The CC clears this status bit when protocol control command was accepted by the PE. When the application issues a protocol control command while the BSY bit is asserted, the CC ignores this command, sets the protocol command ignored error flag PCMI_EF in the CHI Error Flag Register (FR_CHIERFR) , and will not change the value of the POCCMD field. WMC (Write-Only) Protocol Control Command Write. This status bit indicates the acceptance of the protocol control command issued by the application via the POCCMD field. The CC sets this status bit when the application has issued a protocol control command via the POCCMD field. The CC clears this status bit when protocol control command was accepted by the PE. When the application issues a protocol control command while the BSY bit is asserted, the CC ignores this command, sets the protocol command ignored error flag PCMI_EF in the CHI Error Flag Register (FR_CHIERFR) , and will not change the value of the POCCMD field. 0 (Write-Only) Write to POCCMD field on register write. 1 (Write-Only) Do not write to POCCMD field on register write. 0 (Read-Only) Command write idle, command accepted and ready to receive new protocol command. 1 (Read-Only) Command write busy, command not yet accepted, not ready to receive new protocol command.

Table continues on the next page...

FR_POCR field descriptions (continued)

Field	Description
9–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–15 POCCMD	Protocol Control Command. The application writes to this field to issue a protocol control command to the PE. The CC sends the protocol command to the PE immediately. While the transfer is running, the BSY bit is set. 0000 ALLOW_COLDSTART. Immediately activate capability of node to cold start cluster. 0001 ALL_SLOTS. Delayed transition to the all slots transmission mode. (Delayed means on completion of current communication cycle.) 0010 CONFIG. Immediately transition to the POC:config state. 0011 FREEZE. Immediately transition to the POC:halt state. 0100 READY, CONFIG_COMPLETE. Immediately transition to the POC:ready state. 0101 RUN. Immediately transition to the POC:startup start state. 0110 DEFAULT_CONFIG. Immediately transition to the POC:default config state. 0111 HALT. Delayed transition to the POC:halt state 1000 WAKEUP. Immediately initiate the wakeup procedure. 1001 Reserved 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

50.6.11 Global Interrupt Flag and Enable Register (FR_GIFER)

This register provides the means to control some of the interrupt request lines and provides the corresponding interrupt flags. The interrupt flags MIF, PRIF, CHIF, RBIF, and TBIF are the outcome of a binary OR of the related individual interrupt flags and interrupt enables . The generation scheme for these flags is depicted in Figure 50-33 . For more details on interrupt generation, see Interrupt Support . These flags are cleared automatically when all of the corresponding interrupt flags or interrupt enables in the related interrupt flag and enable registers are cleared by the application.

Address: 0h base + 16h offset = 16h

Bit	0	1	2	3	4	5	6	7
Read	MIF	PRIF	CHIF	WUPIF	FAFBIF	FAFAIF	RBIF	TBIF
Write				w1c	w1c	w1c		
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read Write	MIE	PRIE	CHIE	WUPIE	FAFBIE	FAFAIE	RBIE	TBIE
Reset	0	0	0	0	0	0	0	0

FR_GIFER field descriptions

Field	Description
0 MIF	Module Interrupt Flag. This interrupt flag is set if at least one of the other interrupt flags in this register and the related interrupt enable bit are set. 0 No interrupt flag and related interrupt enable bit are set 1 At least one of the other interrupt flags in this register and the related interrupt bit are set.
1 PRIF	Protocol Interrupt Flag. This interrupt flag is set if at least one of the individual flags in the Protocol Interrupt Flag Register 0 (FR_PIFR0) and Protocol Interrupt Flag Register 1 (FR_PIFR1) and the related interrupt enable bit are set. 0 No individual protocol interrupt flag and related interrupt enable bit are set. 1 At least one of the individual protocol interrupt flags and the related interrupt enable bit are set.
2 CHIF	CHI Interrupt Flag. This interrupt flag is set if at least one of the error flags in the CHI Error Flag Register (FR_CHIERFR) and the chi error interrupt enable bit FR_GIFER[CHIE] are set . 0 All CHI error flags are equal to 0 or the chi error interrupt is disabled. 1 At least one CHI error flag and the chi error interrupt enable are is set.
3 WUPIF	Wakeup Interrupt Flag. This interrupt flag is set when the CC has received a wakeup symbol on the FlexRay bus. The application can determine on which channel the wakeup symbol was received by reading the related wakeup flags WUB and WUA in the Protocol Status Register 3 (FR_PSR3).

Table continues on the next page...

FR_GIFER field descriptions (continued)

Field	Description
	0 No Wakeup symbol received on FlexRay bus 1 Wakeup symbol received on FlexRay bus
4 FAFBIF	Receive FIFO Channel B Almost Full Interrupt Flag. This interrupt flag is set when one of the following events occurs a) the current number of FIFO B entries is equal to or greater than the watermark defined by the WM field in the Receive FIFO Watermark and Selection Register (FR_RFWMSR), and the CC writes a received message into the FIFO B, or b) the current number of FIFO B entries is at least 1 and the periodic timer as defined by Receive FIFO Periodic Timer Register (FR_RFPTR) expires. 0 no such event 1 FIFO B almost full event has occurred
5 FAFAIF	Receive FIFO Channel A Almost Full Interrupt Flag. This interrupt flag is set when one of the following events occurs a) the current number of FIFO A entries is equal to or greater than the watermark defined by the WM field in the Receive FIFO Watermark and Selection Register (FR_RFWMSR), and the CC writes a received message into the FIFO A, or b) the current number of FIFO B entries is at least 1 and the periodic timer as defined by Receive FIFO Periodic Timer Register (FR_RFPTR) expires. 0 no such event 1 FIFO A almost full event has occurred
6 RBIF	Receive Message Buffer Interrupt Flag. This interrupt flag is set if for at least one of the individual receive message buffers (FR_MBCCSRn[MTD] = 0) both the interrupt flag MBIF and the interrupt enable bit MBIE in the corresponding Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn) are asserted. The application can not clear this interrupt flag directly, instead it is cleared by the CC when all of the interrupt flags MBIF of the individual receive message buffers are cleared by the application or if the application has cleared the related interrupt enables bit MBIE. 0 None of the individual receive message buffers has the MBIF and MBIE flag set. 1 At least one individual receive message buffer has the MBIF and MBIE flag set.
7 TBIF	Transmit Message Buffer Interrupt Flag. This flag is set if for at least one of the individual message buffers (FR_MBCCSRn[MTD] = 1) both the interrupt flag MBIF and the interrupt enable bit MBIE in the corresponding Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn) are equal to 1. The application can not clear this interrupt flag directly, instead, this interrupt flag is cleared by the CC when either all of the individual interrupt flags MBIF of the individual transmit message buffers are cleared by the application or the application has cleared the related interrupt enables bit MBIE. 0 None of the individual transmit message buffers has the MBIF and MBIE flag set. 1 At least one individual transmit message buffer has the MBIF and MBIE flag set.
8 MIE	Module Interrupt Enable. This bit controls if the Module Interrupt line is asserted when the MIF flag is set. 0 Disable interrupt line 1 Enable interrupt line
9 PRIE	Protocol Interrupt Enable. This bit controls if the Protocol Interrupt line is asserted when the PRIF flag is set. 0 Disable interrupt line 1 Enable interrupt line

Table continues on the next page...

FR_GIFER field descriptions (continued)

Field	Description
10 CHIE	CHI Interrupt Enable. This bit controls if the CHI Interrupt line is asserted when the CHIF flag is set. 0 Disable interrupt line 1 Enable interrupt line
11 WUPIE	Wakeup Interrupt Enable. This bit controls if the Wakeup Interrupt line is asserted when the WUPIF flag is set. 0 Disable interrupt line 1 Enable interrupt line
12 FAFBIE	Receive FIFO Channel B Almost Full Interrupt Enable. This bit controls if the RX FIFO B Almost Full Interrupt line is asserted when the FAFBIF flag is set. 0 Disable interrupt line 1 Enable interrupt line
13 FAFAIE	Receive FIFO Channel A Almost Full Interrupt Enable. This bit controls if the RX FIFO A Almost Full Interrupt line is asserted when the FAFAIF flag is set. 0 Disable interrupt line 1 Enable interrupt line
14 RBIE	Receive Message Buffer Interrupt Enable. This bit controls if the Receive Message Buffer Interrupt line is asserted when the RBIF flag is set. 0 Disable interrupt line 1 Enable interrupt line
15 TBIE	Transmit Message Buffer Interrupt Enable. This bit controls if the Transmit Message Buffer Interrupt line is asserted when the TBIF flag is set. 0 Disable interrupt line 1 Enable interrupt line

50.6.12 Protocol Interrupt Flag Register 0 (FR_PIFR0)

The register holds one set of the protocol-related individual interrupt flags.

Address: 0h base + 18h offset = 18h

Bit	0	1	2	3	4	5	6	7
Read	FATL_IF	INTL_IF	ILCF_IF	CSA_IF	MRC_IF	MOC_IF	CCL_IF	MXS_IF
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	MTX_IF	LTXB_IF	LTXA_IF	TBVB_IF	TBVA_IF	TI2_IF	TI1_IF	CYS_IF
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

FR_PIFR0 field descriptions

Field	Description
0 FATL_IF	Fatal Protocol Error Interrupt Flag. This flag is set when the protocol engine has detected a fatal protocol error. In this case, the protocol engine goes into the POC:halt state immediately. The fatal protocol errors are: 1) pLatestTx violation, as described in the MAC process of the FlexRay protocol 2) transmission across slot boundary violation, as described in the FSP process of the FlexRay protocol 0 No such event. 1 Fatal protocol error detected.
1 INTL_IF	Internal Protocol Error Interrupt Flag. This flag is set when the protocol engine has detected an internal protocol error. In this case, the protocol engine goes into the POC:halt state immediately. An internal protocol error occurs when the protocol engine has not finished a calculation and a new calculation is requested. This can be caused by a hardware error. 0 No such event. 1 Internal protocol error detected.
2 ILCF_IF	Illegal Protocol Configuration Interrupt Flag. This flag is set when the protocol engine has detected an illegal protocol configuration parameter setting. In this case, the protocol engine goes into the POC:halt state immediately. The protocol engine checks the listen_timeout value programmed into the Protocol Configuration Register 14 (FR_PCR14) and Protocol Configuration Register 15 (FR_PCR15) when the CONFIG_COMPLETE command was sent by the application via the Protocol Operation Control Register (FR_POCR). If the value of listen_timeout is equal to zero, the protocol configuration setting is considered as illegal. 0 No such event. 1 Illegal protocol configuration detected.
3 CSA_IF	Cold Start Abort Interrupt Flag. This flag is set when the configured number of allowed cold start attempts is reached and none of these attempts was successful. The number of allowed cold start attempts is configured by the coldstart_attempts field in the Protocol Configuration Register 3 (FR_PCR3). 0 No such event. 1 Cold start aborted and no more coldstart attempts allowed.
4 MRC_IF	Missing Rate Correction Interrupt Flag. This flag is set when an insufficient number of measurements is available for rate correction at the end of the communication cycle. 0 No such event 1 Insufficient number of measurements for rate correction detected
5 MOC_IF	Missing Offset Correction Interrupt Flag. This flag is set when an insufficient number of measurements is available for offset correction. This is related to the MISSING_TERM event in the CSP process for offset correction in the FlexRay protocol. 0 No such event. 1 Insufficient number of measurements for offset correction detected.
6 CCL_IF	Clock Correction Limit Reached Interrupt Flag. This flag is set when the internal calculated offset or rate calculation values have reached or exceeded its configured thresholds as given by the offset_coorection_out field in the Protocol Configuration Register 9 (FR_PCR9) and the rate_correction_out field in the Protocol Configuration Register 14 (FR_PCR14). 0 No such event. 1 Offset or rate correction limit reached.

Table continues on the next page...

FR_PIFR0 field descriptions (continued)

Field	Description
7 MXS_IF	Max Sync Frames Detected Interrupt Flag. This flag is set when the number of synchronization frames detected in the current communication cycle exceeds the value of the node_sync_max field in the Protocol Configuration Register 30 (FR_PCR30). **NOTE:** Only synchronization frames that have passed the synchronization frame acceptance and rejection filters are taken into account. 0 No such event. 1 More than node_sync_max sync frames detected.
8 MTX_IF	Media Access Test Symbol Received Interrupt Flag. This flag is set when the MTS symbol was received on channel A or channel B. 0 No such event. 1 MTS symbol received.
9 LTXB_IF	pLatestTx Violation on Channel B Interrupt Flag. This flag is set when the frame transmission on channel B in the dynamic segment exceeds the dynamic segment boundary. This is related to the pLatestTx violation, as described in the MAC process of the FlexRay protocol. 0 No such event. 1 pLatestTx violation occurred on channel B.
10 LTXA_IF	pLatestTx Violation on Channel A Interrupt Flag. This flag is set when the frame transmission on channel A in the dynamic segment exceeds the dynamic segment boundary. This is related to the pLatestTx violation as described in the MAC process of the FlexRay protocol. 0 No such event. 1 pLatestTx violation occurred on channel A.
11 TBVB_IF	Transmission across boundary on channel B Interrupt Flag. This flag is set when the frame transmission on channel B crosses the slot boundary. This is related to the transmission across slot boundary violation as described in the FSP process of the FlexRay protocol. 0 No such event. 1 Transmission across boundary violation occurred on channel B.
12 TBVA_IF	Transmission across boundary on channel A Interrupt Flag. This flag is set when the frame transmission on channel A crosses the slot boundary. This is related to the transmission across slot boundary violation as described in the FSP process of the FlexRay protocol. 0 No such event. 1 Transmission across boundary violation occurred on channel A.
13 TI2_IF	Timer 2 Expired Interrupt Flag. This flag is set whenever timer 2 expires. 0 No such event. 1 Timer 2 has reached its time limit.
14 TI1_IF	Timer 1 Expired Interrupt Flag. This flag is set whenever timer 1 expires. 0 No such event 1 Timer 1 has reached its time limit
15 CYS_IF	Cycle Start Interrupt Flag. This flag is set when a communication cycle starts. 0 No such event 1 Communication cycle started.

50.6.13 Protocol Interrupt Flag Register 1 (FR_PIFR1)

The register holds one set of the protocol-related individual interrupt flags.

Address: 0h base + 1Ah offset = 1Ah

Bit	0	1	2	3	4	5	6	7
Read	EMC_IF	IPC_IF	PECF_IF	PSC_IF	SSI3_IF	SSI2_IF	SSI1_IF	SSI0_IF
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	0		EVT_IF	ODT_IF	0			
Write			w1c	w1c				
Reset	0	0	0	0	0	0	0	0

FR_PIFR1 field descriptions

Field	Description
0 EMC_IF	Error Mode Changed Interrupt Flag. This flag is set when the value of the ERRMODE bit field in the Protocol Status Register 0 (FR_PSR0) is changed by the CC. 0 No such event. 1 ERRMODE field changed.
1 IPC_IF	Illegal Protocol Control Command Interrupt Flag. This flag is set when the PE tries to execute a protocol control command, which was issued via the POCCMD field of the Protocol Operation Control Register (FR_POCR), and detects that this protocol control command is not allowed in the current protocol state. In this case the command is not executed. For more details, see Protocol Control Command Execution . 0 No such event. 1 Illegal protocol control command detected.
2 PECF_IF	Protocol Engine Communication Failure Interrupt Flag. This flag is set if the CC has detected a communication failure between the PE and the CHI. 0 No such event. 1 Protocol Engine Communication Failure detected.
3 PSC_IF	Protocol State Changed Interrupt Flag. This flag is set when the protocol state in the PROTSTATE field in the Protocol Status Register 0 (FR_PSR0) has changed. 0 No such event. 1 Protocol state changed.
4 SSI3_IF	Slot Status Counter Incremented Interrupt Flag. Each of these flags is set when the SLOTSTATUSCNT field in the corresponding Slot Status Counter Registers (FR_SSCRn) is incremented. 0 No such event. 1 The corresponding slot status counter has incremented.
5 SSI2_IF	Slot Status Counter Incremented Interrupt Flag. Each of these flags is set when the SLOTSTATUSCNT field in the corresponding Slot Status Counter Registers (FR_SSCRn) is incremented.

Table continues on the next page...

FR_PIFR1 field descriptions (continued)

Field	Description
	0 No such event. 1 The corresponding slot status counter has incremented.
6 SSI1_IF	Slot Status Counter Incremented Interrupt Flag. Each of these flags is set when the SLOTSTATUSCNT field in the corresponding Slot Status Counter Registers (FR_SSCRn) is incremented. 0 No such event. 1 The corresponding slot status counter has incremented.
7 SSI0_IF	Slot Status Counter Incremented Interrupt Flag. Each of these flags is set when the SLOTSTATUSCNT field in the corresponding Slot Status Counter Registers (FR_SSCRn) is incremented. 0 No such event. 1 The corresponding slot status counter has incremented.
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 EVT_IF	Even Cycle Table Written Interrupt Flag. This flag is set if the CC has written the sync frame measurement / ID tables into the FlexRay memory area for the even cycle. 0 No such event. 1 Sync frame measurement table written
11 ODT_IF	Odd Cycle Table Written Interrupt Flag. This flag is set if the CC has written the sync frame measurement / ID tables into the FlexRay memory area for the odd cycle. 0 No such event. 1 Sync frame measurement table written
12–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

50.6.14 Protocol Interrupt Enable Register 0 (FR_PIER0)

This register defines whether or not the individual interrupt flags defined in the Protocol Interrupt Flag Register 0 (FR_PIFR0) can generate a protocol interrupt request.

Address: 0h base + 1Ch offset = 1Ch

Bit	0	1	2	3	4	5	6	7
Read Write	FATL_IE	INTL_IE	ILCF_IE	CSA_IE	MRC_IE	MOC_IE	CCL_IE	MXS_IE
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15

Reset	0	0	0	0	0	0	0	0

FR_PIER0 field descriptions

Field	Description
0 FATL_IE	Fatal Protocol Error Interrupt Enable. This bit controls FATL_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
1 INTL_IE	Internal Protocol Error Interrupt Enable. This bit controls INTL_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
2 ILCF_IE	Illegal Protocol Configuration Interrupt Enable. This bit controls ILCF_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
3 CSA_IE	Cold Start Abort Interrupt Enable. This bit controls CSA_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
4 MRC_IE	Missing Rate Correction Interrupt Enable. This bit controls MRC_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
5 MOC_IE	Missing Offset Correction Interrupt Enable. This bit controls MOC_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
6 CCL_IE	Clock Correction Limit Reached Interrupt Enable. This bit controls CCL_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
7 MXS_IE	Max Sync Frames Detected Interrupt Enable. This bit controls MXS_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
8 MTX_IE	Media Access Test Symbol Received Interrupt Enable. This bit controls MTX_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
9 LTXB_IE	pLatestTx Violation on Channel B Interrupt Enable. This bit controls LTXB_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
10 LTXA_IE	pLatestTx Violation on Channel A Interrupt Enable. This bit controls LTXA_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
11 TBVB_IE	Transmission across boundary on channel B Interrupt Enable. This bit controls TBVB_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled

Table continues on the next page...

FR_PIER0 field descriptions (continued)

Field	Description
12 TBVA_IE	Transmission across boundary on channel A Interrupt Enable. This bit controls TBVA_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
13 TI2_IE	Timer 2 Expired Interrupt Enable. This bit controls TI1_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
14 TI1_IE	Timer 1 Expired Interrupt Enable. This bit controls TI1_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
15 CYS_IE	Cycle Start Interrupt Enable. This bit controls CYC_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled

50.6.15 Protocol Interrupt Enable Register 1 (FR_PIER1)

This register defines whether or not the individual interrupt flags defined in Protocol Interrupt Flag Register 1 (FR_PIFR1) can generate a protocol interrupt request.

Address: 0h base + 1Eh offset = 1Eh

Bit	0	1	2	3	4	5	6	7
Read Write	EMC_IE	IPC_IE	PECF_IE	PSC_IE	SSI3_IE	SSI2_IE	SSI1_IE	SSI0_IE

FR_PIER1 field descriptions

Field	Description
0 EMC_IE	Error Mode Changed Interrupt Enable. This bit controls EMC_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
1 IPC_IE	Illegal Protocol Control Command Interrupt Enable. This bit controls IPC_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled

Table continues on the next page...

FR_PIER1 field descriptions (continued)

Field	Description
2 PECF_IE	Protocol Engine Communication Failure Interrupt Enable. This bit controls PECF_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
3 PSC_IE	Protocol State Changed Interrupt Enable. This bit controls PSC_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
4 SSI3_IE	Slot Status Counter Incremented Interrupt Enable. This bit controls SSI[3:0]_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
5 SSI2_IE	Slot Status Counter Incremented Interrupt Enable. This bit controls SSI[3:0]_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
6 SSI1_IE	Slot Status Counter Incremented Interrupt Enable. This bit controls SSI[3:0]_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
7 SSI0_IE	Slot Status Counter Incremented Interrupt Enable. This bit controls SSI[3:0]_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 EVT_IE	Even Cycle Table Written Interrupt Enable. This bit controls EVT_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
11 ODT_IE	Odd Cycle Table Written Interrupt Enable. This bit controls ODT_IF interrupt request generation. 0 interrupt request generation disabled 1 interrupt request generation enabled
12–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

50.6.16 CHI Error Flag Register (FR_CHIERFR)

This register holds the CHI related error flags. The interrupt generation for each of these error flags is controlled by the CHI interrupt enable bit CHIE in the Global Interrupt Flag and Enable Register (FR_GIFER).

Address: 0h base + 20h offset = 20h

Bit	0	1	2	3	4	5	6	7
Read	FRLB_EF	FRLA_EF	PCMI_EF	FOVB_EF	FOVA_EF	MBS_EF	MBU_EF	LCK_EF
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	0	SBCF_EF	FID_EF	DPL_EF	SPL_EF	NML_EF	NMF_EF	ILSA_EF
Write		w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

FR_CHIERFR field descriptions

Field	Description
0 FRLB_EF	Frame Lost Channel B Error Flag. This flag is set if a complete frame was received on channel B but could not be stored in the selected individual message buffer because this message buffer is currently locked by the application. In this case, the frame and the related slot status information are lost. 0 No such event 1 Frame lost on channel B detected
1 FRLA_EF	Frame Lost Channel A Error Flag. This flag is set if a complete frame was received on channel A but could not be stored in the selected individual message buffer because this message buffer is currently locked by the application. In this case, the frame and the related slot status information are lost. 0 No such error 1 Frame lost on channel A detected
2 PCMI_EF	Protocol Command Ignored Error Flag. This flag is set if the application has issued a POC command by writing to the POCCMD field in the Protocol Operation Control Register (FR_POCR) while the BSY flag is equal to 1. In this case the command is ignored by the CC and is lost. 0 No such error 1 POC command ignored
3 FOVB_EF	Receive FIFO Overrun Channel B Error Flag. This flag is set when an overrun of the FIFO for channel B occurred. This error occurs if a semantically valid frame was received on channel B and matches the all criteria to be appended to the FIFO for channel B but the FIFO is full. In this case, the received frame and its related slot status information is lost. 0 No such error 1 FIFO overrun on channel B has been detected

Table continues on the next page...

FR_CHIERFR field descriptions (continued)

Field	Description
4 FOVA_EF	Receive FIFO Overrun Channel A Error Flag. This flag is set when an overrun of the FIFO for channel A occurred. This error occurs if a semantically valid frame was received on channel A and matches the all criteria to be appended to the FIFO for channel A but the FIFO is full. In this case, the received frame and its related slot status information is lost. 0 No such error 1 FIFO overrun on channel B has been detected
5 MBS_EF	Message Buffer Search Error Flag. This flag is set if at least one of the following events occurs: a) The message buffer search engine is still running while the next search must be started due to the FlexRay protocol timing. b) A message buffer index greater than 67 is detected in the FR_MBIDXR[MBIDX] field of an found message buffer or in one of the FR_RSBIR[RSBIDX] fields. Refer to Message Buffer Search Error for details. 0 No such event 1 Search engine active while search start appears or illegal message buffer index detected
6 MBU_EF	Message Buffer Utilization Error Flag. This flag is asserted if the application writes to a message buffer control field that is beyond the number of utilized message buffers programmed in the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR). If the application writes to a FR_MBCCSRn register with n > LAST_MB_UTIL, the CC ignores the write attempt and asserts the message buffer utilization error flag MBU_EF in the CHI Error Flag Register (FR_CHIERFR). 0 No such event 1 Non-utilized message buffer enabled
7 LCK_EF	Lock Error Flag. This flag is set if the application tries to lock a message buffer that is already locked by the CC due to internal operations. In that case, the CC does not grant the lock to the application. The application must issue the lock request again. 0 No such error 1 Lock error detected
8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 SBCF_EF	System Bus Communication Failure Error Flag. This flag is set if a system bus access was not finished within the required amount of time (see System Bus Access Timeout). 0 No such event 1 System bus access not finished in time
10 FID_EF	Frame ID Error Flag. This flag is set if the frame ID stored in the message buffer header area differs from the frame ID stored in the message buffer control register . 0 No such error occurred 1 Frame ID error occurred
11 DPL_EF	Dynamic Payload Length Error Flag. This flag is set if the payload length written into the message buffer header field of a transmit message buffer assigned to the dynamic segment is greater than the maximum payload length for the dynamic segment as it is configured in the corresponding protocol configuration register field max_payload_length_dynamic in the Protocol Configuration Register 24 (FR_PCR24). 0 No such error occurred 1 Dynamic payload length error occurred

Table continues on the next page...

FR_CHIERFR field descriptions (continued)

Field	Description
12 SPL_EF	Static Payload Length Error Flag. This flag is set if the payload length written into the message buffer header field of a transmit message buffer assigned to the static segment is different from the payload length for the static segment as it is configured in the corresponding protocol configuration register field payload_length_static in the Protocol Configuration Register 19 (FR_PCR19). 0 No such error occurred 1 Static payload length error occurred
13 NML_EF	Network Management Length Error Flag. This flag is set if the payload length written into the header structure of a receive message buffer assigned to the static segment is less than the configured length of the Network Management Vector as configured in the Network Management Vector Length Register (FR_NMVLR). In this case the received part of the Network Management Vector will be used to update the Network Management Vector. 0 No such error occurred 1 Network management length error occurred
14 NMF_EF	Network Management Frame Error Flag. This flag is set if a received message in the static segment with a Preamble Indicator flag PP asserted has its Null Frame indicator flag NF asserted as well. In this case, the Global Network Management Registers (see Network Management Vector Registers (FR_NMVR0-FR_NMVR5)) are not updated. 0 No such error occurred 1 Network management frame error occurred
15 ILSA_EF	Illegal System Bus Address Error Flag. This flag is set if the external system bus subsystem has detected an access to an illegal system bus address from the CC (see System Bus Illegal Address Access). 0 No such event 1 Illegal system bus address accessed

50.6.17 Message Buffer Interrupt Vector Register (FR_MBIVEC)

This register indicates the lowest numbered receive message buffer and the lowest numbered transmit message buffer that have their interrupt status flag MBIF and interrupt enable MBIE bits asserted. This means that message buffers with lower message buffer numbers have higher priority.

Address: 0h base + 22h offset = 22h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0		TBIVEC						0		RBIVEC					
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_MBIVEC field descriptions

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–7 TBIVEC	Transmit Buffer Interrupt Vector. This field provides the number of the lowest numbered enabled transmit message buffer that has its interrupt status flag MBIF and its interrupt enable bit MBIE set. If there is no transmit message buffer with the interrupt status flag MBIF and the interrupt enable MBIE bits asserted, the value in this field is set to 0.
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–15 RBIVEC	Receive Buffer Interrupt Vector. This field provides the message buffer number of the lowest numbered receive message buffer which has its interrupt flag MBIF and its interrupt enable bit MBIE asserted. If there is no receive message buffer with the interrupt status flag MBIF and the interrupt enable MBIE bits asserted, the value in this field is set to 0.

50.6.18 Channel A Status Error Counter Register (FR_CASERCR)

This register provides the channel status error counter for channel A. The protocol engine generates a slot status vector for each static slot, each dynamic slot, the symbol window, and the NIT. The slot status vector contains the four protocol related error indicator bits vSS!SyntaxError, vSS!ContentError, vSS!BViolation, and vSS!TxConflict. The CC increments the status error counter by 1 if, for a slot or segment, at least one error indicator bit is set to 1. The counter wraps around after it has reached the maximum value. For more information on slot status monitoring, see Slot Status Monitoring.

Address: 0h base + 24h offset = 24h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	CHAERSCNT															
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_CASERCR field descriptions

Field	Description
0–15 CHAERSCNT	Channel A Status Error Counter. This field provides the current value channel status error counter. The counter value is updated within the first macrotick of the following slot or segment.

50.6.19 Channel B Status Error Counter Register (FR_CBSERCR)

This register provides the channel status error counter for channel B. The protocol engine generates a slot status vector for each static slot, each dynamic slot, the symbol window, and the NIT. The slot status vector contains the four protocol related error indicator bits vSS!SyntaxError, vSS!ContentError, vSS!BViolation, and vSS!TxConflict. The CC increments the status error counter by 1 if, for a slot or segment, at least one error indicator bit is set to 1. The counter wraps around after it has reached the maximum value. For more information on slot status monitoring see Slot Status Monitoring.

Address: 0h base + 26h offset = 26h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	CHBERSCNT															
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_CBSERCR field descriptions

Field	Description
0–15 CHBERSCNT	Channel B Status Error Counter. This field provides the current channel status error count. The counter value is updated within the first macrotick of the following slot or segment.

50.6.20 Protocol Status Register 0 (FR_PSR0)

This register provides information about the current protocol status.

Address: 0h base + 28h offset = 28h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	ERRMODE		SLOTMODE		0	PROTSTATE			STARTUPSTATE				0	WAKEUPSTATUS		
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PSR0 field descriptions

Field	Description
0–1 ERRMODE	Error Mode. protocol related variable: vPOC!ErrorMode. This field indicates the error mode of the protocol. 00 ACTIVE 01 PASSIVE

Table continues on the next page...

FR_PSR0 field descriptions (continued)

Field	Description
	10 COMM_HALT 11 reserved
2–3 SLOTMODE	Slot Mode. protocol related variable: vPOC!SlotMode. This field indicates the slot mode of the protocol. 00 SINGLE 01 ALL_PENDING 10 ALL 11 reserved
4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–7 PROTSTATE	Protocol State. protocol related variable: vPOC!State. This field indicates the state of the protocol. 000 POC:default config 001 POC:config 010 POC:wakeup 011 POC:ready 100 POC:normal passive 101 POC:normal active 110 POC:halt 111 POC:startup
8–11 STARTUPSTATE	Startup State. protocol related variable: vPOC!StartupState. This field indicates the current sub-state of the startup procedure. 0000 reserved 0001 reserved 0010 POC:coldstart collision resolution 0011 POC:coldstart listen 0100 POC:integration consistency check 0101 POC:integration listen 0110 reserved 0111 POC:initialize schedule 1000 reserved 1001 reserved 1010 POC:coldstart consistency check 1011 reserved 1100 reserved 1101 POC:integration coldstart check 1110 POC:coldstart gap 1111 POC:coldstart join
12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13–15 WAKEUPSTATUS	Wakeup Status. protocol related variable: vPOC!WakeupStatus. This field provides the outcome of the execution of the wakeup mechanism. 000 UNDEFINED 001 RECEIVED_HEADER 010 RECEIVED_WUP 011 COLLISION_ HEADER

Write								
Reset	0	0	0	0	0	0	0	0

FR_PSR1 field descriptions

Field	Description
0 CSAA	Cold Start Attempt Aborted Flag. protocol related event: 'set coldstart abort indicator in CHI' This flag is set when the CC has aborted a cold start attempt. 0 No such event 1 Cold start attempt aborted
1 CSP	Leading Cold Start Path. This status bit is set when the CC has reached the POC:normal active state via the leading cold start path. This indicates that this node has started the network 0 No such event 1 POC:normal active reached from POC:startup state via leading cold start path
2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3–7 REMCSAT	Remaining Coldstart Attempts. protocol related variable: vRemainingColdstartAttempts This field provides the number of remaining cold start attempts that the CC will execute.
8 CPN	Leading Cold Start Path Noise. protocol related variable: vPOC!ColdstartNoise This status bit is set if the CC has reached the POC:normal active state via the leading cold start path under noise conditions. This indicates there was some activity on the FlexRay bus while the CC was starting up the cluster. 0 No such event 1 POC:normal active state was reached from POC:startup state via noisy leading cold start path
9 HHR	Host Halt Request Pending. protocol related variable: vPOC!CHIHaltRequest This status bit is set when CC receives the HALT command from the application via the Protocol Operation Control Register

Table continues on the next page...

FR_PSR1 field descriptions (continued)

Field	Description
	(FR_POCR). The CC clears this status bit after a hard reset condition or when the protocol is in the POC:default config state. 0 No such event 1 HALT command received
10 FRZ	Freeze Occurred. protocol related variable: vPOC!Freeze This status bit is set when the CC has reached the POC:halt state due to the host FREEZE command or due to an internal error condition requiring immediate halt. The CC clears this status bit after a hard reset condition or when the protocol is in the POC:default config state. 0 No such event 1 Immediate halt due to FREEZE or internal error condition
11–15 APTAC	Allow Passive to Active Counter. protocol related variable: vPOC!vAllowPassivetoActive This field provides the number of consecutive even/odd communication cycle pairs that have passed with valid rate and offset correction terms, but the protocol is still in the POC:normal passive state due to an application configured delay to enter POC:normal active state. This delay is defined by the allow_passive_to_active field in the Protocol Configuration Register 12 (FR_PCR12).

50.6.22 Protocol Status Register 2 (FR_PSR2)

This register provides a snapshot of status information about the Network Idle Time NIT, the Symbol Window and the clock synchronization. The NIT related status bits NBVB, NSEB, NBVA, and NSEA are updated by the CC after the end of the NIT and before the end of the first slot of the next communication cycle. The Symbol Window related status bits STCB, SBVB, SSEB, MTB, STCA, SBVA, SSEB, and MTA are updated by the CC after the end of the symbol window and before the end of the current communication cycle. If no symbol window is configured, the symbol window related status bits remain in their reset state. The clock synchronization related CLKCORRFAILCNT is updated by the CC after the end of the static segment and before the end of the current communication cycle.

FR_PSR2 field descriptions

Field	Description
0 NBVB	NIT Boundary Violation on Channel B. protocol related variable: vSS!BViolation for NIT on channel B This status bit is set when there was some media activity on the FlexRay bus channel B at the end of the NIT. 0 No such event 1 Media activity at boundaries detected
1 NSEB	NIT Syntax Error on Channel B. protocol related variable: vSS!SyntaxError for NIT on channel B This status bit is set when a syntax error was detected during NIT on channel B. 0 No such event 1 Syntax error detected
2 STCB	Symbol Window Transmit Conflict on Channel B. protocol related variable: vSS!TxConflict for symbol window on channel B This status bit is set if there was a transmission conflict during the symbol window on channel B. 0 No such event 1 Transmission conflict detected
3 SBVB	Symbol Window Boundary Violation on Channel B. protocol related variable: vSS!BViolation for symbol window on channel B This status bit is set if there was some media activity on the FlexRay bus channel B at the start or at the end of the symbol window. 0 No such event 1 Media activity at boundaries detected
4 SSEB	Symbol Window Syntax Error on Channel B. protocol related variable: vSS!SyntaxError for symbol window on channel B This status bit is set when a syntax error was detected during the symbol window on channel B. 0 No such event 1 Syntax error detected
5 MTB	Media Access Test Symbol MTS Received on Channel B. protocol related variable: vSS!ValidMTS for Symbol Window on channel B This status bit is set if the Media Access Test Symbol MTS was received in the symbol window on channel B. 0 No such event 1 MTS symbol received
6 NBVA	NIT Boundary Violation on Channel A. protocol related variable: vSS!BViolation for NIT on channel A This status bit is set when there was some media activity on the FlexRay bus channel A at the end of the NIT. 0 No such event 1 Media activity at boundaries detected
7 NSEA	NIT Syntax Error on Channel A. protocol related variable: vSS!SyntaxError for NIT on channel A This status bit is set when a syntax error was detected during NIT on channel A. 0 No such event 1 Syntax error detected

Table continues on the next page...

FR_PSR2 field descriptions (continued)

Field	Description
8 STCA	Symbol Window Transmit Conflict on Channel A. protocol related variable: vSS!TxConflict for symbol window on channel A This status bit is set if there was a transmission conflicts during the symbol window on channel A. 0 No such event 1 Transmission conflict detected
9 SBVA	Symbol Window Boundary Violation on Channel A. protocol related variable: vSS!BViolation for symbol window on channel A This status bit is set if there was some media activity on the FlexRay bus channel A at the start or at the end of the symbol window. 0 No such event 1 Media activity at boundaries detected
10 SSEA	Symbol Window Syntax Error on Channel A. protocol related variable: vSS!SyntaxError for symbol window on channel A This status bit is set when a syntax error was detected during the symbol window on channel A. 0 No such event 1 Syntax error detected
11 MTA	Media Access Test Symbol MTS Received on Channel A. protocol related variable: vSS!ValidMTS for symbol window on channel A This status bit is set if the Media Access Test Symbol MTS was received in the symbol window on channel A. 1 MTS symbol received 0 No such event
12–15 CKCORFCNT	Clock Correction Failed Counter. protocol related variable: vClockCorrectionFailed This field provides the number of consecutive even/odd communication cycle pairs that have passed without clock synchronization having performed an offset or a rate correction due to lack of synchronization frames. It is not incremented when it has reached the configured value of either max_without_clock_correction_fatal or max_without_clock_correction_passive as defined in the Protocol Configuration Register 8 (FR_PCR8). The CC resets this counter on a hard reset condition, when the protocol enters the POC:normal active state, or when both the rate and offset correction terms have been calculated successfully.

50.6.23 Protocol Status Register 3 (FR_PSR3)

This register provides aggregated channel status information as an accrued status of channel activity for all communication slots, regardless of whether they are assigned for transmission or subscribed for reception. It provides accrued information for the symbol window, the NIT, and the wakeup status.

Address: 0h base + 2Eh offset = 2Eh

Bit	0	1	2	3	4	5	6	7
Read	0		WUB	ABVB	AACB	ACEB	ASEB	AVFB

FR_PSR3 field descriptions

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 WUB	Wakeup Symbol Received on Channel B. This flag is set when a wakeup symbol was received on channel B. 0 No wakeup symbol received 1 Wakeup symbol received
3 ABVB	Aggregated Boundary Violation on Channel B. This flag is set when a boundary violation has been detected on channel B. Boundary violations are detected in the communication slots, the symbol window, and the NIT. 0 No boundary violation detected 1 Boundary violation detected
4 AACB	Aggregated Additional Communication on Channel B. This flag is set when at least one valid frame was received on channel B in a slot that also contained an additional communication with either syntax error, content error, or boundary violations. 0 No additional communication detected 1 Additional communication detected
5 ACEB	Aggregated Content Error on Channel B. This flag is set when a content error has been detected on channel B. Content errors are detected in the communication slots, the symbol window, and the NIT. 0 No content error detected 1 Content error detected

Table continues on the next page...

FR_PSR3 field descriptions (continued)

Field	Description
6 ASEB	Aggregated Syntax Error on Channel B. This flag is set when a syntax error has been detected on channel B. Syntax errors are detected in the communication slots, the symbol window and the NIT. 0 No syntax error detected 1 Syntax errors detected
7 AVFB	Aggregated Valid Frame on Channel B. This flag is set when a syntactically correct valid frame has been received in any static or dynamic slot through channel B. 1 At least one syntactically valid frame received 0 No syntactically valid frames received
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 WUA	Wakeup Symbol Received on Channel A. This flag is set when a wakeup symbol was received on channel A. 0 No wakeup symbol received 1 Wakeup symbol received
11 ABVA	Aggregated Boundary Violation on Channel A. This flag is set when a boundary violation has been detected on channel A. Boundary violations are detected in the communication slots, the symbol window, and the NIT. 0 No boundary violation detected 1 Boundary violation detected
12 AACA	Aggregated Additional Communication on Channel A. This flag is set when a valid frame was received in a slot on channel A that also contained an additional communication with either syntax error, content error, or boundary violations. 0 No additional communication detected 1 Additional communication detected
13 ACEA	Aggregated Content Error on Channel A. This flag is set when a content error has been detected on channel A. Content errors are detected in the communication slots, the symbol window, and the NIT. 0 No content error detected 1 Content error detected
14 ASEA	Aggregated Syntax Error on Channel A. This flag is set when a syntax error has been detected on channel A. Syntax errors are detected in the communication slots, the symbol window, and the NIT. 0 No syntax error detected 1 Syntax errors detected
15 AVFA	Aggregated Valid Frame on Channel A. This flag is set when a syntactically correct valid frame has been received in any static or dynamic slot through channel A. 0 No syntactically valid frames received 1 At least one syntactically valid frame received

50.6.24 Macrotick Counter Register (FR_MTCTR)

This register provides the macrotick count of the current communication cycle.

Address: 0h base + 30h offset = 30h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0		MTCT													
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_MTCTR field descriptions

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–15 MTCT	Macrotick Counter. protocol related variable: vMacrotick This field provides the macrotick count of the current communication cycle.

50.6.25 Cycle Counter Register (FR_CYCTR)

This register provides the number of the current communication cycle.

Address: 0h base + 32h offset = 32h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0										CYCCNT					
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_CYCTR field descriptions

Field	Description
0–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–15 CYCCNT	Cycle Counter. protocol related variable: vCycleCounter This field provides the number of the current communication cycle. If the counter reaches the maximum value of 63, the counter wraps and starts from zero again.

50.6.26 Slot Counter Channel A Register (FR_SLTCTAR)

This register provides the number of the current slot in the current communication cycle for channel A.

Address: 0h base + 34h offset = 34h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0					SLOTCNTA										
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SLTCTAR field descriptions

Field	Description
0–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 SLOTCNTA	Slot Counter Value for Channel A. protocol related variable: vSlotCounter for channel A This field provides the number of the current slot in the current communication cycle.

50.6.27 Slot Counter Channel B Register (FR_SLTCTBR)

This register provides the number of the current slot in the current communication cycle for channel B.

Address: 0h base + 36h offset = 36h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0					SLOTCNTB										
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SLTCTBR field descriptions

Field	Description
0–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 SLOTCNTB	Slot Counter Value for Channel B. protocol related variable: vSlotCounter for channel B This field provides the number of the current slot in the current communication cycle.

50.6.28 Rate Correction Value Register (FR_RTCORVR)

This register provides the sign extended rate correction value in microticks as it was calculated by the clock synchronization algorithm. The CC updates this register during the NIT of each odd numbered communication cycle.

Address: 0h base + 38h offset = 38h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	RATECORR															
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RTCORVR field descriptions

Field	Description
0–15 RATECORR	Rate Correction Value. protocol related variable: vRateCorrection (before value limitation and external rate correction) This field provides the sign extended rate correction value in microticks as it was calculated by the clock synchronization algorithm. The value is represented in 2's complement format. This value does not include the value limitation and the application of the external rate correction. If the magnitude of the internally calculated rate correction value exceeds the limit given by rate_correction_out in the Protocol Configuration Register 13 (FR_PCR13), the clock correction reached limit interrupt flag CCL_IF is set in the Protocol Interrupt Flag Register 0 (FR_PIFR0). **NOTE:** If the CC was not able to calculate a new rate correction term due to a lack of synchronization frames, the RATECORR value is not updated.

50.6.29 Offset Correction Value Register (FR_OFCORVR)

This register provides the sign extended offset correction value in microticks as it was calculated by the clock synchronization algorithm. The CC updates this register during the NIT.

Address: 0h base + 3Ah offset = 3Ah

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	OFFSETCORR															
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_OFCORVR field descriptions

Field	Description
0–15 OFFSETCORR	Offset Correction Value. protocol related variable: vOffsetCorrection (before value limitation and external offset correction) This field provides the sign extended offset correction value in microticks as it was calculated by the clock synchronization algorithm. The value is represented in 2's complement format. This value does not include the value limitation and the application of the external offset correction. If the magnitude of the internally calculated rate correction value exceeds the limit given by offset_correction_out field in the Protocol Configuration Register 29 (FR_PCR29), the clock correction reached limit interrupt flag CCL_IF is set in the Protocol Interrupt Flag Register 0 (FR_PIFR0). **NOTE:** If the CC was not able to calculate an new offset correction term due to a lack of synchronization frames, the OFFSETCORR value is not updated.

50.6.30 Combined Interrupt Flag Register (FR_CIFR)

This register provides five combined interrupt flags and a copy of three individual interrupt flags. The combined interrupt flags are the result of a binary OR of the values of other interrupt flags regardless of the state of the interrupt enable bits. The generation scheme for the combined interrupt flags is depicted in Figure 50-35 . The individual interrupt flags WUPIF, FAFBIF, and FAFAIF are copies of corresponding flags in the Global Interrupt Flag and Enable Register (FR_GIFER) and are provided here to simplify the application interrupt flag check. To clear the individual interrupt flags, the application must use the Global Interrupt Flag and Enable Register (FR_GIFER).

NOTE

The meanings of the combined status bits MIF, PRIF, CHIF, RBIF, and TBIF are different from those mentioned in the Global Interrupt Flag and Enable Register (FR_GIFER).

Address: 0h base + 3Ch offset = 3Ch

Bit	0	1	2	3	4	5	6	7
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15

Write								
Reset	0	0	0	0	0	0	0	0

FR_CIFR field descriptions

Field	Description
0–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

FR_CIFR field descriptions (continued)

Field	Description
8 MIF	Module Interrupt Flag. This flag is set if there is at least one interrupt source that has its interrupt flag asserted. 0 No interrupt source has its interrupt flag asserted 1 At least one interrupt source has its interrupt flag asserted
9 PRIF	Protocol Interrupt Flag. This flag is set if at least one of the individual protocol interrupt flags in the Protocol Interrupt Flag Register 0 (FR_PIFR0) or Protocol Interrupt Flag Register 1 (FR_PIFR1) is equal to 1. 0 All individual protocol interrupt flags are equal to 0 1 At least one of the individual protocol interrupt flags is equal to 1
10 CHIF	CHI Interrupt Flag. This flag is set if at least one of the individual CHI error flags in the CHI Error Flag Register (FR_CHIERFR) is equal to 1. 0 All CHI error flags are equal to 0 1 At least one CHI error flag is equal to 1
11 WUPIF	Wakeup Interrupt Flag. Provides the same value as FR_GIFER[WUPIF]
12 FAFBIF	Receive FIFO Channel B Almost Full Interrupt Flag. Provides the same value as FR_GIFER[FAFBIF]
13 FAFAIF	Receive FIFO Channel A Almost Full Interrupt Flag. Provides the same value as FR_GIFER[FAFAIF]
14 RBIF	Receive Message Buffer Interrupt Flag. This flag is set if for at least one of the individual receive message buffers (FR_MBCCSRn[MTD] = 0) the interrupt flag MBIF in the corresponding Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn) is equal to 1. 0 None of the individual receive message buffers has the MBIF flag asserted. 1 At least one individual receive message buffers has the MBIF flag asserted.
15 TBIF	Transmit Message Buffer Interrupt Flag. This flag is set if for at least one of the individual transmit message buffers (FR_MBCCSRn[MTD] = 1) the interrupt flag MBIF in the corresponding Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn) is equal to 1. 0 None of the individual transmit message buffers has the MBIF flag asserted. 1 At least one individual transmit message buffers has the MBIF flag asserted.

50.6.31 System Memory Access Time-Out Register (FR_SYMATOR)

Address: 0h base + 3Eh offset = 3Eh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0								TIMEOUT							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0

FR_SYMATOR field descriptions

Field	Description
0–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8–15 TIMEOUT	System Memory Access Time-Out. This value defines when a system bus access timout is detected. For a detailed description see Configure System Memory Access Time-Out Register (FR_SYMATOR) and System Bus Access Timeout .

50.6.32 Sync Frame Counter Register (FR_SFCNTR)

This register provides the number of synchronization frames that are used for clock synchronization in the last even and in the last odd numbered communication cycle. This register is updated after the start of the NIT and before 10 MT after offset correction start.

NOTE

If the application has locked the even synchronization table at the end of the static segment of an even communication cycle, the CC will not update the fields SFEVB and SFEVA.

NOTE

If the application has locked the odd synchronization table at the end of the static segment of an odd communication cycle, the CC will not update the values SFODB and SFODA.

Address: 0h base + 40h offset = 40h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	SFEVB				SFEVA				SFODB				SFODA			
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SFCNTR field descriptions

Field	Description
0–3 SFEVB	Sync Frames Channel B, even cycle. protocol related variable: size of (vsSyncIdListB for even cycle) This field provides the size of the internal list of frame IDs of received synchronization frames used for clock synchronization.
4–7 SFEVA	Sync Frames Channel A, even cycle. protocol related variable: size of (vsSyncIdListA for even cycle) This field provides the size of the internal list of frame IDs of received synchronization frames used for clock synchronization.
8–11 SFODB	Sync Frames Channel B, odd cycle. protocol related variable: size of (vsSyncIdListB for odd cycle) This field provides the size of the internal list of frame IDs of received synchronization frames used for clock synchronization .
12–15 SFODA	Sync Frames Channel A, odd cycle. protocol related variable: size of (vsSyncIdListA for odd cycle) This field provides the size of the internal list of frame IDs of received synchronization frames used for clock synchronization .

50.6.33 Sync Frame Table Offset Register (FR_SFTOR)

This register defines the FlexRay memory area related offset for sync frame tables. For more details, see Sync Frame ID and Sync Frame Deviation Tables .

Address: 0h base + 42h offset = 42h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	SFT_OFFSET															0
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SFTOR field descriptions

Field	Description
0–14 SFT_OFFSET	Sync Frame Table Offset. The offset of the Sync Frame Tables in the FlexRay memory area. This offset is required to be 16-bit aligned. Thus STF_OFFSET[0] is always 0.
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

50.6.34 Sync Frame Table Configuration, Control, Status Register (FR_SFTCCSR)

This register provides configuration, control, and status information related to the generation and access of the clock sync ID tables and clock sync measurement tables. For a detailed description, see Sync Frame ID and Sync Frame Deviation Tables .

Address: 0h base + 44h offset = 44h

Bit	0	1	2	3	4	5	6	7
Read	0	0	CYCNUM					
Write	ELKT	OLKT						
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	ELKS	OLKS	EVAL	OVAL	0	0	SDVEN	SIDEN
Write						OPT		
Reset	0	0	0	0	0	0	0	0

FR_SFTCCSR field descriptions

Field	Description
0 ELKT	Even Cycle Tables Lock/Unlock Trigger. This trigger bit is used to lock and unlock the even cycle tables. 0 No effect 1 Triggers lock/unlock of the even cycle tables.
1 OLKT	Odd Cycle Tables Lock/Unlock Trigger. This trigger bit is used to lock and unlock the odd cycle tables. 0 No effect 1 Triggers lock/unlock of the odd cycle tables.
2–7 CYCNUM	Cycle Number. This field provides the number of the cycle in which the currently locked table was recorded. If none or both tables are locked, this value is related to the even cycle table.
8 ELKS	Even Cycle Tables Lock Status. This status bit indicates whether the application has locked the even cycle tables. 0 Application has not locked the even cycle tables. 1 Application has locked the even cycle tables.
9 OLKS	Odd Cycle Tables Lock Status. This status bit indicates whether the application has locked the odd cycle tables. 0 Application has not locked the odd cycle tables. 1 Application has locked the odd cycle tables.
10 EVAL	Even Cycle Tables Valid. This status bit indicates whether the Sync Frame ID and Sync Frame Deviation Tables for the even cycle are valid. The CC clears this status bit when it starts updating the tables, and sets this bit when it has finished the table update. 0 Tables are not valid (update is ongoing) 1 Tables are valid (consistent).
11 OVAL	Odd Cycle Tables Valid. This status bit indicates whether the Sync Frame ID and Sync Frame Deviation Tables for the odd cycle are valid. The CC clears this status bit when it starts updating the tables, and sets this bit when it has finished the table update. 0 Tables are not valid (update is ongoing) 1 Tables are valid (consistent).
12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 OPT	One Pair Trigger. This trigger bit controls whether the CC writes continuously or only one pair of Sync Frame Tables into the FlexRay memory area. If this trigger is set to 1 while SDVEN or SIDEN is set to 1, the CC writes only one pair of the enabled Sync Frame Tables corresponding to the next even-odd-cycle pair into the FlexRay memory area. In this case, the CC clears the SDVEN or SIDEN bits immediately. If this trigger is set to 0 while SDVEN or SIDEN is set to 1, the CC writes continuously the enabled Sync Frame Tables into the FlexRay memory area. 0 Write continuously pairs of enabled Sync Frame Tables into FlexRay memory area. 1 Write only one pair of enabled Sync Frame Tables into FlexRay memory area.
14 SDVEN	Sync Frame Deviation Table Enable. This bit controls the generation of the Sync Frame Deviation Tables. The application must set this bit to request the CC to write the Sync Frame Deviation Tables into the FlexRay memory area. **NOTE:** If SDVEN is set to 1, then SIDEN must also be set to 1.

Table continues on the next page...

FR_SFTCCSR field descriptions (continued)

Field	Description
	0 Do not write Sync Frame Deviation Tables 1 Write Sync Frame Deviation Tables into FlexRay memory area
15 SIDEN	Sync Frame ID Table Enable. This bit controls the generation of the Sync Frame ID Tables. The application must set this bit to 1 to request the CC to write the Sync Frame ID Tables into the FlexRay memory area. 0 Do not write Sync Frame ID Tables 1 Write Sync Frame ID Tables into FlexRay memory area

50.6.35 Sync Frame ID Rejection Filter Register (FR_SFIDRFR)

This register defines the Sync Frame Rejection Filter ID. The application must update this register outside of the static segment. If the application updates this register in the static segment, it can appear that the CC accepts the sync frame in the current cycle.

Address: 0h base + 46h offset = 46h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0						SYNFRID									
Write	▨															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SFIDRFR field descriptions

Field	Description
0–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–15 SYNFRID	Sync Frame Rejection ID. This field defines the frame ID of a frame that must not be used for clock synchronization. For details see Sync Frame Rejection Filtering .

50.6.36 Sync Frame ID Acceptance Filter Value Register (FR_SFIDAFVR)

This register defines the sync frame acceptance filter value. For details on filtering, see Sync Frame Filtering .

Address: 0h base + 48h offset = 48h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0						FVAL									
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SFIDAFVR field descriptions

Field	Description
0–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–15 FVAL	Filter Value. This field defines the value for the sync frame acceptance filtering.

50.6.37 Sync Frame ID Acceptance Filter Mask Register (FR_SFIDAFMR)

This register defines the sync frame acceptance filter mask. For details on filtering see Sync Frame Acceptance Filtering .

Address: 0h base + 4Ah offset = 4Ah

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0						FMSK									
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SFIDAFMR field descriptions

Field	Description
0–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–15 FMSK	Filter Mask. This field defines the mask for the sync frame acceptance filtering.

50.6.38 Network Management Vector Register (FR_NMVR*n*)

Each of these six registers holds one part of the Network Management Vector. The length of the Network Management Vector is configured in the Network Management Vector Length Register (FR_NMVLR). If FR_NMVLR is programmed with a value that is less than 12 bytes, the remaining bytes of the Network Management Vector Registers (FR_NMVR0-FR_NMVR5), which are not used for the Network Management Vector accumulating, will remain 0.

The NMVR provides accrued information over all received NMVs in the last communication cycle. All NMVs received in one cycle are ORed into the NMVR. The NMVR is updated at the end of the communication cycle.

Address: 0h base + 4Ch offset + (2d × i), where i=0d to 5d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	NMVP

Field	Description
0–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–15 NMVL	Network Management Vector Length. protocol related variable: gNetworkManagementVectorLength This field defines the length of the Network Management Vector in bytes. Legal values are between 0 and 12.

50.6.40 Timer Configuration and Control Register (FR_TICCR)

This register is used to configure and control the two timers T1 and T2. For timer details, see Timer Support . The Timer T1 is an absolute timer. The Timer T2 can be configured as an absolute or relative timer.

NOTE

Both timers are deactivated immediately when the protocol enters a state different from POC:normal active or POC:normal passive.

Address: 0h base + 5Ah offset = 5Ah

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

FR_TICCR field descriptions (continued)

Field	Description
2 T2_CFG	Timer T2 Configuration. This bit configures the timebase mode of Timer T2. 0 T2 is absolute timer. 1 T2 is relative timer.
3 T2_REP	Timer T2 Repetitive Mode. This bit configures the repetition mode of Timer T2. 0 T2 is non repetitive 1 T2 is repetitive
4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5 T2SP	Timer T2 Stop. This trigger bit is used to stop timer T2. 0 no effect 1 stop timer T2
6 T2TR	Timer T2 Trigger. This trigger bit is used to start timer T2. 0 no effect 1 start timer T2
7 T2ST	Timer T2 State. This status bit provides the current state of timer T2. 0 timer T2 is idle 1 timer T2 is running
8–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 T1_REP	Timer T1 Repetitive Mode. This bit configures the repetition mode of timer T1. 0 T1 is non repetitive 1 T1 is repetitive
12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 T1SP	Timer T1 Stop. This trigger bit is used to stop timer T1. 0 no effect 1 stop timer T1
14 T1TR	Timer T1 Trigger. This trigger bit is used to start timer T1. 0 no effect 1 start timer T1
15 T1ST	Timer T1 State. This status bit provides the current state of timer T1. 0 timer T1 is idle 1 timer T1 is running

50.6.41 Timer 1 Cycle Set Register (FR_TI1CYSR)

This register defines the cycle filter value and the cycle filter mask for timer T1. For a detailed description of timer T1, refer to Absolute Timer T1 .

NOTE

If the application modifies the value in this register while the timer is running, the change becomes effective immediately and timer T1 will expire according to the changed value.

Address: 0h base + 5Ch offset = 5Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0		T1_CYC_VAL						0		T1_CYC_MSK					
Write	▨	▨							▨	▨						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_TI1CYSR field descriptions

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–7 T1_CYC_VAL	Timer T1 Cycle Filter Value. This field defines the cycle filter value for timer T1.
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–15 T1_CYC_MSK	Timer T1 Cycle Filter Mask. This field defines the cycle filter mask for timer T1.

50.6.42 Timer 1 Macrotick Offset Register (FR_TI1MTOR)

This register holds the macrotick offset value for timer T1. For a detailed description of timer T1, refer to Absolute Timer T1 .

NOTE

If the application modifies the value in this register while the timer is running, the change becomes effective immediately and timer T1 will expire according to the changed value.

Address: 0h base + 5Eh offset = 5Eh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0		T1_MTOFFSET													
Write	▨	▨

50.6.47 Slot Status Selection Register (FR_SSSR)

This register is used to access the four internal non-memory mapped slot status selection registers FR_SSSR0 to FR_SSSR3. Each internal register selects a slot, or symbol window/NIT, whose status vector will be saved in the corresponding Slot Status Registers (FR_SSR0-FR_SSR7) according to Slot Status Selection Register (FR_SSSR) . For a detailed description of slot status monitoring, refer to Slot Status Monitoring .

Table 50-10. Mapping Between FR_SSSRn and FR_SSRn

Internal Slot Status Selection Register	Write the Slot Status of the Slot Selected by FR_SSSRn for each			
	Even Communication Cycle		Odd Communication Cycle	
	For Channel B to	For Channel A to	For Channel B to	For Channel A to
FR_SSSR0	FR_SSR0[15:8]	FR_SSR0[7:0]	FR_SSR1[15:8]	FR_SSR1[7:0]
FR_SSSR1	FR_SSR2[15:8]	FR_SSR2[7:0]	FR_SSR3[15:8]	FR_SSR3[7:0]

Table continues on the next page...

Table 50-10. Mapping Between FR_SSSRn and FR_SSRn (continued)

FR_SSSR field descriptions

Field	Description
0 WMD	Write Mode. This control bit defines the write mode of this register. 0 Write to all fields in this register on write access. 1 Write to SEL field only on write access.
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–3 SEL	Selector. This field selects one of the four internal slot status selection registers for access. 00 select FR_SSSR0. 01 select FR_SSSR1. 10 select FR_SSSR2. 11 select FR_SSSR3.
4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 SLOTNUMBER	Slot Number. This field specifies the number of the slot whose status will be saved in the corresponding slot status registers. **NOTE:** If this value is set to 0, the related slot status register provides the status of the symbol window after the NIT start, and provides the status of the NIT after the cycle start.

50.6.48 Slot Status Counter Condition Register (FR_SSCCR)

This register is used to access and program the four internal non-memory mapped Slot Status Counter Condition Registers FR_SSCCR0 to FR_SSCCR3. Each of these four internal slot status counter condition registers defines the mode and the conditions for incrementing the counter in the corresponding Slot Status Counter Registers (FR_SSCR0-FR_SSCR3). The correspondence is given in Slot Status Counter Condition Register (FR_SSCCR) . For a detailed description of slot status counters, refer to Slot Status Counter Registers .

Table 50-11. Mapping between internal FR_SSCCRn and FR_SSCRn

Condition Register	Condition Defined for Register
FR_SSCCR0	FR_SSCR0
FR_SSCCR1	FR_SSCR1
FR_SSCCR2	FR_SSCR2
FR_SSCCR3	FR_SSCR3

Address: 0h base + 66h offset = 66h

Write	WMD															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_SSCCR field descriptions

Field	Description
0 WMD	Write Mode. This control bit defines the write mode of this register. 0 Write to all fields in this register on write access. 1 Write to SEL field only on write access.
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–3 SEL	Selector. This field selects one of the four internal slot counter condition registers for access. 00 select FR_SSCCR0. 01 select FR_SSCCR1. 10 select FR_SSCCR2. 11 select FR_SSCCR3.
4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–6 CNTCFG	Counter Configuration. These bit field controls the channel related incrementing of the slot status counter.

Table continues on the next page...

FR_SSCCR field descriptions (continued)

Field	Description
	00 increment by 1 if condition is fulfilled on channel A. 01 increment by 1 if condition is fulfilled on channel B. 10 increment by 1 if condition is fulfilled on at least one channel. 11 increment by 2 if condition is fulfilled on both channels channel; increment by 1 if condition is fulfilled on only one channel.
7 MCY	Multi Cycle Selection. This bit defines whether the slot status counter accumulates over multiple communication cycles or provides information for the previous communication cycle only. 0 The Slot Status Counter provides information for the previous communication cycle only. 1 The Slot Status Counter accumulates over multiple communication cycles.
8 VFR	Valid Frame Restriction. This bit is used to restrict the counter to received valid frames. 0 The counter is not restricted to valid frames only. 1 The counter is restricted to valid frames only.
9 SYF	Sync Frame Restriction. This bit is used to restrict the counter to received frames with the sync frame indicator bit set to 1. 0 The counter is not restricted with respect to the sync frame indicator bit. 1 The counter is restricted to frames with the sync frame indicator bit set to 1.
10 NUF	Null Frame Restriction. This bit is used to restrict the counter to received frames with the null frame indicator bit set to 0. 0 The counter is not restricted with respect to the null frame indicator bit. 1 The counter is restricted to frames with the null frame indicator bit set to 0.
11 SUF	Startup Frame Restriction. This bit is used to restrict the counter to received frames with the startup frame indicator bit set to 1. 0 The counter is not restricted with respect to the startup frame indicator bit. 1 The counter is restricted to received frames with the startup frame indicator bit set to 1.
12–15 STATUSMASK	Slot Status Mask. This bit field is used to enable the counter with respect to the four slot status error indicator bits. STATUSMASK[3] - This bit enables the counting for slots with the syntax error indicator bit set to 1. STATUSMASK[2] - This bit enables the counting for slots with the content error indicator bit set to 1. STATUSMASK[1] - This bit enables the counting for slots with the boundary violation indicator bit set to 1. STATUSMASK[0] - This bit enables the counting for slots with the transmission conflict indicator bit set to 1.

50.6.49 Slot Status Register (FR_SSR*n*)

Each Slot Status Register (SSR) holds the status vector of the slot specified in the corresponding internal slot status selection register, which can be programmed using the Slot Status Selection Register (FR_SSSR). Each register is updated after the end of the corresponding slot as shown in Figure 50-31 . The register bits are directly related to the protocol variables and described in more detail in Slot Status Monitoring .

Address: 0h base + 68h offset + (2d × i), where i=0d to 7d

50.6.50 Slot Status Counter Register (FR_SSCR*n*)

Each of these four registers provides the slot status counter value for the previous communication cycle(s) and is updated at the cycle start. The provided value depends on the control bits and fields in the related internal slot status counter condition register FR_SSCCRn, which can be programmed by using the Slot Status Counter Condition Register (FR_SSCCR). For more details, see Slot Status Counter Registers .

NOTE

If the counter has reached its maximum value 0xFFFF and is in the multicycle mode, i.e. FR_SSCCRn[MCY] = 1, the counter is not reset to 0x0000. The application can reset the counter by clearing the FR_SSCCRn[MCY] bit and waiting for the next cycle start, when the CC clears the counter. Subsequently, the counter can be set into the multicycle mode again.

NOTE

Address: 0h base + 78h offset + (2d × i), where i=0d to 3d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Field	Description
0 MTE	Media Access Test Symbol Transmission Enable. This control bit is used to enable and disable the transmission of the Media Access Test Symbol in the selected set of cycles. 0 MTS transmission disabled 1 MTS transmission enabled
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–7 CYCCNTMSK	Cycle Counter Mask. This field provides the filter mask for the MTS cycle count filter.
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–15 CYCCNTVAL	Cycle Counter Value. This field provides the filter value for the MTS cycle count filter.

50.6.53 Receive Shadow Buffer Index Register (FR_RSBIR)

This register is used to provide and retrieve the indices of the message buffer header fields currently associated with the receive shadow buffers . For more details on the receive shadow buffer concept, refer to Receive Shadow Buffers Concept .

Address: 0h base + 84h offset = 84h

Bit	0	1	2	3	4	5	6	7
Read Write	WMD	Reserved	SEL		Reserved			
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read Write	Reserved	RSBIDX						
Reset	0	0	0	0	0	0	0	0

FR_RSBIR field descriptions

Field	Description
0 WMD	Write Mode. This bit controls the write mode for this register. 0 update SEL and RSBIDX field on register write 1 update only SEL field on register write
1 Reserved	This field is reserved.
2–3 SEL	Selector. This field is used to select the internal receive shadow buffer index register for access. 00 FR_RSBIR_A1. receive shadow buffer index register for channel A, segment 1 01 FR_RSBIR_A2. receive shadow buffer index register for channel A, segment 2 10 FR_RSBIR_B1. receive shadow buffer index register for channel B, segment 1 11 FR_RSBIR_B2. receive shadow buffer index register for channel B, segment 2
4–8 Reserved	This field is reserved.
9–15 RSBIDX	RSBIDXA1/RSBIDXA2/RSBIDXB1/RSBIDXB2- Receive Shadow Buffer Index Receive Shadow Buffer Index. This field contains the current index of the message buffer header field of the receive shadow message buffer selected by the SEL field. The CC uses this index to determine the physical location of the shadow buffer header field in the FlexRay memory area. The CC will update this field during receive operation.The application provides initial message buffer header index value in the configuration phase. CC: Updates the message buffer header index after successful reception. Application: Provides initial message buffer header index. Legal Values are 0 <= i <= 67 . Illegal values will be detected during the message buffer search.

50.6.54 Receive FIFO Watermark and Selection Register (FR_RFWMSR)

This register is used to

- select a receiver FIFO for subsequent programming access through the receiver FIFO configuration registers summarized in Receive FIFO Watermark and Selection Register (FR_RFWMSR) .
- to define the watermark for the selected FIFO.

Table 50-12. SEL Controlled Receiver FIFO Registers

Register
Receive FIFO Start Index Register (FR_RFSIR)
Receive FIFO Depth and Size Register (FR_RFDSR)
Receive FIFO Message ID Acceptance Filter Value Register (FR_RFMIDAFVR)
Receive FIFO Message ID Acceptance Filter Mask Register (FR_RFMIDAFMR)
Receive FIFO Frame ID Rejection Filter Value Register (FR_RFFIDRFVR)
Receive FIFO Frame ID Rejection Filter Mask Register (FR_RFFIDRFMR)
Receive FIFO Range Filter Configuration Register (FR_RFRFCFR)
Receive FIFO Range Filter Control Register (FR_RFRFCTR)

Address: 0h base + 86h offset = 86h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	WM								0							SEL
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFWMSR field descriptions

Field	Description
0–7 WM	WMA/WMB - Watermark This field defines the watermark value for the selected FIFO. This value is used to control the generation of the almost full interrupt flags.
8–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15 SEL	Select. This control bit selects the receiver FIFO for subsequent programming. 0 Receiver FIFO for channel A selected 1 Receiver FIFO for channel B selected

50.6.55 Receive FIFO Start Index Register (FR_RFSIR)

This register defines the message buffer header index of the first message buffer of the selected FIFO.

Address: 0h base + 88h offset = 88h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0						SIDX									
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFSIR field descriptions

Field	Description
0–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–15 SIDX	SIDXA/SIDXB - Start Index This field defines the number of the message buffer header field of the first message buffer of the selected FIFO. The CC uses the value of the SIDX field to determine the physical location of the receiver FIFO's first message buffer header field.

50.6.56 Receive FIFO Depth and Size Register (FR_RFDSR)

This register defines the structure of the selected FIFO, i.e. the number of entries and the size of each entry .

Address: 0h base + 8Ah offset = 8Ah

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	FIFO_DEPTH								0	ENTRY_SIZE						
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFDSR field descriptions

Field	Description
0–7 FIFO_DEPTH	FIFO_DEPTHA/FIFO_DEPTHB - FIFO Depth FIFO Depth. This field defines the depth of the selected FIFO, i.e. the number of entries. Note: If the FIFO_DEPTH is configured to 0, FR_RFFIDRFMR[FIDRFMSK] must be configured to 0 too, to ensure that no frames are received into the FIFO.

Table continues on the next page...

FR_RFDSR field descriptions (continued)

Field	Description
8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–15 ENTRY_SIZE	ENTRY_SIZEA/ENTRY_SIZEB - Entry Size This field defines the size of the frame data sections for the selected FIFO in 2 byte entities.

50.6.57 Receive FIFO A Read Index Register (FR_RFARIR)

This register provides the message buffer header index of the next available FIFO A entry that the application can read.

NOTE

If the FIFO is empty, the RDIDX field points to an physical message buffer with invalid content.

Address: 0h base + 8Ch offset = 8Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0						RDIDX									
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFARIR field descriptions

Field	Description
0–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–15 RDIDX	Read Index. This field provides the message buffer header index of the next available FIFO message buffer that the application can read.

50.6.58 Receive FIFO B Read Index Register (FR_RFBRIR)

This register provides the message buffer header index of the next available FIFO B entry that the application can read.

NOTE

If the FIFO is empty, the RDIDX field points to an physical message buffer with invalid content.

Address: 0h base + 8Eh offset = 8Eh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0						RDIDX									
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFBRIR field descriptions

Field	Description
0–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–15 RDIDX	Read Index. This field provides the message buffer header index of the next available FIFO message buffer that the application can read.

50.6.59 Receive FIFO Message ID Acceptance Filter Value Register (FR_RFMIDAFVR)

This register defines the filter value for the message ID acceptance filter of the selected FIFO. For details on message ID filtering see FIFO Filtering .

Address: 0h base + 90h offset = 90h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	MIDAFVAL															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFMIDAFVR field descriptions

Field	Description
0–15 MIDAFVAL	MIDAFVALA/MIDAFVALB - Message ID Acceptance Filter Value Filter value for the message ID acceptance filter.

50.6.60 Receive FIFO Message ID Acceptance Filter Mask Register (FR_RFMIDAFMR)

This register defines the filter mask for the message ID acceptance filter of the selected FIFO. For details on message ID filtering see FIFO Filtering .

Address: 0h base + 92h offset = 92h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	MIDAFMSK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFMIDAFMR field descriptions

Field	Description
0–15 MIDAFMSK	MIDAFMSKA/MIDAFMSKB - Message ID Acceptance Filter Mask Filter mask for the message ID acceptance filter.

50.6.61 Receive FIFO Frame ID Rejection Filter Value Register (FR_RFFIDRFVR)

This register defines the filter value for the frame ID rejection filter of the selected FIFO. For details on frame ID filtering see FIFO Filtering .

Address: 0h base + 94h offset = 94h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0					FIDRFVAL										
Write	▨	▨	▨	▨	▨											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFFIDRFVR field descriptions

Field	Description
0–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 FIDRFVAL	FIDRFVALA/FIDRFVALB - Frame ID Rejection Filter Value Filter value for the frame ID rejection filter.

50.6.62 Receive FIFO Frame ID Rejection Filter Mask Register (FR_RFFIDRFMR)

This register defines the filter mask for the frame ID rejection filter of the selected FIFO. For details on frame ID filtering see FIFO Filtering .

Address: 0h base + 96h offset = 96h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0					FIDRFMSK										
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFFIDRFMR field descriptions

Field	Description
0–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 FIDRFMSK	Frame ID Rejection Filter Mask. Filter mask for the frame ID rejection filter.

50.6.63 Receive FIFO Range Filter Configuration Register (FR_RFRFCFR)

This register provides access to the four internal frame ID range filter boundary registers of the selected FIFO. For details on frame ID range filter see FIFO Filtering .

Address: 0h base + 98h offset = 98h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0	IBD	SEL		0	SID										
Write	WMD															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFRFCFR field descriptions

Field	Description
0 WMD	Write Mode. This control bit defines the write mode of this register. 0 Write to all fields in this register on write access. 1 Write to SEL and IBD field only on write access.

Table continues on the next page...

FR_RFRFCFR field descriptions (continued)

Field	Description
1 IBD	Interval Boundary. This control bit selects the interval boundary to be programmed with the SID value. 0 program lower interval boundary 1 program upper interval boundary
2–3 SEL	Filter Selector. This control field selects the frame ID range filter to be accessed. 00 select frame ID range filter 0. 01 select frame ID range filter 1. 10 select frame ID range filter 2. 11 select frame ID range filter 3.
4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 SID	Slot ID Defines the IBD-selected frame ID boundary value for the SEL-selected range filter.

50.6.64 Receive FIFO Range Filter Control Register (FR_RFRFCTR)

This register is used to enable and disable each frame ID range filter and to define whether it is running as acceptance or rejection filter.

Address: 0h base + 9Ah offset = 9Ah

Bit	0	1	2	3	4	5	6	7
Read	0				F3MD	F2MD	F1MD	F0MD
Write								
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	0				F3EN	F2EN	F1EN	F0EN
Write								
Reset	0	0	0	0	0	0	0	0

FR_RFRFCTR field descriptions

Field	Description
0–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4 F3MD	Range Filter 3 Mode. This control bit defines the filter mode of the frame ID range filter 3. 0 range filter 3 runs as acceptance filter 1 range filter 3 runs as rejection filter
5 F2MD	Range Filter 2 Mode. This control bit defines the filter mode of the frame ID range filter 2.

Table continues on the next page...

FR_RFRFCTR field descriptions (continued)

Field	Description
	0 range filter 2 runs as acceptance filter 1 range filter 2 runs as rejection filter
6 F1MD	Range Filter 1 Mode. This control bit defines the filter mode of the frame ID range filter 1. 0 range filter 1 runs as acceptance filter 1 range filter 1 runs as rejection filter
7 F0MD	Range Filter 0 Mode. This control bit defines the filter mode of the frame ID range filter 0. 0 range filter 0 runs as acceptance filter 1 range filter 0 runs as rejection filter
8–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 F3EN	Range Filter 3 Enable. This control bit is used to enable and disable the frame ID range filter 3. 0 range filter 3 disabled 1 range filter 3 enabled
13 F2EN	Range Filter 2 Enable. This control bit is used to enable and disable the frame ID range filter 2. 0 range filter 2 disabled 1 range filter 2 enabled
14 F1EN	Range Filter 1 Enable. This control bit is used to enable and disable the frame ID range filter 1. 0 range filter 1 disabled 1 range filter 1 enabled
15 F0EN	Range Filter 0 Enable. This control bit is used to enable and disable the frame ID range filter 0. 0 range filter 0 disabled 1 range filter 0 enabled

50.6.65 Last Dynamic Transmit Slot Channel A Register (FR_LDTXSLAR)

This register provides the number of the last transmission slot in the dynamic segment for channel A. This register is updated after the end of the dynamic segment and before the start of the next communication cycle.

Address: 0h base + 9Ch offset = 9Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0					LDYNTXSLOTA										
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_LDTXSLAR field descriptions

Field	Description
0–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 LDYNTXSLOTA	Last Dynamic Transmission Slot Channel A. protocol related variable: zLastDynTxSlot channel A Number of the last transmission slot in the dynamic segment for channel A. If no frame was transmitted during the dynamic segment on channel A, the value of this field is set to 0.

50.6.66 Last Dynamic Transmit Slot Channel B Register (FR_LDTXSLBR)

This register provides the number of the last transmission slot in the dynamic segment for channel B. This register is updated after the end of the dynamic segment and before the start of the next communication cycle.

Address: 0h base + 9Eh offset = 9Eh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0					LDYNTXSLOTB										
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_LDTXSLBR field descriptions

Field	Description
0–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 LDYNTXSLOTB	Last Dynamic Transmission Slot Channel B. protocol related variable: zLastDynTxSlot channel B Number of the last transmission slot in the dynamic segment for channel B. If no frame was transmitted during the dynamic segment on channel B the value of this field is set to 0.

50.6.67 Protocol Configuration Register 0 (FR_PCR0)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Table 50-13. Protocol Configuration Register (PCR0-30) Fields

Name	Description	Min	Max	Unit	FR_PCR
coldstart_attempts	gColdstartAttempts			number	3

Table continues on the next page...

1–8 symbol_window_after_action_point	gdSymbolWindow - gdActionPointOffset - 1
9–15 macro_initial_offset_a	pMacroInitialOffset[A]

50.6.74 Protocol Configuration Register 7 (FR_PCR7)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + AEh offset = AEh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	decoding_correction_b									micro_per_macro_nom_half						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR7 field descriptions

Field	Description
0–8 decoding_ correction_b	pDecodingCorrection + pDelayCompensation[B] + 2
9–15 micro_per_ macro_nom_half	round(pMicroPerMacroNom / 2)

50.6.75 Protocol Configuration Register 8 (FR_PCR8)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + B0h offset = B0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	max_without_clock_ correction_fatal				max_without_clock_ correction_passive				wakeup_symbol_tx_idle							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR8 field descriptions

Field	Description
0–3 max_without_ clock_correction_ fatal	gMaxWithoutClockCorrectionFatal

Table continues on the next page...

FR_PCR8 field descriptions (continued)

Field	Description
4–7 max_without_ clock_correction_ passive	gMaxWithoutClockCorrectionPassive
8–15 wakeup_symbol_ tx_idle	gdWakeupSymbolTxIdle

50.6.76 Protocol Configuration Register 9 (FR_PCR9)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + B2h offset = B2h

Bit	0	1	2	3	4	5	6	7
Read Write	minislot_ exists	symbol_ window_ exists	offset_correction_out					
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read Write	offset_correction_out							
Reset	0	0	0	0	0	0	0	0

FR_PCR9 field descriptions

Field	Description
0 minislot_exists	gNumberOfMinislots!=0
1 symbol_window_ exists	gdSymbolWindow!=0
2–15 offset_ correction_out	pOffsetCorrectionOut

50.6.77 Protocol Configuration Register 10 (FR_PCR10)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + B4h offset = B4h

Bit	0	1	2	3	4	5	6	7
Read Write	single_slot_ enabled	wakeup_ channel	macro_per_cycle					
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read Write	macro_per_cycle							
Reset	0	0	0	0	0	0	0	0

FR_PCR10 field descriptions

Field	Description
0 single_slot_ enabled	pSingleSlotEnabled
1 wakeup_channel	pWakeupChannel
2–15 macro_per_cycle	gMacroPerCycle

50.6.78 Protocol Configuration Register 11 (FR_PCR11)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + B6h offset = B6h

Bit	0	1	2	3	4	5	6	7
Read Write	key_slot_used_for_startup	key_slot_used_for_sync	offset_correction_start					
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read Write	offset_correction_start							
Reset	0	0	0	0	0	0	0	0

FR_PCR11 field descriptions

Field	Description
0 key_slot_used_for_startup	pKeySlotUsedForStartup
1 key_slot_used_for_sync	pKeySlotUsedForSync
2–15 offset_correction_start	gOffsetCorrectionStart

50.6.79 Protocol Configuration Register 12 (FR_PCR12)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + B8h offset = B8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	allow_passive_to_active					key_slot_header_crc										
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR12 field descriptions

Field	Description
0–4 allow_passive_to_active	pAllowPassiveToActive
5–15 key_slot_header_crc	header CRC for key slot

50.6.80 Protocol Configuration Register 13 (FR_PCR13)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + BAh offset = BAh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	first_minislot_action_point_offset						static_slot_after_action_point									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR13 field descriptions

Field	Description
0–5 first_minislot_action_point_offset	max(gdActionPointOffset, gdMinislotActionPointOffset) - 1
6–15 static_slot_after_action_point	gdStaticSlot - gdActionPointOffset - 1

50.6.81 Protocol Configuration Register 14 (FR_PCR14)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + BCh offset = BCh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	rate_correction_out											listen_timeout				
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR14 field descriptions

Field	Description
0–10 rate_correction_ out	pRateCorrectionOut
11–15 listen_timeout	pdListenTimeout - 1

50.6.82 Protocol Configuration Register 15 (FR_PCR15)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + BEh offset = BEh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	listen_timeout															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR15 field descriptions

Field	Description
0–15 listen_timeout	pdListenTimeout - 1

50.6.83 Protocol Configuration Register 16 (FR_PCR16)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + C0h offset = C0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	macro_initial_offset_b							noise_listen_timeout								
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR16 field descriptions

Field	Description
0–6 macro_initial_ offset_b	pMacroInitialOffset[B]
7–15 noise_listen_ timeout	(gListenNoise * pdListenTimeout) - 1

50.6.84 Protocol Configuration Register 17 (FR_PCR17)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + C2h offset = C2h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	noise_listen_timeout															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR17 field descriptions

Field	Description
0–15 noise_listen_ timeout	(gListenNoise * pdListenTimeout) - 1

50.6.85 Protocol Configuration Register 18 (FR_PCR18)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + C4h offset = C4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	wakeup_pattern						key_slot_id									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR18 field descriptions

Field	Description
0–5 wakeup_pattern	pWakeupPattern
6–15 key_slot_id	pKeySlotId

50.6.86 Protocol Configuration Register 19 (FR_PCR19)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + C6h offset = C6h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	decoding_correction_a									payload_length_static						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR19 field descriptions

Field	Description
0–8 decoding_ correction_a	pDecodingCorrection + pDelayCompensation[A] + 2
9–15 payload_length_ static	gPayloadLengthStatic

50.6.87 Protocol Configuration Register 20 (FR_PCR20)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + C8h offset = C8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	micro_initial_offset_b								micro_initial_offset_a							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR20 field descriptions

Field	Description
0–7 micro_initial_ offset_b	pMicroInitialOffset[A]
8–15 micro_initial_ offset_a	pMicroInitialOffset[A]

50.6.88 Protocol Configuration Register 21 (FR_PCR21)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + CAh offset = CAh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	extern_rate_ correction			latest_tx												
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR21 field descriptions

Field	Description
0–2 extern_rate_ correction	pExternRateCorrection
3–15 latest_tx	gNumberOfMinislots - pLatestTx

50.6.89 Protocol Configuration Register 22 (FR_PCR22)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + CCh offset = CCh

Bit	0	1	2	3	4	5	6	7
Read Write	Reserved	comp_accepted_startup_range_a						
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read Write	comp_accepted_startup_range_a				micro_per_cycle			
Reset	0	0	0	0	0	0	0	0

FR_PCR22 field descriptions

Field	Description
0 Reserved	Reserved bit, will not be changed. Application must not write any value different from the reset value. This field is reserved.
1–11 comp_accepted_ startup_range_a	pdAcceptedStartupRange - pDelayCompensation[A]
12–15 micro_per_cycle	pMicroPerCycle

50.6.90 Protocol Configuration Register 23 (FR_PCR23)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + CEh offset = CEh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	micro_per_cycle															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR23 field descriptions

Field	Description
0–15 micro_per_cycle	pMicroPerCycle

50.6.91 Protocol Configuration Register 24 (FR_PCR24)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + D0h offset = D0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	cluster_drift_damping					max_payload_length_dynamic							micro_per_cycle_min			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR24 field descriptions

Field	Description
0–4 cluster_drift_ damping	pClusterDriftDamping
5–11 max_payload_ length_dynamic	pPayloadLengthDynMax
12–15 micro_per_cycle_ min	pMicroPerCycle - pdMaxDrift

50.6.92 Protocol Configuration Register 25 (FR_PCR25)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + D2h offset = D2h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	micro_per_cycle_min															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR25 field descriptions

Field	Description
0–15 micro_per_cycle_min	pMicroPerCycle - pdMaxDrift

50.6.93 Protocol Configuration Register 26 (FR_PCR26)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + D4h offset = D4h

Bit	0	1	2	3	4	5	6	7
Read Write	allow_halt_due_to_clock	comp_accepted_startup_range_b						
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read Write	comp_accepted_startup_range_b				micro_per_cycle_max			
Reset	0	0	0	0	0	0	0	0

FR_PCR26 field descriptions

Field	Description
0 allow_halt_due_to_clock	pAllowHaltDueToClock
1–11 comp_accepted_startup_range_b	pdAcceptedStartupRange - pDelayCompensation[B]
12–15 micro_per_cycle_max	pMicroPerCycle + pdMaxDrift

50.6.94 Protocol Configuration Register 27 (FR_PCR27)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + D6h offset = D6h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	micro_per_cycle_max															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR27 field descriptions

Field	Description
0–15 micro_per_cycle_max	pMicroPerCycle + pdMaxDrift

50.6.95 Protocol Configuration Register 28 (FR_PCR28)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + D8h offset = D8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	dynamic_slot_idle_phase		macro_after_offset_correction													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR28 field descriptions

Field	Description
0–1 dynamic_slot_idle_phase	gdDynamicSlotIdlePhase.
2–15 macro_after_offset_correction	gMacroPerCycle - gOffsetCorrectionStart

50.6.96 Protocol Configuration Register 29 (FR_PCR29)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + DAh offset = DAh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	extern_offset_correction			minislots_max												
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR29 field descriptions

Field	Description
0–2 extern_offset_correction	pExternOffsetCorrection
3–15 minislots_max	gNumberOfMinislots - 1

50.6.97 Protocol Configuration Register 30 (FR_PCR30)

The protocol configuration registers (FR_PCRn) provide the necessary configuration information to the protocol engine. The individual values in the registers are described in Protocol Configuration Register 0 (FR_PCR0) .

Address: 0h base + DCh offset = DCh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0												sync_node_max			
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_PCR30 field descriptions

Field	Description
0–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–15 sync_node_max	gSyncNodeMax

50.6.98 Protocol Event Output Enable Register (FR_PEOER)

This register defines whether or not the Event output ports are enabled based on the events such as Cycle start and Timer1 and Timer2 expiry (see Timer Support for details).

Address: 0h base + E2h offset = E2h

Bit	0	1	2	3	4	5	6	7
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	0					TIM2_EE	TIM1_EE	CYC_EE
Write								
Reset	0	0	0	0	0	0	0	0

FR_PEOER field descriptions

Field	Description
0–12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 TIM2_EE	Timer 2 expired Event Output Enable- This bit controls the event on port "fr_evt_tim2" 0 Timer 2 expired event out disabled 1 Timer 2 expired event out enabled
14 TIM1_EE	Timer 1 expired Event Output Enable- This bit controls the event on port "fr_evt_tim1" 0 Timer 1 expired event out disabled 1 Timer 1 expired event out enabled
15 CYC_EE	Cycle Start Event Output Enable- This bit controls the event on port "fr_evt_cyc" 0 Cycle start event out disabled 1 Cycle start event out enabled

50.6.99 Receive FIFO Start Data Offset Register (FR_RFSDOR)

NOTE

Since all data fields of the FIFO are of equal length and are located at subsequent system memory addresses the content of the FR_RFSDOR corresponds to the start address of payload area of the selected FIFO.

Address: 0h base + E6h offset = E6h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	SDO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFSDOR field descriptions

Field	Description
0–15 SDO	SDOA/SDOB - Start Data Field Offset Start Data Field Offset. This field defines the data field offset of the header field of the first message buffer of the selected FIFO. The CC uses the value of the SDO field to determine the physical location of the receiver FIFO's first message buffer header field. For configuration constraints see Configure Data Field Offsets .

50.6.100 Receive FIFO System Memory Base Address High Register (FR_RFSYMBADHR)

These registers define the system memory base address for the receive FIFO if the FIFO address mode bit FR_MCR[FAM] is set to 1. The system memory base address is used by the BMIF to calculate the physical memory address for system memory accesses for the FIFOs.

Address: 0h base + E8h offset = E8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	SMBA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_RFSYMBADHR field descriptions

Field	Description
0–15 SMBA	System Memory Base Address. This is the value of the system memory base address for the receive FIFO if the FIFO address mode bit FR_MCR[FAM] is set to 1. It is defines as a byte address.

50.6.101 Receive FIFO System Memory Base Address Low Register (FR_RFSYMBADLR)

These registers define the system memory base address for the receive FIFO if the FIFO address mode bit FR_MCR[FAM] is set to 1. The system memory base address is used by the BMIF to calculate the physical memory address for system memory accesses for the FIFOs.

Address: 0h base + EAh offset = EAh

<table>

</table>

FR_RFSYMBADLR field descriptions

Field	Description
0–11 SMBA	System Memory Base Address. This is the value of the system memory base address for the receive FIFO if the FIFO address mode bit FR_MCR[FAM] is set to 1. It is defines as a byte address.
12–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

50.6.102 Receive FIFO Periodic Timer Register (FR_RFPTR)

This register holds periodic timer duration for the periodic FIFO timer. The periodic timer applies to both FIFOs (see FIFO Periodic Timer).

Address: 0h base + ECh offset = ECh

<table>
<tr><td>Bit</td><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td><td>15</td></tr>

</table>

FR_RFPTR field descriptions

Field	Description
0–1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2–15 PTD	Periodic Timer Duration. This value defines the periodic timer duration in terms of macroticks. 0000 timer stays expired 3FFF timer never expires other timer expires after specified number of macroticks, expires and is restarted at each cycle start

50.6.103 Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR)

This register provides the current fill level of the two receiver FIFOs and is used to pop a number of entries from the FIFOs

If the pop count value PCA/PCB is greater than the current FIFO fill level FLB/FLA, than the FIFO is empty after the update. No notification is given that not the required number of entries was removed.

.

Address: 0h base + EEh offset = EEh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	FLB_or_PCB								FLA_or_PCA							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table continues on the next page...

FR_RFFLPCR field descriptions (continued)

Field	Description		
	Operation	**Sub-Field**	**Description**
	Read	-	-
		8-15 FLA	Fill Level FIFO A- This field provides the current number of entries in the FIFO A.
	Write	-	-
		8-15 PCA	Pop Count FIFO A - This field defines the number of entries to be removed from FIFO A.

50.6.104 ECC Error Interrupt Flag and Enable Register (FR_EEIFER)

This register provides the means to control the ECC related interrupt request lines and provides the corresponding interrupt flags. The interrupt flags are cleared by writing 1, which resets the corresponding report registers. For a detailed description see Memory Error Reporting .

FR_EEIFER field descriptions

Field	Description
0 LRNE_OF	LRAM Non-Corrected Error Overflow Flag. This flag is set to 1 when at least one of the following events appears: a) memory errors are detected but not corrected on CHI LRAM and interrupt flag LRNE_IF is already 1. b) memory errors are detected but not corrected on at least two banks of CHI LRAM 0 no such event 1 Non-Corrected Error overflow detected on CHI LRAM
1 LRCE_OF	LRAM Corrected Error Overflow Flag. This flag is set to 1 when at least one of the following events appears

Table continues on the next page...

FR_EEIFER field descriptions (continued)

Field	Description
	a) memory errors are detected and corrected on CHI LRAM and interrupt flag LRCE_IF is already 1. b) memory errors are detected and corrected on at least two banks of CHI LRAM **NOTE:** Error Correction not implemented on CHI LRAM, flag will never be asserted. 0 no such event 1 Corrected Error overflow detected on CHI LRAM
2 DRNE_OF	DRAM Non-Corrected Error Overflow Flag. This flag is set to 1 when at least one of the following events appears: a) memory errors are detected but not corrected on PE DRAM and interrupt flag DRNE_IF is already 1. b) memory errors are detected but not corrected on at least two banks of the PE DRAM 0 no such event 1 Non-Corrected Error overflow detected on PE DRAM
3 DRCE_OF	DRAM Corrected Error Overflow Flag. This flag is set to 1 when at least one of the following events appears: a) memory errors are detected and corrected on PE DRAM and interrupt flag DRCE_IF is already 1. b) memory errors are detected and corrected on at least two banks of PE DRAM 0 no such event 1 Corrected Error overflow detected on PE DRAM
4 LRNE_IF	LRAM Non-Corrected Error Interrupt Flag. This interrupt flag is set to 1 when a memory error is detected but not corrected on the CHI LRAM. 0 no such event 1 Non-Corrected Error detected on CHI LRAM
5 LRCE_IF	LRAM Corrected Error Interrupt Flag. This interrupt flag is set to 1 when a memory error is detected and corrected on the CHI LRAM. **NOTE:** Error Correction not implemented on CHI LRAM, flag will never be asserted. 0 no such event 1 Corrected Error detected on CHI LRAM
6 DRNE_IF	DRAM Non-Corrected Error Interrupt Flag. This interrupt flag is set to 1 when a memory error is detected but not corrected on PE DRAM. 0 no such event 1 Non-Corrected Error detected on PE DRAM
7 DRCE_IF	DRAM Corrected Error Interrupt Flag. This interrupt flag is set to 1 when a memory error is detected and corrected on PE DRAM. 0 no such event 1 Corrected Error detected on PE DRAM
8–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 LRNE_IE	LRAM Non-Corrected Error Interrupt Enable. This flag controls if the LRAM Non-Corrected Error Interrupt line is asserted when the LRNE_IF flag is set.

Table continues on the next page...

FR_EEIFER field descriptions (continued)

Field	Description
	0 Disable interrupt line 1 Enable interrupt line
13 LRCE_IE	LRAM Corrected Error Interrupt Enable. This flag controls if the LRAM Corrected Error Interrupt line is asserted when the LRCE_IF flag is set. 0 Disable interrupt line 1 Enable interrupt line
14 DRNE_IE	DRAM Non-Corrected Error Interrupt Enable. This flag controls if the DRAM Non-Corrected Error Interrupt line is asserted when the DRNE_IF flag is set. 0 Disable interrupt line 1 Enable interrupt line
15 DRCE_IE	DRAM Corrected Error Interrupt Enable. This flag controls if the DRAM Corrected Error Interrupt line is asserted when the DRCE_IF flag is set. 0 Disable interrupt line 1 Enable interrupt line

50.6.105 ECC Error Report and Injection Control Register (FR_EERICR)

This register configures the error injection and error reporting and provides the selector for the content of the report registers.

Address: 0h base + F2h offset = F2h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	BSY	0					ERS		0			ERM	0		EIM	EIE
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_EERICR field descriptions

Field	Description
0 BSY	Register Update Busy- This field indicates the current state of the ECC configuration update and controls the register write access condition IDL specified in " Register Write Access 0 ECC configuration is idle 1 ECC configuration is running
1–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–7 ERS	Error Report Select. This field selects the content of the ECC Error reporting registers. 00 show PE DRAM non-corrected error information

Table continues on the next page...

FR_EERICR field descriptions (continued)

Field	Description
	01 show PE DRAM corrected error information 10 show CHI LRAM non-corrected error information 11 show CHI LRAM corrected error information
8–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 ERM	Error Report Mode. This bit configures the type of data written into the internal error report registers on the detection of a memory error. 0 store data and code as delivered by ecc decoding logic. 1 store data and code as read from the memory.
12–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 EIM	Error Injection Mode. This bit configures the ECC error injection mode. 0 use FR_EEIDR[DATA] and FR_EEICR[CODE] as XOR distortion pattern for error injection. 1 use FR_EEIDR[DATA] and FR_EEICR[CODE] as write value for error injection.
15 EIE	Error Injection Enable. This bit configures the ECC error injection on the memories. 0 Error injection disabled 1 Error injection enabled

50.6.106 ECC Error Report Address Register (FR_EERAR)

This register provides the memory identifier, bank, and address for which the memory error is reported.

Address: 0h base + F4h offset = F4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	MID	BANK			ADDR											
Write																
Reset	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0

FR_EERAR field descriptions

Field	Description
0 MID	Memory Identifier. This flag provides the memory instance for which the memory error is reported. 0 PE DRAM 1 CHI LRAM
1–3 BANK	Memory Bank. This field provides the BANK for which the memory error is reported. 111 reset value, indicates no error found after reset. For MID=0:

Field	Description
0–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

FR_EERCR field descriptions (continued)

Field	Description
11–15 CODE	Code. The content of this field depends on the report mode selected by FR_EERICR[ERM] ERM=0: Syndrome. Shows the ecc syndrome generated by the ecc decoding logic. The coding of the PE DRAM syndrome is shown in PE DRAM Syndrome . The coding of the CHI LRAM syndrome is shown in CHI LRAM Syndrome . ERM=1: Checkbits. Shows the ecc checkbits read from the memory.

50.6.109 ECC Error Injection Address Register (FR_EEIAR)

This register defines the memory module, bank, and address where the ECC error has to be injected.

Address: 0h base + FAh offset = FAh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	MID	BANK			ADDR											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_EEIAR field descriptions

Field	Description
0 MID	Memory Identifier. This flag defines the memory instance for ECC error injection. 0 PE DRAM 1 CHI LRAM
1–3 BANK	Memory Bank. This field defines the memory bank for ECC error injection. For MID=0: 000 BANK0: PE DRAM [7:0] 001 BANK1: PE DRAM [15:8] others reserved For MID=1: Refer to ECC Error Report Address Register (FR_EERAR) for the assignment of the LRAM banks.
4–15 ADDR	Memory Address. This flag defines the memory address for ECC error injection.

50.6.110 ECC Error Injection Data Register (FR_EEIDR)

This register defines the data distortion pattern for the error injection write. The number of valid bits depends on the selected memory and memory bank as shown in ECC Error Report Data Register (FR_EERDR) .

NOTE

The effect of the error injected depends from the LRAM content at the address accessed and from the module internal usage of the data. Refer to Memory Error Response for details.

Address: 0h base + FCh offset = FCh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	DATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_EEIDR field descriptions

Field	Description
0–15 DATA	Data. The content of this field depends on the error injection mode selected by FR_EERICR[EIM]. EIM=0: This field defines the XOR distortion pattern for the data written into the memory. EIM=1: This field defines the data to be written into the memory.

50.6.111 ECC Error Injection Code Register (FR_EEICR)

This register defines the ECC code distortion pattern for the error injection write.

Address: 0h base + FEh offset = FEh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0											CODE				
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FR_EEICR field descriptions

Field	Description
0–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11–15 CODE	Code. The content of this field depends on the error injection mode selected by FR_EERICR[EIM]. EIM=0: This field defines the XOR distortion pattern for the ecc checkbits written into the memory. EIM=1: This field defines the ecc checkbits written into the memory.

50.6.112 Message Buffer Configuration, Control, Status Register (FR_MBCCSR*n*)

The content of these registers is composed of message buffer configuration data, message buffer control data, message buffer status information, and message buffer interrupt flags. A detailed description of all flags can be found in Individual Message Buffer Functional Description.

If the application writes 1 to the EDT bit, no write access to the other register bits is performed.

If the application writes 0 to the EDT bit and 1 to the LCKT bit, no write access to the other bits is performed.

Address: 0h base + 800h offset + (8d × i), where i=0d to 63d

Bit	0	1	2	3	4	5	6	7
Read	0			MTD	CMT		0	MBIE
Write						EDT	LCKT	
Reset	0	0	0	0	0	0	0	0

Bit	8	9	10	11	12	13	14	15
Read	0			DUP	DVAL	EDS	LCKS	MBIF
Write								w1c
Reset	0	0	0	0	0	0	0	0

FR_MBCCSR*n* field descriptions

Field	Description
0–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 MTD	Message Buffer Transfer Direction. This bit configures the transfer direction of a message buffer. 0 Receive message buffer 1 Transmit message buffer
4 CMT	Commit for Transmission. This bit indicates if the transmit message buffer data are ready for transmission. **NOTE:** This bit is read/write but may be modified by hardware other than by a reset. 0 Message buffer data not ready for transmission 1 Message buffer data ready for transmission
5 EDT	Enable/Disable Trigger. If the application writes 1 to this bit, a message buffer enable or disable is triggered, depending on the current value of the EDS status bit. 0 No effect 1 Message buffer enable or disable is triggered
6 LCKT	Lock/Unlock Trigger. If the application writes 1 to this bit and writes 0 to the EDT bit, a message buffer lock or unlock is triggered, depending on the current value of the LCKS status bit.

Table continues on the next page...

FR_MBCCSR*n* field descriptions (continued)

Field	Description
	0 No effect 1 Message buffer lock or unlock is triggered
7 MBIE	Message Buffer Interrupt Enable. This control bit defines whether the message buffer will generate an interrupt request when its MBIF flag is set. 0 Interrupt request generation disabled 1 Interrupt request generation enabled
8–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 DUP	Data Updated. This status bit indicates whether the frame header in the message buffer header field and the data in the message buffer data field were updated after a frame reception. 0 Frame Header and Message buffer data field not updated 1 Frame Header and Message buffer data field updated
12 DVAL	Data Valid. For receive message buffers this status bit indicates whether the message buffer data field contains valid frame data. For transmit message buffers the status bit indicates if a message is transferred again due to the state transmission mode of the message buffer. 0 receive message buffer contains no valid frame data / message is transmitted for the first time 1 receive message buffer contains valid frame data / message will be transferred again
13 EDS	Enable/Disable Status. This status bit indicates whether the message buffer is enabled or disabled. 0 Message buffer is disabled. 1 Message buffer is enabled.
14 LCKS	Lock Status. This status bit indicates the current lock status of the message buffer. 0 Message buffer is not locked by the application. 1 Message buffer is locked by the application.
15 MBIF	Message Buffer Interrupt Flag. This flag is set when the slot status field of the message buffer was updated after frame transmission or reception, or when a transmit message buffer was just enabled by the application. 0 No such event 1 Slot status field updated or transmit message buffer just enabled

50.6.113 Message Buffer Cycle Counter Filter Register (FR_MBCCFR*n*)

NOTE

After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

This register contains message buffer configuration data for the transmission mode, the channel assignment, and for the cycle counter filtering. For detailed information on cycle counter filtering, refer to Message Buffer Cycle Counter Filtering .

NOTE

If at least one message buffer assigned to a certain slot is assigned to both channels, then all message buffers assigned to this slot have to be assigned to both channels. Otherwise, the message buffer configuration is illegal and the result of the message buffer search is not defined.

Table 50-17. Channel Assignment Description

CHA	CHB	Transmit Message Buffer		Receive Message Buffer	
		static segment	dynamic segment	static segment	dynamic segment
1	1	transmit on both channel A and channel B	transmit on channel A only	store first valid frame received on either channel A or channel B	store first valid frame received on channel A, ignore channel B
0	1	transmit on channel B	transmit on channel B	store first valid frame received on channel B	store first valid frame received on channel B
1	0	transmit on channel A	transmit on channel A	store first valid frame received on channel A	store first valid frame received on channel A
0	0	no frame transmission	no frame transmission	no frame stored	no frame stored

Address: 0h base + 802h offset + (8d × i), where i=0d to 63d

Bit	0	1	2	3	4	5	6	7
Read Write	MTM	CHA	CHB	CCFE	CCFMSK			
Reset	0*	0*	0*	0*	0*	0*	0*	0*

Bit	8	9	10	11	12	13	14	15
Read Write	CCFMSK		CCFVAL					
Reset	0*	0*	0*	0*	0*	0*	0*	0*

* Notes:

- After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

FR_MBCCFR*n* field descriptions

Field	Description
0 MTM	Message Buffer Transmission Mode. This control bit applies only to transmit message buffers and defines the transmission mode. 0 Event transmission mode 1 State transmission mode
1 CHA	Channel Assignment. In conjunction with the CHB field, defines the channel assignment and control the receive and transmit behavior of the message buffer according to Message Buffer Cycle Counter Filter Register (FR_MBCCFR*n*) .
2 CHB	Channel Assignment. In conjunction with the CHB field, defines the channel assignment and control the receive and transmit behavior of the message buffer according to Message Buffer Cycle Counter Filter Register (FR_MBCCFR*n*) .

Table continues on the next page...

FR_MBCCFR*n* field descriptions (continued)

Field	Description
3 CCFE	Cycle Counter Filtering Enable. This control bit is used to enable and disable the cycle counter filtering. 0 Cycle counter filtering disabled 1 Cycle counter filtering enabled
4–9 CCFMSK	Cycle Counter Filtering Mask. This field defines the filter mask for the cycle counter filtering.
10–15 CCFVAL	Cycle Counter Filtering Value. This field defines the filter value for the cycle counter filtering.

50.6.114 Message Buffer Frame ID Register (FR_MBFIDR*n*)

NOTE

After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

Address: 0h base + 804h offset + (8d × i), where i=0d to 63d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0					FID										
Write	▨															
Reset	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*

* Notes:

- After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

FR_MBFIDR*n* field descriptions

Field	Description
0–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–15 FID	Frame ID. The semantic of this field depends on the message buffer transfer type. • Receive Message Buffer: This field is used as a filter value to determine if the message buffer is used for reception of a message received in a slot with the slot ID equal to FID. • Transmit Message Buffer: This field is used to determine the slot in which the message in this message buffer should be transmitted.

50.6.115 Message Buffer Index Register (FR_MBIDXR*n*)

NOTE

After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

Address: 0h base + 806h offset + (8d × i), where i=0d to 63d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0									MBIDX						
Write	▨															
Reset	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*

* Notes:

- After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

FR_MBIDXR*n* field descriptions

Field	Description
0–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–15 MBIDX	Message Buffer Index. This field provides the index of the message buffer header field of the physical message buffer that is currently associated with this message buffer. The application writes the index of the initially associated message buffer header field into this register. The CC updates this register after frame reception or transmission. Legal Values are 0 <= i <= 67 . Illegal values will be detected during the message buffer search.

50.6.116 Message Buffer Data Field Offset Register (FR_MBDOR*n*)

NOTE

After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

Address: 0h base + 1000h offset + (2d × i), where i=0d to 67d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	MBDO															
Reset	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*

* Notes:
- After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

FR_MBDOR*n* field descriptions

Field	Description
0–15 MBDO	Message Buffer Data Field Offset. This field provides the data field offset belonging to a particular Message Buffer Index. For configuration constraints see Configure Data Field Offsets .

50.6.117 LRAM ECC Error Test Register (FR_LEETR*n*)

NOTE

After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

Address: 0h base + 1090h offset + (2d × i), where i=0d to 5d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read Write	LEETD															
Reset	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*	0*

* Notes:
- After Phase3 reset, LRAM is not initialized. LRAM is initialized when CC leaves the Disabled Mode (For details, refer CHI LRAM Initialization section).

FR_LEETR*n* field descriptions

Field	Description
0–15 LEETD	LRAM ECC Error Test Data. This field contains the LRAM data belonging to the test register located in LRAM Bank n.

50.7 Functional Description

This section provides a detailed description of the functionality implemented in the CC.

50.7.1 Message Buffer Concept

The CC uses a data structure called a *message buffer* to store frame data, configuration, control, and status data. Each message buffer consists of two parts, the *message buffer control data* and the *physical message buffer*. The message buffer control data are located in dedicated registers. The structure of the message buffer control data depends on the message buffer type and is described in the Message Buffer Types section. The physical message buffer is located in the FlexRay memory area and is described in the next section.

50.7.2 Physical Message Buffer

All FlexRay messages and related frame and slot status information of received frames and of frames to be transmitted to the FlexRay bus are stored in data structures called *physical message buffers*. The physical message buffers are located in the FlexRay memory area.The structure of a physical message buffer is depicted in the figure below.

A physical message buffer consists of two fields, the *message buffer header field* and the *message buffer data field*. The message buffer header field contains the *frame header* and the *slot status*. The message buffer data field contains the *frame data*.

The connection between the two fields is established by the *data field offset*.

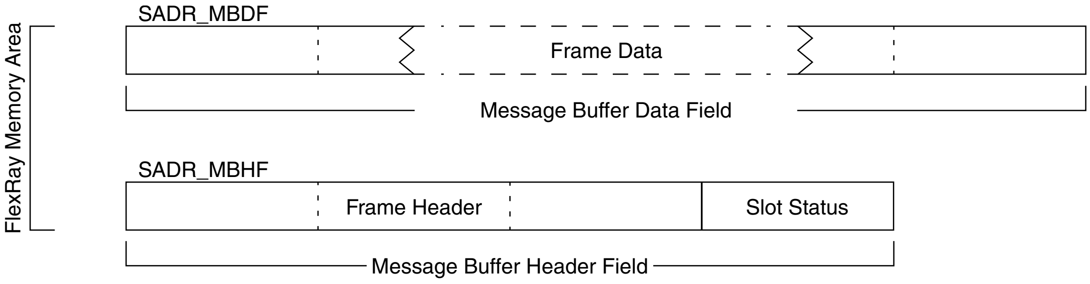

Figure 50-2. Physical Message Buffer Structure

50.7.2.1 Message Buffer Header Field

The message buffer header field is a contiguous region in the FlexRay memory area and occupies eight bytes. It contains the frame header, and the slot status. Its structure is shown in the above figure. The physical start address *SADR_MBHF* of the message buffer header field must be 16-bit aligned.

50.7.2.1.1 Frame Header

The frame header occupies the first six bytes in the message buffer header field. It contains all FlexRay frame header related information according to the *FlexRay Communications System Protocol Specification, Version*2.1 Rev A. A detailed description of the usage and the content of the frame header is provided in Frame Header Description section.

50.7.2.1.2 Slot Status

The slot status occupies the last two bytes of the message buffer header field. It provides the slot and frame status related information according to the *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*. A detailed description of the content and usage of the slot status is provided in the Slot Status Description section.

50.7.2.2 Message Buffer Data Field

The message buffer data field is a contiguous area of 2-byte entities. This field contains the frame payload data, or a part of it, of the frame to be transmitted to or received from the FlexRay bus. The minimum length of this field depends on the specific message buffer configuration and is specified in the message buffer descriptions given in the following section.

50.7.3 Message Buffer Types

The CC provides three different types of message buffers.

- *Individual Message Buffers*
- *Receive Shadow Buffers*
- *Receive FIFO Buffers*

For each message buffer type the structure of the physical message buffer is identical. The message buffer types differ only in the structure and content of message buffer control data, which control the related physical message buffer. The message buffer control data are described in the following sections.

50.7.3.1 Individual Message Buffers

The individual message buffers are used for all types of frame transmission and for dedicated frame reception based on individual filter settings for each message buffer. The CC supports three types of individual message buffers, which are described in the Individual Message Buffer Functional Description section.

Each individual message buffer consists of two parts, the physical message buffer, which is located in the FlexRay memory area, and the message buffer control data, which are located in dedicated registers. The structure of an individual message buffer is given in the figure below.

Each individual message buffer has a message buffer number n assigned, which determines the set of message buffer control registers associated to this individual message buffer. The individual message buffer with message buffer number *n* is controlled by the registers FR_MBCCSRn, FR_MBCCFRn, FR_MBFIDRn, and FR_MBIDXRn.

The connection between the message buffer control registers and the physical message buffer is established by the message buffer index field MBIDX in the Message Buffer Index Registers (FR_MBIDXRn). The start address SADR_MBHF of the related message buffer header field in the FlexRay memory area is determined according to this equation:

$$\mathrm{SADR\_MBHF} = (\mathrm{FR\_MBIDXRn}[\mathrm{MBIDX}] \times 8) + \mathrm{SMBA}$$

Equation 17

The data field belonging to a particular physical message buffer is characterized by the data field offset. For each physical message buffer with MBIDX i the FR_MBDORi contains the offset of the corresponding message buffer data field with respect to the CC FlexRay memory area base address as provided by SMBA field in the System Memory Base Address Register (FR_SYMBADR).

The data field offset is used to determine the start address SADR_MBDF of the corresponding message buffer data field in the FlexRay memory area according to this equation:

$$SADR\_MBDF = [DataFieldOffset] + SMBA$$

Equation 18

The FR_MBDORn are stored in the module internal memory LRAM. Refer to CHI LRAM Initialization for the setup of the data field offset values.

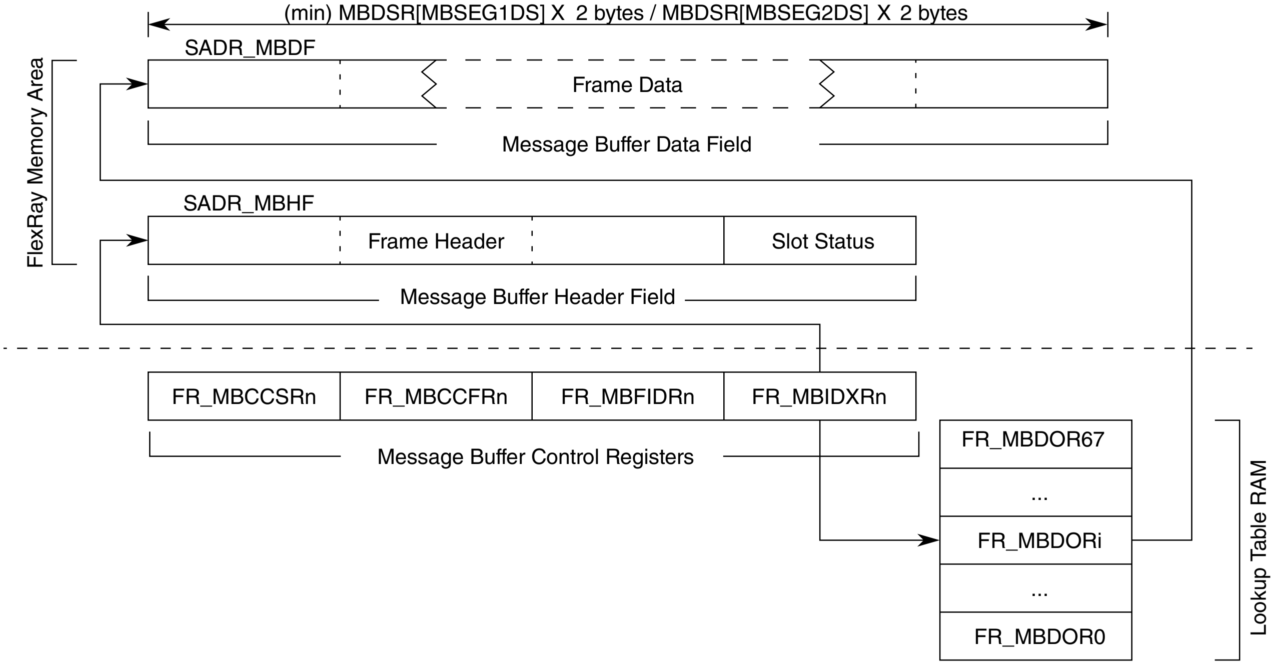

Figure 50-3. Individual Message Buffer Structure

50.7.3.1.1 Individual Message Buffer Segments

The set of the individual message buffers can be split up into two message buffer segments using the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR). All individual message buffers with a message buffer number n ≤ FR_MBSSUTR[LAST_MB_SEG1] belong to the first message buffer segment. All individual message buffers with a message buffer number n > FR_MBSSUTR[LAST_MB_SEG1] belong to the second message buffer segment. The following rules apply to the length of the message buffer data field:

- *all physical message buffers associated to individual message buffers that belong to the same message buffer segment must have message buffer data fields of the same length*
- *the minimum length of the message buffer data field for individual message buffers in the first message buffer segment is 2 × FR_MBDSR[MBSEG1DS] bytes*
- *the minimum length of the message buffer data field for individual message buffers assigned to the second segment is 2 × FR_MBDSR[MBSEG2DS] bytes.*

50.7.3.2 Receive Shadow Buffers

The receive shadow buffers are required for the frame reception process for individual message buffers. The CC provides four receive shadow buffers, one receive shadow buffer per channel and per message buffer segment.

Each receive shadow buffer consists of two parts, the physical message buffer located in the FlexRay memory area and the receive shadow buffer control registers located in dedicated registers. The structure of a receive shadow buffer is shown in the figure below. The four internal shadow buffer control registers can be accessed by the Receive Shadow Buffer Index Register (FR_RSBIR).

The connection between the receive shadow buffer control register and the physical message buffer for the selected receive shadow buffer is established by the receive shadow buffer index field RSBIDX in the Receive Shadow Buffer Index Register (FR_RSBIR). The start address SADR_MBHF of the related message buffer header field in the FlexRay memory area is determined according to this equation:

$$\mathrm{SADR\_MBHF} = (\mathrm{FR\_RSBIR}[\mathrm{RSBIDX}] \times 8) + \mathrm{SMBA}$$

Equation 19

The length required for the message buffer data field depends on the message buffer segment that the receive shadow buffer is assigned to. For the receive shadow buffers assigned to the first message buffer segment, the length must be the same as for the individual message buffers assigned to the first message buffer segment. For the receive shadow buffers assigned to the second message buffer segment, the length must be the same as for the individual message buffers assigned to the second message buffer segment. The receive shadow buffer assignment is described in Receive Shadow Buffer Index Register (FR_RSBIR).

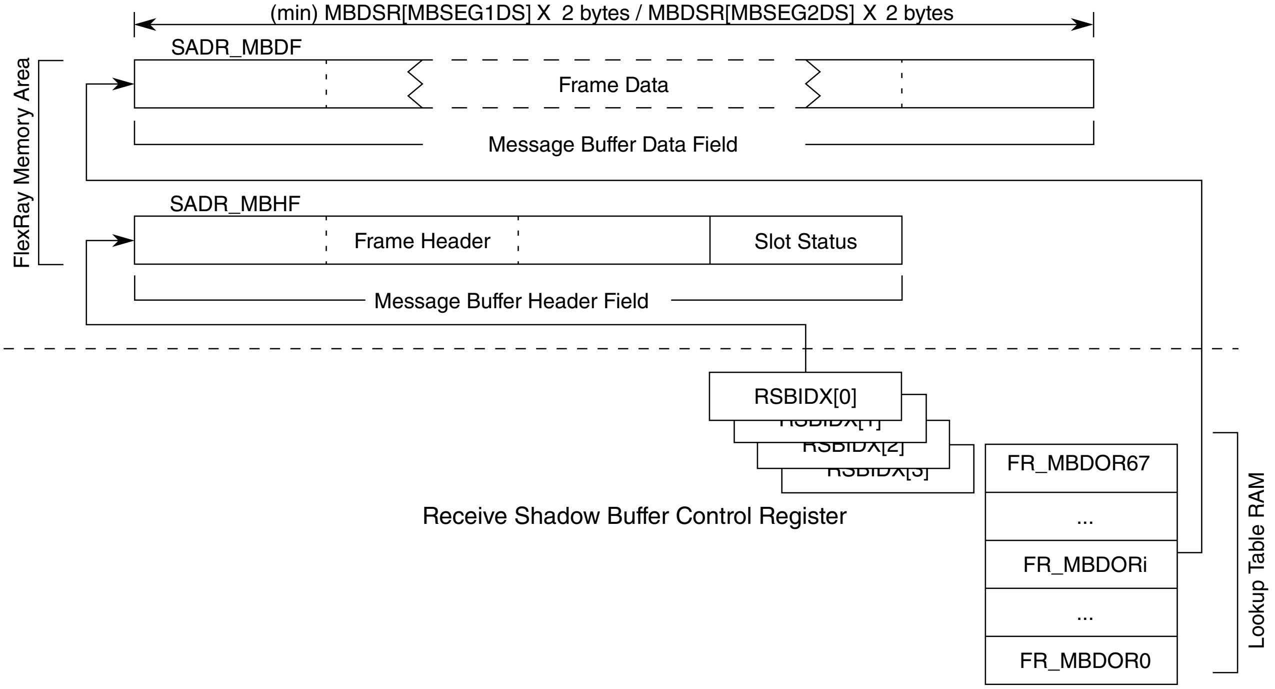

Figure 50-4. Receive Shadow Buffer Structure

50.7.3.3 Receive FIFO

The receive FIFO implements a frame reception system based on the FIFO concept. The CC provides two independent receive FIFOs, one per channel.

A receive FIFO consists of a set of physical message buffers in the FlexRay memory area and a set of receive FIFO control registers located in dedicated registers. The structure of a receive FIFO is given in the Receive FIFO Structure figure, later in this section.

The connection between the receive FIFO control registers and the set of physical message buffers is established by the Receive FIFO Start Index Register (FR_RFSIR), the Receive FIFO Depth and Size Register (FR_RFDSR), and the Receive FIFO A Read Index Register (FR_RFARIR) / Receive FIFO B Read Index Register (FR_RFBRIR).

The system memory base address SMBA valid for the receive FIFOs is defined by the system memory base address register selected by the FIFO address mode bit FR_MCR[FAM] in the Module Configuration Register.

The start byte address SADR_MBHF[1] of the first message buffer header field that belongs to the receive FIFO is determined according to Equation 20 on page 1778.

$$\mathrm{SADR\_MBHF}[1] = (8 \times \mathrm{FR\_RFSIR}[\mathrm{SIDX}]) + \mathrm{SMBA}$$

Equation 20

The start byte address SADR_MBHF[n] of the last message buffer header field that belongs to the receive FIFO in the FlexRay memory area is determined according Equation 21 on page 1779 .

$$\mathrm{SADR\_MBHF}[n] = (8 \times (\mathrm{FR\_RFSIR}[\mathrm{SIDX}] + \mathrm{FR\_RFDSR}[\mathrm{FIFO\_DEPTH}])) + \mathrm{SMBA}$$

Equation 21

The required information to access the current entry of the FIFO is given in the following registers:

- *The registers Receive FIFO A Read Index Register (FR_RFARIR) and Receive FIFO B Read Index Register (FR_RFBRIR) provide the index of the physical message buffer belonging to the current entry.*

  The data field offset belonging to the current FIFO entry RF_DFO[X] must be calculated using the current read index i according to the following formula:

$$\mathrm{RF\_DFO}[X] = \mathrm{FR\_RFSDOR}[X] + (\mathrm{FR\_RFDSR}[X][\mathrm{ENTRY\_SIZE}] \times 2) \times i - \mathrm{FR\_RFSIDX}[X\})$$

Equation 22

Note

The current read index loops up starting at the number given in the FR_RD[A/B]RDIDX register for the required number of entries.

Refer to FIFO Update for details about updating the FIFO read pointer.

All message buffer header fields assigned to a receive FIFO are within a contiguous region defined by FR_RFSIR[SIDX] and FR_RFDSR[FIFO_DEPTH].

The data sections of all FIFO entries within on receive FIFO are of the same length defined by FR_RFDSR[FIFO_SIZE].

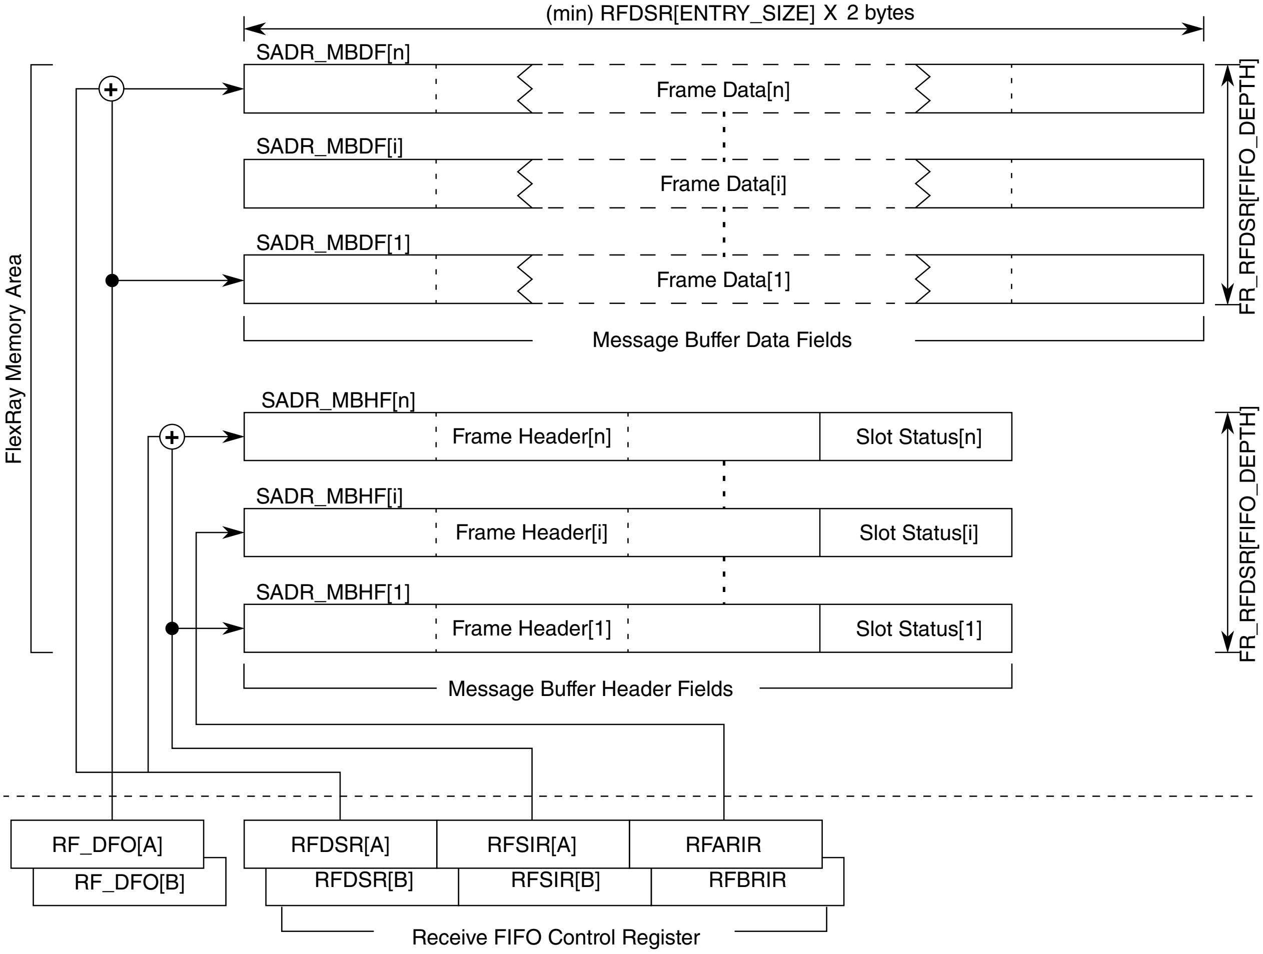

Figure 50-5. Receive FIFO Structure

Note

The actual values of the data field offsets RF_DFO[A/B] need to be calculated according to Equation 22 on page 1779. They are not stored in a register.

50.7.3.4 Message Buffer Configuration and Control Data

This section describes the configuration and control data for each message buffer type.

50.7.3.4.1 Individual Message Buffer Configuration Data

Before an individual message buffer can be used for transmission or reception, it must be configured. There is a set of common configuration parameters that applies to all individual message buffers and a set of configuration parameters that applies to each message buffer individually.

50.7.3.4.1.1 Common Configuration Data

The set of common configuration data for individual message buffers is located in the following registers.

- *Message Buffer Data Size Register (FR_MBDSR)*

  The MBSEG2DS and MBSEG1DS fields define the minimum length of the message buffer data field with respect to the message buffer segment.

- *Message Buffer Segment Size and Utilization Register (FR_MBSSUTR)*

  The LAST_MB_SEG1 and LAST_MB_UTIL fields define the segmentation of the individual message buffers and the number of individual message buffers that are used. For more details, see Individual Message Buffer Segments.

50.7.3.4.1.2 Specific Configuration Data

The set of message buffer specific configuration data for individual message buffers is located in the following registers.

- *Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn)*

  The MTD bit configures the message buffer type.

- *Message Buffer Cycle Counter Filter Registers (FR_MBCCFRn)*

  The MTM, CHA, CHB bits configure the transmission mode and the channel assignment. The CCFE, CCFMSK, and CCFVAL bits and fields configure the cycle counter filter.

- *Message Buffer Frame ID Registers (FR_MBFIDRn)*

  For a transmit message buffer, the FID field is used to determine the slot in which the message in this message buffer will be transmitted.

- *Message Buffer Index Registers (FR_MBIDXRn)This MBIDX field provides the index of the message buffer header field of the physical message buffer that is currently associated with this message buffer.*

50.7.3.5 Individual Message Buffer Control Data

During normal operation, each individual message buffer can be controlled by the control and trigger bits CMT, LCKT, EDT, and MBIE in the Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn).

50.7.3.6 Receive Shadow Buffer Configuration Data

Before frame reception into the individual message buffers can be performed, the receive shadow buffers must be configured. The configuration data are provided by the Receive Shadow Buffer Index Register (FR_RSBIR). For each receive shadow buffer, the application provides the message buffer header index. When the protocol is in the *POC:normal active* or *POC:normal passive* state, the receive shadow buffers are under full CC control.

50.7.3.7 Receive FIFO Control and Configuration Data

This section describes the configuration and control data for the two receive FIFOs.

50.7.3.7.1 Receive FIFO Configuration Data

The CC provides two functional independent receive FIFOs, one per channel. The FIFOs have a common subset of configuration data:

- *Receive FIFO Periodic Timer Register (FR_RFPTR)*

Each FIFO has its own set of configuration data. The configuration data are located in the following registers:

- *Receive FIFO Watermark and Selection Register (FR_RFWMSR)*
- *Receive FIFO Start Index Register (FR_RFSIR)*
- *Receive FIFO Start Data Offset Register (FR_RFSDOR)*
- *Receive FIFO Depth and Size Register (FR_RFDSR)*
- *Receive FIFO Message ID Acceptance Filter Value Register (FR_RFMIDAFVR)*
- *Receive FIFO Message ID Acceptance Filter Mask Register (FR_RFMIDAFMR)*
- *Receive FIFO Frame ID Rejection Filter Value Register (FR_RFFIDRFVR)*

- *Receive FIFO Frame ID Rejection Filter Mask Register (FR_RFFIDRFMR)*
- *Receive FIFO Range Filter Configuration Register (FR_RFRFCFR)*

50.7.3.7.2 Receive FIFO Control Data

The application can access the FIFOs at any time using the control bits in the following registers:

- *Global Interrupt Flag and Enable Register (FR_GIFER)*
- *Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR)*

50.7.3.7.3 Receive FIFO Status Data

The current status of the receive fifo is provided in the following register:

- *Global Interrupt Flag and Enable Register (FR_GIFER)*
- *Receive FIFO A Read Index Register (FR_RFARIR)*
- *Receive FIFO B Read Index Register (FR_RFBRIR)*
- *Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR)*

50.7.4 FlexRay Memory Area Layout

The CC supports a wide range of possible layouts for the FlexRay memory area. Two basic layout modes can be selected by the FIFO address mode bit FR_MCR[FAM].

50.7.4.1 FlexRay Memory Area Layout (FR_MCR[FAM] = 0)

In the figure given below, shows an example layout for the FIFO address mode FR_MCR[FAM]=0. In this mode, the following set of rules applies to the layout of the FlexRay memory area:

- The FlexRay memory area is one contiguous region.
- The FlexRay memory area size is maximum 64 KB.
- The FlexRay memory area starts at a 16 byte boundary

The FlexRay memory area contains three areas: the *message buffer header area*, the *message buffer data area*, and the *sync frame table area*.

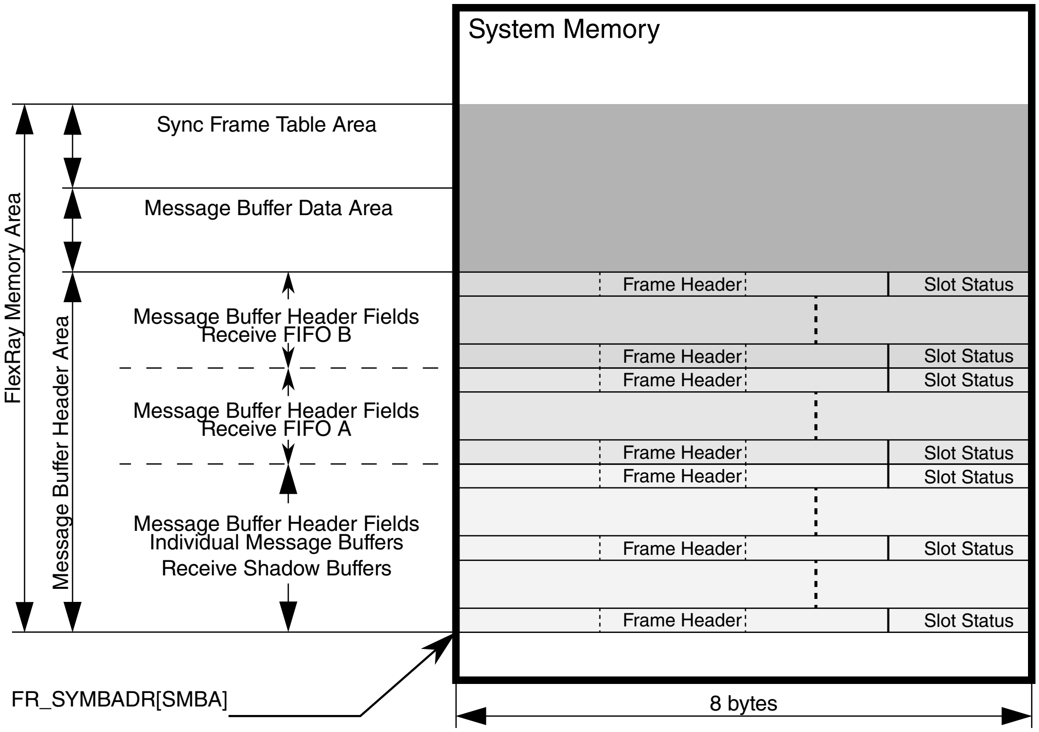

Figure 50-6. Example of FlexRay Memory Area Layout (FR_MCR[FAM] = 0)

50.7.4.2 FlexRay Memory Area Layout (FR_MCR[FAM] = 1)

The following figure shows an example layout for the FIFO address mode FR_MCR[FAM]=1. The following set of rules applies to the layout of the FlexRay memory area:

- The FlexRay memory area consists of two contiguous regions.
- The size of each region is maximum 64 KB.
- Each region start at a 16 byte boundary.

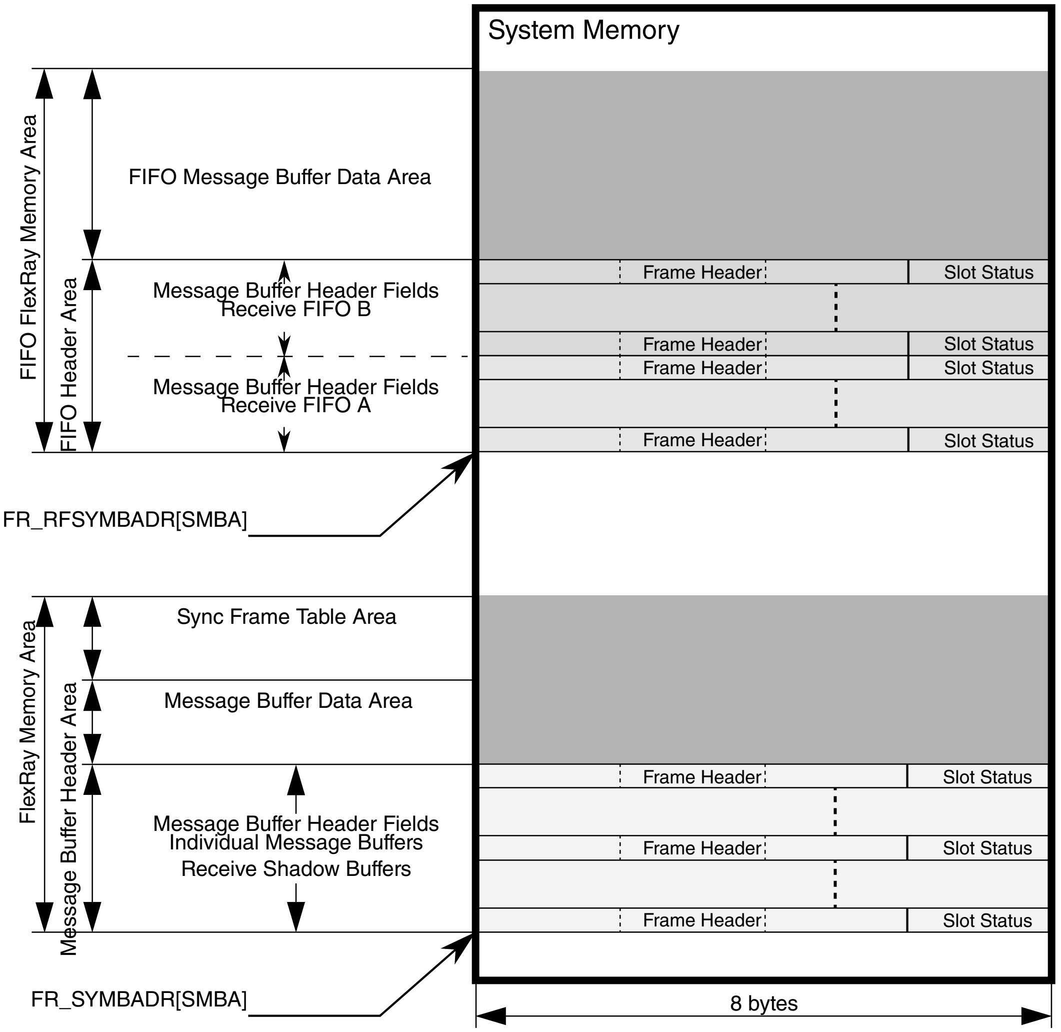

Figure 50-7. Example of FlexRay Memory Area Layout (FR_MCR[FAM] = 1)

50.7.4.3 Message Buffer Header Area (FR_MCR[FAM] = 0)

The message buffer header area contains all message buffer header fields of the physical message buffers for all message buffer types. The following rules apply to the message buffer header fields for the three type of message buffers.

1. The start byte address SADR_MBHF of each message buffer header field for *individual message buffers* and *receive shadow buffers* must fulfill Equation 23 on page 1785.

$$\mathrm{SADR\_MBHF} = (i \times 8) + \mathrm{FR\_SYMBADR[SMBA]}; (0 \le i \le 67)$$

Equation 23

2. The start byte address SADR_MBHF of each message buffer header field for the *FIFO* must fulfill Equation 23 on page 1785.

$$\mathrm{SADR\_MBHF} = (i \times 8) + \mathrm{FR\_SYMBADR[SMBA]}; (0 \leq i \leq 1023)$$

Equation 24

$$\mathrm{SADR\_MBHF} = (i \times 8) + \mathrm{FR\_SYMBADR[SMBA]}; (0 \leq i \leq 1023)$$

Equation 25

3. The message buffer header fields for each FIFO have to be a contiguous area.

50.7.4.4 Message Buffer Header Area (FR_MCR[FAM] = 1)

The message buffer header area contains all message buffer header fields of the physical message buffers for the individual message buffers and receiver shadow buffers. The following rules apply to the message buffer header fields for the two type of message buffers.

1. The start address SADR_MBHF of each message buffer header field for individual message buffers and receive shadow buffers must fulfill Equation 26 on page 1786.

$$\mathrm{SADR\_MBHF} = (i \times 8) + \mathrm{FR\_SYMBADR[SMBA]}; (0 \leq i \leq 67)$$

Equation 26

50.7.4.5 FIFO Message Buffer Header Area (FR_MCR[FAM] = 1)

The FIFO message buffer header area contains all message buffer header fields of the physical message buffers for the FIFO. The following rules apply to the FIFO message buffer header fields.

1. The start byte address SADR_MBHF of each message buffer header field for the FIFO must fulfill the following equation:Equation 27 on page 1786.

$$\mathrm{SADR\_MBHF} = (i\gamma 8) + \mathrm{FR\_RFSYMBADR[SMBA]}; (0 \leq i \leq 1023)$$

Equation 27

2. The message buffer header fields for each FIFO have to be a contiguous area.

50.7.4.6 Message Buffer Data Area

The message buffer data area contains all the message buffer data fields of the physical message buffers. Each message buffer data field must start at a 16-bit boundary.

50.7.4.7 Sync Frame Table Area

The sync frame table area is used to provide a copy of the internal sync frame tables for application access. Refer to Sync Frame ID and Sync Frame Deviation Tables for the description of the sync frame table area.

50.7.5 Physical Message Buffer Description

This section provides a detailed description of the usage and the content of the two parts of a physical message buffer, the message buffer header field and the message buffer data field.

50.7.5.1 Message Buffer Protection and Data Consistency

The physical message buffers are located in the FlexRay memory area. The CC provides no means to protect the FlexRay memory area from uncontrolled or illegal host or other client write access. To ensure data consistency of the physical message buffers, the application must follow the write access scheme that is given in the description of each of the physical message buffer fields.

50.7.5.2 Message Buffer Header Field Description

This section provides a detailed description of the usage and content of the message buffer header field. A description of the structure of the message buffer header fields is given in Message Buffer Header Field. Each message buffer header field consists of two sections: the frame header section and the slot status section.

50.7.5.2.1 Frame Header Description

Frame header content, access, and checks are discussed in this section.

50.7.5.2.1.1 Frame Header Content

The semantic and content of the frame header section depends on the message buffer type.

For individual receive message buffers and receive FIFOs, the frame header receives the frame header data of the *first valid frame* received on the assigned channels.

For receive shadow buffers, the frame header receives the frame header data of the current frame received regardless of whether the frame is valid or not.

For transmit message buffers, the application writes the frame header of the frame to be transmitted into this location. The frame header will be read out when the frame is transferred to the FlexRay bus.

The structure of the frame header in the message buffer header field for receive message buffers and the receive FIFO is given in the figure below. A detailed description is given in Table 50-22.

Table 50-18. Frame Header Structure (Receive Message Buffer and Receive FIFO)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0x0	R	PPI	NUF	SYF	SUF	FID										
0x2	0	0	CYCCNT						0	PLDLEN						
0x4	0	0	0	0	0	HDCRC										

The structure of the frame header in the message buffer header field for transmit message buffers is given in the following figure. A detailed description is given in Table 50-23. The checks that will be performed are described in Frame Header Checks.

Table 50-19. Frame Header Structure (Transmit Message Buffer)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0x0	R	PPI	NUF	SYF	SUF	FID [1]

0x4	▨	▨	▨	▨	▨	HDCRC										

▨ = not used

[1] checked

[2] checked if not static

The structure of the frame header in the message buffer header field for transmit message buffers assigned to key slot is given in the figure below.

Table 50-20. Frame Header Structure (Transmit Message Buffer for Key Slot)

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0x0	R	PPI	NUF	SYF	SUF	FID										
0x2	▨	▨	CYCCNT						▨	PLDLEN						
0x4	▨	▨	▨	▨	▨	HDCRC										

▨ = not used

50.7.5.2.1.2 Frame Header Access

The frame header is located in the FlexRay memory area. To ensure data consistency, the application must follow the write access scheme described below.

For receive message buffers, receive shadow buffers, and receive FIFOs, the application must not write to the frame header field.

For transmit message buffers, the application must follow the write access restrictions given in the following table. This table shows the condition under which the application can write to the frame header entries without corrupting the FlexRay message transmission.

Table 50-21. Frame Header Write Access Constraints (Transmit Message Buffer)

Field	Static Segment	Dynamic Segment
FID	*POC:config* or MB_DIS	
PPI, PLDLEN, HDCRC	*POC:config* or MB_DIS or	
		MB_LCK

50.7.5.2.1.3 Frame Header Checks

As shown in Table 50-19 and Table 50-20 not all fields in the message buffer frame header are used for transmission. Some fields in the message buffer frame header are ignored, some are used for transmission, and some of them are checked for correct values. All checks that will be performed are described below.

For message buffers assigned to the key slot, no checks will be performed.

The value of the FID field must be equal to the value of the corresponding Message Buffer Frame ID Registers (FR_MBFIDRn). If the CC detects a mismatch while transmitting the frame header, it will set the frame ID error flag FID_EF in the CHI Error Flag Register (FR_CHIERFR). The value of the FID field will be ignored and replaced by the value provided in the Message Buffer Frame ID Registers (FR_MBFIDRn).

For transmit message buffers assigned to the *static* segment, the PLDLEN value must be equal to the value of the payload_length_static field in the Protocol Configuration Register 19 (FR_PCR19). If this is not fulfilled, the static payload length error flag SPL_EF in the CHI Error Flag Register (FR_CHIERFR) is set when the message buffer is under transmission. A syntactically and semantically correct frame is generated with payload_length_static payload words and the payload length field in the transmitted frame header set to payload_length_static.

For transmit message buffers assigned to the *dynamic* segment, the PLDLEN value must be less than or equal to the value of the max_payload_length_dynamic field in the Protocol Configuration Register 24 (FR_PCR24). If this is not fulfilled, the dynamic payload length error flag DPL_EF in the CHI Error Flag Register (FR_CHIERFR) is set when the message buffer is under transmission. A syntactically and semantically correct dynamic frame is generated with PLDLEN payload words and the payload length field in the frame header set to PLDLEN.

Table 50-22. Frame Header Field Descriptions (Receive Message Buffer and Receive FFO)

Field	Description
R	**Reserved Bit** — This is the value of the *Reserved bit* of the received frame stored in the message buffer
PPI	**Payload Preamble Indicator** — This is the value of the *Payload Preamble Indicator* of the received frame stored in the message buffer.
NUF	**Null Frame Indicator** — This is the value of the *Null Frame Indicator* of the received frame stored in the message buffer.
SYF	**Sync Frame Indicator** — This is the value of the *Sync Frame Indicator* of the received frame stored in the message buffer.
SUF	**Startup Frame Indicator** — This is the value of the *Startup Frame Indicator* of the received frame stored in the message buffer.
FID	**Frame ID** — This is the value of the *Frame ID* field of the received frame stored in the message buffer.
CYCCNT	**Cycle Count** — This is the number of the communication cycle in which the frame stored in the message buffer was received.
PLDLEN	**Payload Length** — This is the value of the *Payload Length* field of the received frame stored in the message buffer.
HDCRC	**Header CRC** — This is the value of the *Header CRC* field of the received frame stored in the message buffer.

Table 50-23. Frame Header Field Descriptions (Transmit Message Buffer)

Field	Description
R	**Reserved Bit** — This bit is not used, the value of the *Reserved bit* is generated internally according to *FlexRay Communications System Protocol Specification, Version*2.1 Rev A.
PPI	**Payload Preamble Indicator** — This bit provides the value of the *Payload Preamble Indicator* for the frame transmitted from the message buffer.
NUF	**Null Frame Indicator** — This bit is not used, the value of the *Null Frame Indicator* is generated internally according to *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*.
SYF	**Sync Frame Indicator** — This bit is not used, the value of the *Sync Frame Indicator* is generated internally according to *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*.
SUF	**Startup Frame Indicator** — This bit is not used, the value of the *Startup Frame Indicator* is generated internally according to *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*.
FID	**Frame ID** — This field is checked as described in Frame Header Checks.
CYCCNT	**Cycle Count** — This field is not used, the value of the transmitted *Cycle Count* field is taken from the internal communication cycle counter.
PLDLEN	**Payload Length** — This field is checked and used as described in Frame Header Checks.

Table continues on the next page...

Table 50-23. Frame Header Field Descriptions (Transmit Message Buffer) (continued)

Field	Description
HDCRC	**Header CRC** — This field provides the value of the *Header CRC* field for the frame transmitted from the message buffer.

50.7.5.2.2 Slot Status Description

The slot status is a read-only structure for the application and a write-only structure for the CC. The meaning and content of the slot status in the message buffer header field depends on the message buffer type.

50.7.5.2.2.1 Receive Message Buffer and Receive FIFO Slot Status Description

This section describes the slot status structure for the individual receive message buffers and receive FIFOs. The content of the slot status structure for receive message buffers depends on the message buffer type and on the channel assignment for individual receive message buffers as given in the next table.

Table 50-24. Receive Message Buffer Slot Status Content

Receive Message Buffer Type	Slot Status Content
Individual Receive Message Buffer assigned to both channels FR_MBCCFRn[CHA]=1 and FR_MBCCFRn[CHB]=1	see Table 50-25
Individual Receive Message Buffer assigned to channel A FR_MBCCFRn[CHA]=1 and FR_MBCCFRn[CHB]=0	see Table 50-26
Individual Receive Message Buffer assigned to channel B FR_MBCCFRn[CHA]=0 and FR_MBCCFRn[CHB]=1	see Table 50-27
Receive FIFO Channel A Message Buffer	see Table 50-26
Receive FIFO Channel B Message Buffer	see Table 50-27

The meaning of the bits in the slot status structure is explained in the Receive Message Buffer Slot Status Field Description table below.

Table 50-25. Receive Message Buffer Slot Status Structure (ChAB)

50.7.5.2.2.2 Transmit Message Buffer Slot Status Description

This section describes the slot status structure for transmit message buffers. Only the TCA and TCB status bits are directly related to the transmission process. All other status bits in this structure are related to a receive process that may have occurred. The content of the slot status structure for transmit message buffers depends on the channel assignment as given in the table below.

Table 50-29. Transmit Message Buffer Slot Status Content

Transmit Message Buffer Type	Slot Status Content
Individual Transmit Message Buffer assigned to both channels FR_MBCCFRn[CHA]=1 and FR_MBCCFRn[CHB]=1	see Table 50-30

50.7.5.3 Message Buffer Data Field Description

The message buffer data field is used to store the frame payload data, or a part of it, of the frame to be transmitted to or received from the FlexRay bus. The minimum required length of this field depends on the message buffer type that the physical message buffer is assigned to and is given in the table below. The structure of the message buffer data field is given in the next figure.

Table 50-34. Message Buffer Data Field Minimum Length

physical message buffer assigned to	minimum length defined by
Individual Message Buffer in Segment 1	FR_MBDSR[MBSEG1DS]
Receive Shadow Buffer in Segment 1	FR_MBDSR[MBSEG1DS]
Individual Message Buffer in Segment 2	FR_MBDSR[MBSEG2DS]
Receive Shadow Buffer in Segment 2	FR_MBDSR[MBSEG2DS]
Receive FIFO for channel A	FR_RFDSR[ENTRY_SIZE] (FR_RFWMSR[SEL] = 0)
Receive FIFO for channel B	FR_RFDSR[ENTRY_SIZE] (FR_RFWMSR[SEL] = 1)

Note

The CC will not access any locations outside the message buffer data field boundaries given in the table above.

Table 50-35. Message Buffer Data Field Structure

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0x0	DATA0 / MID0 / NMV0								DATA1 / MID1 / NMV1							
0x2	DATA2 / NMV2								DATA3 / NMV3							
…	…								…							
0xN-2	DATA N-2								DATA N-1							

The message buffer data field is located in the FlexRay memory area; thus, the CC has no means to control application write access to the field. To ensure data consistency, the application must follow a write and read access scheme.

50.7.5.3.1 Message Buffer Data Field Read Access

For transmit message buffers, the CC will not modify the content of the Message Buffer Data Field. Thus the application can read back the data at any time without any impact on data consistency.

For receive message buffers the application must lock the related receive message buffer and retrieve the message buffer header index from the Message Buffer Index Registers (FR_MBIDXRn). While the message buffer is locked, the CC will not update the Message Buffer Data Field.

For receive FIFOs, the application can read the message buffer indicated by the Receive FIFO A Read Index Register (FR_RFARIR) or the Receive FIFO B Read Index Register (FR_RFBRIR) when the related fill levels in the Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR) indicate an non-empty FIFO.

50.7.5.3.2 Message Buffer Data Field Write Access

For receive message buffers, receive shadow buffers, and receive FIFOs, the application must not write to the message buffer data field.

For transmit message buffers, the application must follow the write access restrictions given in the Frame Data Write Access Constraints table below.

Table 50-36. Frame Data Write Access Constraints

Field	CC/MB State
DATA, MID, NMV	*POC:config* or MB_DIS or MB_LCK

Table 50-37. Frame Data Field Descriptions

Field	Description
DATA 0, DATA 1, … DATA N-1	**Message Data** — Provides the message data received or to be transmitted.For receive message buffer and receive FIFOs, this field provides the message data received for this message buffer. For transmit message buffers, the field provides the message data to be transmitted.
MID 0, MID 1	**Message Identifier** — If the payload preamble bit PPI is set in the message buffer frame header, the MID field holds the message ID of a dynamic frame located in the message buffer. The receive FIFO filter uses the received message ID for message ID filtering.

Table continues on the next page...

Table 50-37. Frame Data Field Descriptions (continued)

Field	Description
NMV 0, NMV 1, … NMV 11	**Network Management Vector** — If the payload preamble bit PPI is set in the message buffer frame header, the network management vector field holds the network management vector of a static frame located in the message buffer. **Note:** The MID and NMV bytes replace the corresponding DATA bytes.

50.7.6 Individual Message Buffer Functional Description

The CC provides these basic types of individual message buffers:

1. Transmit Message Buffers
2. Receive Message Buffers

Before an individual message buffer can be used, it must be configured by the application. After the initial configuration, the message buffer can be reconfigured later. The set of the configuration data for individual message buffers is given in Individual Message Buffer Configuration Data.

50.7.6.1 Individual Message Buffer Configuration

The individual message buffer configuration consists of two steps. The first step is the allocation of the required amount of memory for the FlexRay memory area. The second step is the programming of the message buffer configuration registers, which is described in this section.

50.7.6.1.1 Common Configuration Data

One part of the message buffer configuration data is common to all individual message buffers and the receive shadow buffers. These data can only be set when the protocol is in the *POC:config* state.

The application configures the number of utilized individual message buffers by writing the message buffer number of the last utilized message buffer into the LAST_MB_UTIL field in the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR).

The application configures the size of the two segments of individual message buffers by writing the message buffer number of the last message buffer in the first segment into the LAST_MB_SEG1 field in the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR).

The application configures the length of the message buffer data fields for both of the message buffer segments by writing to the MBSEG2DS and MBSEG1DS fields in the Message Buffer Data Size Register (FR_MBDSR).

Depending on the current receive functionality of the CC, the application must configure the receive shadow buffers. For each segment and for each channel with at least one individual receive message buffer assigned, the application must configure the related receive shadow buffer using the Receive Shadow Buffer Index Register (FR_RSBIR).

50.7.6.1.2 Specific Configuration Data

The second part of the message buffer configuration data is specific for each message buffer.

These data can be changed only when either

- *the protocol is in the POC:config state or*
- *the message buffer is disabled, i.e. FR_MBCCSRn[EDS] = 0*

The individual message buffer type is defined by the MTD and MBT bits in the Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn) as given in the following table.

Table 50-38. Individual Message Buffer Types

FR_MBCCSRn		Individual Message Buffer Description
MTD	MBT	
0	0	Receive Message Buffer
0	1	Reserved
1	0	Transmit Message Buffer
1	1	Reserved

The message buffer specific configuration data are

1. MTD bits in Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn)
2. all fields and bits in Message Buffer Cycle Counter Filter Registers (FR_MBCCFRn)

3. all fields and bits in Message Buffer Frame ID Registers (FR_MBFIDRn)
4. all fields and bits in Message Buffer Index Registers (FR_MBIDXRn)

The meaning of the specific configuration data depends on the message buffer type, as given in the detailed message buffer type descriptions in the Transmit Message Buffers section and Receive Message Buffers section.

50.7.6.2 Transmit Message Buffers

The section provides a detailed description of the functionality of single buffered transmit message buffers.

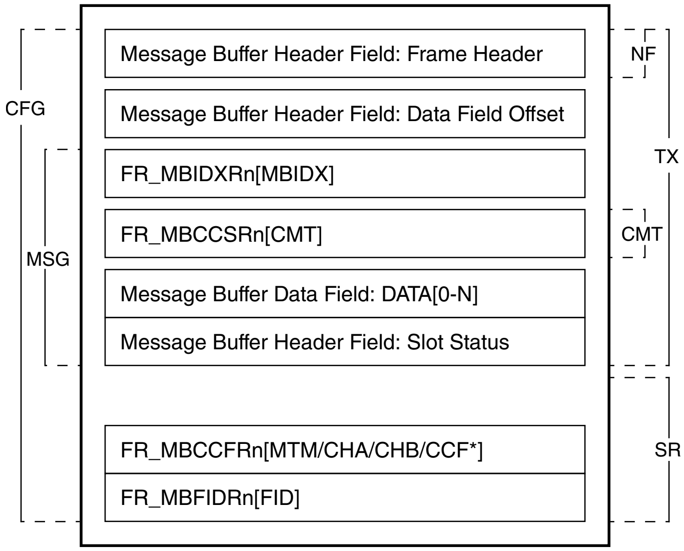
A transmit message buffer is used by the application to provide message data to the CC that will be transmitted over the FlexRay Bus. The CC uses the transmit message buffers to provide information about the transmission process and status information about the slot in which message was transmitted.

The individual message buffer with message buffer number n is configured to be a transmit message buffer by the following settings:

- FR__ MBCCSRn[MBT] = 0(singlebufferedmessagebuffer)
- FR_ MBCCSRn[MDT] = 1(transmitmessagebuffer)

50.7.6.2.1 Access Regions

To certain message buffer fields, both the application and the CC have access. To ensure data consistency, a message buffer locking scheme is implemented, which is used to control the access to the data, control, and status bits of a message buffer. The access regions for transmit message buffers are depicted in the figure below. A description of the regions is given in Table 50-40. If an region is active as indicated in Table 50-41, the access scheme given for that region applies to the message buffer.



CFG
MSG
Message Buffer Header Field: Frame Header
Message Buffer Header Field: Data Field Offset
FR_MBIDXRn[MBIDX]
FR_MBCCSRn[CMT]
Message Buffer Data Field: DATA[0-N]
Message Buffer Header Field: Slot Status
FR_MBCCFRn[MTM/CHA/CHB/CCF*]
FR_MBFIDRn[FID]
NF
TX
CMT
SR

Figure 50-8. Transmit Message Buffer Access Regions

Table 50-39. Transmit Message Buffer Access Regions Description

Region	Access from		Region used for
	Application	Module	
CFG	read/write	-	Message Buffer Configuration
MSG	read/write	-	Message Data and Slot Status Access
NF	-	read-only	Message Header Access for Null Frame Transmission
TX	-	read/write	Message Transmission and Slot Status Update
CM	-	read-only	Message Buffer Validation
SR	-	read-only	Message Buffer Search

The trigger bits FR_MBCCSRn[EDT] and FR_MBCCSRn[LCKT], and the interrupt enable bit FR_MBCCSRn[MBIE] are not under access control and can be accessed from the application at any time. The status bits FR_MBCCSRn[EDS] and FR_MBCCSRn[LCKS] are not under access control and can be accessed from the CC at any time.

The interrupt flag FR_MBCCSRn[MBIF] is not under access control and can be accessed from the application and the CC at any time. CC clear access has higher priority.

The CC restricts its access to the regions depending on the current state of the message buffer. The application must adhere to these restrictions in order to ensure data consistency. The transmit message buffer states are given in the next figure. A description of the states is given in Table 50-40, which also provides the access scheme for the access regions.

The status bits FR_MBCCSRn[EDS] and FR_MBCCSRn[LCKS] provide the application with the required message buffer status information. The internal status information is not visible to the application.

50.7.6.2.2 Message Buffer States

This section describes the transmit message buffer states and provides a state diagram.

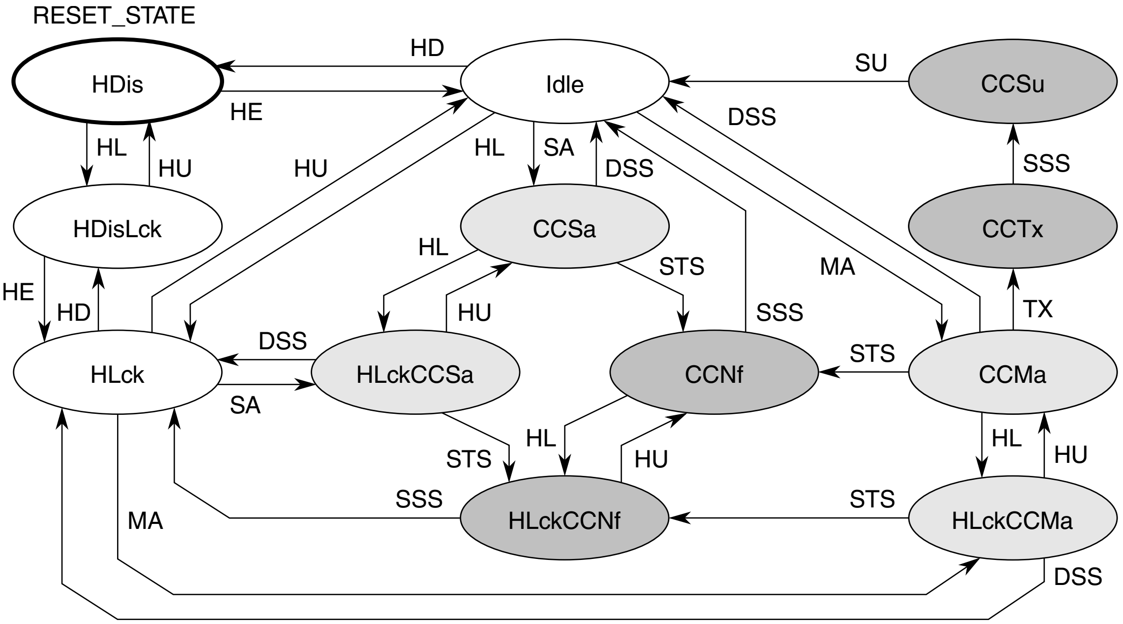


Figure 50-9. Transmit Message Buffer States

Table 50-40. Transmit Message Buffer State Description (Sheet 1 of 2)

State	FR_MBCCSRn		Access Region		Description
	EDS	LCKS	Appl.	Module	
Idle	1	0	–	CM,SR	**Idle** - Message Buffer is idle. Included in message buffer search.
HDis	0	0	CFG	–	**Disabled** - Message Buffer under configuration. Excluded from message buffer search.
HDisLck	0	1	CFG	–	**Disabled and Locked** - Message Buffer under configuration.Excluded from message buffer search.
HLck	1	1	MSG	SR	**Locked** - Applications access to data, control, and status.Included in message buffer search.
CCSa	1	0	–	–	**Slot Assigned** - Message buffer assigned to next static slot.Ready for Null Frame transmission.
HLckCCSa	1	1	MSG	–	**Locked and Slot Assigned** - Applications access to data, control, and status.Message buffer assigned to next static slot
CCNf	1	0	–	NF	**Null Frame Transmission** Header is used for null frame transmission.

Table continues on the next page...

Table 50-40. Transmit Message Buffer State Description (Sheet 1 of 2) (continued)

State	FR_MBCCSRn		Access Region		Description
	EDS	LCKS	Appl.	Module	
HLckCCNf	1	1	MSG	NF	**Locked and Null Frame Transmission** - Applications access to data, control, and status. Header is used for null frame transmission.
CCMa	1	0	–	CM	**Message Available** - Message buffer is assigned to next slot and cycle counter filter matches.
HLckCCMa	1	1	MSG	–	**Locked and Message Available** - Applications access to data, control, and status. Message buffer is assigned to next slot and cycle counter filter matches.
CCTx	1	0	–	TX	**Message Transmission** - Message buffer data transmit. Payload data from buffer transmitted
CCSu	1	0	–	TX	**Status Update** - Message buffer status update. Update of status flags, the slot status field, and the header index.

50.7.6.2.3 Message Buffer Transitions

Application transitions, module transitions, and transition priorities are discussed in this section.

50.7.6.2.3.1 Application Transitions

The application transitions can be triggered by the application using the commands described in the table below. The application issues the commands by writing to the Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn). Only one command can be issued with one write access. Each command is executed immediately. If the command is ignored, it must be issued again.

50.7.6.2.3.1.1 Message Buffer Enable and Disable

The enable and disable commands issued by writing 1 to the trigger bit FR_MBCCSRn[EDT]. The transition that will be triggered by each of these command depends on the current value of the status bit FR_MBCCSRn[EDS]. If the command triggers the disable transition HD and the message buffer is in one of the states CCSa, HLckCCSa, CCMa, HLckCCMa, CCNf, HLckCCNf, or CCTx, the disable transition has no effect (command is ignored) and the message buffer state is not changed. No notification is given to the application.

50.7.6.2.3.1.2 Message Buffer Lock and Unlock

The lock and unlock commands issued by writing 1 to the trigger bit FR_MBCCSRn[LCKT]. The transition that will be triggered by each of these commands depends on the current value of the status bit FR_MBCCSRn[LCKS]. If the command triggers the lock transition HL and the message buffer is in the state CCTx, the lock transition has no effect (command is ignored) and message buffer state is not changed. In this case, the message buffer lock error flag LCK_EF in the CHI Error Flag Register (FR_CHIERFR) is set.

Table 50-41. Transmit Message Buffer Application Transitions

Transition	Command	Condition	Description
HE	FR_MBCCSRn[EDT]:= 1	FR_MBCCSRn[EDS] = 0	Application triggers message buffer enable.
HD		FR_MBCCSRn[EDS] = 1	Application triggers message buffer disable.
HL	FR_MBCCSRn[LCKT]:= 1	FR_MBCCSRn[LCKS] = 0	Application triggers message buffer lock.
HU		FR_MBCCSRn[LCKS] = 1	Application triggers message buffer unlock.

50.7.6.2.3.2 Module Transitions

The module transitions that can be triggered by the CC are described in the following table. Each transition will be triggered for certain message buffers when the related condition is fulfilled.

Table 50-42. Transmit Message Buffer Module Transitions

Transition	Condition	Description
SA	slot match andstatic slot	**Slot Assigned** - Message buffer is assigned to next static slot.
MA	slot match andCycleCounter match	**Message Available** - Message buffer is assigned to next slot and cycle counter filter matches.
TX	slot start and FR_MBCCSRn[CMT] = 1	**Transmission Slot Start** - Slot Start and commit bit CMT is set. In case of a dynamic slot, pLatestTx is not exceeded.
SU	status updated	**Status Updated** - Slot Status field and message buffer status flags updated. Interrupt flag set.
STS	static slot start	**Static Slot Start** - Start of static slot.
DSS	dynamic slot start orsymbol window start orNIT start	**Dynamic Slot or Segment Start.** - Start of dynamic slot or symbol window or NIT.
SSS	slot start orsymbol window start orNIT start	**Slot or Segment Start** - Start of static slot or dynamic slot or symbol window or NIT.

50.7.6.2.3.3 Transition Priorities

The application can trigger only one transition at a time. There is no need to specify priorities among them.

As shown in the first part of the next table, the module transitions have a higher priority than the application transitions. For all states except the CCMa state, both a lock/unlock transition HL/HD and a module transition can be executed at the same time. The result state is reached by first applying the application transition and subsequently the module transition to the intermediately reached state. For example, if the message buffer is in the HLck state and the application unlocks the message buffer by the HU transition and the module triggers the slot assigned transition SA, the intermediate state is Idle and the resulting state is CCSa.

The priorities among the module transitions is given in the second part of the table below.

Table 50-43. Transmit Message Buffer Transition Priorities

State	Priorities	Description
module vs. application		
Idle, HLck	SA > HD	Slot Assigned > Message Buffer Disable
	MA > HD	Message Available > Message Buffer Disable
CCMa	TX > HL	Transmission Start > Message Buffer Lock
module internal		
Idle, HLck	MA > SA	Message Available > Slot Assigned
CCMa	TX > STS	Transmission Slot Start > Static Slot Start
	TX > DSS	Transmission Slot Start > Dynamic Slot Start

50.7.6.2.4 Transmit Message Setup

To transmit a message over the FlexRay bus, the application writes the message data into the message buffer data field and sets the commit bit CMT in the Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn). The physical access to the message buffer data field is described in Individual Message Buffers.

As indicated by Table 50-33, the application shall write to the message buffer data field and change the commit bit CMT only if the transmit message buffer is in one of the states HDis, HDisLck, HLck, HLckCCSa, HLckCCMa, or HLckCCMa. The application can change the state of a message buffer if it issues the appropriate commands shown in Table 50-33. The state change is indicated through the FR_MBCCSRn[EDS] and FR_MBCCSRn[LCKS] status bits.

If the transmit message buffer enters one of the states HDis, HDisLck, HLck, HLckCCSa, HLckCCMa, or HLckCCMa the FR_MBCCSRn[DVAL] flag is negated.

50.7.6.2.5 Message Transmission

As a result of the message buffer search described in Individual Message Buffer Search, the CC triggers the message available transition MA for up to two transmit message buffers. This changes the message buffer state from Idle to CCMa and the message buffers can be used for message transmission in the next slot.

The CC transmits a message from a message buffer if both of the following two conditions are fulfilled at the start of the transmission slot:

1. the message buffer is in the message available state CCMa
2. the message data are still valid, i.e. FR_MBCCSRn[CMT] = 1

In this case, the CC triggers the TX transition and changes the message buffer state to CCTx. A transmit message buffer timing and state change diagram for message transmission is given in the "Message Transmission Timing" figure below. In this example, the message buffer with message buffer number n is Idle at the start of the search slot, matches the slot and cycle number of the next slot, and message buffer data are valid, i.e. FR_MBCCSRn[CMT] = 1.

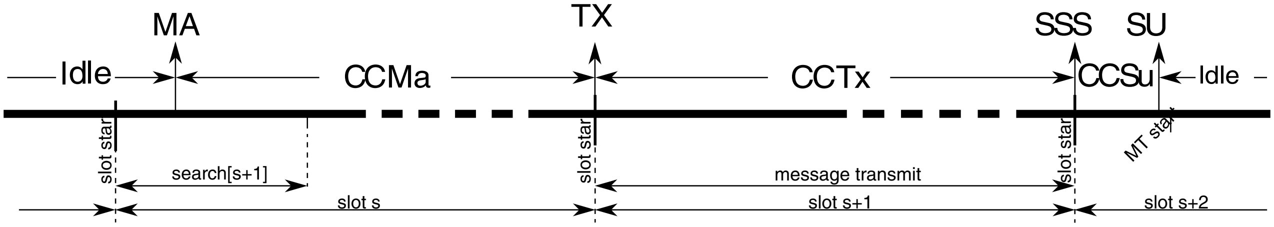

Figure 50-10. Message Transmission Timing

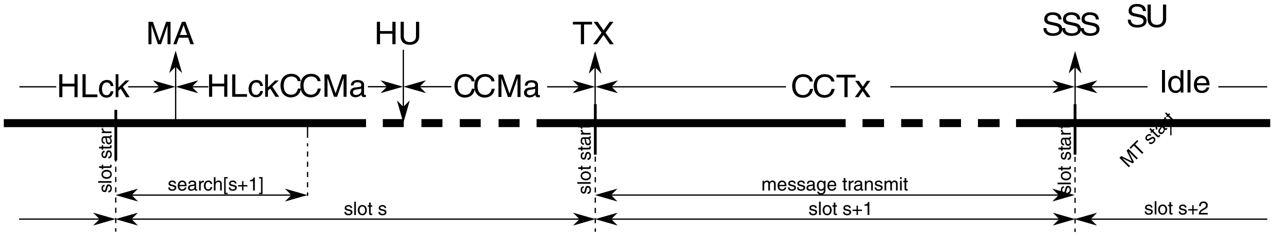

Figure 50-11. Message Transmission from HLck state with unlock

The amount of message data read from the FlexRay memory area and transferred to the FlexRay bus is determined by the following three items

1. the message buffer segment that the message buffer is assigned to, as defined by the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR).
2. the message buffer data field size, as defined by the related field of the Message Buffer Data Size Register (FR_MBDSR)

3. the value of the PLDLEN field in the message buffer header field, as described in Frame Header Description

If a message buffer is assigned to message buffer segment 1, and PLDLEN > MBSEG1DS, then 2 × MBSEG1DS bytes will be read from the message buffer data field and zero padding is used for the remaining bytes for the FlexRay bus transfer. If PLDLEN <= MBSEG1DS, the CC reads and transfers 2 ×PLDLEN bytes. The same holds for segment 2 and MBSEG2DS.

50.7.6.2.6 Null Frame Transmission

A static slot with slot number S is assigned to the CC for channel A, if at least one transmit message buffer is configured with the FR_MBFIDRn[FID] set to S and FR_MBCCFRn[CHA] set to 1. A Null Frame is transmitted in the static slot S on channel A, if this slot is assigned to the CC for channel A, and all transmit message buffers with FR_MBFIDRn[FID] = s and FR_MBCCFRn[CHA] = 1 are either not committed, i.e FR_MBCCSRn[CMT] = 0, or locked by the application, i.e. FR_MBCCSRn[LCKS] = 1, or the cycle counter filter is enabled and does not match.

Additionally, the application can clear the commit bit of a message buffer that is in the CCMa state, which is called *uncommit* or *transmit abort*. This message buffer will be used for null frame transmission.

As a result of the message buffer search described in Individual Message Buffer Search, the CC triggers the slot assigned transition SA for up to two transmit message buffers if at least one of the conditions mentioned above is fulfilled for these message buffers. The transition SA changes the message buffer states from either Idle to CCSa or from HLck to HLckCCSa. In each case, these message buffers will be used for null frame transmission in the next slot. A message buffer timing and state change diagram for null frame transmission from Idle state is given in the figure below.

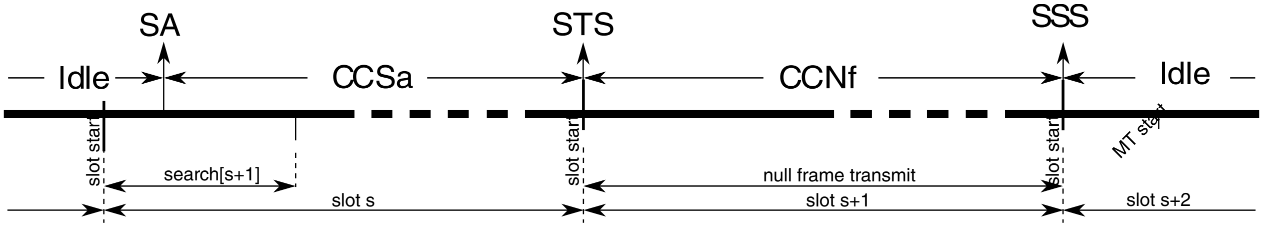

Figure 50-12. Null Frame Transmission from Idle state

A message buffer timing and state change diagram for null frame transmission from HLck state is given in the following figure.

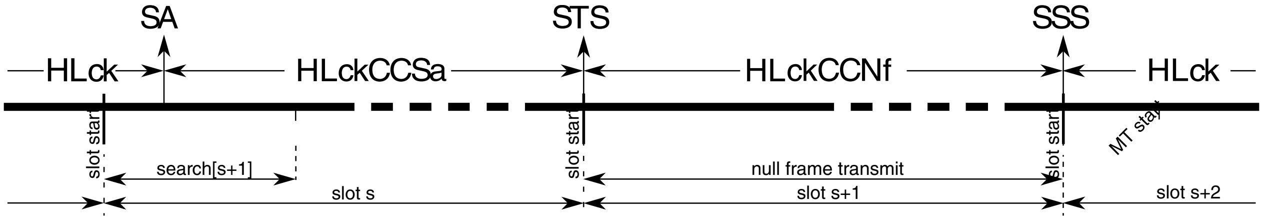

Figure 50-13. Null Frame Transmission from HLck state

If a transmit message buffer is in the CCSa or HLckCCSa state at the start of the transmission slot, a null frame is transmitted in any case, even if the message buffer is unlocked or committed before the transmission slot starts. A transmit message buffer timing and state change diagram for null frame transmission for this case is given in the next figure.

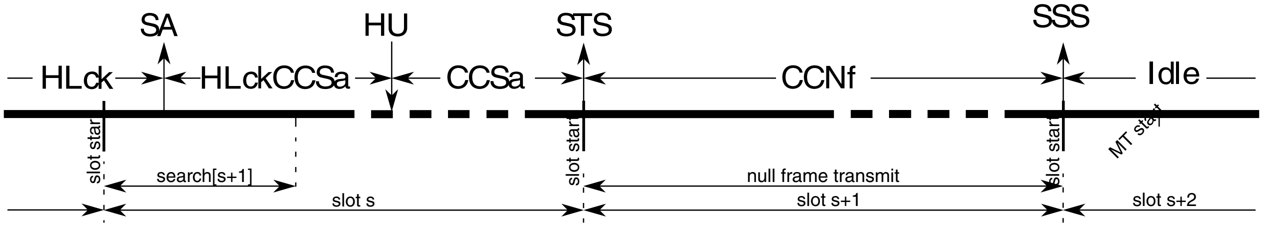

Figure 50-14. Null Frame Transmission from HLck state with unlock

Since the null frame transmission will not use the message buffer data, the application can lock/unlock the message buffer during null frame transmission. A transmit message buffer timing and state change diagram for null frame transmission for this case is given in the figure below.

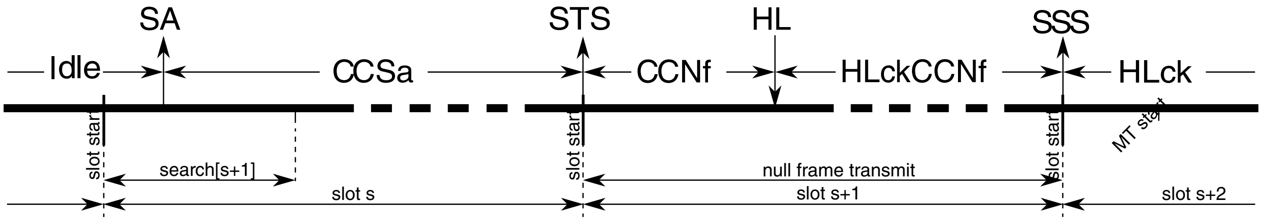

Figure 50-15. Null Frame Transmission from Idle state with locking

50.7.6.2.7 Message Buffer Status Update

After the end of each slot, the PE generates the slot status vector. Depending on the this status, the transmitted frame type, and the amount of transmitted data, the message buffer status is updated.

50.7.6.2.7.1 Message Buffer Status Update after Complete Message Transmission

The term complete message transmission refers to the fact that all payload data stored in the message buffer were send to FlexRay bus. In this case, the CC updates the slot status field of the message buffer and triggers the status updated transition SU. With the SU transition, the CC sets the message buffer interrupt flag FR_MBCCSRn[MBIF] to indicate the successful message transmission.

Depending on the transmission mode flag FR_MBCCFRn[MTM], the CC changes the commit flag FR_MBCCSRn[CMT] and the valid flag FR_MBCCSRn[DVAL]. If the FR_MBCCFRn[MTM] flag is negated, the message buffer is in the *event transmission mode*. In this case, each committed message is transmitted only once. The commit flag FR_MBCCSRn[CMT] is cleared with the SU transition. If the FR_MBCCFRn[MTM] flag is asserted, the message buffer is in the *state transmission mode*. In this case, each committed message is transmitted as long as the application provides new data or locks the message buffers. The CC will not clear the FR_MBCCSRn[CMT] flag at the end of transmission and will set the valid flag FR_MBCCSRn[DVAL] to indicate that the message will be transmitted again.

50.7.6.2.7.2 Message Buffer Status Update after Incomplete Message Transmission

The term incomplete message transmission refers to the fact that not all payload data that should be transmitted were send to FlexRay bus. This may be caused by the following regular conditions in the dynamic segment:

1. The transmission slot starts in a minislot with a minislot number greater than *pLatestTx*.
2. The transmission slot did not exist in the dynamic segment at all.

In any of these two aforementioned conditions occur, the status of the message buffer is not changed at all with the SU transition. The slot status field is not updated, the status and control flags are not changed, and the interrupt flag is not set.

Additionally, an incomplete message transmission can be caused by internal communication errors. If those errors occur, the Protocol Engine Communication Failure Interrupt Flag PECF_IF is set in the Protocol Interrupt Flag Register 1 (FR_PIFR1).

50.7.6.2.7.3 Message Buffer Status Update after Null Frame Transmission

After the transmission of a null frame, the status of the message buffer that was used for the null frame transmission is not changed at all. The slot status field is not updated, the status and control flags are not changed, and the interrupt flag is not set.

50.7.6.3 Receive Message Buffers

The section provides a detailed description of the functionality of the receive message buffers. If receive message buffers are used it is required to configure the related receive shadow buffer as described in Receive Shadow Buffers.

A receive message buffer is used to receive a message from the FlexRay Bus based on individual filter criteria. The CC uses the receive message buffer to provide the following data to the application.

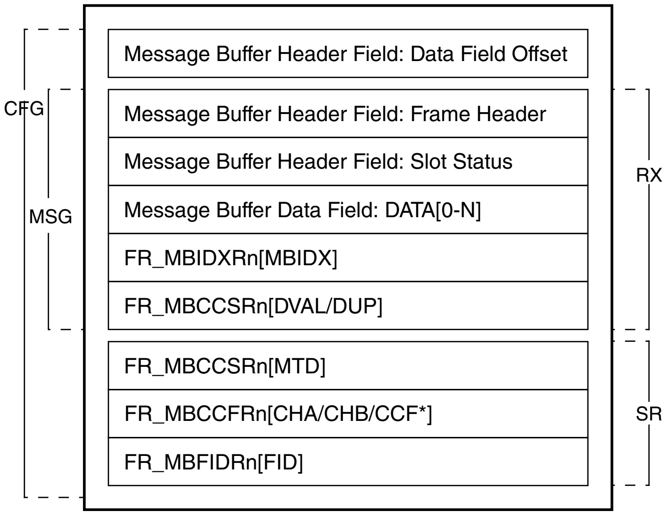
1. message data received
2. information about the reception process
3. status information about the slot in which the message was received

A individual message buffer with message buffer number *n* is configured as a receive message buffer by the following configuration settings

$$\mathrm{FR\_\ MBCCSRn}[\mathrm{MTD}] = 0(\mathrm{receivemessagebuffer})$$

Equation 28

To certain message buffer fields, both the application and the CC have access. To ensure data consistency, a message buffer locking scheme is implemented that is used to control the access to the data, control, and status bits of a message buffer. The access regions for receive message buffers are depicted in the figure below. A description of the regions is given in the following table. If a region is active as indicated in the "Receive Message Buffer States and Access (Sheet 2 of 2)" table below, the access scheme given for that region applies to the message buffer.



Message Buffer Header Field: Data Field Offset
Message Buffer Header Field: Frame Header
Message Buffer Header Field: Slot Status
Message Buffer Data Field: DATA[0-N]
FR_MBIDXRn[MBIDX]
FR_MBCCSRn[DVAL/DUP]
FR_MBCCSRn[MTD]
FR_MBCCFRn[CHA/CHB/CCF*]
FR_MBFIDRn[FID]
CFG
MSG
RX
SR

Figure 50-16. Receive Message Buffer Access Regions

Table 50-44. Receive Message Buffer Access Region Description

Region	Access from		Region used for
	Application	Module	
CFG	read/write	-	Message Buffer Configuration, Message Data and Status Access
MSG	read/write	-	Message Data, Header, and Status Access
RX	-	write-only	Message Reception and Status Update
SR	-	read-only	Message Buffer Search Data

The trigger bits FR_MBCCSRn[EDT] and FR_MBCCSRn[LCKT] and the interrupt enable bit FR_MBCCSRn[MBIE] are not under access control and can be accessed from the application at any time. The status bits FR_MBCCSRn[EDS] and FR_MBCCSRn[LCKS] are not under access control and can be accessed from the CC at any time.

The interrupt flag FR_MBCCSRn[MBIF] is not under access control and can be accessed from the application and the CC at any time. CC set access has higher priority.

The CC restricts its access to the regions depending on the current state of the message buffer. The application must adhere to these restrictions in order to ensure data consistency. The receive message buffer states are given in the figure below. A description of the message buffer states is given in Table 50-40, which also provides the access scheme for the access regions.

The status bits FR_MBCCSRn[EDS] and FR_MBCCSRn[LCKS] provide the application with the required status information. The internal status information is not visible to the application.

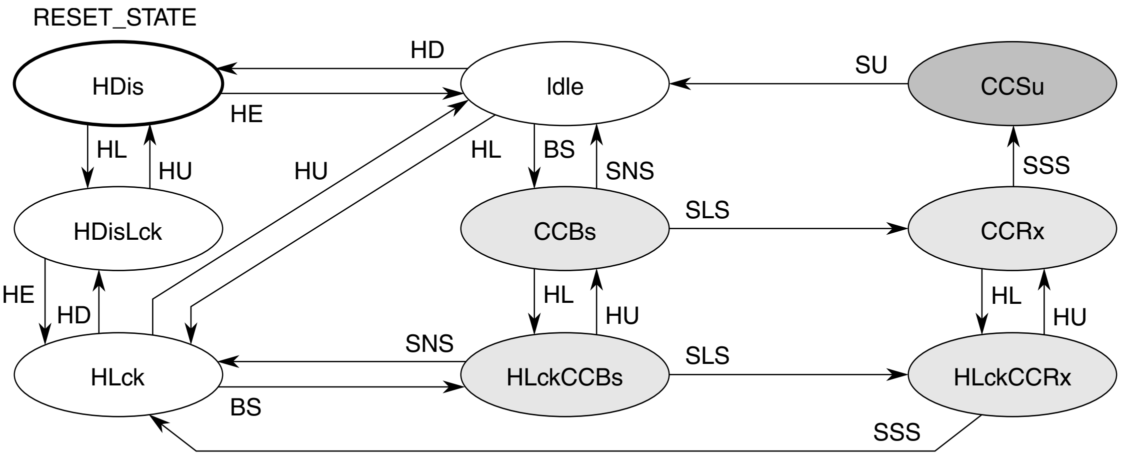


Figure 50-17. Receive Message Buffer States

Table 50-45. Receive Message Buffer States and Access (Sheet 2 of 2)

State	FR_MBCCSRn		Access from		Description
	EDS	LCKS	Appl.	Module	
Idle	1	0	–	SR	**Idle** - Message Buffer is idle. Included in message buffer search.
HDis	0	0	CFG	–	**Disabled** - Message Buffer under configuration. Excluded from message buffer search.
HDisLck	0	1	CFG	–	**Disabled and Locked** - Message Buffer under configuration.Excluded from message buffer search.
HLck	1	1	MSG	–	**Locked** - Applications access to data, control, and status.Included in message buffer search.
CCBs	1	0	–	–	**Buffer Subscribed** - Message buffer subscribed for reception. Filter matches next (slot, cycle, channel) tuple.
HLckCCBs	1	1	MSG	–	**Locked and Buffer Subscribed** - Applications access to data, control, and status. Message buffer subscribed for reception.
CCRx	1	0	–	–	**Message Receive** - Message data received into related shadow buffer.
HLckCCRx	1	1	MSG	–	**Locked and Message Receive** - Applications access to data, control, and status. Message data received into related shadow buffer.
CCSu	1	0	–	RX	**Status Update** - Message buffer status update. Update of status flags, the slot status field, and the header index.

50.7.6.3.1 Message Buffer Transitions

Application transitions, message buffer enable and disable, message buffer lock and unlock, module transitions, and transition priorities are discussed in this section.

50.7.6.3.1.1 Application Transitions

The application transitions that can be triggered by the application using the commands described in Table 50-41. The application issues the commands by writing to the Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn). Only one command can be issued with one write access. Each command is executed immediately. If the command is ignored, it must be issued again.

50.7.6.3.1.2 Message Buffer Enable and Disable

The enable and disable commands issued by writing 1 to the trigger bit FR_MBCCSRn[EDT]. The transition that will be triggered by each of these command depends on the current value of the status bit FR_MBCCSRn[EDS]. If the command triggers the disable transition HD and the message buffer is in one of the states CCBs, HLckCCBs, or CCRx, the disable transition has no effect (command is ignored) and the message buffer state is not changed. No notification is given to the application.

50.7.6.3.1.3 Message Buffer Lock and Unlock

The lock and unlock commands issued by writing 1 to the trigger bit FR_MBCCSRn[LCKT]. The transition that will be triggered by each of these commands depends on the current value of the status bit FR_MBCCSRn[LCKS]. If the command triggers the lock transition HL while the message buffer is in the state CCRx, the lock transition has no effect (command is ignored) and message buffer state is not changed. In this case, the message buffer lock error flag LCK_EF in the CHI Error Flag Register (FR_CHIERFR) is set.

Table 50-46. Receive Message Buffer Application Transitions

Transition	Host Command	Condition	Description
HE	FR_MBCCSRn[EDT]:= 1	FR_MBCCSRn[EDS] = 0	Application triggers message buffer enable.
HD		FR_MBCCSRn[EDS] = 1	Application triggers message buffer disable.
HL	FR_MBCCSRn[LCKT]: = 1	FR_MBCCSRn[LCKS] = 0	Application triggers message buffer lock.
HU		FR_MBCCSRn[LCKS] = 1	Application triggers message buffer unlock.

50.7.6.3.1.4 Module Transitions

The module transitions that can be triggered by the CC are described in the next table. Each transition will be triggered for certain message buffers when the related condition is fulfilled.

Table 50-47. Receive Message Buffer Module Transitions

Transition	Condition	Description
BS	slot match and CycleCounter match	**Buffer Subscribed** - The message buffer filter matches next slot and cycle.
SLS	slot start	**Slot Start** - Start of either Static Slot or Dynamic Slot.
SNS	symbol window start or NIT start	**Symbol Window or NIT Start** - Start of either Symbol Window or NIT.
SSS	slot start or symbol window start or NIT start	**Slot or Segment Start** - Start of either Static Slot, Dynamic Slot, Symbol Window, or NIT.
SU	status updated	**Status Updated** - Slot Status field, message buffer status flags, header index updated. Interrupt flag set.

50.7.6.3.1.5 Transition Priorities

The application can trigger only one transition at a time. There is no need to specify priorities among them.

As shown in the table below, the module transitions have a higher priority than the application transitions. For all states except the CCRx state, a module transition and the application lock/unlock transition HL/HU and can be executed at the same time. The result state is reached by first applying the module transition and subsequently the application transition to the intermediately reached state. For example, if the message buffer is in the buffer subscribed state CCBs and the module triggers the slot start transition SLS at the same time as the application locks the message buffer by the HL transition, the intermediate state is CCRx and the resulting state is locked buffer subscribed state HLckCCRx.

Table 50-48. Receive Message Buffer Transition Priorities

State	Priorities	Description
module vs. application		
Idle	BS > HD	Buffer Subscribed > Message Buffer Disable
HLck	BS > HD	Buffer Subscribed > Message Buffer Disable
CCRx	SSS > HL	Slot or Segment Start > Message Buffer Lock

50.7.6.3.2 Message Reception

As a result of the message buffer search, the CC changes the state of up to two enabled receive message buffers from either idle state Idle or locked state HLck to the either subscribed state CCBs or locked buffer subscribed state HLckCCBs by triggering the buffer subscribed transition BS.

If the receive message buffers for the next slot are assigned to both channels, then at most one receive message buffer is changed to a buffer subscribed state.

If more than one matching message buffers assigned to a certain channel, then only the message buffer with the lowest message buffer number is in one of the states mentioned above.

With the start of the next static or dynamic slot the module trigger the slot start transition SLS. This changes the state of the subscribed receive message buffers from either CCBs to CCRx or from HLckCCBs to HLckCCRx, respectively.

During the reception slot, the received frame data are written into the shadow buffers. For details on receive shadow buffers, see Receive Shadow Buffers Concept. The data and status of the receive message buffers that are the CCRx or HLckCCRx are not modified in the reception slot.

50.7.6.3.3 Message Buffer Update

With the start of the next static or dynamic slot or with the start of the symbol window or NIT, the module triggers the slot or segment start transition SSS. This transition changes the state of the receiving receive message buffers from either CCRx to CCSu or from HLckCCRx to HLck, respectively.

If a message buffer was in the locked state HLckCCRx, no update will be performed. The received data are lost. This is indicated by setting the Frame Lost Channel A/B Error Flag FRLA_EF/FRLB_EF in the CHI Error Flag Register (FR_CHIERFR).

If a message buffer was in the CCRx state it is now in the CCSu state. After the evaluation of the slot status provided by the PE the message buffer is updated. The message buffer update depends on the slot status bits and the segment the message buffer is assigned to. This is described in Table 50-51.

Table 50-49. Receive Message Buffer Update (Continued)

vSS!ValidFrame	*vRF!Header! NFIndicator*	Update description
1	1	**Valid non-null frame received.** - Message Buffer Data Field updated. - Frame Header Field updated. - Slot Status Field updated. - DUP:= 1 - DVAL:= 1 - MBIF:= 1
1	0	**Valid null frame received.**

Table continues on the next page...

Table 50-49. Receive Message Buffer Update (Continued) (continued)

vSS!ValidFrame	*vRF!Header!NFIndicator*	**Update description**
		- Message Buffer Data Field *not* updated. - Frame Header Field *not* updated. - Slot Status Field updated. - DUP:= 0 - DVAL *not* changed - MBIF:= 1
0	x	**No valid frame received.** - Message Buffer Data Field not updated. - Frame Header Field not updated. - Slot Status Field updated. - DUP:= 0 - DVAL *not* changed. - MBIF:= 1, if the slot was not an empty dynamic slot. **Note:** An empty dynamic slot is indicated by the following frame and slot status bit values: *vSS!ValidFrame* = 0 and *vSS!SyntaxError* = 0 and *vSS!ContentError* = 0 and *vSS!BViolation* = 0.

Note

If the number of the last slot in the current communication cycle on a given channel is n, then all receive message buffers assigned to this channel with FR_MBFIDRn[FID] > *n* will not be updated at all.

When the receive message buffer update has finished the status updated transition SU is triggered, which changes the buffer state from CCSu to Idle. An example receive message buffer timing and state change diagram for a normal frame reception is given in the following figure.

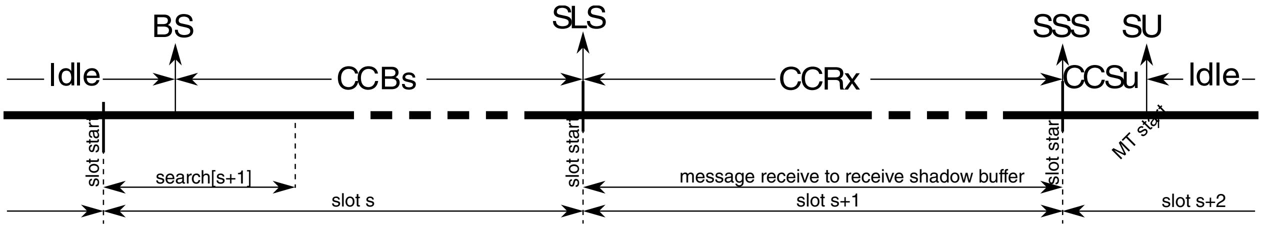

Figure 50-18. Message Reception Timing

The amount of message data written into the message buffer data field of the receive shadow buffer is determined by the following two items:

1. the message buffer segment that the message buffer is assigned to, as defined by the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR).
2. the message buffer data field size, as defined by the related field of the Message Buffer Data Size Register (FR_MBDSR)
3. the number of bytes received over the FlexRay bus

If the message buffer is assigned to the message buffer segment 1, and the number of received bytes is greater than 2 ×FR_MBDSR.MBSEG1DS, the CC writes only 2 × FR_MBDSR.MBSEG1DS bytes into the message buffer data field of the receive shadow buffer. If the number of received bytes is less than 2 × FR_MBDSR.MBSEG1DS, the CC writes only the received number of bytes and will not change the trailing bytes in the message buffer data field of the receive shadow buffer. The same holds for the message buffer segment 2 with FR_MBDSR.MBSEG2DS.

50.7.6.3.4 Received Message Access

To access the message data received over the FlexRay bus, the application reads the message data stored in the message buffer data field of the corresponding receive message buffer. The access to the message buffer data field is described in Individual Message Buffers.

The application can read the message buffer data field if the receive message buffer is one of the states HDis, HDisLck, or HLck. If the message buffer is in one of these states, the CC will not change the content of the message buffer.

50.7.6.3.5 Receive Shadow Buffers Concept

The receive shadow buffer concept applies only to individual receive message buffers. The intention of this concept is to ensure that only syntactically and semantically valid received non-null frames are presented to the application in a receive message buffer. The basic structure of a receive shadow buffer is described in Receive Shadow Buffers.

The receive shadow buffers temporarily store the received frame header and message data. After the slot boundary the slot status information is generated. If the slot status information indicates the reception of the valid non-null frame (see Table 50-49), the CC writes the slot status into the slot status field of the receive shadow buffer and exchanges the content of the Message Buffer Index Registers (FR_MBIDXRn) with the content of the corresponding internal shadow buffer index register. In all other cases, the CC writes the slot status into the identified receive message buffer, depending on the slot status and the FlexRay segment the message buffer is assigned to.

The shadow buffer concept, with its index exchange, results in the fact that the FlexRay memory area located message buffer associated to an individual receive message buffer changes after successful reception of a valid frame. This means that the message buffer area in the FlexRay memory area accessed by the application for reading the received message is different from the initial setting of the message buffer. Therefore, the application must not rely on the index information written initially into the Message Buffer Index Registers (FR_MBIDXRn). Instead, the index of the message buffer header field must be fetched from the Message Buffer Index Registers (FR_MBIDXRn).

50.7.7 Individual Message Buffer Search

This section provides a detailed description of the message buffer search algorithm.

The message buffer search determines for each enabled channel if a slot s in a communication cycle c is assigned for frame or null frame transmission or if it is subscribed for frame reception on that channel.

The message buffer search is a sequential algorithm which is invoked at the following protocol related events:

1. NIT start
2. slot start in the static segment
3. minislot start in the dynamic segment

The message buffer search within the NIT searches for message buffers assigned or subscribed to slot 1. The message buffer search within slot *n* searches for message buffers assigned or subscribed to slot *n+1*.

In general, the message buffer search for the next slot *n* considers only message buffers which are

1. enabled, i.e. FR_MBCCSRn[EDS] = 1, and
2. matches the next slot *n*, i.e. FR_MBFIDRn[FID] = *n*, and

On top of that, for the static segment only those message buffers are considered, that match the condition of at least one row of the "Message Buffer Search Priority (static segment)" table shown below. For the dynamic segment only those message buffers are considered, that match the condition of at least one row of the next "Message Buffer Search Priority (dynamic segment)" table. These message buffers are called *matching* message buffers.

For each enabled channel the message buffer search may identify multiple *matching* message buffers. Among all matching message buffers the message buffers with highest priority according to the "Message Buffer Search Priority (static segment)" table for the static segment and according to the "Message Buffer Search Priority (dynamic segment)" table for the dynamic segment are selected.

Table 50-50. Message Buffer Search Priority (static segment)

Priority	MTD	LCKS	CMT	CCFM-[1]	Description	Transition
(highest) 0	1	0	1	1	transmit buffer, matches cycle count, not locked and committed	MA
1	1	-	0	1	transmit buffer, matches cycle count, not committed	SA
	1	1	-	1	transmit buffer, matches cycle count, locked	SA
2	1	-	-	-	transmit buffer	SA
3	0	0	n/a	1	receive buffer, matches cycle count, not locked	SB
(lowest) 4	0	1	n/a	1	receive buffer, matches cycle count, locked	SB

1. Cycle Counter Filter Match, see Message Buffer Cycle Counter Filtering.
2. Cycle Counter Filter Match, see Message Buffer Cycle Counter Filtering.

Table 50-51. Message Buffer Search Priority (dynamic segment)

Priority	MTD	LCKS	CMT	CCFM-[1]	Description	Transition
(highest) 0	1	0	1	1	transmit buffer, matches cycle count, not locked and committed	MA
1	0	0	n/a	1	receive buffer, matches cycle count, not locked	SB
(lowest) 2	0	1	n/a	1	receive buffer, matches cycle count, locked	SB

1. Cycle Counter Filter Match, see Message Buffer Cycle Counter Filtering.
2. Cycle Counter Filter Match, see Message Buffer Cycle Counter Filtering.

If there are multiple message buffer with highest priority, the message buffer with the lowest message buffer number is selected. All message buffer which have the highest priority must have a consistent channel assignment as specified in Message Buffer Channel Assignment Consistency.

Depending on the message buffer channel assignment the same message buffer can be found for both channel A and channel B. In this case, this message buffer is used as described in Individual Message Buffers.

50.7.7.1 Message Buffer Cycle Counter Filtering

The message buffer cycle counter filter is a value-mask filter defined by the CCFE, CCFMSK, and CCFVAL fields in the Message Buffer Cycle Counter Filter Registers (FR_MBCCFRn). This filter determines a set of communication cycles in which the message buffer is considered for message reception or message transmission. If the cycle counter filter is disabled, i.e. CCFE = 0, this set of cycles consists of all communication cycles.

If the cycle counter filter of a message buffer does not match a certain communication cycle number, this message buffer is not considered for message transmission or reception in that communication cycle. In case of a transmit message buffer assigned to a slot in the static segment, though, this buffer is added to the matching message buffers to indicate the slot assignment and to trigger the null frame transmission.

The cycle counter filter of a message buffer matches the communication cycle with the number CYCCNT if at least one of the following conditions evaluates to true:

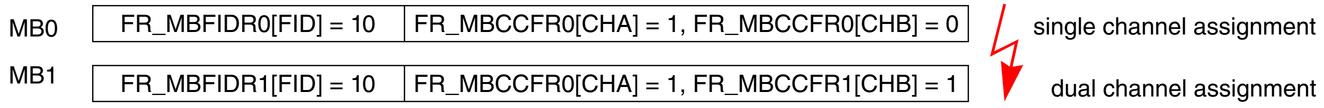
$$\mathrm{MBCCFRn}[\mathrm{CCFE}] = 0$$

$$\mathrm{CYCCNT}\ \&\ \mathrm{MBCCFRn}[\mathrm{CCFMSK}] = \mathrm{MBCCFRn}[\mathrm{CCFVAL}]\ \&\ \mathrm{MBCCFRn}[\mathrm{CCFMSK}]$$

50.7.7.2 Message Buffer Channel Assignment Consistency

The message buffer channel assignment given by the CHA and CHB bits in the Message Buffer Cycle Counter Filter Registers (FR_MBCCFRn) defines the channels on which the message buffer will receive or transmit. The message buffer with number *n* transmits or receives on channel A if FR_MBCCFRn[CHA] = 1 and transmits or receives on channel B if FR_MBCCFRn[CHB] = 1.

To ensure correct message buffer operation, all message buffers assigned to the same slot and with the same priority must have a *consistent* channel assignment. That means they must be either assigned to one channel only, or must be assigned to *both* channels. The behavior of the message buffer search is not defined, if both types of channel assignments occur for one slot and priority. An inconsistent channel assignment for message buffer 0 and message buffer 1 is depicted in the figure below.



MB0
FR_MBFIDR0[FID] = 10
FR_MBCCFR0[CHA] = 1, FR_MBCCFR0[CHB] = 0
single channel assignment
MB1
FR_MBFIDR1[FID] = 10
FR_MBCCFR0[CHA] = 1, FR_MBCCFR1[CHB] = 1
dual channel assignment

Figure 50-19. Inconsistent Channel Assignment

50.7.7.3 Node Related Slot Multiplexing

The term *Node Related Slot Multiplexing* applies to the dynamic segment only and refers to the functionality if there are transmit as well as receive message buffers are configured for the same slot.

According to Table 50-51 the transmit buffer is only found if the cycle counter filter matches, and the buffer is not locked and committed. In all other cases, the receive buffer will be found. Thus, if the block has no data to transmit in a dynamic slot, it is able to receive frames on that slot.

50.7.7.4 Message Buffer Search Error

There are two kinds of errors which may occur during message buffer search[1].

50.7.7.4.1 Message Buffer Search Start while Running

If the message buffer search is running in slot *n-1* and the next message buffer search start event appears due to the start of slot *n*, the message buffer search engine is stopped and the Message Buffer Search Error Flag MBS_EF is set in the CHI Error Flag Register (FR_CHIERFR). As a result of this stop, no individual message buffer is identified for transmission or reception in slot *n*. Additionally, the search engine will not be started in slot *n*, and consequently no individual message buffer is identified for transmission or reception in slot *n+1*.

A message buffer search error appears only if the CHI frequency is too slow to allow the search through all message buffers to be completed within the NIT or a minislot.

For more details of minimum required CHI frequency see Number of Usable Message Buffers.

50.7.7.4.2 Illegal Message Buffer Index Found

If the message buffer search has finished the message buffer search in slot *n-1*, it retrieves the data offset values for the found message buffers and the receive shadow buffers. If one of these message buffers contains an illegal message buffer index, the Message Buffer Search Error Flag MBS_EF is set in the CHI Error Flag Register (FR_CHIERFR) is set and no individual message buffer is identified for transmission or reception in slot

[1] The FIFO reception is not affected by the search errors. Additionally, if no rx buffer has been found due to an search error, the received frame is considered for FIFO reception.

n. The legal message buffer index values for the individual and receive shadow buffers are specified in the Receive Shadow Buffer Index Register section (FR_RSBIR) and the Message Buffer Index Registers sections (FR_MBIDXRn).

50.7.8 Individual Message Buffer Reconfiguration

The initial configuration of each individual message buffer can be changed even when the protocol is not in the *POC:config* state. This is referred to as individual message buffer *reconfiguration*. The configuration bits and fields that can be changed are given in the section on Specific Configuration Data. The common configuration data given in the section on Specific Configuration Data can not be reconfigured when the protocol is out of the *POC:config* state.

50.7.8.1 Reconfiguration Schemes

Depending on the target and destination basic state of the message buffer that is to be reconfigured, there are three reconfiguration schemes.

50.7.8.1.1 Basic Type Not Changed (RC1)

A reconfiguration will not change the basic type of the individual message buffer, if the message buffer transfer direction bit FR_MBCCSRn[MTD] are not changed. This type of reconfiguration is denoted by RC1 in Figure 50-20. Transmit and receive message buffers can be RC1-reconfigured when in the HDis or HDisLck state.

50.7.8.1.2 Buffer Type Not Changed (RC2)

A reconfiguration will not change the buffer type of the individual message buffer. This type of reconfiguration is denoted by RC2 in the figure below. It applies to transmit and receive message buffers. Transmit and receive message buffers can be RC2-reconfigured when in the HDis or HDisLck state.

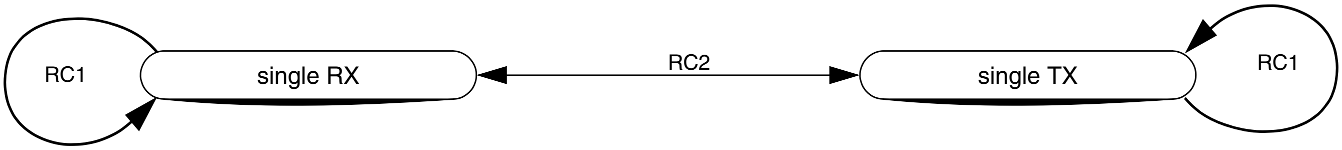


Figure 50-20. Message Buffer Reconfiguration Scheme

50.7.9 Receive FIFOs

This section provides the functional description of the two receive FIFOs.

50.7.9.1 Overview

The two receive FIFOs implement the queued message buffer concept defined by the *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*. One FIFO is assigned to channel A, the other FIFO is assigned to channel B. Both FIFOs work completely independent from each other.

The message buffer structure of each FIFO is described in Receive FIFO. The area in the FlexRay memory area for each of the two FIFOs is characterized by:

- *The FIFO system memory base address*
- *The index of the first FIFO entry given by Receive FIFO Start Index Register (FR_RFSIR)*
- *The data field offset of the data field belonging to the first FIFO entry given by Receive FIFO Start Data Offset Register (FR_RFSDOR)*
- *The number of FIFO entries and the length of each FIFO entry as given by Receive FIFO Depth and Size Register (FR_RFDSR)*

50.7.9.2 FIFO Configuration

The FIFOs can be configured for two different locations of the system memory base address via the FIFO address mode bit FAM in the Module Configuration Register (FR_MCR).

50.7.9.2.1 Single System Memory Base Address Mode

This mode is configured, when the FIFO address mode flag FR_MCR[FAM] is set to 0. In this mode, the location of the system memory base address for the FIFO buffers is System Memory Base Address Register (FR_SYMBADR).

50.7.9.2.2 Dual System Memory Base Address Mode

This mode is configured, when the FIFO address mode flag FR_MCR[FAM] is set to 1. In this mode, the location of the system memory base address for the FIFO buffers is Receive FIFO System Memory Base Address Register (FR_RFSYMBADR).

The FIFO control and configuration data are given in Receive FIFO Control and Configuration Data. The configuration of the FIFOs consists of two steps.

The first step is the allocation of the required amount of FlexRay memory area for the FlexRay window. This includes the allocation of the message buffer header area and the allocation of the message buffer data fields. For more details see FlexRay Memory Area Layout.

The second step is the programming of the configuration data register while the PE is in *POC:config*.

The following steps configure the layout of the FIFO.

- Configure the FIFO update and address modes in Module Configuration Register (FR_MCR)
- Configure the FIFO system memory base address
- Configure the Receive FIFO Start Index Register (FR_RFSIR) with the first message buffer header index that belongs to the FIFO
- Configure the Receive FIFO Start Data Offset Register (FR_RFSDOR) with the data field offset of the data field belonging to the first message buffer that belongs to the FIFO
- Configure the Receive FIFO Depth and Size Register (FR_RFDSR) with FIFO entry size
- Configure the Receive FIFO Depth and Size Register (FR_RFDSR) with FIFO depth
- Configure the FIFO Filters

50.7.9.3 FIFO Periodic Timer

The FIFO periodic timer is used to generate an FIFO almost-full interrupt at certain point in time, if the almost-full watermark is not reached, but the FIFO is not empty. This can be used to prevent frames from get stuck in the FIFO for a long time.

The FIFO periodic timer is configured via the Receive FIFO Periodic Timer Register (FR_RFPTR). If the periodic timer duration FR_RFPTR[PTD] is configured to 0x0000, the periodic timer is continuously expired. If the periodic timer duration FR_RFPTR[PTD] is configured to 0x3FFF, the periodic timer never expires. If the periodic timer is configured to a value *ptd*, greater than 0x0000 and smaller 0x3FFF, the periodic timer expires and is restarted at the start of every communication cycle, and expires and is restarted after *ptd* macroticks have been elapsed.

50.7.9.4 FIFO Reception

The FIFO reception is a CC internal operation.

A message frame reception is directed into the FIFO, if no individual message buffer is assigned for transmission or subscribed for reception for the current slot. In this case the FIFO filter path shown in Figure 50-21 is activated.

If the FIFO filter path indicates that the received frame has to be appended to the FIFO and the FIFO is not full, the CC writes the received frame header into the message buffer header field indicated by the CC internal FIFO write index. The frame payload data are written into the corresponding message buffer data field. If the status of the received frame indicates a valid non-null frame, the slot status information is written into the message buffer header field and the CC internal FIFO write index is updated by 1 and the fifo fill level FLA (FLB) in the Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR) is incremented. If the status of the received frame indicates an invalid or null frame, the frame is not appended to the FIFO.

50.7.9.5 FIFO Almost-Full Interrupt Generation

If the fifo fill level FLA (FLB) is updated after a frame reception and exceeds the FIFO watermark level WM, i.e. $FLA>WM_A$ ($FLB>WM_B$), then the FIFO almost-full interrupt flag FR_GIFER[FAFAIF] (FR_GIFER[FAFBIF]) is asserted.

If the periodic timer expires, and FIFOA (FIFOB) is not empty, i.e. FLA>0 (FLB>0), then the FIFO almost-full interrupt flag FR_GIFER[FAFAIF] (FR_GIFER[FAFBIF]) is asserted.

50.7.9.6 FIFO Overflow Error Generation

If the FIFOA (FIFOB) is full, i.e. $FLA=FIFO\_DEPTH_A$ ($FLB=FIFO\_DEPTH_B$) and the conditions for a FIFO reception as described in FIFO Reception are fulfilled, then the fifo overflow error flag FR_CHIERFR[FOVA_EF] (FR_CHIERFR[FOVB_EF]) is asserted.

50.7.9.7 FIFO Message Access

The FIFOA (FIFOB) contains valid messages if the FIFO fill level given in the fields FLA (FLB) in the Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR) is greater than 0. The Receive FIFO A Read Index Register (FR_RFARIR) and the

(Receive FIFO B Read Index Register (FR_RFBRIR)) point to a message buffer with valid content and the oldest frames stored in the FIFO.The respective read data field offsets can be calculated according to Equation 1-125.

If the FIFO fill level FLA (FLB) in the Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR) is 0, than the FIFOA (FIFOB) contains no valid messages and the corresponding read index register Receive FIFO A Read Index Register (FR_RFARIR) or (Receive FIFO B Read Index Register (FR_RFBRIR) point to a message buffer with invalid content. In this case the application must not read data from this FIFO.

To access the oldest message in the FIFOA (FIFOB), the application first reads the read index RDIDX out of the Receive FIFO A Read Index Register (FR_RFARIR) (Receive FIFO B Read Index Register (FR_RFBRIR)). This read index points to the message buffer header field of the oldest message buffer that contains valid received message data. The data field offset belonging to this message buffer must be calculated by the application according to Equation 1-125. The application can access the message data as described in Receive FIFO. When the application has read the message buffer data and status information, it can update the FIFO as described in FIFO Update.

50.7.9.8 FIFO Update

The application updates the FIFOA (FIFOB) by writing a pop count value *pc* different from 0 to the PCA (PCB) field in the Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR).

As a result of the this operation, the CC removes the oldest *pc* entries from FIFOA (FIFOB).

If the specified pop count value *pc* is greater than the current fill level *fl* provided in FLA (FAB) field, then only *fl* entries are removed from the FIFOA (FIFOB), the remaining *fl-pc* requested pop operations are discarded without any notification. In this case FIFOA (FIFOB) is empty after the update operation.

The read index in the Receive FIFO A Read Index Register (FR_RFARIR) (Receive FIFO B Read Index Register (FR_RFBRIR)) is incremented by the number of removed items. If the read index reaches the top of the FIFO, it wraps around to the FIFO start index defined in Receive FIFO Start Index Register (FR_RFSIR) automatically.

50.7.9.8.1 FIFO Interrupt Flag Update

The FIFO Interrupt Flag Update mode is configured, when the FIFO update mode flag FR_MCR[FUM] is set to 0. In this mode FIFOA (FIFOB) will be updated by 1 entry, when the interrupt flag FR_GIFER[FAFAIF] (FR_GIFER[FAFBIF]) is written with 1 by the application.

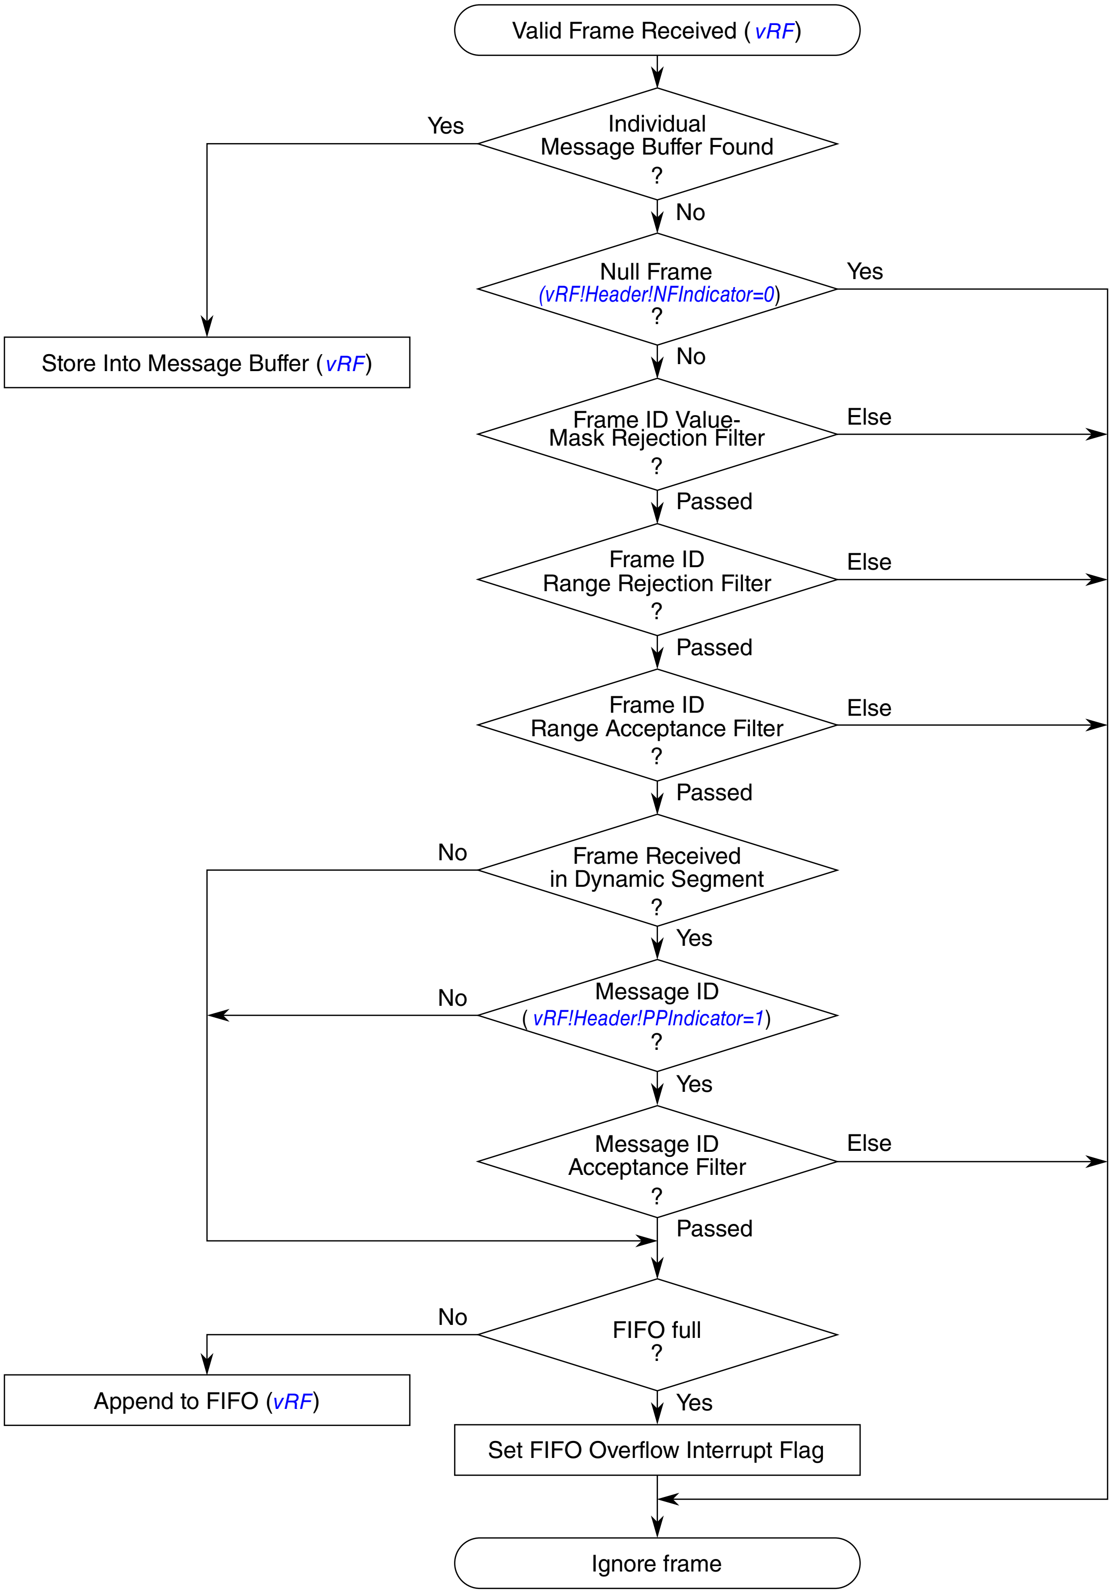
If the FIFO is empty, the update request is ignored without any notification.

The read index in the Receive FIFO A Read Index Register (FR_RFARIR) (Receive FIFO B Read Index Register (FR_RFBRIR)) is incremented by 1, if the FIFO was not empty. If the read index reaches the top of the FIFO, it wraps around to the FIFO start index automatically.

50.7.9.9 FIFO Filtering

The FIFO filtering is activated after all enabled individual receive message buffers have been searched without success for a message buffer to receive the current frame.

The CC provides three sets of FIFO filters. The FIFO filters are applied to valid non-null frames only. The FIFO will not receive invalid or null-frames. For each FIFO filter, the pass criteria is specified in the related section given below. Only frames that have passed all filters will be appended to the FIFO. The FIFO filter path is depicted in the figure below.



Valid Frame Received (vRF)
Individual Message Buffer Found ?
Yes
No
Store Into Message Buffer (vRF)
Null Frame (vRF!Header!NFIndicator=0) ?
Yes
No
Frame ID Value-Mask Rejection Filter ?
Else
Passed
Frame ID Range Rejection Filter ?
Else
Passed
Frame ID Range Acceptance Filter ?
Else
Passed
Frame Received in Dynamic Segment ?
No
Yes
Message ID (vRF!Header!PPIndicator=1) ?
No
Yes
Message ID Acceptance Filter ?
Else
Passed
FIFO full ?
No
Yes
Append to FIFO (vRF)
Set FIFO Overflow Interrupt Flag
Ignore frame

Figure 50-21. Received Frame FIFO Filter Path

A received frame passes the FIFO filtering if it has passed all three type of filter.

50.7.9.9.1 RX FIFO Frame ID Value-Mask Rejection Filter

The frame ID value-mask rejection filter is a value-mask filter and is defined by the fields in the Receive FIFO Frame ID Rejection Filter Value Register (FR_RFFIDRFVR) and the Receive FIFO Frame ID Rejection Filter Mask Register (FR_RFFIDRFMR). Each received frame with a frame ID FID that does not match the value-mask filter value passes the filter, i.e. is not rejected.

Consequently, a received valid frame with the frame ID FID passes the RX FIFO Frame ID Value-Mask Rejection Filter if Equation 29 on page 1829 is fulfilled.

$$\mathrm{FID}\ \&\ \mathrm{FR\_RFFIDRFMR}[\mathrm{FIDRFMSK}] \neq \mathrm{FR\_RFFIDRFVR}[\mathrm{FIDRFVAL}]\ \&\ \mathrm{FR\_RFFIDRFMR}[\mathrm{FIDRFMSK}]$$

Equation 29

The RX FIFO Frame ID Value-Mask Rejection Filter can be configured to pass all frames by the following settings.

$$\mathrm{FR\_RFFIDRFVR}[\mathrm{FIDRFVAL}] = 0x000 \text{ and } \mathrm{FR\_RFFIDRFMR}[\mathrm{FIDRFMSK}] = 0\mathrm{x7FF}$$

Equation 30

Using the settings above, only the frame with frame ID 0 will be rejected, which is an invalid frame. All other frames will pass.

The RX FIFO Frame ID Value-Mask Rejection Filter can be configured to reject all frames by the following settings.

$$\mathrm{FR\_RFFIDRFMR}[\mathrm{FIDRFMSK}] = 0\mathrm{x}000$$

Equation 31

Using these settings, Equation 29 on page 1829 can never be fulfilled (0!= 0) and thus all frames are rejected; no frame will pass. This is the reset value for the RX FIFO.

50.7.9.9.2 RX FIFO Frame ID Range Rejection Filter

Each of the four RX FIFO Frame ID Range filters can be configured as a rejection filter. The filters are configured by the Receive FIFO Range Filter Configuration Register (FR_RFRFCFR) and controlled by the Receive FIFO Range Filter Control Register (FR_RFRFCTR). The RX FIFO Frame ID range filters apply to all received valid frames. A received frame with the frame ID FID passes the RX FIFO Frame ID Range rejection filters if either no rejection filter is enabled, or, for all of the enabled RX FIFO Frame ID Range rejection filters, i.e. FR_RFRFCTR[FiMD] = 1 and FR_RFRFCTR[FiEN] = 1, Equation 32 on page 1830 is fulfilled.

$$FID < FR\_RFRFCFR_{SEL}[SID_{IBD=0}]) or (FR\_RFRFCFR_{SEL}[SID_{IBD=1}] < FID)$$

Equation 32

Consequently, all frames with a frame ID that fulfills Equation 33 on page 1830 for at least one of the enabled rejection filters will be rejected and thus not pass.

$$FR\_RFRFCFR_{SEL}[SID_{IBD=0}] \leq FID \leq FR\_RFRFCFR_{SEL}[SID_{IBD=1}]$$

Equation 33

50.7.9.9.3 RX FIFO Frame ID Range Acceptance filter

Each of the four RX FIFO Frame ID Range filters can be configured as an acceptance filter. The filters are configured by the Receive FIFO Range Filter Configuration Register (FR_RFRFCFR) and controlled by the Receive FIFO Range Filter Control Register (FR_RFRFCTR). The RX FIFO Frame ID range filters apply to all received valid frames. A received frame with the frame ID FID passes the RX FIFO Frame ID Range acceptance filters if either no acceptance filter is enabled, or, for at least one of the enabled RX FIFO Frame ID Range acceptance filters, i.e. FR_RFRFCTR[FiMD] = 0 and FR_RFRFCTR[FiEN] = 1, Equation 34 on page 1830 is fulfilled.

$$FR\_RFRFCFR_{SEL}[SID_{IBD=0}] \leq FID \leq FR\_RFRFCFR_{SEL}[SID_{IBD=1}]$$

Equation 34

50.7.9.9.4 RX FIFO Message ID Acceptance Filter

The RX FIFO Message ID Acceptance Filter is a value-mask filter and is defined by the Receive FIFO Message ID Acceptance Filter Value Register (FR_RFMIDAFVR) and the Receive FIFO Message ID Acceptance Filter Mask Register (FR_RFMIDAFMR). This filter applies only to valid frames received in the dynamic segment with the payload preamble indicator bit PPI set to 1. All other frames will pass this filter.

A received valid frame in the dynamic segment with the payload preamble indicator bit PPI set to 1 and with the message ID MID (the first two bytes of the payload) will pass the RX FIFO Message ID Acceptance Filter if Equation 35 on page 1830 is fulfilled.

$$MID \,\&\, FR\_RFMIDAFMR[MIDAFMSK] = FR\_RFMIDAFMR[MIDAFVAL] \,\&\, FR\_RFMIDAFMR[MIDAFMSK]$$

Equation 35

The RX FIFO Message ID Acceptance Filter can be configured to accept all frames by setting

$$FR\_\ RFMIDAFMR[MIDAFMSK]:=0x000$$

Equation 36

Using these settings, Equation 35 on page 1830 is always fulfilled and all frames will pass.

50.7.10 Channel Device Modes

This section describes the two FlexRay channel device modes that are supported by the CC.

50.7.10.1 Dual Channel Device Mode

In the dual channel device mode, both FlexRay ports are connected to physical FlexRay bus lines. The FlexRay port consisting of FR_A_RX, FR_A_TX, and $\overline{\text{FR\_A\_TX\_EN}}$ is connected to the physical bus channel A and the FlexRay port consisting of FR_B_RX, FR_B_TX, and $\overline{\text{FR\_B\_TX\_EN}}$ is connected to the physical bus channel B. The dual channel system is shown in the following figure.

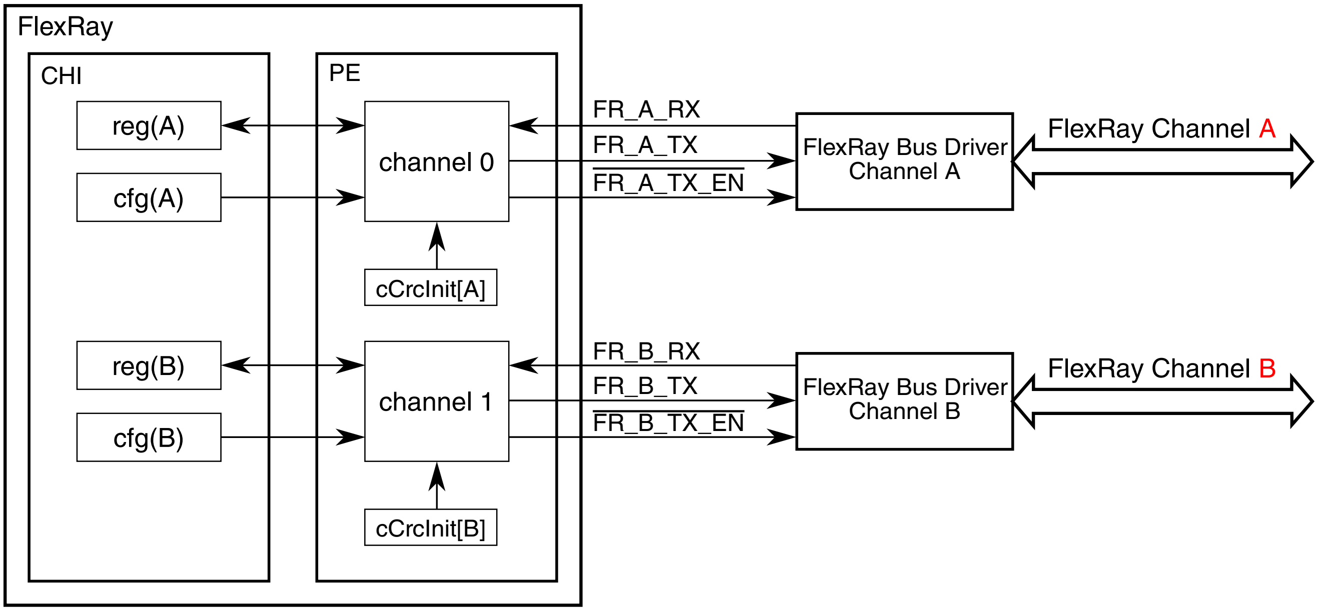


Figure 50-22. Dual Channel Device Mode

50.7.10.2 Single Channel Device Mode

The single channel device mode supports devices that have only one FlexRay port available. This FlexRay port consists of the signals FR_A_RX, FR_A_TX, and FR_A_TX_EN and can be connected to either the physical bus channel A (shown in the "Single Channel Device Mode (Channel A)" figure below) or the physical bus channel B (shown in the "Single Channel Device Mode (Channel B)" figure below).

If the device is configured as a single channel device by setting FR_MCR[SCM] to 1, only the internal channel A and the FlexRay Port A is used. Depending on the setting of FR_MCR[CHA] and FR_MCR[CHB], the internal channel A behaves either as a FlexRay Channel A or FlexRay Channel B. The bit FR_MCR[CHA] must be set, if the FlexRay Port A is connected to a FlexRay Channel A. The bit FR_MCR[CHB] must be set if the FlexRay Port A is connected to a FlexRay Channel B. The two FlexRay channels differ only in the initial value for the frame CRC *cCrcInit*. For a single channel device, the application can access and configure only the registers related to internal channel A.

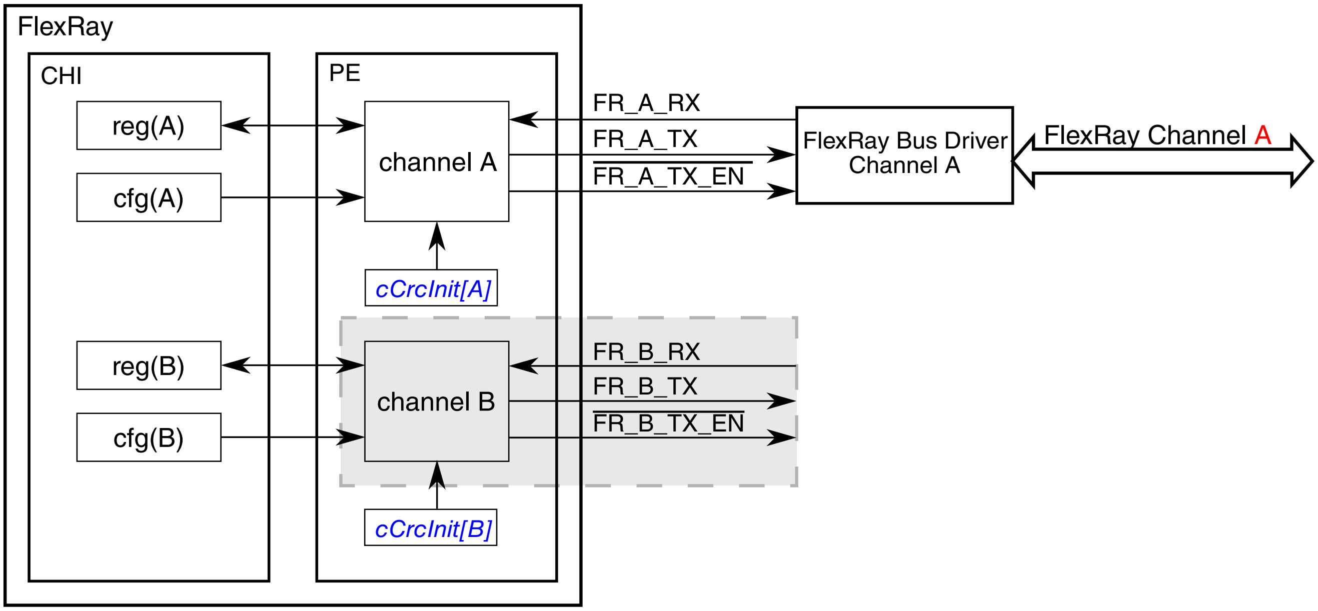

Figure 50-23. Single Channel Device Mode (Channel A)

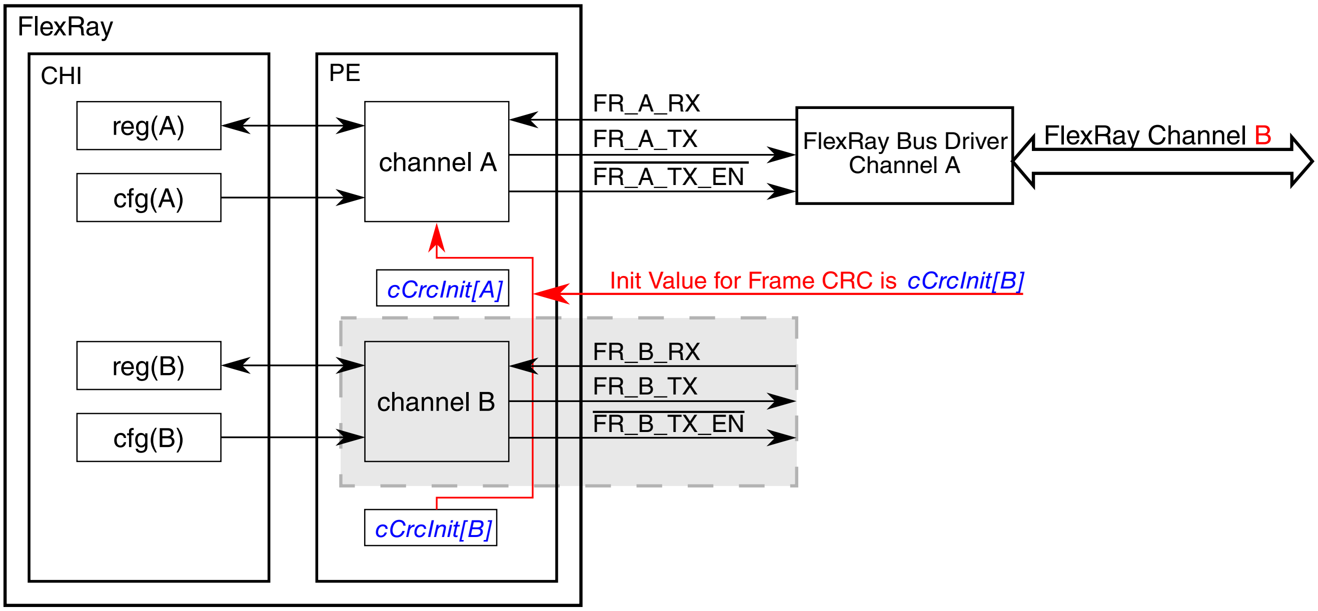

Figure 50-24. Single Channel Device Mode (Channel B)

50.7.11 External Clock Synchronization

The application of the external rate and offset correction is triggered when the application writes to the EOC_AP and ERC_AP fields in the Protocol Operation Control Register (FR_POCR). The PE applies the external correction values in the next even-odd cycle pair as shown in the "External Offset Correction Write and Application Timing" figure and the "External Rate Correction Write and Application Timing" figures below.

Note

> The values provided in the EOC_AP and ERC_AP fields are the values that were written from the application most recently. If these value were already applied, they will not be applied in the current cycle pair again.

If the offset correction applied in the NIT of cycle 2n+1 shall be affect by the external offset correction, the EOC_AP field must be written to after the start of cycle 2n and before the end of the static segment of cycle 2n+1. If this field is written to after the end of the static segment of cycle 2n+1, it is not guaranteed that the external correction value is applied in cycle 2n+1. If the value is not applied in cycle 2n+1, then the value will be applied in the cycle 2n+3. Refer to the following for timing details.

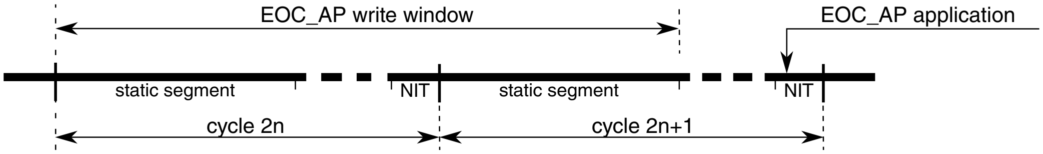

Figure 50-25. External Offset Correction Write and Application Timing

If the rate correction for the cycle pair [2n+2, 2n+3] shall be affect by the external offset correction, the ERC_AP field must be written to after the start of cycle 2n and before the end of the static segment start of cycle 2n+1. If this field is written to after the end of the static segment of cycle 2n+1, it is not guaranteed that the external correction value is applied in cycle pair [2n+2, 2n+3]. If the value is not applied for cycle pair [2n+2, 2n+3], then the value will be applied for cycle pair [2n+4, 2n+5]. Refer to the following for details.

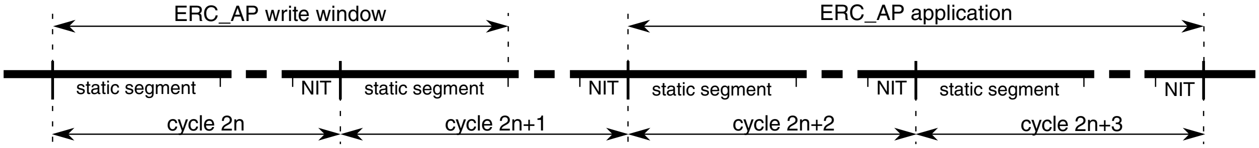

Figure 50-26. External Rate Correction Write and Application Timing

50.7.12 Sync Frame ID and Sync Frame Deviation Tables

The FlexRay protocol requires the provision of a snapshot of the Synchronization Frame ID tables for the even and odd communication cycle for both channels. The CC provides the means to write a copy of these internal tables into the FlexRay memory area and ensures application access to consistent tables by means of table locking. Once the application has locked the table successfully, the CC will not overwrite these tables and the application can read a consistent snapshot.

Note

Only synchronization frames that have passed the synchronization frame filters are considered for clock synchronization and appear in the sync frame tables.

50.7.12.1 Sync Frame ID Table Content

The Sync Frame ID Table is a snapshot of the protocol related variables *vsSyncIdListA* and *vsSyncIdListB* for each even and odd communication cycle. This table provides a list of the frame IDs of the synchronization frames received on the corresponding channel and cycle that are used for the clock synchronization.

50.7.12.2 Sync Frame Deviation Table Content

The Sync Frame Deviation Table is a snapshot of the protocol related variable zsDev(id)(oe)(ch)!Value. Each Sync Frame Deviation Table entry provides the deviation value for the sync frame, with the frame ID presented in the corresponding entry in the Sync Frame ID Table.

	FR_SFTOR EVEN	FR_SFTOR + 60 ODD	FR_SFTOR + 120 EVEN	FR_SFTOR + 180 ODD
Offset + $00	Sync Frame ID Ch A 1	Sync Frame ID Ch A 1	Sync Deviation Ch A 1	Sync Deviation Ch A 1

Figure 50-27. Sync Table Memory Layout

50.7.12.3 Sync Frame ID and Sync Frame Deviation Table Setup

The CC writes a copy of the internal synchronization frame ID and deviation tables into the FlexRay memory area if requested by the application. The application must provide the appropriate amount of FlexRay memory area for the tables. The memory layout of the tables is given in Figure 50-27. Each table occupies 120 16-bit entries.

While the protocol is in *POC:config* state, the application must program the offsets for the tables into the Sync Frame Table Offset Register (FR_SFTOR).

50.7.12.4 Sync Frame ID and Sync Frame Deviation Table Generation

The application controls the generation process of the Sync Frame ID and Sync Frame Deviation Tables into the FlexRay memory area using the Sync Frame Table Configuration, Control, Status Register (FR_SFTCCSR). A summary of the copy modes is given in the table below.

Table 50-52. Sync Frame Table Generation Modes

FR_SFTCCSR			Description
OPT	SDVEN	SIDEN	
0	0	0	No Sync Frame Table copy
0	0	1	Sync Frame ID Tables will be copied continuously
0	1	0	Reserved
0	1	1	Sync Frame ID Tables and Sync Frame Deviation Tables will be copied continuously
1	0	0	No Sync Frame Table copy
1	0	1	Sync Frame ID Tables for next even-odd-cycle pair will be copied
1	1	0	Reserved
1	1	1	Sync Frame ID Tables and Sync Frame Deviation Tables for next even-odd-cycle pair will be copied

The Sync Frame Table generation process is described in the following for the even cycle. The same sequence applies to the odd cycle.

If the application has enabled the sync frame table generation by setting FR_SFTCCSR[SIDEN] to 1, the CC starts the update of the even cycle related tables after the start of the NIT of the next even cycle. The CC checks if the application has locked the tables by reading the FR_SFTCCSR[ELKS] lock status bit. If this bit is set, the CC will not update the table in this cycle. If this bit is cleared, the CC locks this table and starts the table update. To indicate that these tables are currently updated and may contain inconsistent data, the CC clears the even table valid status bit FR_SFTCCSR[EVAL]. Once all table entries related to the even cycle have been transferred into the FlexRay memory area, the CC sets the even table valid bit FR_SFTCCSR[EVAL] and the Even Cycle Table Written Interrupt Flag EVT_IF in the Protocol Interrupt Flag Register 1 (FR_PIFR1). If the interrupt enable flag EVT_IE is set, an interrupt request is generated.

To read the generated tables, the application must lock the tables to prevent the CC from updating these tables. The locking is initiated by writing a 1 to the even table lock trigger FR_SFTCCSR[ELKT]. When the even table is not currently updated by the CC, the lock is granted and the even table lock status bit FR_SFTCCSR[ELKS] is set. This indicates that the application has successfully locked the even sync tables and the corresponding status information fields SFRA, SFRB in the Sync Frame Counter Register (FR_SFCNTR). The value in the FR_SFTCCSR[CYCNUM] field provides the number of the cycle that this table is related to.

The number of available table entries per channel is provided in the FR_SFCNTR[SFEVA] and FR_SFCNTR[SFEVB] fields. The application can now start to read the sync table data from the locations given in Figure 50-27.

After reading all the data from the locked tables, the application must unlock the table by writing to the even table lock trigger FR_SFTCCSR[ELKT] again. The even table lock status bit FR_SFTCCSR[ELKS] is reset immediately.

If the sync frame table generation is disabled, the table valid bits FR_SFTCCSR[EVAL] and FR_SFTCCSR[EVAL] are reset when the counter values in the Sync Frame Counter Register (FR_SFCNTR) are updated. This is done because the tables stored in the FlexRay memory area are no longer related to the values in the Sync Frame Counter Register (FR_SFCNTR).

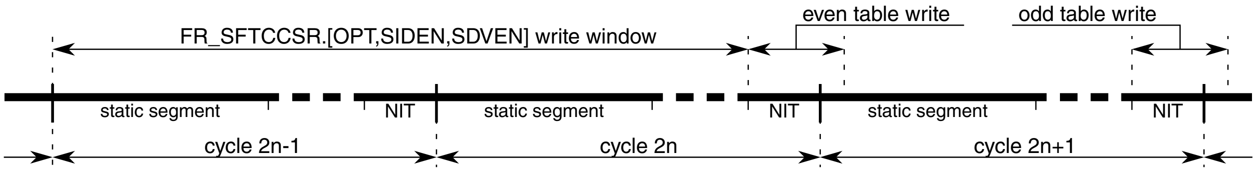

Figure 50-28. Sync Frame Table Trigger and Generation Timing

50.7.12.5 Sync Frame Table Access

The sync frame tables will be transferred into the FlexRay memory area during the table write windows shown in Figure 50-27. During the table write, the application can not lock the table that is currently written. If the application locks the table outside of the table write window, the lock is granted immediately.

50.7.12.5.1 Sync Frame Table Locking and Unlocking

The application locks the even/odd sync frame table by writing 1 to the lock trigger bit ELKT/OLKT in the Sync Frame Table Configuration, Control, Status Register (FR_SFTCCSR). If the affected table is not currently written to the FlexRay memory area, the lock is granted immediately, and the lock status bit ELKS/OLKS is set. If the affected table is currently written to the FlexRay memory area, the lock is not granted. In this case, the application must issue the lock request again until the lock is granted.

The application unlocks the even/odd sync frame table by writing 1 to the lock trigger bit ELKT/OLKT. The lock status bit ELKS/OLKS is cleared immediately.

50.7.13 MTS Generation

The CC provides a flexible means to request the transmission of the Media Access Test Symbol MTS in the symbol window on channel A or channel B.

The application can configure the set of communication cycles in which the MTS will be transmitted over the FlexRay bus by programming the CYCCNTMSK and CYCCNTVAL fields in the MTS A Configuration Register (FR_MTSACFR) and MTS B Configuration Register (FR_MTSBCFR).

The application enables or disables the generation of the MTS on either channel by setting or clearing the MTE control bit in the MTS A Configuration Register (FR_MTSACFR) or MTS B Configuration Register (FR_MTSBCFR). If an MTS is to be transmitted in a certain communication cycle, the application must set the MTE control bit during the static segment of the preceding communication cycle.

The MTS is transmitted over channel A in the communication cycle with number CYCCNT, if the following equations are fulfilled.

$$\mathrm{FR\_PSR0}[\mathrm{PROTSTATE}] = \mathrm{POC{:}\ normalactive}$$

Equation 37

$$\mathrm{FR\_MTSACRF}[\mathrm{MTE}] = 1$$

Equation 38

$$\mathrm{CYCCNT} \,\&\, \mathrm{FR\_MTSACFR}[\mathrm{CYCCNTMSK}] = \mathrm{FR\_MTSACFR}[\mathrm{CYCCNTVAL}] \,\&\, \mathrm{FR\_MTSACFR}[\mathrm{CYCCNTMSK}]$$

Equation 39

The MTS is transmitted over channel B in the communication cycle with number CYCCNT, if the following equations are fulfilled.

$$\mathrm{FR\_MTSBCRF}[\mathrm{MTE}] = 1$$

Equation 40

$$\mathrm{CYCCNT} \,\&\, \mathrm{FR\_MTSBCFR}[\mathrm{CYCCNTMSK}] = \mathrm{FR\_MTSBCFR}[\mathrm{CYCCNTVAL}] \,\&\, \mathrm{FR\_MTSBCFR}[\mathrm{CYCCNTMSK}]$$

Equation 41

50.7.14 Key Slot Transmission

Key slot assignment, transmission in POC:startup state, and transmission in POC:normal active state are discussed in this section.

50.7.14.1 Key Slot Assignment

A key slot is assigned to the CC if the key_slot_id field in the Protocol Configuration Register 18 (FR_PCR18) is configured with a value greater than 0 and less or equal to number_of_static_slots in Protocol Configuration Register 2 (FR_PCR2), otherwise no key slot is assigned.

50.7.14.2 Key Slot Transmission in POC:startup

If a key slot is assigned and the CC is in the *POC:startup* state, startup null frames will be transmitted as specified by FlexRay Communications System Protocol Specification, Version *2.1 Rev A* .

50.7.14.3 Key Slot Transmission in POC:normal active

If a key slot is assigned and the CC is in *POC:normal active*, a frame of the type as shown in the following table is transmitted. If a transmit message buffer is configured for the key slot and a valid message is available, a message frame is transmitted (see Message Transmission). If no transmit message buffer is configured for the key slot or no valid message is available, a null frame is transmitted (see Null Frame Transmission).

Table 50-53. Key Slot Frame Type

FR_PCR11[key_slot_used_for_sync]	FR_PCR11[key_slot_used_for_startup]	key slot frame type
0	0	normal frame
0	1	normal frame1[1]
1	0	sync frame
1	1	startup frame

[1] The frame transmitted has an semantically incorrect header and will be detected as an invalid frame at the receiver.

50.7.15 Sync Frame Filtering

Each received synchronization frame must pass the Sync Frame Acceptance Filter and the Sync Frame Rejection Filter before it is considered for clock synchronization. If the synchronization frame filtering is globally disabled, i.e. the SFFE control bit in the Module Configuration Register (FR_MCR) is cleared, all received synchronization frames are considered for clock synchronization. If a received synchronization frame did not pass at least one of the two filters, this frame is processed as a normal frame and is not considered for clock synchronization.

50.7.15.1 Sync Frame Acceptance Filtering

The synchronization frame acceptance filter is implemented as a value-mask filter. The value is configured in the Sync Frame ID Acceptance Filter Value Register (FR_SFIDAFVR) and the mask is configured in the Sync Frame ID Acceptance Filter Mask Register (FR_SFIDAFMR). A received synchronization frame with the frame ID FID passes the sync frame acceptance filter, if the following equations evaluates to true.

$$\mathrm{FR\_MCR}[\mathrm{SFFE}] = 0$$

Equation 42

$$\mathrm{FID}\ \&\ \mathrm{FR\_SFIDAFMR}[\mathrm{FMSK}] = \mathrm{FR\_SFIDAFVR}[\mathrm{FVAL}]\ \&\ \mathrm{FR\_SFIDAFMR}[\mathrm{FMSK}]$$

Equation 43

Note

Sync frames are transmitted in the static segment only. Thus FID <= 1023.

50.7.15.2 Sync Frame Rejection Filtering

The synchronization frame rejection filter is a comparator. The compare value is defined by the Sync Frame ID Rejection Filter Register (FR_SFIDRFR). A received synchronization frame with the frame ID FID passes the sync frame rejection filter if the following equations evaluates to true.

$$\mathrm{FR\_MCR}[\mathrm{SFFE}] = 0$$

Equation 44

$$\mathrm{FID} \neq \mathrm{FR\_SFIDRFR}[\mathrm{SYNFRID}]$$

Equation 45

Note

Sync frames are transmitted in the static segment only. Thus FID <= 1023.

50.7.16 Strobe Signal Support

The CC provides a number of strobe signals for observing internal protocol timing related signals in the protocol engine. The signals are listed and described in the Strobe Signal Mapping table, located in the Register Descriptions section.

50.7.16.1 Strobe Signal Assignment

Each of the strobe signals listed in the Strobe Signal Mapping table, located in the Register Descriptions section, can be assigned to one of the four strobe ports using the Strobe Signal Control Register (FR_STBSCR). To assign multiple strobe signals, the application must write multiple times to the Strobe Signal Control Register (FR_STBSCR) with appropriate settings.

To read out the current settings for a strobe signal with number N, the application must execute the following sequence.

1. Write to FR_STBSCR with WMD = 1 and SEL = N. (updates SEL field only)
2. Read STBCSR.

   The SEL field provides N and the ENB and STBPSEL fields provides the settings for signal N.

50.7.16.2 Strobe Signal Timing

This section provides detailed timing information of the strobe signals with respect to the protocol engine clock.

The strobe signals display internal PE signals. Due to the internal architecture of the PE, some signals are generated several PE clock cycles before the actual action is performed on the FlexRay Bus. These signals are listed in the Strobe Signal Mapping table, located in the Register Descriptions section, with a negative clock offset. An example waveform is given in the following figure.

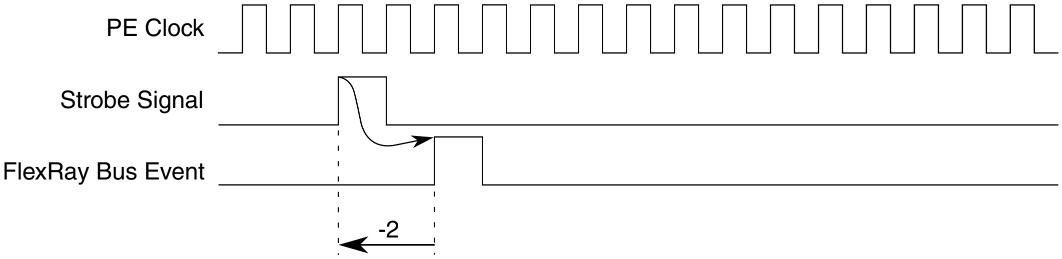

Figure 50-29. Strobe Signal Timing (type = pulse, clk_offset = -2)

Other signals refer to events that occurred on the FlexRay Bus some cycles before the strobe signal is changed. These signals are listed in the Strobe Signal Mapping table, located in the Register Descriptions section, with a positive clock offset. An example waveform is given in the figure below.

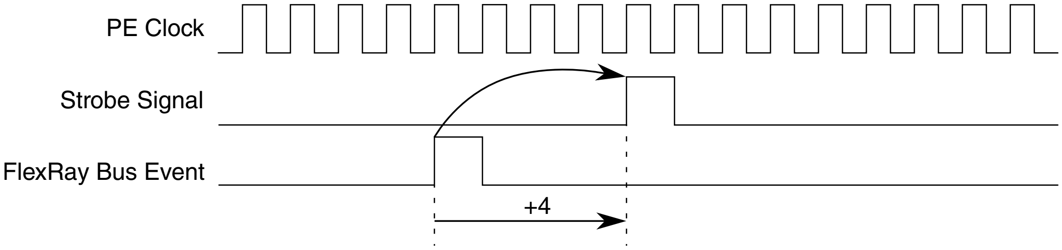

Figure 50-30. Strobe Signal Timing (type = pulse, clk_offset = +4)

50.7.17 Timer Support

The CC provides two timers, which run on the FlexRay time base. Each timer generates a maskable interrupt when it reaches a configured point in time. Timer T1 is an absolute timer. Timer T2 can be configured to be an absolute or a relative timer. Both timers can be configured to be repetitive. In the non-repetitive mode, timer stops if it expires. In repetitive mode, timer is restarted when it expires.

Both timers are active only when the protocol is in *POC:normal active* or *POC:normal passive* state. If the protocol is not in one of these modes, the timers are stopped. The application must restart the timers when the protocol has reached the *POC:normal active* or *POC:normal passive* state.

50.7.17.1 Absolute Timer T1

The absolute timer T1 has the protocol cycle count and the macrotick count as the time base. The timer 1 interrupt flag TI1_IF in the Protocol Interrupt Flag Register 0 (FR_PIFR0) is set at the macrotick start event, if the following equations are fulfilled.

$$\mathrm{CYCTR[CTCCNT]\ \&\ FR\_TI1CYSR[}T\mathrm{1\_CYC\_MSK] = FR\_TI1CYSR[}T\mathrm{1\_CYC\_VAL]\ \&\ FR\_TI1CYSR[}T\mathrm{1\_CYC\_MSK]}$$

Equation 46

$$\mathrm{FR\_MTCTR[MTCT] = FR\_TI1MTOR[}T\mathrm{1\_MTOFFSET]}$$

Equation 47

If the timer 1 interrupt enable bit TI1_IE in the Protocol Interrupt Enable Register 0 (FR_PIER0) is asserted, an interrupt request is generated.

The status bit T1ST is set when the timer is triggered, and is cleared when the timer expires and is non-repetitive. If the timer expires but is repetitive, the T1ST bit is not cleared and the timer is restarted immediately. The T1ST is cleared when the timer is stopped.

The corresponding Interrupt condition (i.e., when the abovementioned equations are fulfilled) also leads to an event out indication on an output port (*fr_evt_tim1*) based on the [TIM1_EE] bit of the Protocol Event Output Enable Register (FR_PEOER).

50.7.17.2 Absolute / Relative Timer T2

The timer T2 can be configured to be an absolute or relative timer by setting the T2_CFG control bit in the Timer Configuration and Control Register (FR_TICCR). The status bit T2ST is set when the timer is triggered, and is cleared when the timer expires and is non-repetitive. If the timer expires but is repetitive, the T2ST bit is not cleared and the timer is restarted immediately. The T2ST is cleared when the timer is stopped.

50.7.17.2.1 Absolute Timer T2

If timer T2 is configured as an absolute timer, it has the same functionality timer T1 but the configuration from Timer 2 Configuration Register 0 (FR_TI2CR0) and Timer 2 Configuration Register 1 (FR_TI2CR1) is used. On expiration of timer T2, the interrupt flag TI2_IF in the Protocol Interrupt Flag Register 0 (FR_PIFR0) is set. If the timer 1 interrupt enable bit TI1_IE in the Protocol Interrupt Enable Register 0 (FR_PIER0) is asserted, an interrupt request is generated.

The corresponding Interrupt condition for T2 also leads to an event out indication on an output port (*fr_evt_tim2*) based on the [TIM2_EE] bit of the Protocol Event Output Enable Register (FR_PEOER).

50.7.17.2.2 Relative Timer T2

If the timer T2 is configured as a relative timer, the interrupt flag TI2_IF in the Protocol Interrupt Flag Register 0 (FR_PIFR0) is set, when the programmed amount of macroticks MT[31:0], defined by Timer 2 Configuration Register 0 (FR_TI2CR0) and Timer 2 Configuration Register 1 (FR_TI2CR1), has expired since the trigger or restart of timer 2. The relative timer is implemented as a down counter and expires when it has reached 0. At the macrotick start event, the value of MT[31:0] is checked and then decremented. Thus, if the timer is started with MT[31:0] == 0, it expires at the next macrotick start.

The corresponding Interrupt condition for T2 also leads to an event out indication on an output port (*fr_evt_tim2*) based on the [TIM2_EE] bit of the Protocol Event Output Enable Register (FR_PEOER).

50.7.18 Slot Status Monitoring

The CC provides several means for slot status monitoring. All slot status monitors use the same slot status vector provided by the PE. The PE provides a slot status vector for each static slot, for each dynamic slot, for the symbol window, and for the NIT, on a per channel base. The content of the slot status vector is described in the "Slot Status Content" table below. The PE provides the slot status vector within the first macrotick after the end of the related slot/window/NIT, as shown in the below figure.

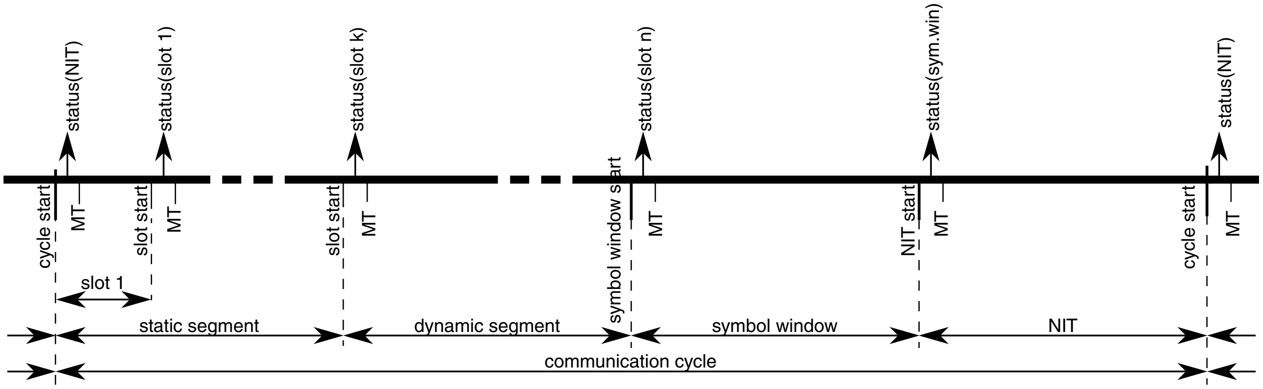

Figure 50-31. Slot Status Vector Update

Note

The slot status for the NIT of cycle n is provided after the start of cycle n+1.

Table 50-54. Slot Status Content

	Status Content
static /dynamic Slot	**slot related status**

Table continues on the next page...

Table 50-54. Slot Status Content (continued)

	Status Content
	vSS!ValidFrame - valid frame received *vSS!SyntaxError* - syntax error occurred while receiving *vSS!ContentError* - content error occurred while receiving *vSS!BViolation* - boundary violation while receiving *for slots in which the module transmits:* *vSS!TxConflict* - reception ongoing while transmission starts *for slots in which the module does not transmit:* *vSS!TxConflict* - reception ongoing while transmission starts first valid - channel that has received the first valid frame **received frame related status** *extracted from* *a)header of valid frame, if vSS!ValidFrame = 1* *b) last received header, if vSS!ValidFrame = 0* *c) set to 0, if nothing was received* *vRF!Header!NFIndicator* - Null Frame Indicator (0 for null frame) *vRF!Header!SuFIndicator* - Startup Frame Indicator *vRF!Header!SyFIndicator* - Sync Frame Indicator
Symbol Window	**window related status** *vSS!ValidFrame* - always 0 *vSS!ContentError* - content error occurred while receiving *vSS!SyntaxError* - syntax error occurred while receiving *vSS!BViolation* - boundary violation while receiving *vSS!TxConflict* - reception ongoing while transmission starts **received symbol related status** *vSS!ValidMTS* - valid Media Test Access Symbol received **received frame related status** *see static/dynamic slot*
NIT	**NIT related status** *vSS!ValidFrame* - always 0 *vSS!ContentError* - content error occurred while receiving *vSS!SyntaxError* - syntax error occurred while receiving *vSS!BViolation* - boundary violation while receiving *vSS!TxConflict* - always 0 **received frame related status** *see static/dynamic slot*

50.7.18.1 Channel Status Error Counter Registers

The two channel status error counter registers, Channel A Status Error Counter Register (FR_CASERCR) and Channel B Status Error Counter Register (FR_CBSERCR), incremented by one, if at least one of four slot status error bits, *vSS!SyntaxError, vSS!ContentError, vSS!BViolation*, or *vSS!TxConflict* is set to 1. The status vectors for all slots in the static and dynamic segment, in the symbol window, and in the NIT are taken into account. The counters wrap round after they have reached the maximum value.

50.7.18.2 Protocol Status Registers

The Protocol Status Register 2 (FR_PSR2) provides slot status information about the Network Idle Time NIT and the Symbol Window. The Protocol Status Register 3 (FR_PSR3) provides aggregated slot status information.

50.7.18.3 Slot Status Registers

The eight slot status registers, Slot Status Registers (FR_SSR0–FR_SSR7), can be used to observe the status of static slots, dynamic slots, the symbol window, or the NIT without individual message buffers. These registers provide all slot status related and received frame / symbol related status information, as given in Table 50-54, except of the *first valid* indicator for non-transmission slots.

50.7.18.4 Slot Status Counter Registers

The CC provides four slot status error counter registers, Slot Status Counter Registers (FR_SSCR0–FR_SSCR3). Each of these slot status counter registers is updated with the value of an internal slot status counter at the start of a communication cycle. The internal slot status counter is incremented if its increment condition, defined by the Slot Status Counter Condition Register (FR_SSCCR), matches the status vector provided by the PE. All static slots, the symbol window, and the NIT status are taken into account. *Dynamic* slots are *excluded*. The internal slot status counting and update timing is shown in the figure below.

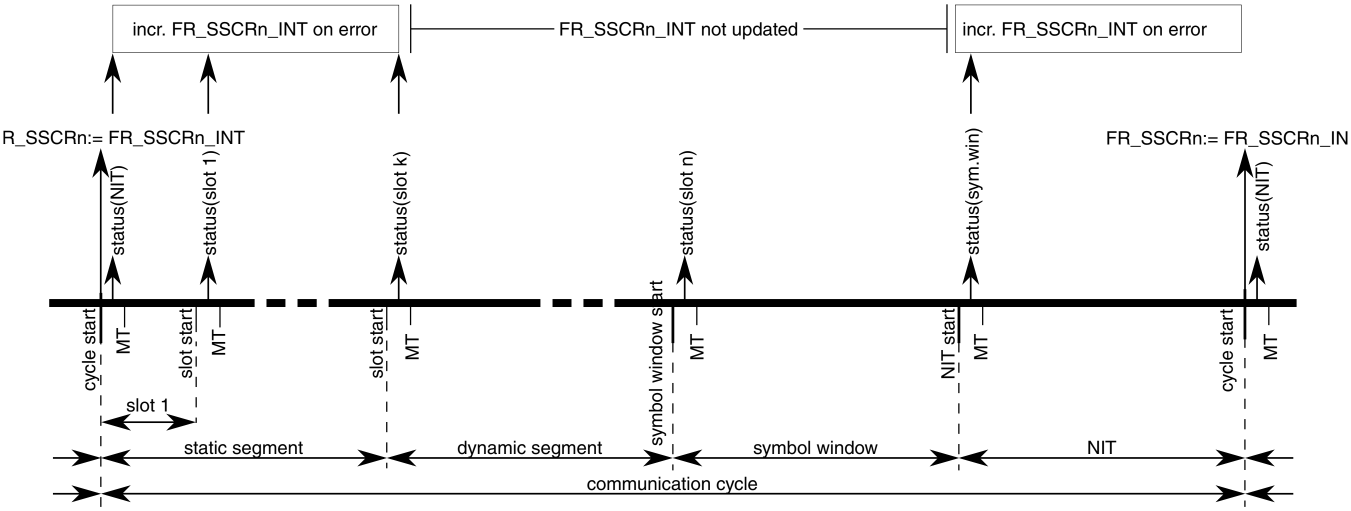

Figure 50-32. Slot Status Counting and FR_SSCRn Update

The PE provides the status of the NIT in the first slot of the next cycle. Due to these facts, the FR_SSCRn register reflects, in cycle n, the status of the NIT of cycle n-2, and the status of all static slots and the symbol window of cycle n-1.

The increment condition for each slot status counter consists of two parts, the frame related condition part and the slot related condition part. The internal slot status counter FR_SSCRn_INT is incremented if at least one of the conditions is fulfilled:

1. frame related condition:

   (FR_SSCCRn[VFR] | FR_SSCCRn[SYF] | FR_SSCCRn[NUF] | FR_SSCCRn[SUF]) // count on frame condition

   = 1;

   and

   ((~FR_SSCCRn[VFR] | vSS!ValidFrame) & // valid frame restriction

   (~FR_SSCCRn[SYF] | vRF!Header!SyFIndicator) & // sync frame indicator restriction

   (~FR_SSCCRn[NUF] | ~vRF!Header!NFIndicator) & // null frame indicator restriction

   (~FR_SSCCRn[SUF] | vRF!Header!SuFIndicator)) // startup frame indicator restriction

   = 1;

Note

> The indicator bits SYF, NUF, and SUF are valid only when a valid frame was received. Thus it is required to set the VFR always, whenever count on frame condition is used.

slot related condition:

((FR_SSCCRn[STATUSMASK[3]] & vSS!ContentError) | // increment on content error

(FR_SSCCRn[STATUSMASK[2]] & vSS!SyntaxError) | // increment on syntax error

(FR_SSCCRn[STATUSMASK[1]] & vSS!BViolation) | // increment on boundary violation

(FR_SSCCRn[STATUSMASK[0]] & vSS!TxConflict)) // increment on transmission conflict

= 1;

If the slot status counter is in single cycle mode, i.e. FR_SSCCRn[MCY] = 0, the internal slot status counter FR_SSCRn_INT is reset at each cycle start. If the slot status counter is in the multicycle mode, i.e. FR_SSCCRn[MCY] = 1, the counter is not reset and incremented, until the maximum value is reached.

50.7.18.5 Message Buffer Slot Status Field

Each individual message buffer and each FIFO message buffer provides a slot status field, which provides the information shown in Table 50-54 for the static/dynamic slot. The update conditions for the slot status field depend on the message buffer type. Refer to the Message Buffer Update Sections in Individual Message Buffer Configuration Data.

50.7.19 System Bus Access

This section provides a description of the system bus accesses failures and the related CC behavior. System bus access failures may occur when the CC transfers data to or from the FlexRay memory area.

The system bus access failure types are described in System Bus Access Failure Types.

The behavior of the CC after the occurrence of a system bus access failure is described in System Bus Access Failure Response.

50.7.19.1 System Bus Access Failure Types

This section describes the two types of system bus access failures.

50.7.19.1.1 System Bus Illegal Address Access

A system bus illegal address access is detected when the CC has used an illegal or invalid address to access the FlexRay system memory area. There are three conditions which are treated as a system bus illegal address access:

- The system bus subsystem detects an CC access to an illegal system memory address.
- The CC detects the usage of an data field offset with the value of 0.
- The CC detects a memory error while reading a data field offset from the CHI LRAM memory (see CHI LRAM Error Response after CC Read).

If a system bus illegal address access is detected, the CC sets the ILSA_EF flag in the CHI Error Flag Register (FR_CHIERFR).

50.7.19.1.2 System Bus Access Timeout

A system bus access timout is detected if an access to the FlexRay memory area is not finished in time. The timeout value is derived from the SYMATOR[TIMEOUT] setting (see Configure System Memory Access Time-Out Register (FR_SYMATOR)).

If a system bus access timout is detected, the CC sets the SBCF_EF flag in the CHI Error Flag Register (FR_CHIERFR).

50.7.19.2 System Bus Access Failure Response

This section describes the two types of behavior of the CC after the occurrence of a system bus access failure. The actual behavior is defined by the SBFF bit in the Module Configuration Register (FR_MCR).

50.7.19.2.1 Continue after System Bus Access Failure

If the SBFF bit in the Module Configuration Register (FR_MCR) is 0, the CC will continue its operation after the occurrence of the system bus access failure, but will not generate any system bus accesses until the start of the next communication cycle.Since no data are read from or written to the FlexRay memory area, no messages are received or transmitted. Consequently, none of the individual message buffers or receive FIFOs will be updated until the next communication cycle starts.

If a frame is under transmission when the system bus failure occurs, a correct frame is generated with the remaining header and frame data are replaced by all zeros. Depending on the point in time this can affect the PPI bit, the Header CRC, the Payload Length in case of an dynamic slot, and the payload data. Starting from the next slot in the current cycle, no frames will be transmitted and received, except for the key slot, where a sync or startup null-frame is transmitted, if the key slot is assigned.

If a frame is received when the system bus failure occurs, the reception is aborted and the related receive message buffer is not updated.

Normal operation is resumed after the start of next communication cycle.

50.7.19.2.2 Freeze after System Bus Access Failure

If the SBFF bit in the Module Configuration Register (FR_MCR) is set to 1, the CC will go into the freeze mode immediately after the occurrence of one of the system bus access failures.

50.7.20 Interrupt Support

The CC provides 108 individual interrupt sources and five combined interrupt sources.

50.7.20.1 Individual Interrupt Sources

Message buffer interrupts are discussed in this section.

50.7.20.1.1 Message Buffer Interrupts

The CC provides 64 message buffer interrupt sources.

Each individual message buffer provides an interrupt flag FR_MBCCSRn[MBIF] and an interrupt enable bit FR_MBCCSRn[MBIE]. The CC sets the interrupt flag when the slot status of the message buffer was updated. If the interrupt enable bit is asserted, an interrupt request is generated.

50.7.20.1.2 FIFO Interrupts

The CC provides 2 FIFO interrupt sources.

Each of the 2 FIFO provides a Receive FIFO Almost Full Interrupt Flag. The CC sets the Receive FIFO Almost Full Interrupt Flags (FR_GIFER[FAFBIF], FR_GIFER[FAFAIF]) in the Global Interrupt Flag and Enable Register (FR_GIFER) if the corresponding Receive FIFO fill level exceeds the defined watermark.

50.7.20.1.3 Wakeup Interrupt

The CC provides one interrupt source related to the wakeup.

The CC sets the Wakeup Interrupt Flag FR_GIFER[WUPIF] when it has received a wakeup symbol on the FlexRay bus. The CC generates an interrupt request if the interrupt enable bit FR_GIFER[WUPIE] is asserted.

50.7.20.1.4 Protocol Interrupts

The CC provides 25 interrupt sources for protocol related events. For details, see Protocol Interrupt Flag Register 0 (FR_PIFR0) and Protocol Interrupt Flag Register 1 (FR_PIFR1). Each interrupt source has its own interrupt enable bit.

50.7.20.1.5 CHI Interrupts

The CC provides 16 interrupt sources for CHI related error events. For details, see CHI Error Flag Register (FR_CHIERFR). There is one common interrupt enable bit FR_GIFER[CHIE] for all CHI error interrupt sources.

50.7.20.2 Combined Interrupt Sources

Each combined interrupt source generates an interrupt request only when at least one of the interrupt sources that is combined generates an interrupt request.

50.7.20.2.1 Receive Message Buffer Interrupt

The Receive Message Buffer Interrupt request is generated when at least one of the individual receive message buffers generates an interrupt request MBXIRQ[n] and the interrupt enable bit FR_GIFER[RBIE] is set.

50.7.20.2.2 Transmit Message Buffer Interrupt

The Transmit Message Buffer Interrupt request is generated when at least one of the individual transmit message buffers generates an interrupt request MBXIRQ[n] and the interrupt enable bit FR_GIFER[TBIE] is asserted.

50.7.20.2.3 Protocol Interrupt

The Protocol Interrupt request is generated when at least one of the individual protocol interrupt sources generates an interrupt request and the interrupt enable bit FR_GIFER[PRIE] is set..

50.7.20.2.4 CHI Interrupt

The CHI Interrupt request is generated when at least one of the individual chi error interrupt sources generates an interrupt request and the interrupt enable bit FR_GIFER[CHIE] is set.

50.7.20.2.5 Module Interrupt

The Module Interrupt request is generated if at least one of the combined interrupt sources generates an interrupt request and the interrupt enable bit FR_GIFER[MIE] is set.

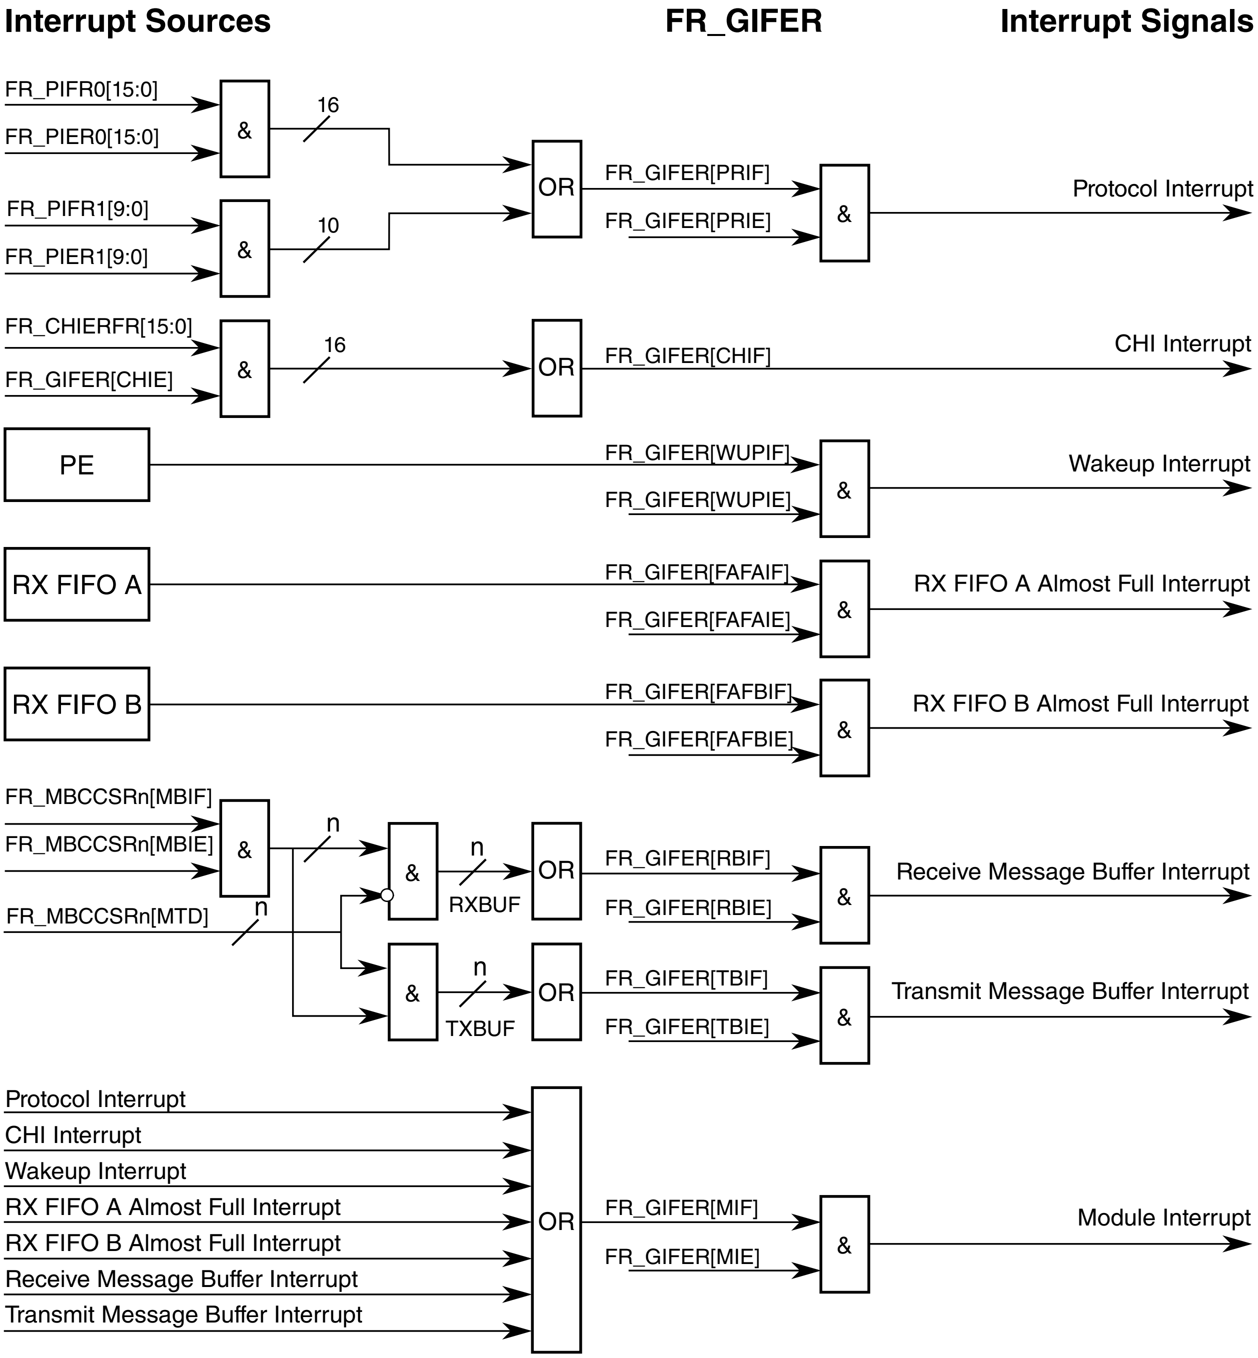

Figure 50-33. Scheme of FR_GIFER interrupt signal generation

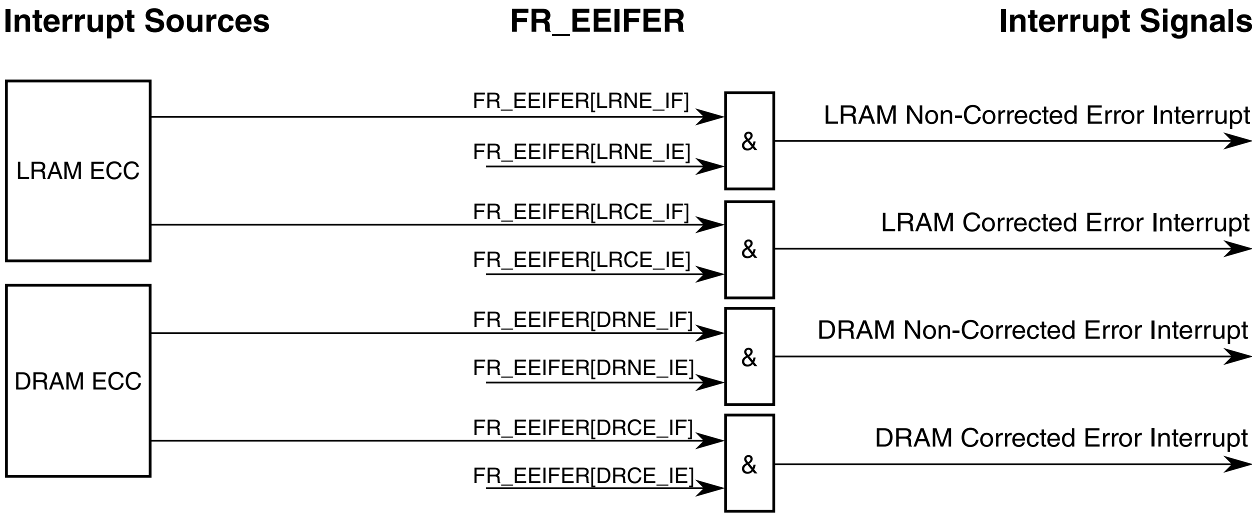

Figure 50-34. Scheme of FR_EEIFER interrupt signal generation

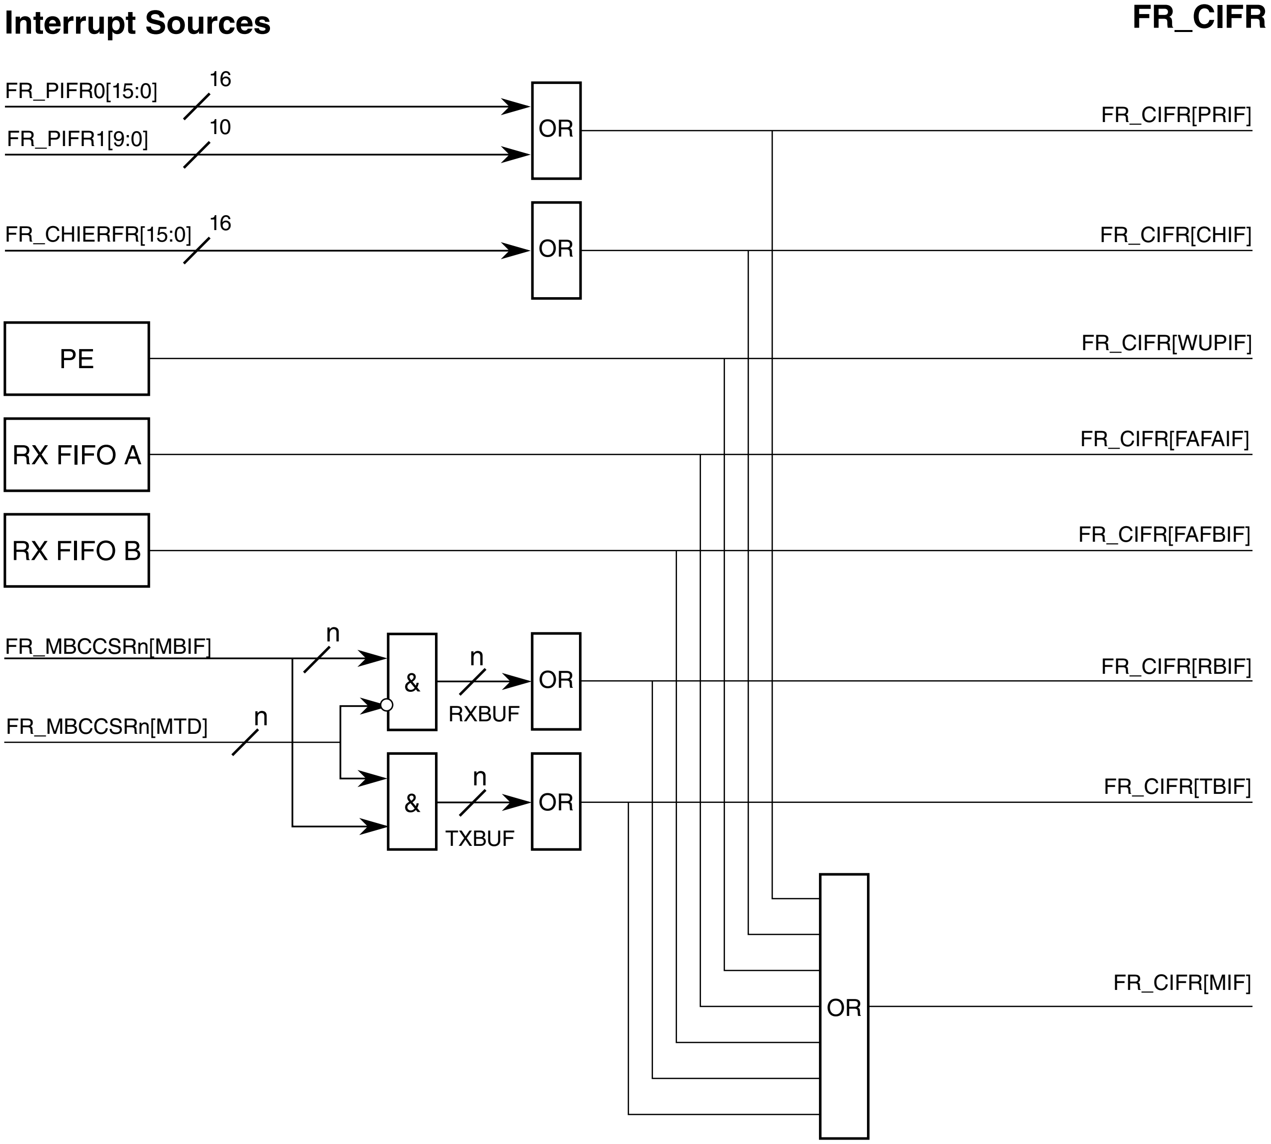

Figure 50-35. Scheme of FR_CIFR flags generation

50.7.21 Lower Bit Rate Support

The CC supports a number of lower bit rates on the FlexRay bus channels. The lower bit rates are implemented by modifying the duration of the microtick *pdMicrotick*, the number of samples per microtick *pSamplesPerMicrotick*, the number of samples per bit *cSamplesPerBit*, and the strobe offset *cStrobeOffset*. The application configures the FlexRay channel bit rate by setting the BITRATE field in the Module Configuration Register (FR_MCR). The protocol values are set internally. The available bit rates, the related BITRATE field configuration settings and related protocol parameter values are shown in the "FlexRay Channel Bit Rate Control" table below.

Table 50-55. FlexRay Channel Bit Rate Control

FlexRay Channel Bit Rate [Mbit/s]	FR_MCR[BITRATE]	pdMicrotick [ns]	gdSampleClockPeriod [ns]	pSamplesPerMicrotick	cSamplesPerBit	cStrobeOffset
10.0	000	25.0	12.5	2	8	5
8.0	011	25.0	12.5	2	10	6
5.0	001	25.0	25.0	1	8	5
2.5	010	50.0	50.0	1	8	5

Note

The bit rate of 8 Mbit/s is not defined by the *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*.

50.7.22 PE Data Memory (PE DRAM)

The PE Data Memory (PE DRAM) is 128 word, 16-bit wide memory with byte access, which contains the program data of the PE internal CPU. The PE DRAM is divided into two banks, 8-bit each. The memory data [7:0] are assigned to BANK0, the memory data [15:8] are assigned to BANK1.

Table 50-56. PE DRAM Layout

ADDR	BANK1	BANK0
0x00	byte1	byte0
0x01	byte3	byte2
…		
0x7F	byte255	byte254

The FlexRay module provides means to access the PE DRAM from the application. The PE DRAM application access is initiated and controlled via PE DRAM Access Register (FR_PEDRAR) and PE DRAM Access Register (FR_PEDRAR). This functionality is used to check the memory error detection.

50.7.22.1 PE DRAM Read Access

A read access from the PE DRAM can be initiated in any protocol state. The following sequence describes a read access from the PE DRAM address 0x70.

1. FR_PEDRAR:= 0x50E0;

   // INST=0x5; ADDR=070
2. wait until FR_PEDRAR[DAD] == 1;

   // wait for end of PE DRAM access
3. val = FR_PEDRDR[DATA];

   // read PE DRAM data

The read access is handled by the PE internal CPU with the lowest execution priority. This may cause an response delay with a maximum of 1000 PE clock cycle (25us).

50.7.22.2 PE DRAM Write Access

A write access into the PE DRAM can be initiated in any protocol state. The following sequence describes a write access to the PE DRAM address 0x70.

1. FR_PEDRDR:= DATA;

   // write value to be written into data register
2. FR_PEDRAR:= 0x30E0;

   // INST=0x3; ADDR=0x70
3. wait until FR_PEDRAR[DAD] == 1;

   // wait for end of PE DRAM access
4. val = FR_PEDRDR[DATA];

   // read back PE DRAM data

The write access is handled by the PE internal CPU with the lowest execution priority. This may causes an response delay with a maximum of 1000 PE clock cycle (25us).

If the conditions given in PE DRAM Write Access Limitations are fulfilled, the data provided in PE DRAM Access Regsiter (FR_PEDRAR) are written into the PE DRAM, read back in the next clock cycle and stored into the PE DRAM Access Register (FR_PEDRAR). Otherwise, data are not written into the PE DRAM and 0x0000 is stored into the PE DRAM Access Register (FR_PEDRAR).

50.7.22.3 PE DRAM Write Access Limitations

The PE DRAM is used by the protocol engine if the module is not in *POC:default config* state. The only address not used by the protocol engine is 0x70. To prevent the corruption of protocol engine data the following PE DRAM write access limitations apply for application writes.

1. When the module is in *POC:default config* state, all PE DRAM addresses are writable.
2. When the module is not *in POC:default config* state, only PE DRAM address 0x70 is writable.

50.7.23 CHI Lookup-Table Memory (CHI LRAM)

The CHI Lookup-Table Memory (CHI LRAM) is an CHI internal memory which contains the message buffer configuration data and the data field offsets for the physical message buffers. The configuration data for two message buffers or 6 data field offsets are contained in one memory row. The CHI LRAM is divided into 6 memory BANKs.

Table 50-57. CHI LRAM Layout

ADR	BANK5	BANK4	BANK3	BANK2	BANK1	BANK0
0x00	FR_MBIDXR1	FR_MBFIDR1	FR_MBCCFR1	FR_MBIDXR0	FR_MBFIDR0	FR_MBCCFR0
0x01	FR_MBIDXR3	FR_MBFIDR3	FR_MBCCFR3	FR_MBIDXR2	FR_MBFIDR2	FR_MBCCFR2
...						
0x1F	FR_MBIDXR63	FR_MBFIDR63	MBCCF63	FR_MBIDXR62	MBFID62	FR_MBCCFR62
0x20	FR_MBDOR5	FR_MBDOR4	FR_MBDOR3	FR_MBDOR2	FR_MBDOR1	FR_MBDOR0
...						
0x2B	-	-	-	-	FR_MBDOR67	FR_MBDOR66
0x2C	FR_LEETR5	FR_LEETR4	FR_LEETR3	FR_LEETR2	FR_LEETR1	FR_LEETR0

50.7.23.1 CHI LRAM Read and Write Access

The CHI LRAM is accessed by the application via regular register read and write accesses.

50.7.24 Memory Content Fault Detection

The FlexRay module provides integrated memory content error detection for both the CHI LRAM and PE DRAM, and memory content error correction for the PE DRAM. The memory error detection for the CHI LRAM uses an standard Hamming code with a Hamming distance of 3 and detects all single-bit and double-bit errors (SEDDED) . The memory error detection and correction for the PE DRAM uses an enhanced Hamming code with a Hamming distance of 4 and detects and corrects all single-bit errors and detects all double-bit errors (SECDED).

This section describes the reporting of the occurrence of memory content errors, the reaction of the module on the occurrence, and how the application can inject memory errors in order to trigger the report and response behavior.

50.7.24.1 Memory Error Types

A memory error is the distortion of one or more bits read out of the memory. The reading of the values of all zeros and all ones is considered as an special case. The FlexRay module detects and indicates the memory errors as shown in the "Detected Memory Error Types" table below. The entries on the top have higher priority.

Each memory read access reads out *all* banks of the addressed row, and runs error detection on *all* banks, even in the case that the application has triggered a read from only one bank. This may lead to the reporting of an memory error if at least one bank contains a memory error, even if an error free bank has been read.

Table 50-58. Detected Memory Error Types

Memory	Priority	Memory Data	Indication
CHI LRAM	0 (highest)	All Zero's	Non-Corrected Error
PE DRAM			Non-Corrected Error
CHI LRAM		All One's	Non-Corrected Error
PE DRAM			
CHI LRAM	1 (lowest)	One Bit Flipped	Non-Corrected Error
PE DRAM			Corrected Error

Table continues on the next page...

Table 50-58. Detected Memory Error Types (continued)

Memory	Priority	Memory Data	Indication
CHI LRAM		Two Bits Flipped	Non-Corrected Error
PE DRAM			
CHI LRAM		Three or more Bits Flipped	one out of {No error, Non-Corrected Error}, defined by coding given in CHI LRAM Checkbits and CHI LRAM Syndrome
PE DRAM			one out of {No error, Corrected Error, Non-Corrected Error}, defined by coding given in PE DRAM Checkbits and PE DRAM Syndrome

50.7.24.2 Memory Error Reporting

The memory error reporting is enabled only if the ECC functionality enable bit ECCE in the Module Configuration Register (FR_MCR) is set.

For each of the two memories exists two sets of internal registers to store the detection of one corrected and one non-corrected memory error.

If a memory error is detected, the module checks whether the related error interrupt flag in the ECC Error Interrupt Flag and Enable Register (FR_EEIFER) is set.

- *If the error interrupt flag is set, the related internal error reporting register is not updated and the related error overflow flag is set to 1 to indicate a loss of error condition.*
- *If the error interrupt flag is not set, the internal reporting register is updated and the error interrupt flag is set to 1. If two or more memory errors of the same type are detected, the error for the bank with the lower bank number will be reported, and the error overflow flag will be set to 1.*

If a memory error is detected for at least two banks of one memory, the related error overflow flag is set to 1 to indicate a loss of error condition.

In addition to above the Error indications (corrected / non corrected) along with the failing address is sent out from the module for external error logging and corrective actions by the Software.

50.7.24.2.1 PE DRAM Checkbits

The coding of the checkbits reported in ECC Error Report Code Register (FR_EERCR) for PE DRAM memory errors is shown in Table 50-58. This table shows the implemented enhanced Hamming code. If the error injection was applied to distort the checkbits, then the distorted checkbits are reported.

Table 50-59. PE DRAM checkbits coding

CODE	CODE				DATA							
	3	2	1	0	7	6	5	4	3	2	1	0
4[1]	X	X	X	X	X	X	X	X	X	X	X	X
3[2]	-	-	-	-	X	X	X	X	-	-	-	-
2	-	-	-	-	X	-	-	-	X	X	X	-
1	-	-	-	-	-	X	X	-	X	X	-	X
0	-	-	-	-	-	X	-	X	X	-	X	X

[1] The checkbit CODE[4] is set to 1 if and only if there is a even number of 1's in columns with X.

[2] The checkbits CODE[3]… CODE[0] are set to 1 if and only if there is a odd number of 1's in all columns with X.

This coding of the checkbit ensures that neither 0x000 nor 0xFFF are valid code words and written into the memory.

50.7.24.2.2 PE DRAM Syndrome

The coding of the syndrome reported in ECC Error Report Code Register (FR_EERCR) for PE DRAM memory errors is shown in the following table.

Table 50-60. FR_EERCR[CODE] PE DRAM Syndrome Coding

FR_EERCR[CODE]		Description
[4]	[3:0]	
0x1	0x0	No Error (Never appears in error report registers)
0x0	0x0	If data == 0: Non Corrected Error (Dedicated Handling of All Zero Code Word) If data!= 0: Corrected Error (Parity Bit 4)
0x0	0x1	Corrected Error (Parity Bit 0)
0x0	0x2	Corrected Error (Parity Bit 1)
0x0	0x3	Corrected Error (Data Bit 0)
0x0	0x4	Corrected Error (Parity Bit 2)
0x0	0x5	Corrected Error (Data Bit 1)
0x0	0x6	Corrected Error (Data Bit 2)
0x0	0x7	Corrected Error (Data Bit 3)
0x0	0x8	Corrected Error (Parity Bit 3)
0x0	0x9	Corrected Error (Data Bit 4)

Table continues on the next page...

Table 50-60. FR_EERCR[CODE] PE DRAM Syndrome Coding (continued)

FR_EERCR[CODE]		Description
[4]	[3:0]	
0x0	0xA	Corrected Error (Data Bit 5)
0x0	0xB	Corrected Error (Data Bit 6)
0x0	0xC	Corrected Error (Data Bit 7)
0x0	0xD-0xF	Non-Corrected Error
0x1	0x1-0xF	Non-Corrected Error

50.7.24.2.3 CHI LRAM Checkbits

The coding of the checkbits reported in ECC Error Report Code Register (FR_EERCR) for CHI LRAM memory errors is shown in the table below. This table shows the implemented Hamming code. If the error injection was applied to distort the checkbits, then the distorted checkbits are reported.

Table 50-61. CHI LRAM checkbits coding

CODE[1]	DATA															
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
4	X	X	X	X	X	-	-	-	-	-	-	-	-	-	-	-
3	-	-	-	-	-	X	X	X	X	X	X	X	-	-	-	-
2	X	X	-	-	-	X	X	X	X	-	-	-	X	X	X	-
1	-	-	X	X	-	X	X	-	-	X	X	-	X	X	-	X
0	X	-	X	-	X	X	-	X	-	X	-	X	X	-	X	X

[1] The checkbit CODE[n] is set to 1 if and only if there is a odd number of 1's in all columns with X.

50.7.24.2.4 CHI LRAM Syndrome

The coding of the syndrome reported in ECC Error Report Code Register (FR_EERCR) for CHI LRAM memory errors is shown in the next table.

Table 50-62. FR_EERCR[CODE] CHI LRAM Syndrome Coding

FR_EERCR[CODE]	Description
0x00	No Error (Never appears in error report registers)
0x01-0x1F	Non Corrected Error

50.7.24.3 Memory Error Response

The memory error response is enabled only when the ECC functionality enable bit ECCE in the Module Configuration Register (FR_MCR) is set.

In case of the detection of a *corrected* memory error, the FlexRay module continues its normal operation using the corrected data word. This section describes the behavior of the FlexRay module after the detection of a *non-corrected* memory error.

50.7.24.3.1 CHI LRAM Error Response after CC Read

When the CC is out of the *POC:default config* state, it reads the configuration data and the data field offsets of all utilized message buffers in every slot and in the NIT. If a non-corrected memory error is detected during this module read access the error response of the module depends from LRAM location where the error occurred.

- *If the LRAM address belongs to physical message buffer configuration data the FlexRay module will consider the affected message buffer as disabled for the current search and will exclude this buffer from the search. The configuration of the affected message buffer is not changed.*

  If the affected message buffer is a tx message buffer, no frame will be transmitted from this message buffer in the next slot. If the affected message buffer is a rx message buffer, no frame will be received to this message buffer in the next slot.
- *If the LRAM address belongs to the data field offset area and the related physical message buffer is used for Rx or Tx the first access to the system memory caused by payload read or write yields to the assertion of the FR_CHIERFR[ILSA_EF]. No memory access occurs w.r.t. payload access is performed for the complete frame.*

50.7.24.3.2 CHI LRAM Error Response after Application Read

The application can read the content of the CHI LRAM via reading the FR_MBCCFRn, FR_MBFIDRn, FR_MBIDXRn, FR_MBDORn, and FR_LEETRn registers. If a non-corrected memory error is detected during this kind of read access, the module indicates the detected memory error, delivers the non-corrected data read and continues its normal operation.

50.7.24.3.3 PE DRAM Error Response after CC Read

If the CC detects an non-corrected memory error during internal read of program data which is contained in PE DRAM, this is considered as an fatal protocol error and the module enters the protocol freeze state immediately.

50.7.24.3.4 PE DRAM Error Response after Application Read in *POC:default config* state

If the CC detects an non-corrected memory error during an application triggered read from any PE DRAM address and the protocol is in the *POC:default config* state, this is considered as an fatal protocol error and the module enters the protocol freeze state. This behavior allows for checking the freeze functionality in case of the detection of non-corrected errors.

50.7.24.3.5 PE DRAM Error Response after Application Read out of *POC:default config*

If the CC detects an non-corrected memory error during an application triggered read from any PE DRAM address, and the protocol is not in the *POC:default config* state, this error is not considered as an fatal error and the protocol state is not changed. This prevents any interference of the running protocol by PE DRAM error injection reads.

50.7.25 Memory Fault Injection

The error injection functionality is used by the application to inject data errors into the memories to trigger and check the memory error detection functionality.

The error injection is enabled only if the ECC functionality enable bit ECCE in the Module Configuration Register (FR_MCR) and the error injection enable control bit EIE in the ECC Error Report and Injection Control Register (FR_EERICR) are set.

The error injection mode is configured by the EIM configuration bit in the ECC Error Report and Injection Control Register (FR_EERICR).

When the error injection is enabled, each write access to the configured memory location will be distorted.

The injector has the same behavior for FlexRay module memory writes and application memory writes.

50.7.25.1 CHI LRAM Error Injection

The following sequence describes an memory error injection sequence for the CHI LRAM memory. This sequence consists of the setup of the error injector followed by an application triggered write access to provoke an distortion of the memory content. The content of the CHI LRAM is described in Table 50-57.

When the CC is in *POC:default config*, there are no limitations for the error injection and no impacts of error injection to the application. For error injection out of *POC:default config* see Memory Fault Injection out of POC:default config.

Injector Setup:

1. FR_MCR[ECCE]:= 1;

   // enable ECC functionality
2. FR_EERICR[EIE]:=I_MODE;

   // configure error injection mode
3. FR_EEIAR[MID]:= 1;

   // select CHI LRAM for error injection
4. FR_EEIAR[BANK]:= I_BANK;

   // select bank for error injection; I_BANK = {0,1,2,3,4,5}
5. FR_EEIAR[ADDR]:= I_ADDR;

   // select address for error injection; I_ADDR <= 0x 2C
6. FR_EEIDR[DATA]:= D_DIST;

   // define data distortion pattern
7. FR_EEICR[CODE]:= C_DIST;

   // define checkbit distortion pattern
8. FR_EERICR[EIE]:=1;

   // enable error injection

Application Write Access:

If (I_BANK==0) -> FR_MBCCFR(2n) / FR_MBDOR(6k) / FR_LEETR0 := DATA;

If (I_BANK==1) -> FR_MBFIDR(2n) / FR_MBDOR(6k+1) / FR_LEETR1 := DATA;

If (I_BANK==2) -> FR_MBIDXR(2n) / FR_MBDOR(6k+2) / FR_LEETR2 := DATA;

If (I_BANK==3) -> FR_MBCCFR(2n+1) / FR_MBDOR(6k+3) / FR_LEETR3 := DATA;

If (I_BANK==4) -> FR_MBFIDR(2n+1) / FR_MBDOR(6k+4) / FR_LEETR4 := DATA;

If (I_BANK==5) -> FR_MBIDXR(2n+1) / FR_MBDOR(6k+5) / FR_LEETR5 := DATA;

// write DATA to the defined injection bank and injection address (see Table 50-57).

50.7.25.2 PE DRAM Error Injection

The following sequence describes an memory error injection sequence for the PE DRAM memory. This sequence consists of the setup of the error injector followed by an application triggered write access to provoke an distortion of the memory content.

When the FlexRay module is in *POC:default config*, there are no limitations for the error injection and no impacts of error injection to the application. For error injection out of *POC:default config* see PE DRAM Error Injection out of POC:default config.

Injector Setup:

1. FR_MCR[ECCE]:= 1;

   // enable ECC functionality
2. FR_EERICR[EIE]:=I_MODE;

   // configure error injection mode
3. FR_EEIAR[MID]:= 0;

   // select PE DRAM for error injection
4. FR_EEIAR[BANK]:= I_BANK;

   // define bank for error injection; I_BANK = {0,1}
5. FR_EEIAR[ADDR]:= I_ADDR;

   // define address for error injection; I_ADDR <= 0x7F
6. FR_EEIDR[DATA]:= D_DIST;

   // define data distortion pattern
7. FR_EEICR[CODE]:= C_DIST;

   // define checkbit distortion pattern
8. FR_EERICR[EIE]:=1;

   // enable error injection

Application Write Access (e.g. I_ADDR=0x70):

1. FR_PEDRAR:= 0x30E0;

   // INST=0x3; ADDR=0x70

2. wait until FR_PEDRAR[DAD] == 1;

   // wait for end of PE DRAM access

3. val = FR_PEDRDR[DATA]; |

   // get read back PE DRAM data

Note

> The write access to the PE DRAM triggers an subsequent read access from PE DRAM in the next cycle, which triggers the detection of the distorted data.

50.8 Application Information

Module operation is discussed in this section.

50.8.1 Module Configuration

This section describes essential parts of the module configuration.

50.8.1.1 Configure System Memory Access Time-Out Register (FR_SYMATOR)

To ensure reliable operation of the CC, the application must ensure that the TIMEOUT value in System Memory Access Time-Out Register (FR_SYMATOR) and the CHI clock frequency f_{CHI} in MHz fulfill this equation[1] :

$$0 \leq \mathrm{SYMATOR}\left[\mathrm{TIMEOUT}\right] \leq \left\lfloor 0.45 \bullet f_{\mathrm{CHI}} - 8 \right\rfloor$$

Equation 48

[1] See Controller Host Interface Clocking for all constraints of minimum CHI clock frequency.

For a given SYMATOR[TIMEOUT] value, f_{CHI} can be increased without causing unreliable operation of the CC. The same holds for reducing the SYMATOR[TIMEOUT] value for a given f_{CHI}.

Some examples for maximum values of the SYMATOR[TIMEOUT] for a minimum CHI frequency are given in the table below.

Table 50-63. Maximum SYMATOR[TIMEOUT] examples

f_{CHI}	SYMATOR[TIMEOUT]	f_{CHI}	SYMATOR[TIMEOUT]
>= 18 MHz	0	>= 100 MHz	<= 37
>= 23 MHz	<= 2	>= 120 MHz	<= 46
>= 27 MHz	<= 4	>= 140 MHz	<= 55
>= 32 MHz	<= 6	>= 160 MHz	<= 64
>= 60 MHz	<= 19	>= 180 MHz	<= 73
>= 80 MHz	<= 28	>= 200 MHz	<= 82

50.8.1.1.1 System Bus Wait State Constraints

The SYMATOR[TIMEOUT] value corresponds directly to a certain acceptable number of wait states on the system bus.

For single channel configurations and if the sync frame table generation functionality is *not* used (FR_SFTCCSR[SDVEN,SIDEN] = 0) no timeout will be detected if less than 2 × SYMATOR[TIMEOUT]+1 wait states will be seen on the system bus for each system bus access.

For dual channel configurations, or if the sync frame table generation functionality is used, no timeout will be detected if less than SYMATOR[TIMEOUT]-1 wait states will be seen on the system bus for each system bus access.

50.8.1.2 Configure Data Field Offsets

The data field offsets are located in the Message Buffer Data Field Offset Registers (FR_MBDORn) and Receive FIFO Start Data Offset Register (FR_RFSDOR). The application has to configure the data field offset values for all message buffers which are used.

When the module is enabled, the initilization value of the FR_MBDORn[MBDO] and FR_RFSDOR[SDO] is 0. This value is considered to be illegal (see System Bus Illegal Address Access).

50.8.2 Initialization Sequence

This section describes the required steps to initialize the CC. The first subsection describes the steps required after a module reset, the second section describes the steps required after preceding shutdown of the CC.

50.8.2.1 Module Initialization

This section describes the module related initialization steps after a system reset.

1. Configure CC.
   a. configure the control bits in the Module Configuration Register (FR_MCR)
   b. configure the system memory base address in System Memory Base Address Register (FR_SYMBADR)
2. Enable the CC.
   a. write 1 to the module enable bit MEN in the Module Configuration Register (FR_MCR)

The CC now enters the Normal Mode. The application can commence with the protocol initialization described in Protocol Initialization.

50.8.2.2 Protocol Initialization

This section describes the protocol related initialization steps.

1. Configure the Protocol Engine.
   a. issue CONFIG command via Protocol Operation Control Register (FR_POCR)
   b. wait for *POC:config* in Protocol Status Register 0 (FR_PSR0)
   c. configure the FR_PCR0,…, FR_PCR30 registers to set all protocol parameters
2. Configure the Message Buffers and FIFOs.
   a. set the number of message buffers used and the message buffer segmentation in the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR)

b. define the message buffer data size in the Message Buffer Data Size Register (FR_MBDSR)

c. configure each message buffer by setting the configuration values in the Message Buffer Configuration, Control, Status Registers (FR_MBCCSRn), Message Buffer Cycle Counter Filter Registers (FR_MBCCFRn), Message Buffer Frame ID Registers (FR_MBFIDRn), Message Buffer Index Registers (FR_MBIDXRn)

d. configure the FIFOs

e. issue CONFIG_COMPLETE command via Protocol Operation Control Register (FR_POCR)

f. wait for *POC:ready* in Protocol Status Register 0 (FR_PSR0)

After this sequence, the CC is configured as a FlexRay node and is ready to integrate into the FlexRay cluster.

50.8.2.3 CHI LRAM Initialization

The initialization of the CHI LRAM is performed by the CC when it leaves the Disabled Mode. The unitization runs for 45 CHI clock cycles. All fields in the FR_MBCCSRn, FR_MBCCFRn, FR_MBFIDRn, FR_MBDORn, and LEETRn registers are initialized to 0. All application read or write accesses to these registers are delayed until the initialization is finished.

50.8.2.4 PE DRAM Initialization

The PE DRAM initialization is performed by the CC in the *POC:default config* state. This initialization runs for 4.8 μs, and will delay the state transition from *POC:default config* into *POC:config*.

50.8.3 Memory Fault Injection out of POC:default config

This section provides information for application driven memory fault injection out if *POC:default config*. The CC provides means to inject memory faults from the application without any impacts to the internal protocol operation of the CC.

50.8.3.1 CHI LRAM Error Injection out of POC:default config

The CC will never perform any internal read access from the LRAM ECC Error Test Registers (FR_LEETRn). Any memory errors injected into these CHI LRAM locations will never be detected by internal access, independent from the protocol state.

The application should use these registers and related CHI LRAM location to inject memory errors into the CHI LRAM. The injection sequence is described in CHI LRAM Error Injection.

50.8.3.2 PE DRAM Error Injection out of POC:default config

The CC will never perform any internal read access from the PE DRAM address 0x70. This is the only one PE DRAM address writable by the application out of the *POC:default config* state.

The application should use these PE DRAM location to inject memory errors into the PE DRAM. The injection sequence is described in PE DRAM Error Injection.

50.8.4 Shut Down Sequence

This section describes a secure shut down sequence to stop the CC gracefully. The main targets of this sequence are

- *finish all ongoing reception and transmission*
- *do not corrupt FlexRay bus and do not disturb ongoing FlexRay bus communication*

For a graceful shutdown the application shall perform the following tasks:

1. Disable all enabled message buffers.
    a. repeatedly write 1 to FR_MBCCSRn[EDT] until FR_MBCCSRn[EDS] == 0.
2. Stop Protocol Engine.
    a. issue HALT command via Protocol Operation Control Register (FR_POCR)
    b. wait for *POC:halt* in Protocol Status Register 0 (FR_PSR0)

50.8.5 Number of Usable Message Buffers

This section describes the required minimum CHI clock frequency for a specified number of utilized message buffers configured in the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR), a configured mini-slot length *gdMinislot*, and a configured nominal macrotick length *gdMacrotick*[1].

Additional constraints for the minimum CHI clock frequency are given in Controller Host Interface Clocking.

The CC uses a sequential search algorithm to determine the individual message buffer assigned or subscribed to the next slot. This search is started at the start of slot and must be finished before the start of the next slot.

The shortest FlexRay slot is a corrected empty dynamic slot. An corrected empty dynamic slot is a mini-slot and consists of gdMinislot corrected macroticks with a duration of *gdMacrotick*. The minimum duration of an corrected macrotick is $gdMacrotick_{\text{min}}$ = 39 μT. This results in a minimum length of an correct slot

$$\Delta_{\text{slotmin}} = 39 \bullet \text{pdMicrotick} \bullet \text{gdMinislot}$$

Equation 49

The message buffer search engine runs on the CHI clock and evaluates one individual message buffer per CHI clock cycle. For internal status update operations and to account for clock domain crossing jitter, an additional amount of 27 CHI clock cycles is required to ensure correct search engine operation.

For a given number of utilized message buffers FR_MBSSUTR[LAST_MB_UTIL] + 1 and for a given CHI clock frequency f_{chi}, this results in a search duration of

$$\Delta_{\text{search}} = \frac{1}{f_{\text{chi}}} \bullet (\text{FR\_MBSSUTR}[\text{LAST\_MB\_UTIL}] + 27)$$

Equation 50

The message buffer search must be finished within one slot which requires fulfillment of this equation::

$$\Delta_{\text{search}} \leq \Delta_{\text{slotmin}}$$

Equation 51

This results in the formula given below which determines the required minimum CHI frequency for a given number of message buffers that are utilized.

[1] See Controller Host Interface Clocking for all constraints of minimum CHI clock frequency.

$$f_{\text{chi}} \geq \frac{(\text{FR\_MBSSUTR}[\text{LAST\_MB\_UTIL}]+27)}{39 \bullet \text{pdMicrotick} \bullet \text{gdMinislot}}$$

Equation 52

The required minimum CHI Clock frequency for a selected set of relevant protocol parameters and for the LAST_MB_UTIL field in the Message Buffer Segment Size and Utilization Register (FR_MBSSUTR) set to 63 is given in the following table.

Table 50-64. Minimum fchi [MHz] examples (64 message buffers used)

pdMicrotick [ns]	***gdMinislot***					
	2	**3**	**4**	**5**	**6**	**7**
25.0	46.7	31.2	23.4	18.7	15.6	13.4
50.0	23.4	15.6	11.7	9.4	7.8	6.7

Note

If the minimum CHI frequency is not met the CHIERFR[MBS_EF] flag is set. Refer to the CHI Error Flag Register (FR_CHIERFR) for details.

50.8.6 Protocol Control Command Execution

This section considers the issues of the protocol control command execution.

The application issues any of the protocol control commands listed in the POCCMD field of the FR_POCR Field Descriptions table, located in the Register Descriptions section, by writing the command to the POCCMD field of the Protocol Operation Control Register (FR_POCR). As a result the CC sets the BSY bit while the command is transferred to the PE. When the PE has accepted the command, the BSY flag is cleared. All commands are accepted by the PE.

The PE maintains a protocol command vector. For each command that was accepted by the PE, the PE sets the corresponding command bit in the protocol command vector. If a command is issued while the corresponding command bit is set, the command is not queued and is lost.

If the command execution block of the PE is idle, it selects the next accepted protocol command with the highest priority from the current protocol command vector according to the protocol control command priorities given in the next table. If the current protocol state does not allow the execution of this protocol command (see POC state changes in *FlexRay Communications System Protocol Specification, Version 2.1 Rev A*) the CC asserts the illegal protocol command interrupt flag IPC_IF in the Protocol Interrupt Flag Register 1 (FR_PIFR1). The protocol command is not executed in this case.

Some protocol commands may be interrupted by other commands or the detection of a fatal protocol error as indicated by the table below. If the application issues the FREEZE or READY command, or if the PE detects a fatal protocol error, some commands already stored in the command vector will be removed from this vector.

Table 50-65. Protocol Control Command Priorities

Protocol Command	Priority	Interrupted By	Cleared and Terminated By
FREEZE	(highest) 1	none	
READY	2		
CONFIG_COMPLETE	3		
ALL_SLOTS	4	FREEZE, READY, CONFIG_COMPLET, fatal protocol error	FREEZE, READY, CONFIG_COMPLETE,fatal protocol error
ALLOW_COLDSTART	5		
RUN	6		FREEZE, fatal protocol error
WAKEUP	7		FREEZE, fatal protocol error
DEFAULT_CONFIG	8		FREEZE, fatal protocol error
CONFIG	9		
HALT	(lowest) 10		FREEZE, READY, CONFIG_COMPLETE,fatal protocol error

50.8.7 Message Buffer Search On Simple Message Buffer Configuration

This sections describes the message buffer search behavior for a simplified message buffer configuration. The FIFO behavior is not considered in this section.

50.8.7.1 Simple Message Buffer Configuration

A simple message buffer configuration is a configuration that has at most one transmit message buffer and at most one receive message buffer assigned to a slot *S*. The simple configuration used in this section utilizes two message buffers, one single buffered transmit message buffer and one receive message buffer.

The transmit message buffer has the message buffer number *t* and has following configuration

Table 50-66. Transmit Buffer Configuration

Register	Field	Value	Description
FR_MBCCSR*t*	MTD	1	transmit buffer

Table continues on the next page...

Table 50-66. Transmit Buffer Configuration (continued)

Register	Field	Value	Description
FR_MBCCFR*t*	MTM	0	event transition mode
	CHA	1	assigned to channel A
	CHB	0	not assigned to channel B
	CCFE	1	cycle counter filter enabled
	CCFMSK	000011	cycle set = {4n} = {0,4,8,12,…}
	CCFVAL	000000	
FR_MBFIDR*t*	FID	*S*	assigned to slot S

The availability of data in the transmit buffer is indicated by the commit bit FR_MBCCSRt[CMT] and the lock bit FR_MBCCSRt[LCKS].

The receive message buffer has the message buffer number r and has following configuration

Table 50-67. Receive Buffer Configuration

Registe*r*	Field	Value	Description
FR_MBCCSR*r*	MTD	0	receive buffer
FR_MBCCFR*r*	MTM	-	n/a
	CHA	1	assigned to channel A
	CHB	0	not assigned to channel B
	CCFE	1	cycle counter filter enabled
	CCFMSK	000001	cycle set = {2n} = {0,2,4,6,…}
	CCFVAL	000000	
FR_MBFIDR*r*	FID	*S*	subscribed slot

Furthermore the assumption is that both message buffers are enabled (FR_MBCCSRt[EDS] = 1 and FR_MBCCSRr[EDS] = 1)

Note

The cycle set {4n+2} = {2,6,10,…} is assigned to the receive buffer only.

The cycle set {4n} = {0,4,8,12,…} is assigned to both buffers.

50.8.7.2 Behavior in static segment

In this case, both message buffers are assigned to a slot *S* in the *static* segment.

The configuration of a transmit buffer for a static slot *S* assigns this slot to the node as a transmit slot. The FlexRay protocol requires:

- When a slot occurs, if the slot is assigned to a node on a channel that node must transmit either a normal frame or a null frame on that channel. Specifically, a null frame will be sent if there is no data ready, or if there is no match on a transmit filter (cycle counter filtering, for example).

Regardless of the availability of data and the cycle counter filter, the node will transmit a frame in the static slot *S*. In any case, the result of the message buffer search will be the transmit message buffer *t*. The receive message buffer *r* will not be found, no reception is possible.

50.8.7.3 Behavior in dynamic segment

In this case, both message buffers are assigned to a slot *S* in the *dynamic* segment. The FlexRay protocol requires:

- When a slot occurs, if a slot is assigned to a node on a channel that node only transmits a frame on that channel if there is data ready and there is a match on relevant transmit filters (no null frames are sent).

The transmission of a frame in the dynamic segment is determined by the availability of data and the match of the cycle counter filter of the transmit message buffer.

50.8.7.3.1 Transmit Data Not Available

If transmit data are *not available*, i.e. the transmit buffer is not committed FR_MBCCSR*t*[CMT]=0 and/or locked FR_MBCCSR*t*[LCKS]=1,

1. for the cycles in the set {4n}, which is assigned to both buffers, the receive buffer will be found and the node can receive data, and
2. for the cycles in the set {4n+2}, which is assigned to the receive buffer only, the receive buffer will be found and the node can receive data.

The receive cycles are shown in the following figure.

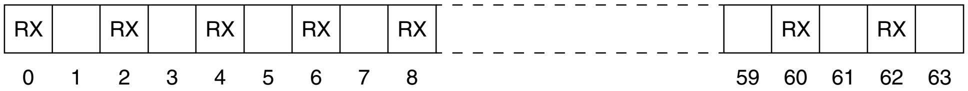

Figure 50-36. Transmit Data Not Available

50.8.7.3.2 Transmit Data Available

If transmit data are *available*, i.e. the transmit buffer is committed FR_MBCCSR*t*[CMT]=1 and not locked FR_MBCCSR*t*[LCKS]=0,

1. for the cycles in the set {4n}, which is assigned to both buffers, the transmit buffer will be found and the node transmits data.
2. for the cycles in the set {4n+2}, which is assigned to the receive buffer only, the receive buffer will be found and the node can receive data.

The receive and transmit cycles are shown in the following figure.

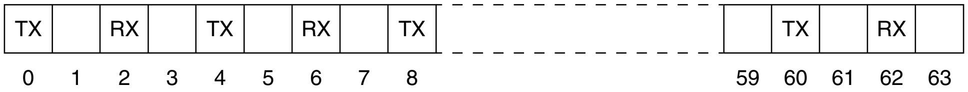

Figure 50-37. Transmit Data Available

Chapter 51
SENT Receiver (SRX)

51.1 Introduction

NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The Single Edge Nibble Transmission (SENT) Receiver (SRX) module is a multi-channel receiver for receiving serial data frames which are being transmitted by a sensor implementing the SENT encoding scheme and present them to the CPU for further processing.

This module is based on the SAE J2716 information report titled "SENT - Single Edge Nibble Transmission for Automotive Applications" and released on January 27, 2010 (http://www.sae.org), Apr2007 and Feb2008. As per this standard, the SENT protocol is intended for use in applications where high resolution sensor data needs to be communicated from a sensor to an Engine Control Unit (ECU). It is intended as a replacement for the lower resolution methods of 10 bit A/Ds and PWM and as a simpler low-cost alternative to CAN or LIN. The implementation assumes that the sensor is a smart sensor containing a microprocessor or dedicated logic device (ASIC) to create the signal.

The SENT encoding scheme is a unidirectional communications scheme from the sensor / transmitting device to the controller /receiving device which does not include a coordination signal from the controller/receiving device. The sensor signal is transmitted as a series of pulses with data encoded as falling to falling edge periods.

51.1.1 Features

The SENT receiver module has the following features:

- The number of SENT channels supported are device-specific. See the device configuration details.
- Unified message read logic to transfer all messages received to system memory via interrupts or DMA
  - Programmable option per channel to support reading of messages via DMA or Interrupt
  - Internal round robin arbitration sequencer to loop across channels to read messages from each channel leaving CPU/DMA transparent to this process
  - A FIFO for storing the received Fast Messages from all channels that are to be read out via DMA. FIFO depth is device-specific. See the device configuration section for details.
  - All received messages are stored excluding the synchronization pulse (for Fast messages) and identifiers (for Slow Serial Messages)
  - Separate buffers for storing Fast and Slow Serial Messages
  - Separate DMA and Interrupts generated for Fast and Slow Serial Messages
- Supports compensation for variation in SENT Tx Clock up to ±25% and adjusts its measurement for drift in the Transmitter and Receiver clocks per channel
  - Calibration pulse correction factor per channel is available for use by software
- Implements for each channel all receiver diagnostics as specified by the SAE Specifications
- Internal 4-bit CRC calculator that can be configured to compute CRC in both Legacy and Recommended method (as given in SAE SENT Specification) for both Fast and Short Serial Message per channel
- Internal 6-bit CRC calculator for Enhanced Serial Messages per channel
- Supports all bit rates by having per channel configurable Rx clock periods from 3 µs to 90 µs
- Support for configurable number of data nibbles per channel
- Option to disable individual channel via programmable control bit
- Time stamping on start of each valid message (i.e. without errors) across all channels. This time stamp is appended to each message for synchronization of messages and for application to understand how much time has elapsed between successive sensor readings

- Support for pause pulse per channel. This can be enabled by programming a bit in the control register for that channel
- Input Programmable Filter on each channel to filter any glitches on input. This filter duration is programmable by the user software.
- 32-bit register interface for programming the module's registers and reading the received messages
- Works on two clocks, one for accurate receive operations (high frequency receiver clock or protocol clock) and other for message read logic (system bus clock) and the module can work irrespective of the frequency relationship between the two clocks. See Clocks and resets for more details on the clocks.

51.1.2 Modes of operation

Modes of operation.

51.1.2.1 Debug mode

In debug mode, message reception will be halted (without waiting for the current message being received to be completed) and all existing status and messages will be retained. DBG_FRZ bit is required to be set for this mode. On debug exit, a calibration length error (CAL_LEN_ERR) can be reported and the channels will start receiving messages from a valid calibration pulse.

51.1.2.2 Low power modes

SENT Receiver behavior is affected by chip-specific low power modes (for example, STOP or WAIT modes). These low power modes should either gate-off both the system bus clock and the protocol clocks or reduce their frequencies, depending on the application.

On exiting from these low power modes, calibration length error (CAL_LEN_ERR) can get set in channel status registers as the SENT sensor (transmitter) could be in the middle of a message transmission at that point. Thus, software should clear all error status bits after exiting the low power modes.

Modes where both system bus clock and protocol clock are gated: In this case, both message reception and interrupt / DMA request generation will halt. The internal receiver channels will freeze (since clock is not there) and will not receive any messages. Messages which are completely received before entering the low power mode can be read after the low power mode exit.

Modes where frequency of system bus clock is changed: For reduced power consumption the system bus clock can be reduced but not below a minimum value (See System bus clock requirements) to avoid overflow of received messages. Protocol clock should not go below the minimum value (See High frequency receiver clock (protocol clock) requirements) for accurate receive operations.

Note

Gating of clocks in the low power mode is chip-specific, see the chapter that refers how the modules behave in low power modes.

NOTE

If the SOC requests entry to debug or stop mode, the message being received currently is discarded and the SOC enters debug/ stop mode immediately. This does not affect the messages received completely prior to entering debug mode and will still be present on the message buffer and registers until they are read out.

NOTE

The message read registers [Channel ‘n' Fast Message Data Read Register (n = 0 to (CH-1)) (CHn_FMSG_DATA), Channel ‘n' Fast Message CRC Read Register (n = 0 to (CH-1)) (CHn_FMSG_CRC), Channel ‘n’ Fast Message Time Stamp Read Register (n = 0 to (CH-1)) (CHn_FMSG_TS), Channel ‘n’ Serial Message Read Register (Bit 3) (n = 0 to (CH-1)) (CHn_SMSG_BIT3), Channel ‘n’ Serial Message Read Register (Bit 2) (n = 0 to (CH-1)) (CHn_SMSG_BIT2), Channel ‘n’ Serial Message Time Stamp Read Register (n = 0 to (CH-1)) (CHn_SMSG_TS), DMA Fast Message Data Read Register (DMA_FMSG_DATA), DMA Fast Message CRC Read Register (DMA_FMSG_CRC), DMA Fast Message Time Stamp Read Register (DMA_FMSG_TS), DMA Slow Serial Message Bit3 Read Register (DMA_SMSG_BIT3), DMA Slow Serial Message Bit2 Read Register (DMA_SMSG_BIT2) and

DMA Slow Serial Message Time Stamp Read Register (DMA_SMSG_TS)] will appear to lose their contents in the following conditions:

- The very first message is being received but not yet completely received and the MCU enters debug or freeze mode, the current message reception will get discarded and message read registers (as mentioned above) will read zeros
- Auto clear functionality is enabled (GBL_CTRL[FAST_CLR] = 1). In this case, when first message is read, it will get clear the message read registers (due to auto clear functionality being enabled). On reading again, the message read registers (as mentioned above) might read zeros.

If the MCU requests entry to debug or stop mode, the message being received currently by SENT Receiver is discarded and the MCU enters debug/stop mode immediately. This does not affect the messages received completely, prior to entering debug mode and these messages will still be present on the message buffer and registers until they are read out. Thus allow one message to be received completely and do not enable "Auto Clear" (GBL_CTRL[FAST_CLR] = 0), to allow messages to be read in debug or stop mode.

51.1.3 Block diagram

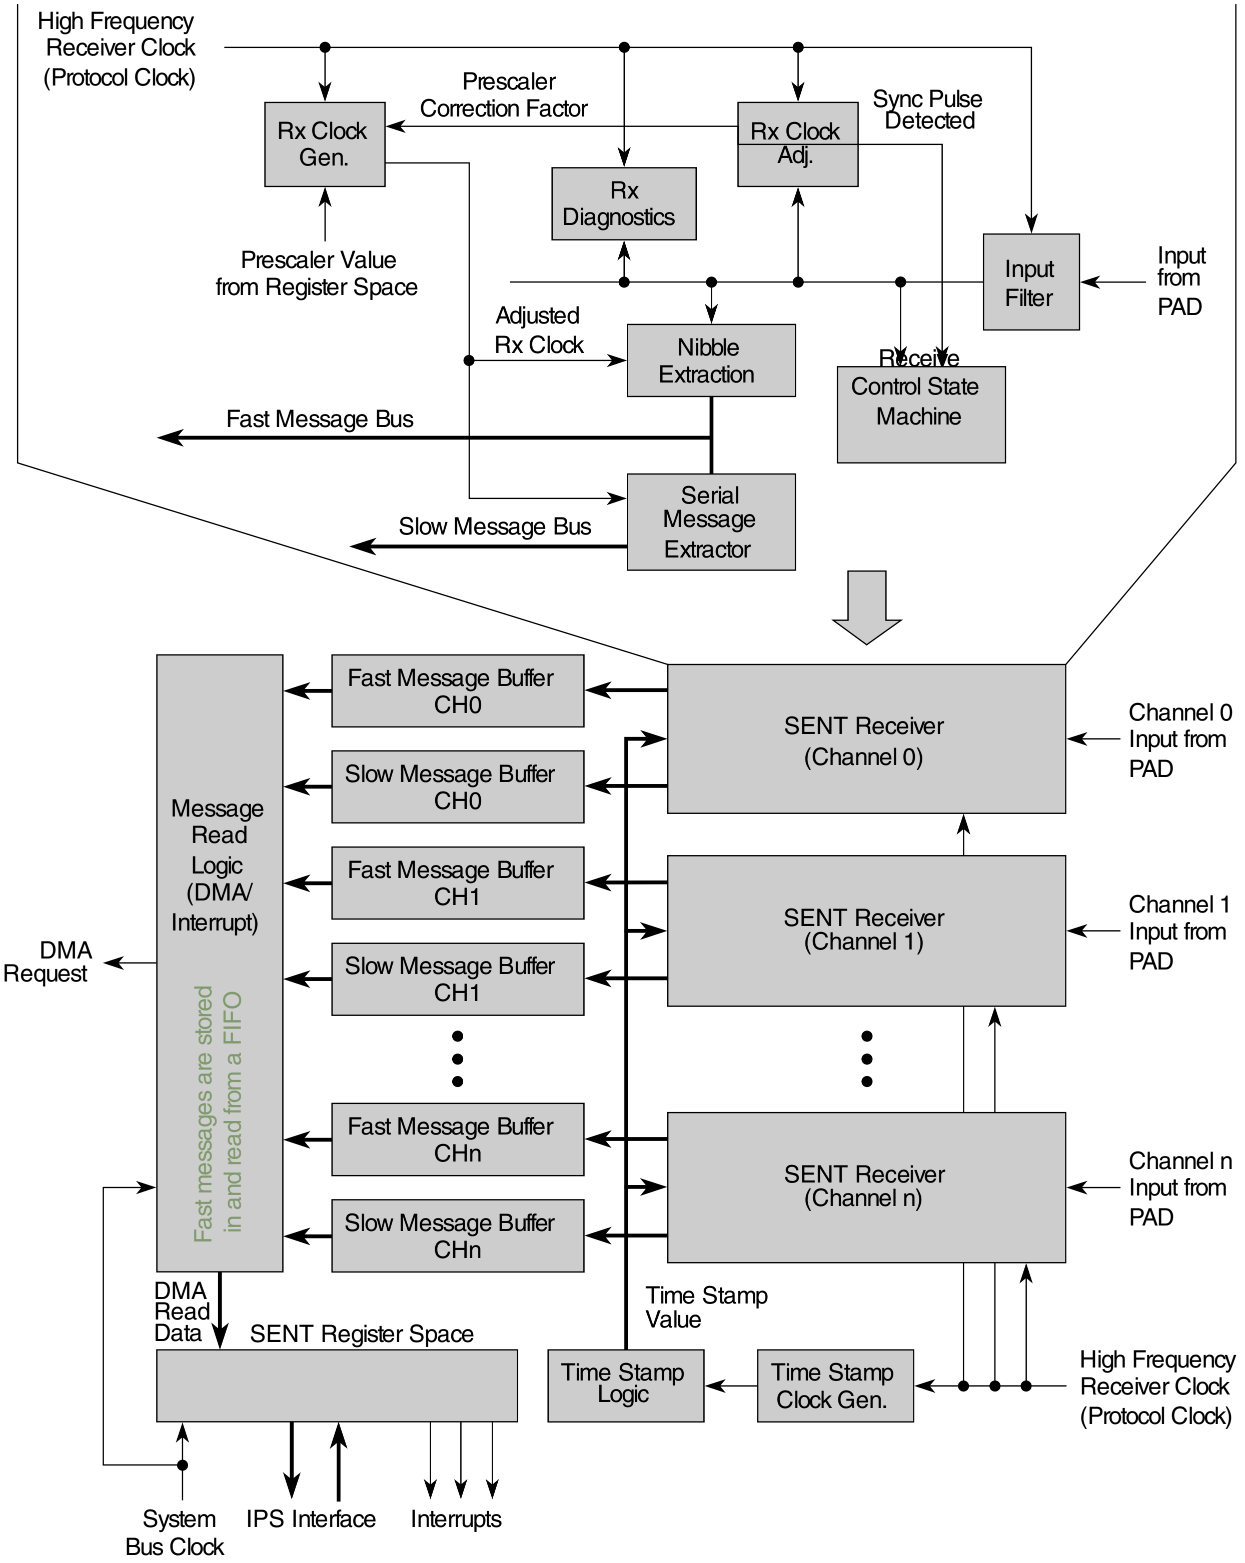

Figure 51-1. SENT Receiver block diagram

51.1.4 Design overview

The SENT Receiver Module is a unified receiver module comprising of a number of receiver channels and a unified DMA and Register Space for accessing the messages from each channel. Figure 51-1 shows the top level block diagram for the SENT Receiver module.

Each channel of the SENT Receiver is composed of a Clock Generation and Adjustment block to generate the receiver clock and adjust it for frequency variation in the transmitter clock. This block also detects the synchronization/calibration pulse which is present in every SENT message.

The SENT Receiver State Machine controls the sequencing of decoding the messages and combining the information as nibbles. In parallel a diagnostic block is running that monitors the incoming messages for any errors and also verifies the CRC of the received messages. The fast and serial message extractors collate the message nibbles and add the channel number and time stamp information to the messages.A free running time stamp counter is used to add the time stamp value to each message received. The value of this counter is input to each channel and the channel logic appends the time stamp to each message. These messages are then formatted to be stored in the DMA FIFOs (for channels which are selected to be connected to the DMA) or in corresponding message read buffer. Only the messages that pass the diagnostics checks are forwarded to be stored in the FIFOs or buffers.

The SENT Receiver provides two mechanisms for reading the received messages, which are via DMA transfers and via Interrupts. Based on the control bit settings in the control registers, a DMA request or Interrupt is asserted to signal the DMA controller or CPU that messages are available to be read.

The free running time stamp counter, register block and DMA interface are common for all channels configured. The register space contains all the necessary registers for all channels. The register space is 32-bit aligned and accessible via 8-/16-/32-bit accesses. The registers for all un-configured channels are marked as reserved.

51.1.4.1 Functional overview

After reset, the SENT module comes up in the disabled state. All channel enable bits and the global enable bit are set to 0 and the user software must program the SENT module parameters correctly before enabling it. The user software must correctly configure all parameters to avoid any underflow or overflow in the message FIFOs or buffers.

Once enabled, the Receiver Clock Generation and Adjustment block detects the synchronization pulse. Until then, the state machine blocks all subsequent operations of the receiver. Once the synchronization pulse is detected, the receiver clock tick period is compensated for variation in transmitter clock tick period and the state machine then waits for the reception of data nibbles. The adjusted receiver clock is used to sample the data nibbles from the incoming serial message. The state machine waits until the status and communication nibble and configured number of data nibbles are received. The state machine then waits for the pause pulse (if configured to receive a pause pulse). The fast and serial message extractor block provides the state machine with the information on how many nibbles have been received. All diagnostics checks are computed in parallel. Once all required data nibbles are received, the CRC is checked, time stamp and channel number is added to the message. The time stamp for a Fast Message is sampled at the falling edge that comes at the end of the calibration pulse (which is also the start of the status and communication nibble pulse) and is stored in the message read buffer along with the message. This final message is stored in the DMA FIFO or message buffer as described in the subsequent sections. Any error detected during the receive process causes the status bits in the corresponding channel's status register to be set.

The above process repeats across each enabled channel in parallel and keeps pushing error free messages into the FIFOs or buffers on high frequency receiver clock. The module's message read logic synchronizes all these messages on the bus clock and pops out these messages on any DMA or CPU read access. Any DMA underflow errors are stored in the global status register while the overflow errors are stored in the corresponding channel's status register. In case of an overflow in Fast Messages, the newer messages received will overwrite the previous message.

For detailed description on the complete functionality of each block, see Functional description.

51.2 External signal description

This section lists all inputs to the SENT Receiver block.

51.2.1 SENT_RX [(CH-1):0]

These pins serve as the serial data input for each of the SENT Receiver channel. There is one bit per channel supported by the device. The SENT sensor input pads on the device using this module should have pull-up enabled to ensure a 1'b1 is seen at the module input when SENT sensor is not driving any data.

Note

The value of CH is device-specific. See the device configuration details.

51.3 Memory map and register definition

This section provides a detailed description of all registers accessible in the SENT Receiver block.

The following table gives an overview on all SENT Receiver registers. The memory map comprises of 32-bit aligned registers which can be accessed via 8-bit, 16-bit, or 32-bit accesses. Write access to reserved locations will generate transfer error. Read access to reserved locations will also generate transfer error and the read data bus will show all 0s. The Memory Map and complete module is in Big Endian Format.

The module will not check for correctness of programmed values in Register Space and software must ensure that correct values are being written.

NOTE

Register Address = Base Address + Address Offset, where the Base Address is defined at the MCU level and the Address Offset is defined at the module level. The number of registers are device specific. See the device configuration section for details.

NOTE

The value of the CH is device-specific. See the device configuration section for details.

SRX_GBL_CTRL field descriptions

Field	Description
0–7 TSPRSC	Time Stamp Prescaler Value. Value in number of clock cycles of high frequency receiver clock set in order to obtain a clock frequency for the time stamp counter block. 0 to 255 - Time Stamp Clock = (High Frequency Clock)/(Value + 1). Value set by user software should be such that the clock period is at least 1 µs. If the high frequency clock input is 75 MHz, then the value set in this field would be 0x4A (or 74) to obtain a 1 µs clock.

Table continues on the next page...

SRX_GBL_CTRL field descriptions (continued)

Field	Description
	Note: Since the time stamp clock is common for all channels, the timestamp clock frequency must be at least twice the fastest receiver channel in the application. This is to ensure that the time stamp clock is fast enough to show change in timestamp from message to message.
8–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11–15 FIFOWM	DMA Read FIFO Water Mark Level. Indicates the number of Fast Messages to be stored in FIFO before a DMA request is asserted. Default = 1 message. 0 Invalid Value. Should not be used 1 to 31 Valid water mark levels. Value fixed by user software. **NOTE:** The number of bytes to be transferred set in the DMA Controller's TCD must be set equal to the number of bytes corresponding to the set water mark value.
16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25 FIFO_EN	FIFO enable bit. Enables FIFO when DMA is enabled. When this bit is low, data is read from module as explained inDMA request for Fast Message reading when FIFO is disabled and when the bit is high, data is read from module as explained inDMA request for Fast Message reading via FIFO . Default value is 0. 0 FIFO is disabled 1 FIFO is enabled
26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 FAST_CLR	Fast Clearing Enable bit. Enables clearing of ready status (for both fast and slow) bit automatically when corresponding message is read. Default value is 1. SeeFast Message Ready Status Register (SRX_FMSG_RDY) andSlow Serial Message Ready Status Register (SRX_SMSG_RDY) for details on the ready status bits. 0 Fast Clearing is disabled. Bits will be cleared by writing 1 1 Fast Clearing is enabled
28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
29 DBG_FRZ	Debug Freeze. This bit will enable the debug mode support. SENT Module will freeze in debug mode if this bit is set. Default is 0. 0 No effect in debug mode 1 Freeze in debug mode
30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

SRX_GBL_CTRL field descriptions (continued)

Field	Description
31 SENT_EN	SENT Receiver Global Enable. This bit enables or disables the complete receiver module irrespective of the setting of individual channel enable bits. User software must program all channel parameters before setting this bit. Default is 0. 0 Entire module is disabled 1 Module is enabled

51.3.2 Channel Enable Register (SRX_CHNL_EN)

This register is used to enable individual SENT Receiver channels in the module. The user software must ensure all channel parameters and control settings have been programmed before writing to this bit. In case these parameters are changed while the channel is enabled, normal operation is not guaranteed.

NOTE

Reads of bits beyond those for the supported number of channels should be ignored, and these bits must be written to 0.

Address: 0h base + 4h offset = 4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SRX_GBL_STATUS field descriptions

Field	Description
0–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 FMFO	Fast Message FIFO Overflow: Interrupt status bit which indicates that Fast Message is received on any channel which has DMA enabled after FIFO is full. Default value is 0. This bit is valid only when fifo is enabled 0 No Overflow 1 Overflow occurred
22 FMDU	Fast Message DMA Underflow: Interrupt Status bit that indicates when there is an underflow in Fast Message buffers or FIFO in any channel which has DMA enabled. If FIFO is enabled, it is set when FIFO is empty and software still reads Fast Message DMA registers. And if FIFO is not enabled, it is set when there is no message in the DMA buffers for read and the software still reads the Fast Message DMA register. Default value is 0. 0 No underflow 1 Underflow occurred
23 SMDU	Slow Serial Message DMA Underflow: Interrupt Status bit that indicates when there is an Underflow in Slow Serial Message DMA buffers on channel which has DMA enabled. The bit is set when there is no

Table continues on the next page...

Field	Description
	message in the DMA buffers for read and the software still reads the Slow Serial Message registers. Default value is 0. 0 No underflow 1 Underflow occurred
24–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

51.3.4 Fast Message Ready Status Register (SRX_FMSG_RDY)

The bits of this register are asserted when a Fast Message arrives on a corresponding channel that is not configured to be read via DMA. If a channel is not configured for DMA (viaFast Message DMA Control Register (SRX_FDMA_CTRL)), it is assumed to be read via Interrupt or Polling this status bit. Even if the Interrupt Enable bit for that channel is not set (viaFast Message Ready Interrupt Control Register (SRX_FRDY_IE)) and the channel is enabled, the message ready status bit in this register will be asserted on Fast Message reception. Software must ensure that if a channel is enabled; either DMA or Interrupt must be enabled for that channel. Proper flow cannot be guaranteed if neither is selected.

These bits can be configured to be cleared via "Write 1 to Clear" or "Fast Clearing Mechanism". The configuration is done by writing to the FAST_CLR bit in theGlobal Control Register (SRX_GBL_CTRL) .

NOTE

> Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver.

Address: 0h base + Ch offset = Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SRX_FMSG_RDY field descriptions

Field	Description
0–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30–31 F_RDY	Fast Message Data Ready Status bits for channels 1 to 0 . Each bit indicates that a Fast Message is ready to be read by CPU from that specific channel. This bit is asserted only when DMA is NOT enabled for that

Table continues on the next page...

SRX_FMSG_RDY field descriptions (continued)

Field	Description
	channel (from the DMA Control Register) and an error free message is received, irrespective of the value of corresponding enable bit in Message Ready Interrupt Control Register. Reading the message from the corresponding memory-mapped Fast Message Read Registers would automatically clear this bit (Fast Clearing Mechanism). **NOTE:** These bits are either "write 1 to clear" (w1c) or self-clearing depending on the value of the FAST_CLR BIT in the Global Control Register (GBL_CTRL). The clearing mechanism is selected by user by programming the FAST_CLR bit in the Global Control register. See SectionGlobal Control Register (SRX_GBL_CTRL) for details on FAST_CLR bit. **NOTE:** When using the fast clearing option, these bits will not clear till the complete message is read out which requires the CPU to read all 3 fast message registers via 32-bit read accesses. For 8/16-bit accesses fast clearing mechanism should not be used as it is not supported. **NOTE:** When the fast clearing option is not configured, the bits will be cleared only if 1 is written to those bits. 0 No Fast Message is available to be read out via Interrupt 1 Fast Message is available to be read out via Interrupt

51.3.5 Slow Serial Message Ready Status Register (SRX_SMSG_RDY)

The bits of this register are asserted when a Slow Serial Message arrives on a corresponding channel that is not configured to be read via DMA. If a channel is not configured for DMA (viaFast Message DMA Control Register (SRX_FDMA_CTRL) andSlow Serial Message DMA Control Register (SRX_SDMA_CTRL)), it is assumed to be read via Interrupt or Polling this status bit. Even if the Interrupt Enable bit for that channel is not set (viaFast Message Ready Interrupt Control Register (SRX_FRDY_IE) andSlow Serial Message Ready Interrupt Enable Register (SRX_SRDY_IE)) and the channel is enabled, the message ready status bit in this register will be asserted on Slow Message reception. Software must ensure that if a channel is enabled; either DMA or Interrupt must be enabled for that channel. Erroneous flow can happen if neither is selected.

These bits can be configured to be cleared via "Write 1 to Clear" or "Fast Clearing Mechanism". The configuration is done by writing to the FAST_CLR bit in theGlobal Control Register (SRX_GBL_CTRL).

NOTE

Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver.

Address: 0h base + 10h offset = 10h

SRX_DMA_FMSG_TS field descriptions

Field	Description
0–31 TS	Time Stamp for received message. Indicates the relative time when the falling edge that comes at the end of the calibration pulse (which is also the start of the status and communication nibble pulse) was detected

51.3.14 DMA Slow Serial Message Bit3 Read Register (SRX_DMA_SMSG_BIT3)

The above register (DMA_SMSG_BIT3) is common for all types of slow serial messages. Bit C defines the type of enhanced packet and bit TYPE defines whether it is short serial or enhanced serial message. Since this register is used to read both Short and Enhanced Serial Messages, the register fields have been placed in such a way to match the bit positions in actual message defined by SAE Specification as shown inTable 51-2,Table 51-3 andTable 51-4.Table 51-2 andTable 51-3 shows the enhanced serial messages format to be used when reading this register for these two types of messages.Table 51-4 shows the short serial message.

DMA Source Size must be set to 32 bits when reading this register via DMA.

NOTE

> If the TYPE bit in the register reads '0', then remainder bits (for CFG, ID and DATA) will be redundant and read zeros. The short serial message will be located in DMA_SMSG_BIT2 register fields. If TYPE bit is '1', then the message in register is Enhanced Serial Message and using CFG bit, software can decode the ID and DATA fields.

Address: 0h base + 50h offset = 50h

SRX_DMA_SMSG_BIT3 field descriptions

Field	Description
0–3 CHNUM	Channel Number. Indicates the channel number of the received message being read by DMA. Valid values are 0 to 1 .
4 TYPE	Serial Message Type. Indicates the type of Serial Message received 0 Short Serial Message 1 Enhanced Serial Message
5–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 CFG	Configuration bit 'C'. Indicates the type of Enhanced Serial message 0 Enhanced Serial Message with 8-bit ID field 1 Enhanced Serial Message with 4-bit ID field
22–25 ID7_4_ID3_0	ID Field. Value depends on setting of 'C' bit. If 'C' bit is 0, this field is ID[7:4] and if the 'C' bit is 1, this field is ID[3:0]
26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–30 ID3_0_DATA15_12	ID or Data Field. Value depends on setting of 'C' bit. If 'C' bit is 0, this field is ID[3:0] and if the 'C' bit is 1, this field is Data[15:12]
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

51.3.15 DMA Slow Serial Message Bit2 Read Register (SRX_DMA_SMSG_BIT2)

This register (DMA_SMSG_BIT2) is common for all types of slow serial messages. Hence, the register fields have been placed in such a way to match the bit positions in actual message defined by SAE Specification as shown inTable 51-2,Table 51-3 andTable 51-4.Table 51-2, andTable 51-3 shows the enhanced serial messages format to be used when reading this register for these two types of messages.Table 51-4 shows the short serial message.

DMA Source Size must be set to 32 bits when reading this register via DMA.

Address: 0h base + 54h offset = 54h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SRX_DMA_SMSG_TS field descriptions

Field	Description
0–31 TS	Time Stamp for the received message. Indicates the relative time of detection of the falling edge that comes at the end of the calibration pulse (which is also the start of the status and communication nibble pulse) of the last Fast Message that completed the Serial Message. Time Stamp for Slow Serial Messages is not latched when the Slow Serial Message starts but when the Slow Serial Message is completely received.

51.3.17 Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CH*n*_CLK_CTRL)

NOTE

> The value of the CH is device-specific. See the device configuration section for details.

The SENT Receiver module generates the Receiver Sensor Clock (or simply Receiver Clock) internally to sample the incoming filtered sensor data. The user software must program the prescaler value (for Receiver Clock) to match the ideal Sensor Tx Clock period. The generated Receiver Clock is compensated for variations and clock drift that might occur in the Sensor Tx Clock. SeeAdjustment for variation in sensor (Tx) clock for more details.

This register configures the generation and subsequent compensation logic of the Receiver Clock. User must program the contents of this register before enabling the channel by writing to the corresponding channel enable bit in theChannel Enable Register (SRX_CHNL_EN) .

Address: 0h base + 60h offset + (16d × i), where i=0d to 1d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

W																
Reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SRX_CH*n*_CLK_CTRL field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1–15 CM_PRSC	Compensated Prescaler Value. This is the compensated prescaler value calculated by Clock Compensation logic and this value is used to compensate for sensor Tx clock variation. This value is indicated as a read only field for use by user software, if needed. This is a 15-bit value. '= Rx Prescaler Value' No variation, hence no compensation or Compensation is disabled '< Rx Prescaler Value' Tx Clock is SLOWER than the programmed receive clock '> Rx Prescaler Value' Tx Clock is FASTER than the programmed receive clock Thus, the new Receiver Clock Tick Period can be computed by software as

Table continues on the next page...

SRX_CH*n*_CLK_CTRL field descriptions (continued)

Field	Description
	Compensated Prescaler Value x High Frequency Receiver Clock Period Note: The value provided in this field is ceil value of actual tick period as measured by the Receiver.
16 COMP_EN	Compensation Enable. To enable compensation logic to adjust the receiver clock against variation in Tx clock on this channel. User must set the Prescaler Value before enabling this bit. 0 Compensation is disabled 1 Compensation is enabled
17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18–31 PRSC	Rx Prescaler Value. This factor is required to generate required Receiver Clock tick from the High Frequency Receiver Clock. This value can only be written when Channel Enable bit is Zero. Hence this value must be programmed before enabling the channel. If required receiver clock tick period (Trx_clk) is not divisible by the high frequency receiver clock (protocol clock) period (Thf_clk), the required prescaler value will have a fractional part which cannot be programmed. In this case then user is advised to program the prescaler value to the lower integer value. 0 Prescaler is bypassed. Should not be used. Non-Zero Value Enables Prescaler The required value is computed by software as follows: $\text{Prescaler\_value} = \text{floor}\left(\frac{T_{\text{rx\_clk}}}{T_{\text{hf\_clk}}}\right)$ **Equation 54** (both clock periods taken in µs). Please seeHigh frequency receiver clock (protocol clock) requirements before setting this value. e.g. if the required receiver clock tick period is 43 µs and the High Frequency Receiver clock is selected to be 62.5 MHz (or 0.016 µs) then, Prescaler Value = 43/0.016 = 2687.5. Hence user must program 2687 in this register.

51.3.18 Channel 'n' Status Register (n=0 to (CH-1)) (SRX_CH*n*_STATUS)

This registers stores information about certain events and error conditions that occur in the channel during the message reception process. The assertion of these bit is not linked to any message but it is a general alert to the CPU that a particular condition (error or normal event) happened in the recent past. Messages are automatically discarded when an error is detected.

User software can clear these bit at any time by writing 1 to them. This register can be updated at any time irrespective of the setting in theChannel Enable Register (SRX_CHNL_EN) bit for the corresponding channel.

NOTE

The value of the CH is device-specific. See the device configuration section for details.

Address: 0h base + 64h offset + (16d × i), where i=0d to 1d

SRX_CH*n*_STATUS field descriptions

Field	Description
0 BUS_IDLE	Bus Idle Status. This bit indicates that the sensor interface has been idle for more than the period defined by the programmed Bus Idle Count value(inChannel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CH*n*_CONFIG)). CPU should write 1 to this clear this bit once it is read. 0 Bus is not idle 1 Channel has been idle for more than the allowed value
1–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4 CAL_RESYNC	Successive Calibration Check (Option 2 of SAE SENT Spec) Resynchronized. This bit indicates that Successive Calibration Check (Option 2 of SAE Spec) has failed three times and has resynchronized to

Table continues on the next page...

SRX_CHn_STATUS field descriptions (continued)

Field	Description
	assume 3rd message to be correct and will be received. The successive calibration check error will also be asserted during re-synchronization (to indicate the 3rd error being detected). 0 No interrupt 1 Interrupt Status condition has occurred
5 CAL_20_25	Calibration Variation 20 - 25% Interrupt Status. This bit indicates that the calibration pulse received on this channel has variation in between ±20% to ±25% from 56 ticks. 0 No Interrupt 1 Interrupt Status condition has occurred
6 SMSG_OFLW	Slow Serial Message Overflow Status. This bit indicates overflow occurred on this channel. Overflow will cause state machine to halt stopping reception of new messages. 0 No Interrupt 1 Interrupt Status condition has occurred
7 FMSG_OFLW	Fast Message Overflow Status. This bit indicates overflow occurred on this channel. Overflow happens when effective data read rate by CPU is slower than data receive rate on channel. On overflow, new incoming messages will overwrite the previous messages (that are not read out) stored in the receiver buffers. However, any message that is currently being read out by DMA or CPU will not get over-written. 0 No Interrupt 1 Interrupt Status condition has occurred
8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 PP_DIAG_ERR	This diagnostic checks status bit indicates that the ratio of calibration pulse length to overall message length (with pause pulse) is more than ±1.5625% between two messages. This check is valid only for messages with pause pulse. This bit indicates whether this diagnostic has failed or passed on this channel, and is cleared by writing a 1 to it. 0 Error Check has passed 1 Error Check has failed
10 CAL_LEN_ERR	This diagnostic checks status bit indicates that Calibration pulse is more than 56 ticks ±25%. This bit indicates whether this diagnostic has failed or passed on this channel, and is cleared by writing a 1 to it. 0 Error Check has passed 1 Error Check has failed
11 CAL_DIAG_ERR	Successive Calibration pulses differ by ±1.56%. SAE spec defines it be 1.5625% but the accuracy of this check depends on the frequency of protocol clock (SeeHigh frequency receiver clock (protocol clock) requirements). This diagnostic checks status bit indicates whether this diagnostic has failed or passed on this channel, and is cleared by writing a 1 to it. 0 Error Check has passed 1 Error Check has failed
12 NIB_VAL_ERR	Any nibble data value <0 or >15. This diagnostic checks status bit indicates whether this diagnostic has failed or passed on this channel, and is cleared by writing a 1 to it. 0 Error Check has passed 1 Error Check has failed
13 SMSG_CRC_ ERR	Checksum error in Slow Serial Message. This diagnostic checks status bit indicates whether this diagnostic has failed or passed on this channel, and is cleared by writing a 1 to it.

Table continues on the next page...

SRX_CH*n*_STATUS field descriptions (continued)

Field	Description
	0 Error Check has passed 1 Error Check has failed
14 FMSG_CRC_ERR	Checksum error in Fast Message. This diagnostic checks status bit indicates whether this diagnostic has failed or passed on this channel, and is cleared by writing a 1 to it. 0 Error Check has passed 1 Error Check has failed
15 NUM_EDGES_ERR	Not the expected number of negative edges between calibration pulse. This diagnostic checks status bit indicates whether this diagnostic has failed or passed on this channel. This bit will not set in case of "Option 2" for successive calibration pulse check is selected. This error will only set when "Option 1" for successive calibration check is selected (SUCC_CAL_CHK). This bit is cleared by writing a 1 to it. 0 Error Check has passed 1 Error Check has failed
16–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

51.3.19 Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CH*n*_CONFIG)

This register (CHn_CONFIG) provides the configurability for interrupt assertion for various events and error as explained inChannel 'n' Status Register (n=0 to (CH-1)) (SRX_CH*n*_STATUS) and control bits for selection of various receive options that might be required by the user software. This register also configures the width of noise glitches (on the sensor input) to be filtered out by the input programmable filter.

User must program the contents of this register before enabling the channel by writing to the corresponding channel enable bit in theChannel Enable Register (SRX_CHNL_EN) .

NOTE

The value of the CH is device-specific. See the device configuration section for details.

Address: 0h base + 68h offset + (16d × i), where i=0d to 1d

SRX_CH*n*_CONFIG field descriptions

Field	Description
0–3 BUS_IDLE_CNT	Bus Idle Count. This register value defines the maximum allowable idle period on the sensor interface of this channel. The value is defined as follows: 0000 Disabled. 0001 127*2 Receiver Clock Tick Counts 0010 127*4 Receiver Clock Tick Counts 0100 127*8 Receiver Clock Tick Counts 1000 127*16 Receiver Clock Tick Counts
4 IE_CAL_ RESYNC	Successive Calibration Check Resynchronized Interrupt Enable: This bit enables interrupt assertion when Successive Calibration diagnosis has failed three times in case of "Option 2" being selected for Successive Calibration Check Method and the check resynchronizes the take the third message to be correct. 0 Interrupt is disabled 1 Interrupt is enabled
5 IE_CAL_20_25	Calibration Variation 20 - 25% Interrupt Enable. This bit enables interrupt assertion when corresponding status bit is set. 0 Interrupt is disabled 1 Interrupt is enabled
6 IE_SMSG_OFLW	Slow Serial Message Overflow Interrupt Enable. This bit enables interrupt assertion when overflow occurs on reception of Slow Serial Messages in corresponding channel 0 Interrupt is disabled 1 Interrupt is enabled
7 IE_FMSG_OFLW	Fast Message Overflow Interrupt Enable. This bit enables interrupt assertion when overflow occurs on reception of Fast Messages in corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled
8 FCRC_CHK_ OFF	Fast Message CRC Check Off: This bit can be used to switch off CRC check in Fast Message 0 Check is enabled 1 Check is disabled/off
9 IE_PP_DIAG_ ERR	Ratio of calibration pulse length to message length varies by more than ±1.5625% between two frames. Valid for messages with pause pulse. This bit enables interrupt assertion when its respective diagnostic check fails on the corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled

Table continues on the next page...

SRX_CH*n*_CONFIG field descriptions (continued)

Field	Description
10 IE_CAL_LEN_ERR	Calibration pulse is wider than 56 ticks ±25%. This bit enables interrupt assertion when its respective diagnostic check fails on the corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled
11 IE_CAL_DIAG_ERR	Successive Calibration pulses differ by more than ±1.56%. SAE spec defines it be 1.5625% but the accuracy of this check depends on the protocol clock. For instance for 62.5 MHz, this check will fail for 1.56% and passes for 1.55%. This bit enables interrupt assertion when its respective diagnostic check fails on the corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled
12 IE_NIB_VAL_ERR	Any nibble data value <0 or >15. This bit enables interrupt assertion when its respective diagnostic check fails on the corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled
13 IE_SMSG_CRC_ERR	Checksum error in Slow Serial Message. This bit enables interrupt assertion when its respective diagnostic check fails on the corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled
14 IE_FMSG_CRC_ERR	Checksum error in Fast Message. This bit enables interrupt assertion when its respective diagnostic check fails on the corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled
15 IE_NUM_EDGES_ERR	Not the expected number of negative edges between calibration pulse. This bit enables interrupt assertion when its respective diagnostic check fails on the corresponding channel. 0 Interrupt is disabled 1 Interrupt is enabled
16 DCHNG_INT	Enable for Interrupt on Reception of Fast Message with Changed Data: This bit is used to enable storing and generating corresponding DMA or Message Ready Interrupt Request for Fast Message only when any of the data nibbles after different from previously received Fast Message on that channel. If a new Fast Message is received that has same values for all data nibbles as that of previous message then the current message will be discarded and will not be stored in the buffer, or FIFO, and neither Fast Message Ready Interrupt nor DMA request will be generated. 0 All Fast Messages will be received even if data nibbles are same 1 Only Fast Messages with differing values of data nibbles will be received
17 CAL_RNG	Valid Calibration Pulse Range Selection: This bit is used to control whether 20% variation or 25% variation in Calibration Pulse will be tolerated when detecting a Calibration Pulse 0 20% variation is acceptable 1 25% variation is acceptable
18 PP_CHKSEL	Pause Pulse Diagnostic Check Selection: This bit controls which diagnostic checks to run when messages are enabled to be received with pause pulses. 0 Both Successive Calibration Pulse Check and Pause Pulse Diagnostic are run 1 Only Pause Pulse Diagnostic is run. Successive Calibration Pulse Check is disabled.

Table continues on the next page...

SRX_CH*n*_CONFIG field descriptions (continued)

Field	Description
19 FCRC_TYPE	Fast Message CRC Type. This indicates the type of CRC method to be used for CRC Diagnostic Check on the received fast messages 0 Recommended implementation (additional 0 data nibble XORed with the rest of the nibbles) 1 Legacy implementation (no additional 0 data nibble is XORed)
20 FCRC_SC_EN	Fast Message CRC Status and Communication Nibble Enable. This bit enables the inclusion of Status and Communication Nibble when CRC is calculated for Fast Messages. 0 Status and Communication Nibble not included in CRC calculation 1 Status and Communication Nibble is included in CRC calculation
21 SCRC_TYPE	Slow Serial Message CRC Type. This indicates the type of CRC method to be used for CRC Diagnostic Check on the received slow serial messages. 0 Recommended implementation (additional 0 data nibble XORed with the rest of the nibbles) 1 Legacy implementation (no additional 0 data nibble XORed)
22 PAUSE_EN	Pause Pulse Enable. Enables the channel receiver to detect a pause pulse. 0 Detection of Pause Pulse is disabled 1 Detection of Pause Pulse enabled
23 SUCC_CAL_CHK	Successive Calibration Pulse Check Method. This bit indicates the method to be used for performing the successive calibration pulse check. Default value is 1. 0 Option 2 i.e. Low Latency Option as per SAE Specification 1 Option 1 i.e. Preferred but High Latency Option as per SAE Specification
24–31 FIL_CNT	Input Filter Sample Count. This indicates twice the number of Protocol Clock (of High Frequency Receiver Clock) cycles required for channel input from device's pad to remain stable before it is sampled as 0 or 1. This field defines the width of glitches to be filtered out by the input programmable filter on that channel. Only one bit should be set in this field and the output of filter will be offset by twice the same number of clocks plus additional 3 clocks due to synchronization. Default value is '4'. 0 No filtering. Input from device's pad is only synchronized 1 Non-Zero Filtering is enabled

51.3.20 Channel 'n' Fast Message Data Read Register (n=0 to (CH-1)) (SRX_CH*n*_FMSG_DATA)

Address offset: 0x0160 + 0x18 x n

This is register CHn_FMSG_DATA. The contents of this register are same asDMA Fast Message Data Read Register (SRX_DMA_FMSG_DATA) .

NOTE

The value of the CH is device-specific. See the device configuration section for details.

Address: 0h base + 160h offset + (24d × i), where i=0d to 1d

SRX_CH*n*_SMSG_TS field descriptions

Field	Description
0–31 TS	Time Stamp for the received message. Indicates the relative time of detection of the falling edge that comes at the end of the calibration pulse (which is also the start of the status and communication nibble pulse) of the last Fast Message that completed the Serial Message. Time Stamp for Slow Serial Messages is not latched when the Slow Serial Message starts but when the Slow Serial Message is completely received.

51.4 Functional description

This section describes the function of the SRX.

51.4.1 Initialization sequence

All the channels are required to be configured before enabling them by writing into corresponding channel enable bit in the Channel Enable Register (SRX_CHNL_EN). There are some registers which must be configured and some which are to be changed if reset value is not as required for that channel. After enabling the channel, no configuration should be changed and if required to be changed, the user needs to first disable the channel and then reconfigure the channel parameters. The following must to be configured before enabling the corresponding channel:

- Time Stamp Prescaler Value in Global Control Register (SRX_GBL_CTRL) to generate the time stamping clock
- Rx Prescaler Value in Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CH*n*_CLK_CTRL) togenerate the channel's receiver clock
- Compensation enable in Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CH*n*_CLK_CTRL)
- Channel Configuration settings in the Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CH*n*_CONFIG)
- Number of Data Nibbles in Channel in the Data Control Register 1 (SRX_DATA_CTRL1)
- Control bits that control whether messages received in channel are to read by interrupt or DMA in Fast Message DMA Control Register (SRX_FDMA_CTRL), Slow Serial Message DMA Control Register (SRX_SDMA_CTRL), Fast Message Ready Interrupt Control Register (SRX_FRDY_IE) and Slow Serial Message DMA Control Register (SRX_SDMA_CTRL)

51.4.2 DMA read logic

The SENT Receiver module generates separate DMA requests for all Fast Messages and Slow Serial Messages received. The DMA requests are common for all channels. Each packet stored in the channels' buffers are appended with a time stamp taken from a free running time keeping counter and the channel number on which it was received. Details on this time stamp counter can be found in Time stamp logic.

51.4.2.1 DMA request for Fast Message reading via FIFO

A single DMA request is generated for all Fast Messages received on any channel. There is a DMA read FIFO to store the incoming messages from all the channels and allow them to be read via DMA. The DMA operation will happen as follows:

- DMA request will be asserted when number of messages stored in FIFO crosses the configured watermark level (in Global Control Register (GBL_CTRL)).
- DMA request will be de-asserted when number of messages stored goes below watermark level. It is assumed that DMA Controller's TCD would be set to transfer bytes equal to the messages indicated by watermark level so as to empty the FIFO.
- It is assumed that when responding to a DMA request, the DMA controller will read at a rate faster than the rate at which messages are getting received and stored in FIFO.
- The complete received message can be read by three consecutive read accesses to DMA Fast Message Data Read Register. The message will be read out in following sequence:
    - Fast Message data as described by DMA Fast Message Data Read Register (DMA_FMSG_DATA)
    - CRC for the Fast Message as described by DMA Fast Message CRC Read Register (DMA_FMSG_CRC)
    - Time stamp value for the Fast Message as described by DMA Fast Message Time Stamp Read Register (DMA_FMSG_TS)
- The channel number is prefixed in each valid message (no error) to allow software to identify messages pertaining to a channel
- Table 51-1 shows the format in which the messages will be stored in any memory-mapped message buffer and when being read out from FIFO.
- Since multiple messages can be received at the same time, there is a Fixed round robin sequencing logic, which will scan all active channels configured for DMA and store their message into the FIFO one by one. Channel configured for DMA but do not have ready messages will be automatically skipped till their turn comes again in the round robin sequence.
- Messages received can be stored in a different order to which they are actually received. The time stamp will indicate the order of reception of messages in a particular channel. However, the time stamp cannot be used to determine the order across channels.

This figure below shows the data for the three 32-bit accesses to be made by DMA to get one complete message with time stamp.

Received data on a channel (shaded) is stored along with time stamp and channel number (in white) in the internal buffer

Figure 51-2. Fast Message DMA Read Logic using FIFO

51.4.2.1.1 Fixed round robin sequencing logic

Figure 51-2 shows a scenario where 8 channels (0-7) with all channels are enabled for DMA reading except channel 2. DMA request will be asserted when FIFO has received packets more than watermark level set. Figure 51-2 shows channels 6 and 4 have not received the complete message. The following points describe the complete round robin sequencing scheme.

- The round robin sequencing logic which stores the messages in the FIFO by looping through each channels' Fast Message register and checking for the availability of the message.
- As shown in Figure 51-2, the arbitration logic will check for messages in sequence 0 -> 1 -> 3 -> 5 -> 7 and back to channel 0 and keep looping. Channel 2 is skipped as it's not enabled to be read via DMA) and channel 4 and 6 are skipped as message is not received completely at the instance the sequencing logic checked their buffers. This sequence continues in this fashion.
- The sequence in which messages are stored in FIFO is not deterministic and depends on the sequence they are detected after the noise filtering by the input filter of the channel.
- The DMA controller responds to the DMA request by reading from the DMA Fast Message Read register. When a DMA read happens, a message is read from the FIFO and split into three 32-bit values and provided to DMA in the order as described in previous section. The three 32-bit values together form one complete Fast Message.
- Once all three 32-bit access are completed, the next data from the FIFO is popped.

Figure 51-2 also shows how the received data (light gray colored boxes) from a channel is stored in FIFO along with the time stamp and channel number appended (both white colored).

51.4.2.2 DMA request for Fast Message reading when FIFO is disabled

In this mode no FIFO will be used as it is disabled via the FIFO Enable bit in the Global Control Register (GBL_CTRL). Fast Messages received are stored in a single system bus clock domain buffer to be read out by the DMA Controller via the DMA Fast Message Read register set. Note the DMA Controller must read all 3 DMA Read Registers to obtain the complete message, unlike the case when FIFO is enabled and message is read out from the DMA Fast Message Data Read register only. The data flow will happen as follows:

- A DMA request will be asserted when any of the DMA enabled channels has successfully received one complete Fast Message. The request is kept asserted till all messages (across DMA enabled channels) have been read out.
- DMA Controller should read the complete message by accessing each register of the DMA Fast Message Read register set, the registers being:
  - DMA Fast Message Data Read Register (SRX_DMA_FMSG_DATA)
  - DMA Fast Message CRC Read Register (SRX_DMA_FMSG_CRC)
  - DMA Fast Message Time Stamp Read Register (SRX_DMA_FMSG_TS)
- A fixed round robin sequencing runs, as shown in Figure 51-3, and this logic checks for messages in sequence 0→1→3 →5→7 and back to channel 0 and so on. Channel 2 is skipped as it is not DMA enabled) and channel 4 and 6 are skipped as message is not received completely. This sequence continues like this.
- The sequence in which messages are read through DMA interface is not deterministic and depends on the sequence in which they are completely received.
- When the sequencing logic detects a message ready to be read, it will update the DMA Fast Message Read register set for DMA read and move to the next channel when this message is read out completely (i.e., 3 read accesses to the above mentioned registers)
- The DMA controller should be programmed to read only one message in one DMA transfer (i.e. 12 bytes). If it is programmed to read more than one message in one DMA transfer, underflow in buffers might occur
- User software should ensure there is no overflow in channels. In case overflow occurs, the message in the channel buffer will get overwritten by the newly received message. However, when a DMA read is in progress, the buffers will not be overwritten if overflow occurs to maintain data integrity.
- The Round Robin sequencing logic loops through each DMA enabled channel and halts at any channel having data till it is read out by the DMA Controller.

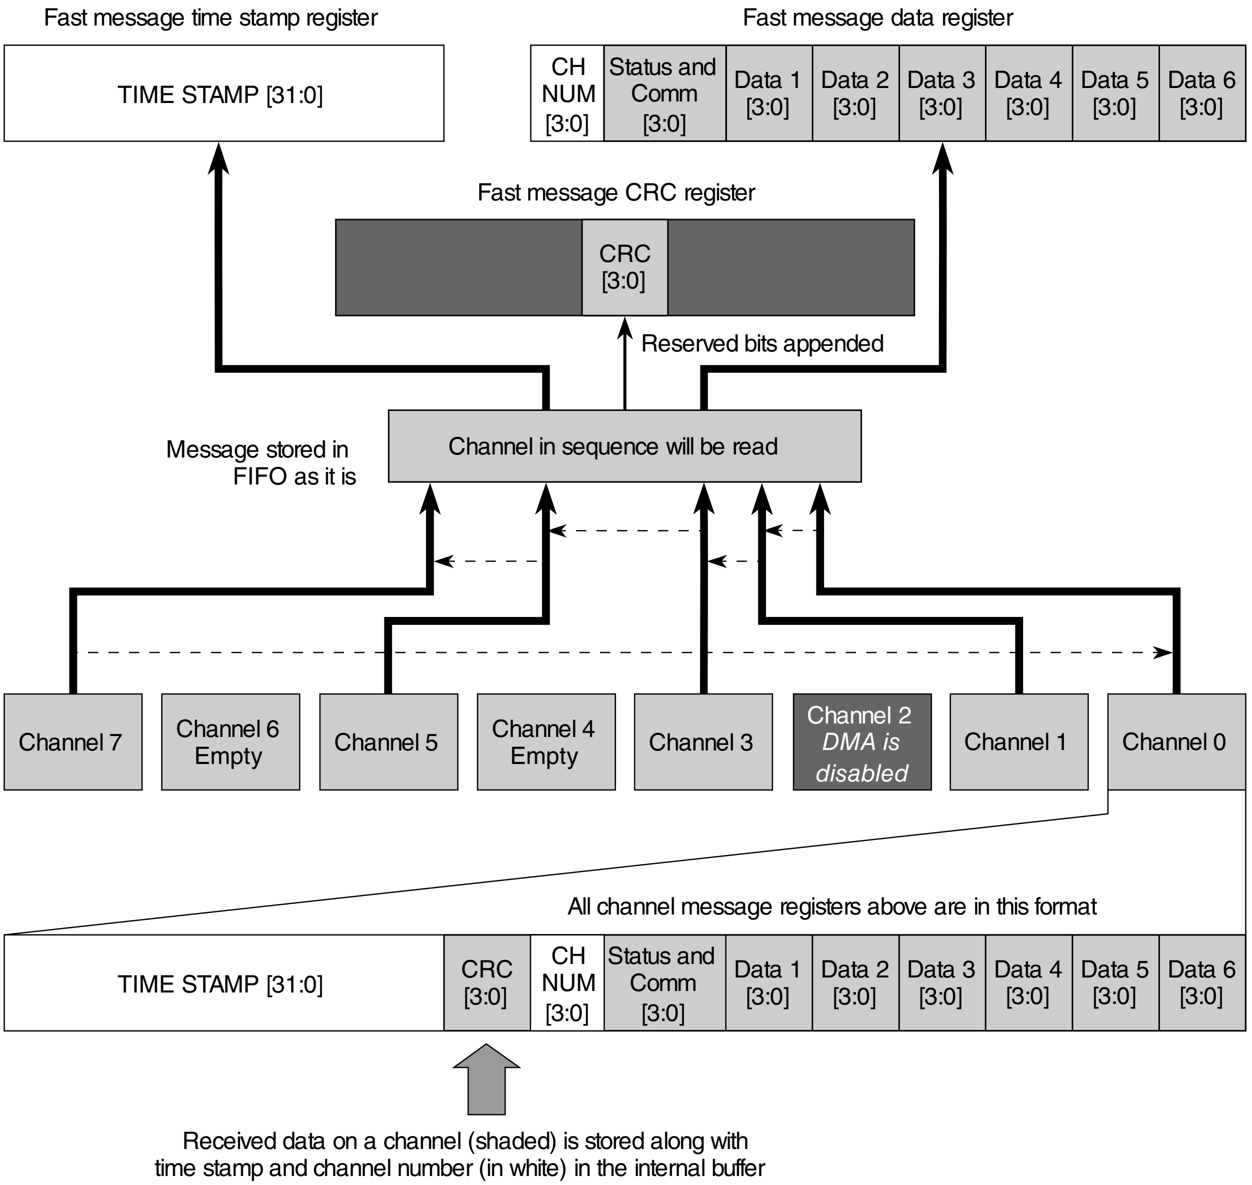

Figure 51-3. Fast Message DMA read logic (when FIFO is disabled)

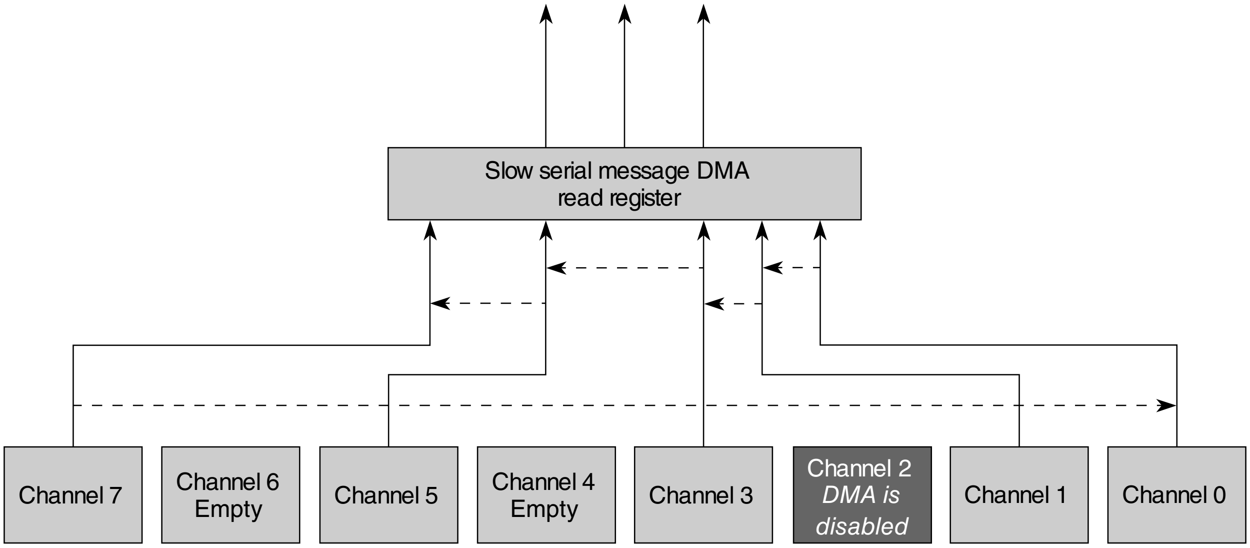
51.4.2.3 DMA request for Slow Serial Message reading

A separate DMA request (different from DMA request for Fast Message) is generated for all slow serial messages received on all channels. The data flow will happen as follows:

- Request will be asserted when any of the DMA enabled channels has successfully received one complete serial message (short or enhanced) and kept asserted till all messages have been read from their respective memory-mapped registers

- Similar to DMA read for Fast Messages, data for slow serial messages will be read from DMA Slow Serial Message Read register set in memory map, the register set comprising of:
    - DMA Slow Serial Message Bit3 Read Register (SRX_DMA_SMSG_BIT3)
    - DMA Slow Serial Message Bit2 Read Register (SRX_DMA_SMSG_BIT2)
    - DMA Slow Serial Message Time Stamp Read Register (SRX_DMA_SMSG_TS)
- A fixed round robin sequencing logic will be running and it will update the DMA Slow Serial Message Read register set for DMA read and move to the next channel when this message is read out completely (i.e., 3 DMA read accesses to the above mentioned registers)
- The channel number and time stamp will also be appended for every message
- A message type bit (TYPE) will also be appended to distinguish between short and enhanced serial messages
- The DMA controller should be programmed to read only one message in one DMA transfer (i.e. 12 bytes). If it is programmed to read more than one message in one DMA transfer, underflow in buffers might occur
- Since serial messages receive rate is very slow, user software should ensure there is no overflow
- The fixed round robin sequence logic for DMA read is the same as that used for Fast Messages (see DMA request for Fast Message reading when FIFO is disabled)

Figure 51-4 shows the sequencing of channels for serial messages to be read when DMA read is done on DMA Slow Serial Message Read register set.



Note: The arrows in the figure indicate next DMA transfer. One DMA Read Register set (3 registers) will be read in

Figure 51-4. Slow Serial Message DMA read logic

The formats in which the 3 types of Serial Messages will be stored in the buffers are shown in figures below.

Table 51-2. Enhanced Serial Message with 8-bit ID field

31	1		16	15		0				0
CH NUM [3:0]	P				0	C	ID [7:4]	0	ID [3:0]	0
			CRC [5:0]		Data Field [11:0]					
TIME STAMP [31:0]										

Table 51-3. Enhanced Serial Message with 4-bit ID field

31	1		16	15		1				0
CH NUM [3:0]	P				0	C	ID [3:0]	0	Data Field [15:12]	0
			CRC [5:0]		Data Field [11:0]					
TIME STAMP [31:0]										

Table 51-2 and Table 51-3 shows the enhanced serial messages. Bit C (shown in figure) or CFG (as shown in DMA Slow Serial Message Bit3 Read Register (DMA_SMSG_BIT3) description) defines the type of enhanced packet and bit P (shown in figure) or bit TYPE (shown in DMA Slow Serial Message Bit3 Read Register (DMA_SMSG_BIT3) description) defines whether it is short serial or enhanced serial message. CRC, ID and Data fields are stored in format as received and shown in SAE specification with just one exception that CRC is shifted to align with 16-bit boundary.

Table 51-4 shows the short serial message. Field locations have been placed in such a way to allow a common register to read all the slow serial messages and also match the bit positions in actual message defined by SAE Specification.

Table 51-4. Short serial message

31	0		16		15	0
CH NUM [3:0]	P					
			CRC [3:0]		ID [3:0]	Data Field [7:0]
TIME STAMP [31:0]						

Again, three 32-bit accesses to be made by DMA to get one complete message with time stamp.

51.4.3 Message reading via interrupts

There is one interrupt request per channel for a Fast message received and one for a serial message received. Each channel is individually configurable to enable or disable interrupt on reception of Fast or Slow Serial messages separately. In case of interrupt request of Fast Message, an interrupt will be asserted when any of the channels has received a complete Fast Message without errors and that channel is not configured for DMA Reads. The interrupt routine should be coded in such a way to take the least amount of overhead (in CPU cycles) while entering the routine and start reading the available messages. The routine should be capable of accessing all channels that are enabled to give out messages via interrupts through the Register Interface.

In response to these interrupts, the CPU is expected to read interrupt status register for fast or Slow Messages (depending on which interrupt was asserted) and store it in system memory. Using this status register value, the interrupt routine can decide from which channels the message is to be read. For instance if bit corresponding to channel 0 is set then routine should read from the address location corresponding to Channel 0 Fast Message Read registers and move onto the next asserted bit. The interrupt routine should scan through all the bits of this stored interrupt status register value and read corresponding channel's fast or Slow Message registers. In this manner all available messages can be read. After scanning through all the bits of status register stored in system memory, routine can read again the message ready interrupt status register to find out if any other channel has received in the mean time. This will save another interrupt routine time mainly from stacking/unstacking delay.

It is assumed that the interrupt controller will be able to respond fast enough to avoid any overflow as only one message per channel will be stored and the system bus clock frequency is sufficient to avoid this.

51.4.3.1 Suggested software interrupt service routine steps

These are suggested step to have an interrupt routine that can read all messages quickly and avoid any underflow/overflow. Actual implementations can vary.

When separate Fast Message and Slow Serial Message Interrupts are used:

The Fast Message Interrupt should have higher priority than Slow Serial Message Interrupt. The suggested ISR steps for a Fast Message Interrupts can be

- Read the Fast Message Ready Register and store it in a variable
- Shift out bits starting from MSB from this variable
- If bit is 1, perform read operation on corresponding channel's memory-mapped Fast Message Read Register set (3 registers). Three read accesses will fetch complete message. Shift out new bit. Repeat Step.
- Else if bit is 0, shift out new bit
- When all bits are shifted out, read the Fast Message Status Registers again to ensure no new message has arrived during the ISR.
- If there are no bits set, exit the ISR, else repeat this process.

The ISR steps for Slow Serial Message Interrupt can be same as for Fast Message ISR.

When common Fast Message and Slow Serial Message Interrupts are used:

The suggested ISR steps can be

- Read the Fast Message Status Register and store it in a variable
- Shift out bits starting from MSB from this variable
- If bit is 1, perform read operation on corresponding channel's memory-mapped Fast Message Read Register. Three read accesses will fetch complete message. Shift out new bit. Repeat Step.
- Else if bit is 0, shift out new bit
- When all bits are shifted out, read the Slow Serial Message Status Register into a new variable

- Shift out bits starting from MSB from this new variable
- If bit is 1, perform read operation on corresponding channel's memory-mapped Slow Serial Message Read Register. Three read accesses will fetch complete message. Shift out new bit. Repeat Step.
- Else if bit is 0, shift out new bit
- When all bits are shifted out, software can again check both Fast and Slow Serial Message Ready register to ready any message that might have been received while the routine was being serviced, or can choose to exit the routine.

51.4.4 Overflow behavior

This section describes the overflow behavior.

51.4.4.1 Fast messages buffers/FIFO

Overflow in Fast Message buffers or FIFO can occur when the CPU or DMA does not read messages from that channel for a long period of time. The receiver channel stores two messages in its buffers and indicates an overflow when these buffers are full. When FIFO is used, overflow is indicated when the FIFO gets full and another fast message is to be stored.

When an overflow event occurs, the newly received message overwrite the previously stored message and the overflow status bit is set. However, if overflow asserts while CPU/DMA is reading that channel (i.e. all 3 read registers have not yet been read), then that message is not overwritten. While messages are being overwritten, the slow message reception is not hampered.

NOTE

> In the case of a fast message overflow and continuous reading of register SRX_CHn_FMSG_DATA, SRX_CHn_FMSG_CRC, and SRX_CHn_FMSG_TS without clearing the SRX_FMSG_RDY[F_RDYn] bit there is a possibility that one message will be lost. Additionally, if the pause pulse feature is enabled the module asserts up to two NUM_EDGES_ERR in the status register (SRX_CHn_STATUS). In this case up to two frames can be lost. Note that some debuggers perform a continuous read of memory which can cause this issue to occur.

In order to avoid this software should ensure that fast message overflow does not occur. If interrupts are used to read the SENT messages the interrupt for data reception should be enabled for every channel n (SRX_FRDY_IE[FRDY_IEn]=1) and the interrupt priority should be such that the software is able to read the message before the next message arrives. When using Direct Memory Accesses (eDMA) to access the messages the DMA request from the SENT module should be serviced before the next message arrives. The minimum duration between the reception of two consecutive messages in one channel is 92 times the utick length (time).

Else ensure that the SRX_CHn_FMSG_DATA, SRX_CHn_FMSG_CRC, and SRX_CHn_FMSG_TS registers are not read continuously either in the software code or as a result of a debugger being connected. They should be read once per message and the FMSG_RDY[F_RDYn] bit should be cleared after the reads.

51.4.4.2 Slow message buffers

Overflow in Slow Message buffers can occur when the CPU or DMA does not read messages from that channel for a long period of time. The receiver channel stores two messages in its buffers and indicates an overflow when these buffers are full.

When an overflow event occurs, further reception of slow messages is halted until the buffers are read out by CPU or DMA. Since it is less likely that CPU or DMA do not read the read registers for 32 or 36 fast message length duration, an overflow in slow messages would not be as frequent as in fast messages.

51.4.5 Adjustment for variation in sensor (Tx) clock

The clock used by the Channel Receiver (referred to as Receiver Clock, or Rx_CLK) to sample the message nibbles is generated from a High Frequency Receiver Clock or Protocol Clock. This high frequency receiver clock is divided using a prescaler counter which generates a tick when it rollovers on reaching a count equal to the Prescaler Value programmed in the channel's clock control register. The receive clock is generated separately for each channel. By varying this Prescaler Factor, we can control the period of the receive clock and make it close to the Transmitter clock used by the sensor for the particular channel.

After reset and once channel is enabled, the compensated prescaler value is set to Zero and the user software programs the Prescaler Value to obtain the desired receiver clock frequency for the particular channel. Thus, the receiver starts working by assuming that the transmitter is sending messages on the frequency that is programmed in its channel clock control register. The channel's input after filtering is continuously measured by the Prescaler Counter. The compensation logic checks each pulse length and determines the calibration pulse from them. When a calibration pulse is detected, the compensated prescaler value is computed and stored in the Channel's Clock Control Register (Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CH*n*_CLK_CTRL)). Software can use this value to determine the variation in Tx Clock.

Note

> A pause pulse may incidentally be detected as a synchronization/calibration pulse during start up after reset. The correction value would be computed on the pause pulse too but since the next synchronization pulse would follow, the logic would again detect the falling edge on the synchronization pulse and the correction value would now be correctly computed on the correct synchronization pulse.

The Clock Compensation or Correction happens for every messages that is received and the compensated prescaler value remains constant for that message.

51.4.5.1 Adjustment for nibble length variation

Section 6.2 of SAE Specifications specifies the maximum allowable limits for clock drift and jitter for the transmitter and receiver separately. This can cause the length of nibbles to vary and can cause incorrect sampling of data nibbles. This variation is adjusted by the SENT Receiver when nibbles are being sampled.

51.4.6 Input programmable filter

The Input Programmable Filter ensures that only valid input pin transitions are received by the SENT Receiver module. The input programmable filter is an 8-bit programmable up counter that increments on the high frequency receiver clock. The sensor input signal from device's pad is synchronized by high frequency receiver clock. When a state change occurs in the sensor input signal, the 8-bit counter resets and starts counting up on the high frequency receiver clock. As long as the new state is stable on the pin, the counter remains incrementing. If a counter overflows occurs, the new pin value (i.e. sensor input) is validated and latched in the filtered output flop (also running on high frequency receiver clock). If the opposite edge appears on the sensor input before validation (i.e. overflow), the counter is reset and the input is not passed onto the filtered output. At the next pin transition, the counter starts counting again. Any pulse that is shorter than a full range of the masked counter is regarded as a glitch and it is not passed on to the filter output. The number of samples (or the match value of the up counter) is programmable by the user in the channel's configuration register Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CH*n*_CONFIG). When zero is programmed into the registers, it bypasses the filter and the synchronized input is output as the filtered output. A non-zero value delays the filtered output by the number of clocks proportional to the programmed value in the Channel Configuration Register (Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CH*n*_CONFIG)). A timing diagram of the input filter when FIL_CNT is 4, is shown in the following figure.

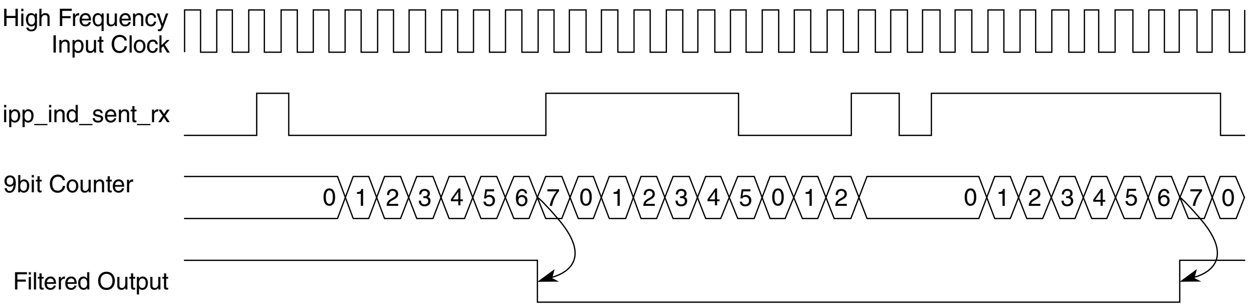


Figure 51-5. Input programmable filter timing diagram

51.4.7 Receiver diagnostics

Most of the receiver diagnostics are controlled by the Fast Message State Machine. The following checks are conducted by the receiver in each channel

- Calibration pulse length < 56 clock ticks – 25% or > 56 clock ticks + 25%
- Not the expected number of falling edges between calibration pulses. (Message length is pre-defined by each sensor device and programmed by user for each channel)
- Checksum error. Two 4-bit CRC checks and one 6-bit CRC check according to the message type. User has a programmable option to select the method of CRC to use i.e. Legacy or Recommended.
- Any nibble data values measured as < 0 or > 15

- Successive calibration pulses differ by > +1.5625% (1/64) or < -1.5625%. The accuracy of this check will depend on the frequency of the protocol clock used.
- For messages with pause pulse, an additional diagnostic is done; however, this diagnostic will not fail any message (to reduce latency in message reception) but the failure of this diagnostic will be indicated in the channel's status register.

On detection of any of the above errors, the receiver rejects the current packet until a new calibration pulse is detected. Occurrence of an error is flagged in the respective channel's status register (Channel 'n' Status Register (n=0 to (CH-1)) (SRX_CH*n*_STATUS)). If error interrupt is enabled, an error interrupt will be generated. There is a single error interrupt generated for all errors, so the CPU must read the status register to find out which error occurred. Once error condition is flagged, subsequent errors (except NUM_EDGES_ERR) are automatically masked out until a valid calibration pulse is detected, after which all checks are automatically enabled. This is done to avoid multiple assertions of the interrupt to CPU in case the channel become unstable and send wrong data continuously.

51.4.7.1 Calibration pulse length check

The calibration pulse length check happens in conjunction with Clock Compensation Logic since current calibration pulse is detected in this block. The Clock Compensation Logic detects a calibration pulse of length between 42 and 70 tick counts. This check will assert the CAL_LEN_ERR status bit on failure.

51.4.7.2 Successive calibration pulse check

The successive calibration pulse check checks if successive calibration pulses differ by > +1.5625% (1/64) or < -1.5625%. The accuracy of this check will depend on the frequency of the protocol clock used. Specifically, the higher the frequency, the closer the check will be to 1.5625%. So if protocol clock is T_{HF_CLK} and channel tick period is T_{TX_CLK} then the check will be of 1.5625% ± $\{100 \times (4 \times T_{HF\_CLK}) / (42 \times T_{TX\_CLK})\}$. So it won't allow variance in clock of a channel by 1.5625% - $\{100 \times (4 \times T_{HF\_CLK}) / (42 \times T_{TX\_CLK})\}$. This check will assert the CAL_DIAG_ERR status bit on failure.

When Option 2 of successive calibration pulse check is enabled, the CAL_RESYNC bit will be asserted on every third successive error detected by this check.

51.4.7.3 Not the expected number of edges check

The number of negative edges between two successive calibration pulses is counted and compared with expected number of edges in case of preferred option of successive calibration pulse check. The expected number of nibbles is the sum of following:

- Status and Communication nibble (1 No.)
- Data nibbles (Programmable as per user software)
- CRC nibble (1 No.)
- Pause Pulse, if configured (1 No.)

This check ("Not the expected number of edges check") will assert the NUM_EDGES_ERR status bit on failure. The check does not run when Option 2 (low latency) of successive calibration pulse check is enabled. This check is not masked after any other error is detected so it could be redundant if it is flagged along with CAL_DIAG_ERR and CAL_LEN_ERR. However, this is true only when CPU is clearing error status bits as and when they are asserted. If errors are accumulated, the above cannot be deduced.

51.4.7.4 Nibble value check

As part of this check, the lengths of the following nibbles are checked to remain in between 0 and 15 nibble values(11.5 ticks to 27.5 ticks):

- Status and Communication nibble
- all Data nibbles
- CRC nibble

The nibble value check will assert the NIB_VAL_ERR status bit on failure. This error can be flagged along with NUM_EDGES_ERR in which case the former can be ignored as the number of pulses in the message is incorrect. However, this is true only when CPU is clearing error status bits as and when they are asserted. In case, errors are accumulated, the above cannot be deduced.

51.4.7.5 CRC check

The CRC check will compute both 4-bit and 6-bit CRC as requested by State Machine control logic. Two 4-bit CRCs and one 6-bit CRC are supported to compute the CRC on Fast/Slow Serial Message (4-bit CRC) and Enhanced Serial Message (6-bit CRC) respectively. The SENT Receiver Module allows the user to calculate the 4-bit CRC using either the legacy CRC implementation method or the new recommended CRC implementation via a control bit in the channel's corresponding control register. Please refer to SAE SENT Specification for details on CRC algorithm.

Asserting the CHn_CONFIG_REG[11] bit, causes the Status and Communication nibble to be included in the 4-bit CRC calculation for Fast Serial Messages. De-asserting this bit enables normal operation as described above.

This check will assert the FMSG_CRC_ERR or SMSG_CRC_ERR status bit on failure, depending on whether the check is run for Fast Message or Slow Message.

The FMSG_CRC_ERR can be flagged along with the NUM_EDGES_ERR, in which case the CRC error can be ignored as the number of pulses in the message was incorrect. However, this is true only when CPU is clearing error status bits as and when they are asserted. If errors are accumulated, the above cannot be deduced.

51.4.7.6 Pause pulse diagnostic

The pause pulse diagnostic checks whether the ratio of calibration pulse length to full message length (including pause pulse) varies from one message to another by less than 1.5625% (as per spec). In order to have reduced latency of operation, message reception is not gated due to this check and no messages are discarded. However, when this check fails, a status bit is asserted to let the software know of this condition. The successive calibration pulse check can be configured to operate along with this check. This configurability is added to avoid conflicting results from the two checks.

There can be some inaccuracy in measuring pause pulse length as SAE specification specifies maximum clock drift/jitter up to maximum nibble length only and the frequency of high frequency receiver clock (protocol clock) used, allows clock compensation logic to ensure accuracy up to maximum nibble length. Hence there could be some inaccuracy in this check when sampling pause pulses that are larger than the maximum nibble pulse length.

This check will assert the PP_DIAG_ERR status bit on failure. This check does not run when reception of pause pulse is disabled.

When the Single Edge Nibble Transmission (SENT) Receiver (SRX) is configured to receive a pause pulse (Channel ‘n' Configuration Register - CHn_CONFIG[PAUSE_EN] = 1) and the length of the pause pulse from the sensor is in range of the valid calibration pulse length, the NUM_EDGES error can get asserted spuriously (Channel ‘n' Status Register - CHn_STATUS(NUM_EDGES_ERR] = 1) when there is any diagnostic error (other than number of expected edges error) or overflow in the incoming messages from the sensor.

Software can distinguish a spurious NUM_EDGES_ERR error from a real one by monitoring other error bits. The following tables will help distinguish between a false and real assertion of NUM_EDGES_ERR error and other errors. Software should handle the first error detected as per application needs and other bits can be evaluated based on these tables. Table 1 contains information due to erratum behavior and Table 2 below contains clarification of normal NUM_EDGES_ERR behavior.

Table 51-5. Behavior of NUM_EDGES_ERR

First Error Detected	Other error bits asserted	Cause for extra error bits getting asserted	Action
NIB_VAL_ERR	NUM_EDGES_ERR asserted twice	Upon detection of the first error, the state machine goes into a state where it waits for a calibration pulse, the first NUM_EDGES_ERR error is for the current message as the state machine does not detect an end of message. The second error comes when both the Pause pulse and the Calibration pulse are seen as back to back calibration pulses and no edges in between.	Ignore both NUM_EDGES_ERR error
FMSG_CRC_ERR	NUM_EDGES_ERR asserted twice	Upon detection of the first error, the state machine goes into a state where it waits for a calibration pulse, the first NUM_EDGES_ERR error is for the current message as the state machine does not detect an end of message. The second error comes when both the Pause pulse and the Calibration pulse are seen as back to back calibration pulses and no edges in between.	Ignore both NUM_EDGES_ERR errors
CAL_LEN_ERR	NUM_EDGES_ERR asserted once	Since the calibration pulse is not detected as a valid calibration pulse, the internal edges counter does not detect the end of one message and	Ignore NUM_EDGES_ERR error

Table 51-5. Behavior of NUM_EDGES_ERR

		start of bad message (which has CAL_LEN_ERR); hence the NUM_EDGES_ERR gets asserted.	

Table 51-6. Expected behavior, clarification of NUM_EDGES_ERR cases

First Error Detected	Other error bits asserted	Cause for extra error bits getting asserted	Action
NUM_EDGES_ERR (when edges are less than expected)	NIB_VAL_ERR is asserted	When the actual number of edges in the message are less than expected, then a pause pulse gets detected as a nibble since the state machine expects nibbles when actually there is a pause pulse present. This generates NIB_VAL_ERR.	Ignore the NIB_VAL_ERR
NUM_EDGES_ERR (when edges are more than expected)	NIB_VAL_ERR and PP_DIAG_ERR are asserted	When the actual number of edges in a message are more than expected, then after receiving the programmed number of data nibbles, the state machine expects a pause pulse. However, the pause pulse comes later and gets detected as a nibble and hence NIB_VAL_ERR is asserted. Since the message length is not correct, PP_DIAG_ERR is also asserted.	Ignore NIB_VAL_ERR and PP_DIAG_ERR

51.4.8 Time stamp logic

A single counter maintains the time stamp for all channels which can be used by the software to determine the relative time of arrival of the messages for each channel. The time stamp counter is a 32-bit counter.

The clock for this counter is derived from the high frequency receiver clock using a Time Stamp Prescaler Counter that divides the high frequency receiver clock to generate the clock of required resolution. The user must program the time stamp prescaler value (in Global Control Register (SRX_GBL_CTRL)) in order to generate the time stamp clock. The period of the time stamp clock must be less than that of the fastest receiver channel being used, or it can be set at some fixed value determined by application, such as 1 µs. For example, if the high frequency receiver clock is 60 MHz, the required prescaler value is 59 to generate a time stamp clock of 1 µs resolution.

Note

> The rollover of time stamp values should be determined in user software, by comparing the time stamp values in previous and current messages that are read out. User software should adjust the time stamp values in these messages accordingly, after reading them.

The time stamp for a Fast Message is sampled at the falling edge that comes at the end of the calibration pulse (which is also the start of the status and communication nibble pulse) and is stored in the message read buffer. However, if the current message is found to be in error, the message buffer is discarded. Thus, the time stamp will be available to user software for only those messages which do not have any error.

The time stamp for a serial message is sampled at the end of the message i.e. when the serial message is completely received and when the message is found to have no errors. the time stamp is stored in the message read buffer to be read by the user software. Again, for messages with error the message and time stamp are discarded.

51.4.8.1 Limitation

Since the same counter is used for all channels, it may happen that more than 1 message is received within the same time stamp across different channels. Hence the software would not be able to determine the sequence of arrival of messages which have the same time stamp value.

51.4.9 Bus Idle Diagnostic

This diagnostic checks the connected sensors for inactivity. SENT module can indicate if the idle period on a particular channel has crossed the period defined by the programmed value in Bus Idle Count (in Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CH*n*_CONFIG)). Status bit (bus_idle in Channel 'n' Status Register (n=0 to (CH-1)) (SRX_CH*n*_STATUS)) will be set when idle period crosses the allowed value. CPU should write 1 to this clear this bit once it is read.

51.5 Clocks and resets

The SENT Receiver works on two clocks. First is the System Bus Clock that is used to program the registers and read messages via DMA or Interrupt from the module's Register Interface. Second is the High Frequency Receiver Clock or Protocol Clock that is used for accurate message receiving operations. There is a single asynchronous reset which is the system asynchronous reset and one internal reset for each of the channel logic.

51.5.1 Clocking strategy

The following figure shows the clock domain in which each module is functioning.

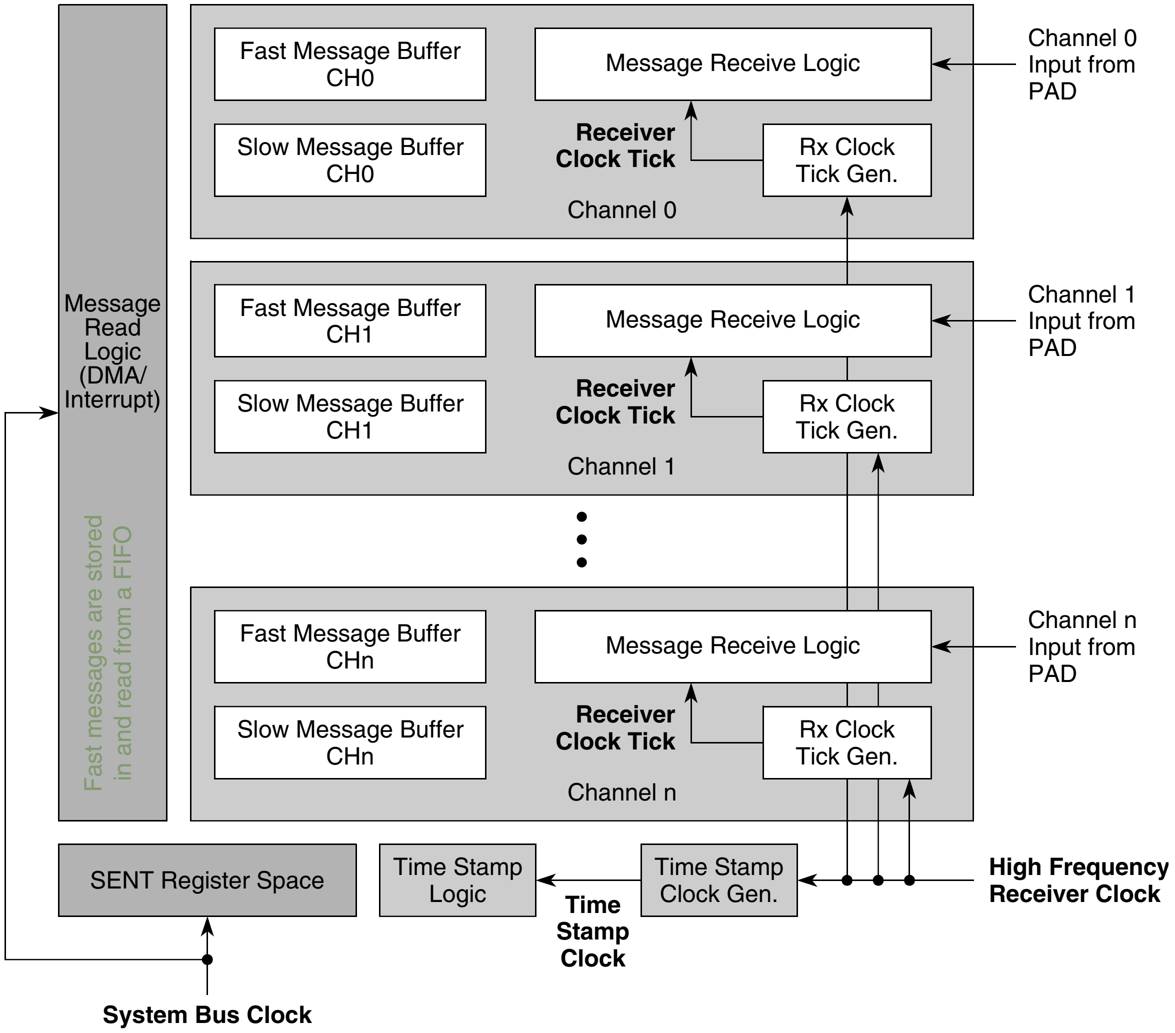

Figure 51-6. SENT Receiver module clock domains

51.5.2 System bus clock requirements

Since all the received messages are read on the System Bus Clock it is necessary that both the interrupt service routine and the DMA controller must be able to access all channels with messages ready to be read within a time to prevent overflow in any channel. The minimum time available to the CPU or DMA is the case when the smallest Fast Message is received back to back on all channels while working on the smallest receive clock tick period.

Now, the smallest Fast Message size with valid checksum as per SAE Specifications is 154 ticks. At 3 µs receive clock tick with a -20% variation in the transmitter clock tick, the effective receiver clock tick is 2.4 µs (after compensation). This gives us the time in which the minimum size Fast Message is received in any channel as 154 × 2.4 = 369.6 µs. Now since messages are arriving in parallel, 369.6 µs is the time available for CPU or DMA to access all channels to prevent an overflow in the channel that received the very first message.

Thus, if assume that 'N_{CHNL}' channels are being used and all channels have messages ready to be read together from either DMA or CPU then the time available to read a message in one channel will be 369.6/N_{CHNL} µs or ~370/N_{CHNL} µs. Since the CPU or the DMA needs to make three 32-bit accesses in order to read a complete message and taking the time required for one 32-bit read access as 'T_{RD}' (assuming it to be same for DMA and CPU); we can determine the minimum frequency for the System Bus Clock as:

For CPU,

$$3 \times T_{\mathrm{RD}} + T_{\mathrm{ISR}} + T_{\mathrm{WAKUP}} < 370 / N_{\mathrm{CHNL}}$$

where T_{ISR} is the overhead in initiating an ISR and T_{WAKUP} is the time to wakeup from low power mode

For DMA,

$$3 \times T_{\mathrm{RD}} + T_{\mathrm{WAKUP}} < 370 / N_{\mathrm{CHNL}}$$

Replacing $T_{RD} = N_{RD} \times T_{SYS\_CLK}$ and $T_{ISR} = N_{ISR} \times T_{SYS\_CLK}$, where N_{RD} is the number of System Bus Clock cycles in one 32-bit read access, N_{ISR} is the number of System Bus Clock Cycles in initiating an interrupt service routine and T_{SYS_CLK} is the period of the same clock, we get

For CPU,

$$(3 \times N_{\mathrm{RD}} + N_{\mathrm{ISR}}) \times T_{\mathrm{SYS\_CLK}} + T_{\mathrm{WAKUP}} < 370 / N_{\mathrm{CHNL}}$$

(all units is µs)

For DMA,

$$3 \times N_{RD} \times T_{SYS\_CLK} + T_{WAKUP} < 370 / N_{CHNL}$$

(all units is µs)

51.5.3 High frequency receiver clock (protocol clock) requirements

For accurate receive operations, the protocol is required to satisfy a minimum frequency defined as per formula: Guard Band > 2.5 * T_{HF_CLK}

where T_{HF_CLK} is the High Frequency Receiver Clock or Protocol Clock in ns and Guard Band is guard band in ns as specified in SAE specification, at particular transmitter uTick.

Note

> T_{HF_CLK} in the above equation should be chosen based on the fastest sensor clock (with minimum guard band as specified in SAE spec) among all channels in the device.

Chapter 52
LINFlexD

52.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The LINFlexD controller is designed to manage a high number of LIN messages efficiently with a minimum of CPU load. To reduce the CPU loading in Master mode, LINFlexD autonomously handles the LIN messages once software has triggered the header transmission, until the next header transmission request in transmitter mode or until checksum reception in the receiver mode.

The LINFlexD supports LIN protocol version 1.3, 2.0, and 2.1. It also consists of an 8-byte buffer for transmission/reception data.

The LINFlexD also provides support for some of the basic UART transfers of 8-bit, 9-bit, 16-bit, and 17-bit frames and also 12-bit data frame + parity reception in UART mode for MSC support.

The LINFlexD supports multi-channels and parametric DMA Tx/Rx interface in LIN/UART operating mode.

52.1.1 Glossary and acronyms

Table 52-1. Glossary and acronyms

Term	Description
LIN	Local interconnect network
UART	Universal asynchronous transmitter receiver
ID	LIN identifier field
DMA	Direct memory access

Table continues on the next page...

Table 52-1. Glossary and acronyms (continued)

Term	Description
TCD	Transfer control descriptor
IPS	Peripheral Bus Interface
IRQ	Interrupt request
FSM	Finite state machine
WS	Wait state
SW	Software
CPU	Central processing unit
SoC	System on a chip

52.1.2 References

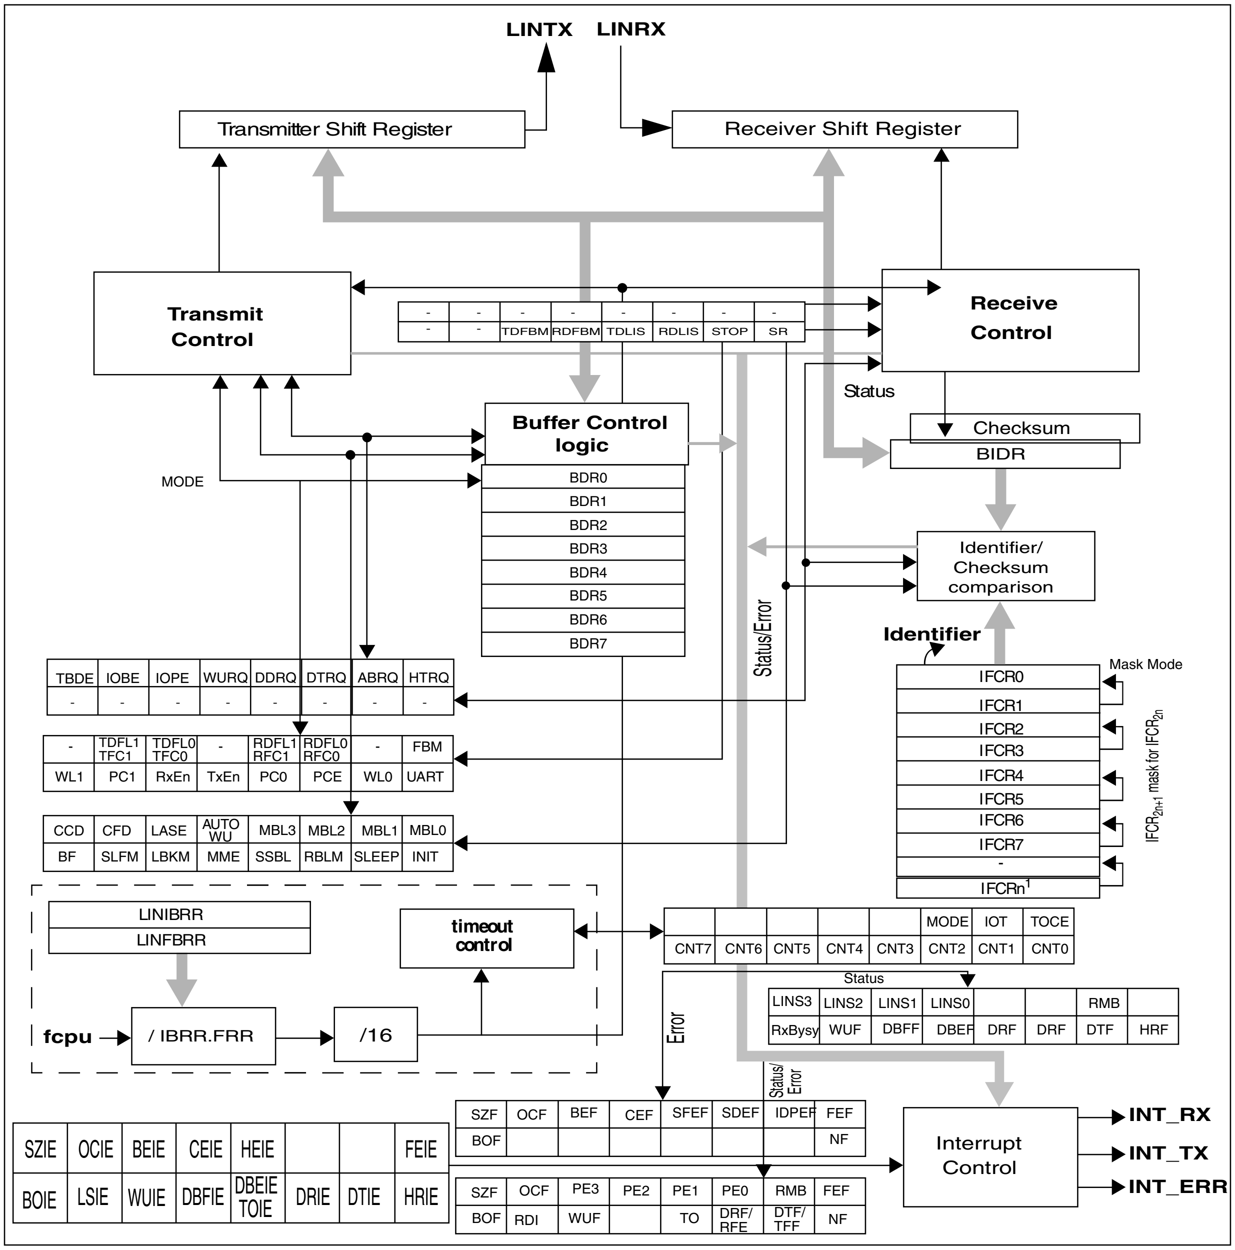

Figure 52-1. Block diagram

Notes:

1: The value of n depends on the no_of_filters. Refer to the chip configuration details to see the number of filters used in this device.

52.2 Main features

The LINFlexD controller can operate in several modes, each of which has a distinct set of features that are described in the following sections. In addition, the LINFlexD controller has several features common to all modes:

- Fractional baud rate generator
- 3 operating modes for power saving and configuration registers lock
    - Initialization
    - Normal
    - Sleep
- Test Mode:Loop Back
- Maskable interrupts
- A maximum of 16 possible identifiers can be programmed into the identifier list

52.2.1 LIN mode features

- Supports LIN protocol version 1.3, 2.0, and 2.1
- Bit rates up to 20 Kbit/s (LIN protocol)
- Master/Slave mode
- Classic and Enhanced Checksum calculation and check
- Single 8-byte buffer or FIFO for Transmission/Reception
- Timeout management
- Identifier filters
- DMA interface
- Supports a maximum of 16 possible identifiers
- Master mode with autonomous message handling
- Extended frame mode for in-application programming purposes
- Wakeup event on dominant bit detection

- True LIN field state machine
- Advanced LIN error detection
- Header, response, and frame timeout
- Slave mode
    - Autonomous header handling
    - Autonomous transmit/receive data handling
- Identifier filters for autonomous message handling in Slave mode
- Separate clock for baud rate calculation

52.2.2 UART mode features

- Full-duplex communication
- Baud rate is a function of baud clock, LINIBRR and LINFBRR registers - see Baud rate generation
- Separate clock for baud rate calculation
- 15/16/7/8 bits data, parity
- 1/2/3 stop bits
- 12-bit + parity reception
- 4-byte buffer for reception, 4-byte buffer for transmission
- 12-bit counter for timeout management

52.3 Functional description

52.3.1 LIN protocol

The LIN (Local Interconnect Network) is a serial communication protocol. A LIN cluster consists of one master task and several slave tasks. A master node contains the master task as well as a slave task. All other nodes contain a slave task only. The master node decides when and which frame is transferred on the bus. The slave task provides the data to be transported by the frame.

52.3.1.1 Frames

A frame consists of a header provided by the master task and a response provided by the slave task. The header consists of a break, a sync pattern, and an identifier. The break is followed by the sync pattern and the sync pattern is followed by the identifier. The slave task associated with the identifier provides the response. The response consists of a data field and checksum. The slave task designated to receive the data associated with the identifier receives the response and verifies the checksum.

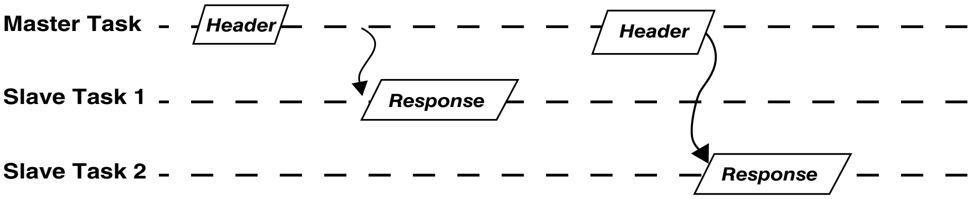

Figure 52-2. Frames

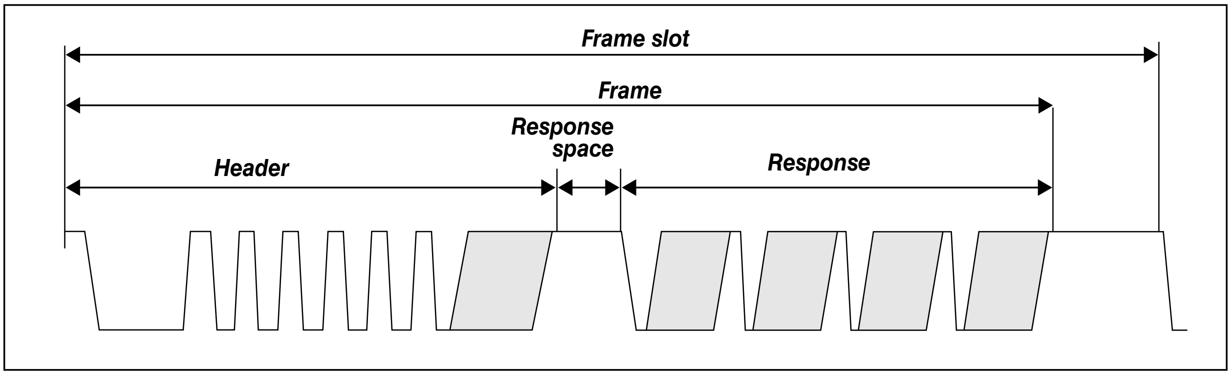

Figure 52-3. Structure of LIN frame

52.3.1.2 Data field

Each byte is transmitted as shown in Figure 52-4. The LSB of the data is sent first and the MSB is sent last. The start bit is encoded as a bit with value zero (dominant) and stop bit is encoded as bit value one (recessive).

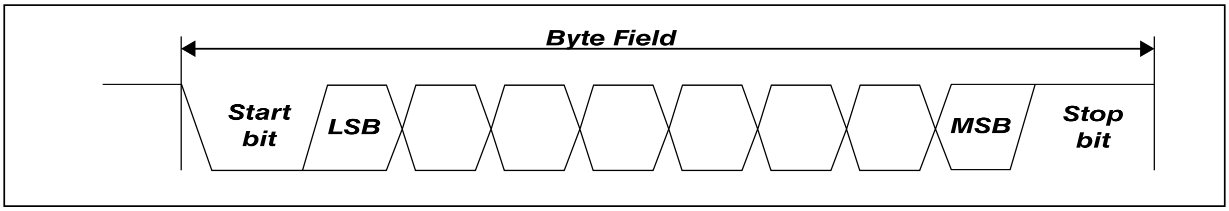

Figure 52-4. Structure of byte field

52.3.1.3 Break

The break symbol is used to signal the beginning of a new frame. It is the only field that does not comply with the above figure. The break is always generated by the master and shall be at least 13 bits of dominant value including the start bit, followed by a break delimiter as shown in Figure 52-5. The break delimiter must be of two-bit duration (to be compliant with LIN protocol 2.1).

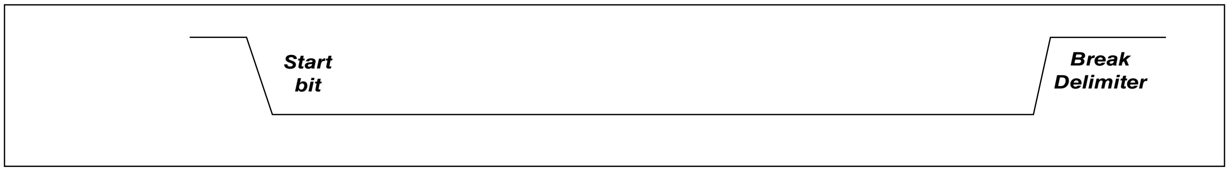

Figure 52-5. Break field

52.3.1.4 Sync byte

Sync is a byte field with the data value of 0x55.

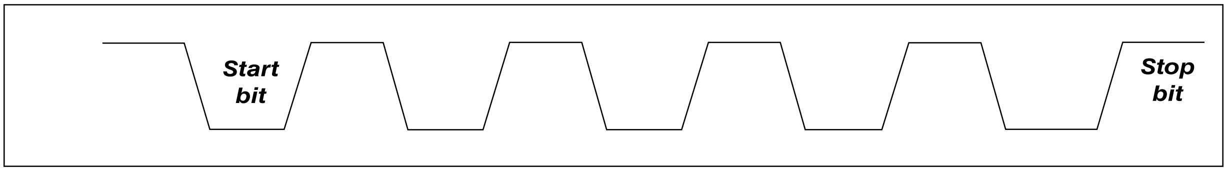

Figure 52-6. Sync byte field

52.3.1.5 Identifer

The Identifier field consists of two sub-fields, the identifier and the identifier parity. Bits 0 to 5 are the identifier and bits 6 and 7 indicate the parity.

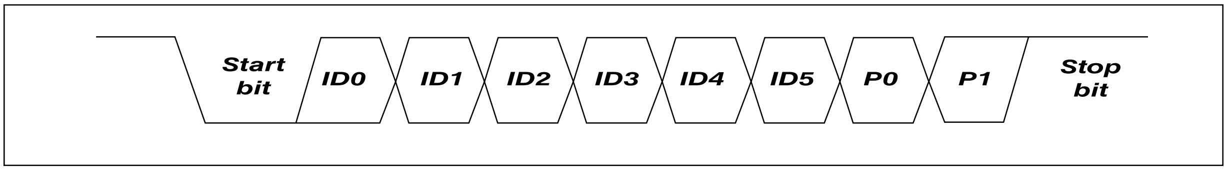

Figure 52-7. Identifier field

P0 = ID0 XOR ID1 XOR ID2 XOR ID4

P1 = NOT (ID1 XOR ID3 XOR ID4 XOR ID5)

52.3.1.6 Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8-bit sum with carryover of all data bytes or all data bytes and the identifier. Checksum calculation over the data bytes only is called classic checksum and is used for communication with LIN 1.3 slaves. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and is used for communication with LIN 2.0 slaves.

52.3.2 LINFlexD features

52.3.2.1 Operating modes

The LINFlexD has three operating modes: **Initialization, Normal** and **Sleep** modes. After hardware reset, the LINFlexD enters sleep mode to reduce power consumption.

Initialization mode (INIT)

To enter this mode, software sets the INIT bit in the LINCR1. To exit the initialization mode, software should reset the INIT bit.

When in initialization mode, all message transfers to and from the LIN bus are stopped and the status of LIN bus output LINTX is recessive (high). If software invokes the initialization mode when a bus transfer is in progress, the transfer is aborted. The software should therefore check the LIN state before setting this bit.

To initialize the LINFlexD controller software must:

1. Set up the baud rate registers
2. Reset UART bit
3. Select the mode (master or slave)
4. Configure checksum control bits
5. Initialize the identifier list (Slave mode)

Normal mode (NM)

Once software has completed initialization of the LINFlexD controller, it can enter the Normal mode by clearing the INIT bit.

Sleep mode (SM)

Sleep mode in LINFlexD reduces power consumption. This mode is entered by setting the SLEEP bit in LINCR1. In this mode the LINFlexD clock is stopped. LINFlexD can be awakened from Sleep mode by clearing the SLEEP bit.

If software detects a wakeup pulse of 150 μs on the LIN Bus, it can request LINFlexD to wake up from Sleep mode. Refer to Wakeup management.

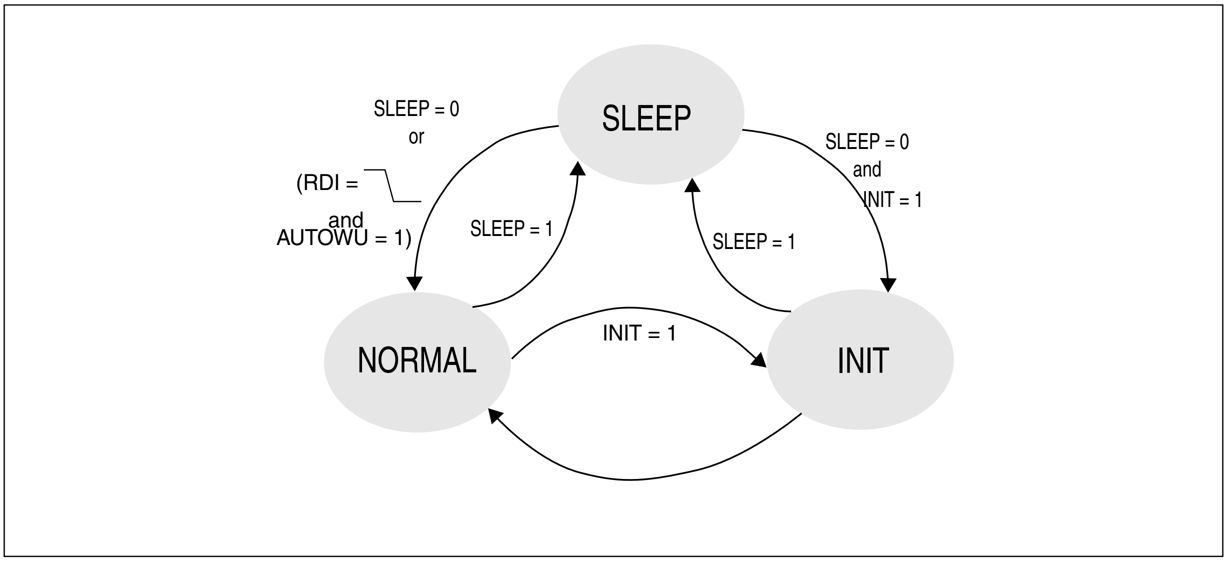

Figure 52-8. Operating modes

52.3.2.2 Test mode

Loop Back mode

This mode is entered by setting the LBKM bit in LINCR1. In this mode, the LINFlexD receives the Identifier and Data transmitted by itself and writes the same in the BIDR and Data buffers respectively. This mode is provided for selftest functions. Bit error is checked in this mode.

The LINFlexD ignores the LINRX signal. There is an internal feedback from its TX output to its RX input. The TX pin can be disconnected from LINTX pin by SIUL2 setting.

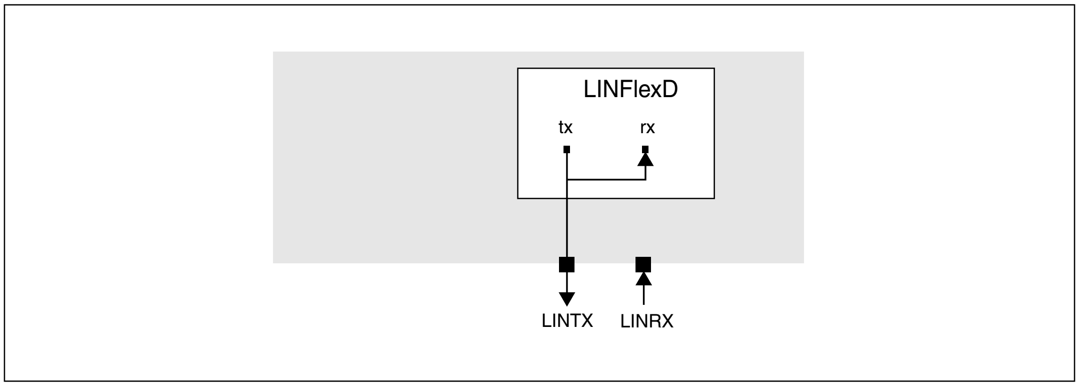

Figure 52-9. LINFlexD in Loop Back Mode

52.3.2.3 Master mode

Master mode is selected by means of the MME bit in LINCR1 register.

Header transmission

According to the LIN protocol any communication on the LIN bus is triggered by the master sending a header. The header is transmitted by the master task of a node while the response is transmitted by the slave task of a node.

To transmit the header, first program the Identifier, data field length, message direction and checksum enable in the BIDR register; then set the HTRQ bit in LINCR2. Once header transmission starts, the user should not modify BIDR register bits untill the current frame is complete. The transmitted ID is also received by the master node and copied to BIDR.

Data transmission

When the master node is the publisher of the data corresponding to the Identifier sent by the master, then the slave task of the node should send the data in the response part of the frame. Hence software must provide the data to the LINFlexD before the header transmission is requested. The data to be transmitted is stored in the message buffer BDRL and BDRM. The number of bytes to be transmitted depends on the Data Field length in BIDR. The software uses the BIDR[CCS] bit to configure the checksum type (classic or enhanced) for each message.

If the response has been sent successfully, LINSR[DTF] is set. In case of error, the DTF flag is not set and the corresponding error flag is set in the LINESR (refer to error handling).

It is possible to handle frames with a response size larger than eight bytes of data (extended frames). If the data field length in the BIDR is configured with a value higher than eight data bytes, LINSR[DBEF] is set once the first eight bytes have been transmitted. The application has to update the buffer BDR before resetting the DBEF bit. The transmission of the next bytes starts when the DBEF bit is reset. Once the last data byte (or the checksum byte) has been sent, the DTF flag is set.

The direction of the message buffer is decided by the DIR bit in the BIDR. The transmitted data is also received by the same node and copied to the buffer.

Data reception

To receive data from a slave node, the master sends a header with the corresponding Identifier. The data received from the slave is stored in the message buffer and the status of the message is stored in the LINSR.

If the response has been received successfully, the LINSR (DRF) bit is set. In case of error, the DRF flag is not set and the corresponding error flag is set in the LINESR (refer to Error handling).

It is possible to handle frames with a Response size larger than eight bytes of data (extended frames). If the data field length in the BIDR is configured with a value higher than eight data bytes, the LINSR (DBFF) bit is set once the first eight bytes have been received. The application has to read the buffer BDR before resetting the DBFF bit. Once the last data byte (or the checksum byte) has been received, the DRF flag is set.

Data Discard

If the user wants to discard the data after header transmission, then the DDRQ bit in LINCR2 should be set.

52.3.2.4 Slave mode

This mode is selected when the MME bit of the LINCR1 register is cleared.

Data transmission

On header reception, the HRF bit is set and an RX interrupt is generated. The software must then:

1. Read the received ID in the BIDR register
2. Fill the BDR[0:x] register
3. Program the CCS and DIR bits in the BIDR register
4. Specify the data field length DFL[5:0] bits in the BIDR register
5. Trigger the data transmission by setting the DTRQ bit

Note that the HRF bit should be reset only after the DTRQ bit is set. For the DTRQ to be effective, the HRF bit must be set. This is to ensure that DTRQ is not set randomly, but only after a header reception. It must be noted that you cannot set the DIR and DTRQ bits once RXbusy is asserted in LINSR.

Alternately, one or more Identifier filters are configured for transmission by setting the DIR bit, and activated by setting the enable bits in IFER. When at least one Identifier filter is active and configured for transmission and the received ID matches the filter, a TX interrupt is generated. The software can use the index in the IFMI register to point directly to the corresponding data array in the RAM and copy this data to the BDR[0:7].

The use of a filter saves software the processing time required to read the ID value in the BIDR, match it, and configure the data field length and checksum type.

If the number of filters provided by LINFlexD are not sufficient for the application, mask mode can be used for the filters.

The transmitted data is also received by the same node and copied to the buffer.

Data reception

When LINFlexD is the subscriber of the data of the received identifier, then on header reception the HRF flag is set and an RX interrupt is generated. The software must read the received ID from the BIDR register and specify the data field length before the reception of the stop bit of the first data byte. When the checksum is received, an RX interrupt is generated for software to read the received data from BDR[0:7] and the RMB bit is set. Software must then release the data buffer by resetting the RMB bit in the LINSR.

When at least one identifier filter is active and configured for reception, an RX interrupt is generated only after the checksum reception. No interrupt request is generated on reception of the ID.

If the Identifier is filtered by software then you can discard the data by setting the DDRQ bit in the LINCR2, while HRF is set.

Note that for software filtering, software must decide the type of checksum (configure the CCS bit of the BIDR register) before reception of data. Otherwise the previous value of the CCS bit is considered while calculating checksum.

52.3.2.5 Errors

52.3.2.5.1 Header error

A header error is an error during the header reception. The error types are:

1. Sync Del error (SDEF)
2. Sync field error (SFEF)
3. Identifier Parity error (IDPEF)

Sync Del error (SDEF)

The delimiter should be 1 for at least one bit time; otherwise it is considered short and consequently the receiver discards synchronization on the current header. Hence the frame is discarded. An interrupt is generated if *HEIE* bit of LINEIER is set.

Sync field error (SFEF)

The SFEF error condition is monitored differently depending on whether autosynchronization (LASE) is ON or OFF.

Case 1: Autosynchronization ON (LASE bit of LINCR1 = 1):

When Autosynchronization is enabled, the SFEF flag indicates:

- The deviation error on the Sync Field is outside the LIN specification, which allows up to 14% of period deviation between the slave and master oscillators or
- An overflow has occurred during the Sync Field Measurement, which leads to an overflow of the divider registers.

Deviation error on the Sync Field

The deviation error is checked by comparing the current baud rate (relative to the slave oscillator) with the received LIN Sync Field (relative to the master oscillator).

This check is based on a measurement between the first falling edge and the last falling edge of the Sync Field. Let's refer to this period deviation as D.

If SFEF field is asserted it means that:

$D > 14.0625\%$

If there is no error, it means that:

$D < 14.84375\%$

If $14.0625\% < D < 14.84375\%$, then the Sync Field could be either consistent or inconsistent depending on dephasing between the signal on the RDI line and the LIN_CLK.

Overflow during Sync Field Measurement

This check is based on the measurement of each bit time between both edges of the Sync Field. This checks that each of these bit times is large enough (more than 12 samples) compared to the bit time of the current baud rate.

Case 2: Autosynchronization OFF (LASE bit of LINCR1 = '0')

In this case the Sync character is received as a normal character. If the received character is 0x55 then the Sync Field is OK.

On any occurrence of an inconsistent Sync Field, the receiver immediately exits from Sync_Field state and the frame is consequently discarded. The SFEF bit of LINESR is set.

Identifier Parity error(IDPEF)

There are two parity bits in the identifier field. These bits are checked against the hardware-calculated parity over the other six bits of identifier, according to the formula:

P0 = ID0 XOR ID1 XOR ID2 XOR ID4

P1 = NOT (ID1 XOR ID3 XOR ID4 XOR ID5)

This parity is checked after the ID is transferred to the BIDR register (after stop of ID has been detected properly) and upon parity mismatch, the receiver state machine exits from Identifier state immediately if the IOPE bit of LINCR2 is set.

52.3.2.5.2 Bit error

This error is flagged in transmission mode when the value read back from the bus is different from the value transmitted. Bit error checking on each bit is guaranteed if transceiver delay is less than one bit time minus 6 LIN_CPU cycles. Bit error is not checked during break field transmission.

1-bit time at 20 Kbit/s = 50 µs

6 LIN_CLK cycles at 80 MHz = 75 ns

Thus, (1-bit time) - (6 LIN_CLK cycles) = 49.925 µs

Transmission of the frame is stopped after the corrupted bit if the IOBE bit in LINCR2 is set. If IOBE is reset, the transmitter continues to transmit in spite of the bit error. An interrupt is generated if the BEIER bit is set in LINIER.

Note

If the break delimiter is not detected by the master within one bit time after delimiter transmission due to transceiver delay or error on the bus, then a train of bit error interrupts are generated. In this case, the Identifier may not be replaced in the BIDR.

Similarly, if the start of a falling edge of data is not detected by the transmitter node within one bit time after start bit transmission, then a train of bit error interrupts are generated. In this case also, data and checksum replacements in the BDR and CFR respectively are not guaranteed.

52.3.2.5.3 Framing error

This error is flagged when a dominant state is sampled on stop bit of the current received character (sync field, identifier field, data field, checksum field). LINFlexD discards the current frame and returns to Idle state. An interrupt is generated if FEIE bit is set in LINEIER.

The byte that caused framing error is also shifted to the buffer but DRF or DBFF is never set in this case.

52.3.2.5.4 Checksum error

This error is flagged when the checksum computed by hardware does not match the received checksum.

LINFlexD discards the received frame and returns to Idle state. An interrupt is generated if the CEIE bit is set in LINEIER.

52.3.2.5.5 Overrun error

Once the message buffer is full (RMB is set), the next valid message reception will lead to an overrun and the message will be lost. The hardware signals the overrun condition by setting the BOF bit. Which message is lost depends on the buffer lock function control bit RBLM.

If RBLM is cleared, the old message in the buffer is overwritten by the most recent message. If RBLM bit is set, the most recent message is discarded and the oldest message is available to the software. In the case of slave, if buffer is not released (RMB is not reset) before reception of next Identifier and if RBLM is set, then the ID along with the data is discarded.

52.3.2.5.6 Timeout error

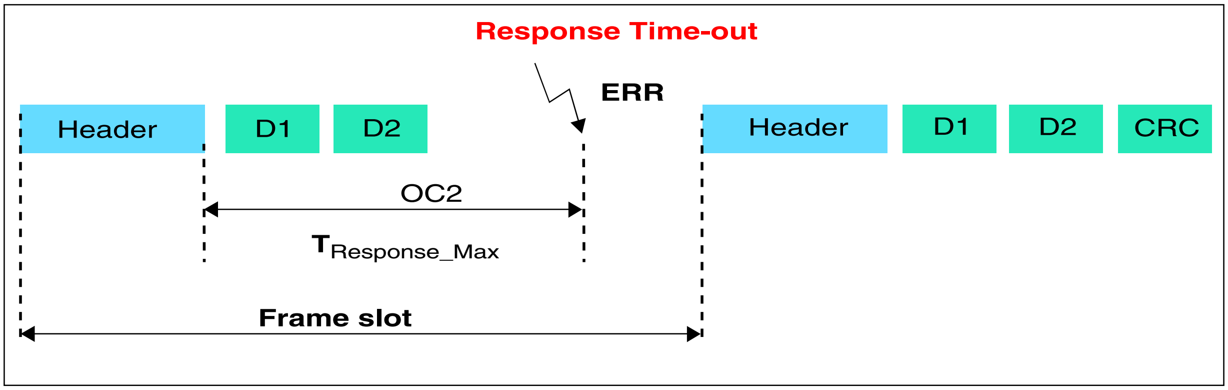

Figure 52-10. Incomplete response (for example, missing checksum)

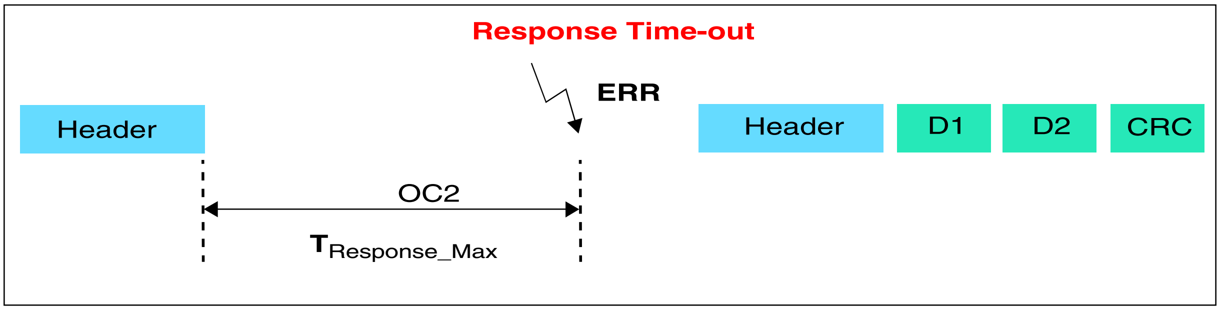

Figure 52-11. No response

Response timeout mechanism

- Master mode
  - OC2 is loaded with Nominal_time_out + LINFlexD_LINTCSR[CNT] at the end of the stop bit of the Identifier field (where nominal_time_out = 1.4 × ((DFL + 2) × 10 bit time).

    This loading takes place at the end of id field (and not at the beginning of data field). Moreover, the correct value, which depends on DFL, is loaded immediately. No further OC2 update is required.
  - In case of no response at all within this time (in other words, start of data is not received), timeout takes place when the counter reaches the OC2 value (no change compared to earlier implementation).
  - In case of an incomplete response, timeout also occurs when the counter reaches the OC2 value (no change compared to earlier implementation).
- Slave mode

- **Case 1**: The received identifier is managed by a filter. The implementation can be similar to the master mode, because the DFL value is loaded by hardware. Thus, OC2 can be loaded with Nominal_time_out + LINFlexD_LINTCSR[CNT] at the end of the stop bit of the Identifier field (where nominal_time_out = 1.4 × ((DFL + 2) × 10 bit time))
- **Case 2**: The received identifier is not managed by a filter. As the DFL value needs to be updated by software after the identifier field has been received, the implementation is the following:
    - At the end of the ID, OC2 is loaded with 36 (maximum possible response space) + LINFlexD_LINTCSR[CNT].
    - At the end of the first_data_byte it is reloaded again according to DFL
    - Before reloading, LINFlexD checks the count_val. If count value is higher than the value to be reloaded, timeout takes place immediately and no reloading occurs.

NOTE

The value of nominal_time_out (1.4 × ((DFL +2) × 10 bit time)) shown is as per the reset value of LINTOCR[RTO] and LINCR1[CFD]. It changes with change in value of LINTOCR[RTO] and LINCR1[CFD]. Here, 1.4 corresponds to (LINTOCR[RTO])/10 and 2 corresponds to (2- LINCR1[CFD])

Header timeout mechanism

- Master mode: As the header is generated by the LINFlexD, there are only two cases:
    - no error on the bus and timing is correct (nominal header length),
    - an error occurs on the bus and LINFlexD flags it in LINESR register (typically a bit error).

  Therefore there is no meaning of header timeout in master mode, so it is disabled.
- Slave mode
    - header_nominal = 13 + 2 + 10 + 10 = 35 Tbit
    - header_max = 1.4 × Header_nominal = 49 Tbit

- taking into account a possible 14% clock deviation, header_max seen by LINFlexD is 49 × 1.14 = 56 Tbit
- If the counter starts after 11 Tbit (break duration), the HTO value is 56 –11 = 45 Tbit.

The reset value of HTO is 45, and this register can only be programmed in slave mode. Counter restarts after break duration and OC1 gets loaded with the value of HTO.

As response space is not included in the response, frame timeout is no longer needed and is removed completely. Indeed, header timeout and response timeout cover all cases.

The timeout counter can be used to detect other timeouts. In this case, the MODE bit must be reset and the output compare value can be updated in the LINTOCR register by software.

Stuck at zero timeout error

If the dominant pulse lasts for a time of at least 100 bits, the SZF bit in LINESR is set. If the same dominant pulse prolongs, the subsequent SZF setting will be 87 bit times apart (instead of 100 bit times).

52.3.2.5.7 Noise

During reception each bit is sampled 16 times and the value of the bit is obtained by taking the majority value of the 8th, 9th and 10th samples. If any one of these three samples has a value different from the other two, this error is flagged.

This error is flagged when there is noise detected in the start bit (see LIN Error Status Register (LINFlexD_LINESR).

52.3.2.6 Identifier filtering

In LIN protocol the identifier of a message is not associated with the address of a node but is related to the content of the message. A transmitter broadcasts its message to all the receivers. Based on the header received, the receiver decides whether to receive or transmit a response (depending on the identifier value). If the message does not target the node, it should be discarded.

To fulfill this requirement, the LINFlexD provides configurable filters in order to eliminate software intervention. This hardware filtering saves CPU resources that would otherwise be required to perform filtering by software.

There are a maximum of 16 filters (depending on the generic no_of_filters) in the LINFlexD, which can be programmed by the user only during Initialization mode. In order to activate a filter the corresponding FACT bit in IFER needs to be set. There are two modes possible for each identifier depending on the corresponding IFM bit of IFMR.

Identifier list mode

If the n^{th} bit of IFMR is cleared, then filter number 2n and 2n+1 is in identifier list mode. In this mode, the maximum number of filters that can be configured for transmission/reception equals no_of_filters, depending on the FACT bit of IFER. In this mode the identifier received should match bit by bit to the ID field of IFCR2n or IFCR2n+1 (if the corresponding FACT bit is set).

Identifier mask mode

If the number of filters required is more than no_of_filters, then filters should be configured in Mask mode. If the n^{th} bit of IFMR is set, then filter number 2n is the filter and 2n+1 acts as a mask for it. The FACT bit for filter 2n+1 has no effect in this case. In this mode, if the x^{th} bit of the mask is set, then the x^{th} bit of the received identifier must match the x^{th} bit of filter.

If there is a match of identifier with the mth filter in any mode, then m+1 is loaded in the IFMI register by hardware. No match condition is denoted by IFMI = 0.

Upon matching DFL (2:0), the CCS and DIR bits of the BIDR register are copied from the filter by hardware and from then on, the BIDR register is read-only untill the end of the frame. Now if the DIR bit of BIDR is set, then a TXI interrupt is generated if the HRIE bit of LINIER is set. In this case, software uses the IFMI register to transfer the relevant data from the RAM area to BDR, and after complete transfer the DTRQ bit of LINCR2 is set to start the transmission. If the DIR bit is cleared then an RXI interrupt is generated (provided DRIE bit of LINIER is set) when the checksum has been received and there is no checksum error.

In case of no filter match condition (IFMI = 0) and if the BF bit of LINCR1 is set, then an RXI is generated. Now it is the responsibility of software to configure BIDR and start transmission (by loading the BDR buffer and setting the DTRQ bit of LINCR2) or discard reception (by setting the DDRQ bit of LINCR2). If the BF bit is reset, then the receiver discards the received identifier and turns to Idle state in search of a new break.

Note

If one identifier matches with two filters (one is in the list and the other in Mask mode) then List mode prevails over Mask mode. In mask mode if two filters match with the identifier then the filter having the lower number prevails.

52.3.2.7 Start detection and break delimiter detection in receiver

There is a 10-bit-shift register sample register in the receiver that shifts signal data to the next least significant bit on each incoming sample.

Table 52-2. Start Detection and Delimiter Detection in receiver

9	8	7	6	5	4	3	2	1	0	Sample_reg
—	—	—	—	—	—	—	—	—	RT1	counter = 0
—	—	—	—	—	—	—	—	RT1	RT2	counter = 1
—	—	—	—	—	—	—	RT1	RT2	RT3	counter = 2
—	—	—	—	—	—	RT1	RT2	RT3	RT4	counter = 3
—	—	—	—	—	RT1	RT2	RT3	RT4	RT5	counter = 4
—	—	—	—	RT1	RT2	RT3	RT4	RT5	RT6	counter = 5
—	—	—	RT1	RT2	RT3	RT4	RT5	RT6	RT7	counter = 6
—	—	RT1	RT2	RT3	RT4	RT5	RT6	RT7	RT8	counter = 7
—	RT1	RT2	RT3	RT4	RT5	RT6	RT7	RT8	RT9	counter = 8
RT1	RT2	RT3	RT4	RT5	RT6	RT7	RT8	RT9	RT10	counter = 9
RT2	RT3	RT4	RT5	RT6	RT7	RT8	RT9	RT10	RT11	counter = 10
RT3	RT4	RT5	RT6	RT7	RT8	RT9	RT10	RT11	RT12	counter = 11
RT4	RT5	RT6	RT7	RT8	RT9	RT10	RT11	RT12	RT13	counter = 12
RT5	RT6	RT7	RT8	RT9	RT10	RT11	RT12	RT13	RT14	counter = 13
RT6	RT7	RT8	RT9	RT10	RT11	RT12	RT13	RT14	RT15	counter = 14
RT7	RT8	RT9	RT10	RT11	RT12	RT13	RT14	RT15	RT16	counter = 15
1	1	1	0	x	0	x	0	x	0	start detect
1	1	1	0	x	0	x	0	x	1	
1	1	1	0	x	0	x	1	x	0	
1	1	1	0	x	1	x	0	x	0	
0	0	0	1	x	1	x	1	x	1	delimiter detect
0	0	0	1	x	1	x	1	x	0	
0	0	0	1	x	1	x	0	x	1	
0	0	0	1	x	0	x	1	x	1	

Hence, a start is detected as soon as it is qualified with 1110 in the sample register and verified with at least two out of three predefined verification samples being zero. Similarly for delimiter detection, qualification samples are 0001 and at least two of the three verification samples are one. The Noise Flag is set if the start is verified with only two valid samples.

52.3.2.7.1 Start detection mechanism

The following steps are followed for detecting a start bit:

1. Refer to Table 52-2 for the status of the sample register (shift register) when count = 6
2. At this point, if RT1 (the first incoming sample) = 0 and the previous three samples already received are all ones, then it might be a start bit.
3. To make sure it is indeed a start bit, the incoming data samples in the sample register (4), sample register (2) and sample register (0) which correspond to RT3, RT5, and RT7 is verified using the steps mentioned below.
4. If the majority (i.e., 2) out of these 3 samples are equal to ‘0’, then start bit is said to be detected.
5. These three samples RT3, RT5, and RT7 are called the “verification samples” which are checked at count = 6.
6. The sample register bits 9, 8, 7, and 6 are called “qualification samples” which are checked at count = 6.
7. At count = 9, if majority value of RT8, RT9, and RT10 is not equal to ‘0’ then Noise flag is set.

52.3.2.7.2 Break delimiter detection mechanism

The following steps are followed for detecting a delimiter bit:

1. Refer to Table 52-2 for the status of the sample register (shift register) when count = 6
2. At this point, if RT1 (the first incoming sample) = 1 and the previous three samples already received are all zeros, then it might be a delimiter bit.
3. To make sure it is indeed a delimiter bit, the incoming data samples in the sample register (4), sample register (2) and sample register (0) which correspond to RT3, RT5, and RT7 is verified using the steps mentioned below.
4. If the majority (i.e., 2) out of these 3 samples are equal to ‘1’, then delimiter bit is said to be detected.
5. These three samples RT3, RT5, and RT7 are called the “verification samples” which are checked at count = 6.
6. The sample register bits 9, 8, 7, and 6 are called “qualification samples” which are checked at count = 6.

Hence, a start is detected as soon as it is qualified with 1110 in the sample register and verified with at least two out of three predefined verification samples being zero. Similarly for delimiter detection, qualification samples are 0001 and at least two out of the three verification samples are one. The Noise Flag is set if the start is verified with only two valid samples.

The choice of the correct sample points depends on the external Rx signal quality. During the application development process, the error information indicated by the parity error can help to find the best setting for an application-specific hardware signal.

52.3.2.8 Baud rate generation

The LIN baud rate is programmed in two registers: the LIN Integer Baud Rate Register and the LIN Fraction baud rate register. The Baud Rate Registers can be programmed only during Initialization mode.

Baud rate is calculated with the following formula for both receiver and transmitter.

Tx = Rx = LIN_CLK / (16 × LDIV)

Where LIN_CLK is the frequency of the baud clock.

LDIV is an unsigned fixed point number. The mantissa is coded into 20 bits of LINIBRR and the fraction is coded on 4 bits of LINFBRR.

52.3.2.9 Automatic resynchronization

To automatically adjust the baud rate based on measurement of the LIN sync field, write the nominal Prescalar value (nominal baud rate) in LINIBRR and LINFBRR, then set the LASE bit in LINCR1 to enable automatic synchronization.

When auto synchronization is enabled, after each LIN Sync Del, the time duration between five falling edges on RDI is sampled on LIN_CLK.

52.3.2.10 Wakeup management

Any node in a sleeping LIN cluster may request a wakeup. The wakeup request is issued by forcing the bus to the dominant state for 250 µs to 5 ms. Every slave node should detect the wakeup request (a dominant pulse longer than 150 µs) and be ready to listen to bus commands within 100 ms, measured from the ending edge of the dominant pulse. The master also wakes on detecting a wakeup request and when the slaves are ready, starts sending frame headers to find out the cause of the wakeup. If the master does not issue a frame header within 150 ms from the wakeup request, then the node issuing a request may try issuing a new wakeup request.

In LINFlexD, a wakeup request can be generated by writing the wakeup character in BDR0 and setting the WURQ bit in LINCR2. On setting the WURQ bit, the character in BDR0 is transmitted. For LIN 2.0, character 0xF0 is sent as the wakeup character.

In LINFlexD, wakeup can be detected in two ways.

1. AUTOWU = 1 On detecting a falling edge in sleep mode, the SLEEP bit is cleared by hardware, the WUF flag is set, and an interrupt is generated if WUPIE is set. LINFlexD is now in normal mode and ready to receive frames.
2. AUTOWU = 0 On detecting a falling edge the WUF flag is set and an interrupt is generated (if WUPIE bit is set). It is then up to the software to clear the SLEEP bit.

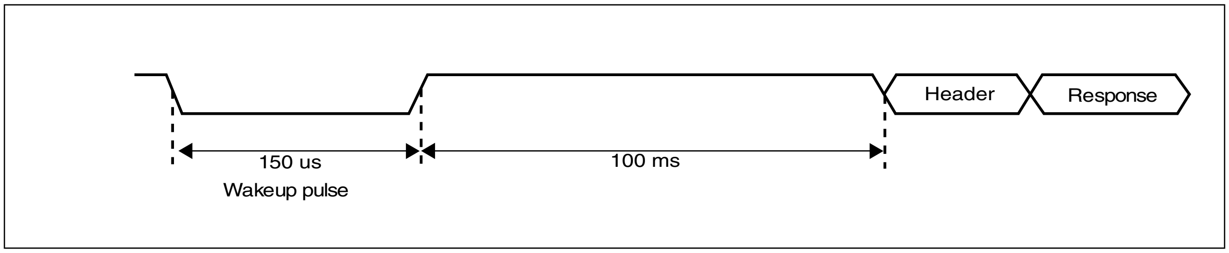

Figure 52-14. Wakeup sequence

52.3.3 Timer

There is an 8-bit counter which has different behavior in different modes as described below:

- **In Output Compare Mode (LINTCSR[MODE]= 1):**

  This counter is running even in Sleep and Initialization mode. The counter value which when matches the two software configurable output compare registers (LINOCR[OC1] or LINOCR[OC2]), generate output compare interrupt (LINESR[OCF]) provided TOCE bit in LINTCSR is set. Once an interrupt occurs subsequent interrupt is generated only when the application has reset the stuck FSM state.
- **In LIN Mode:**

The software has no control over the TOCE bit and output compare registers are utilized for generation of LIN timeout interrupts (header, frame, response times out). In this case, if LIN moves to Sleep or Init state then this counter remains in Reset state. LIN mode has no meaning if UART is enabled, hence the counter will remain in Reset state.

52.3.4 UART mode

Main features in the UART mode are:

- Full duplex communication
- 8-bit frames, 9-bit frames, 13-bit frames, 16-bit frames, 17-bit frames
- Even/Odd/0/1 Parity

52.3.4.1 8-bit data frames

The eighth bit can be a data or a parity bit. Even/Odd/0/1 parity can be selected by the PC[1:0] bit in the same register. An even parity will be set if the modulo-2 sum of the seven data bits is one. An odd parity will be cleared in this case.

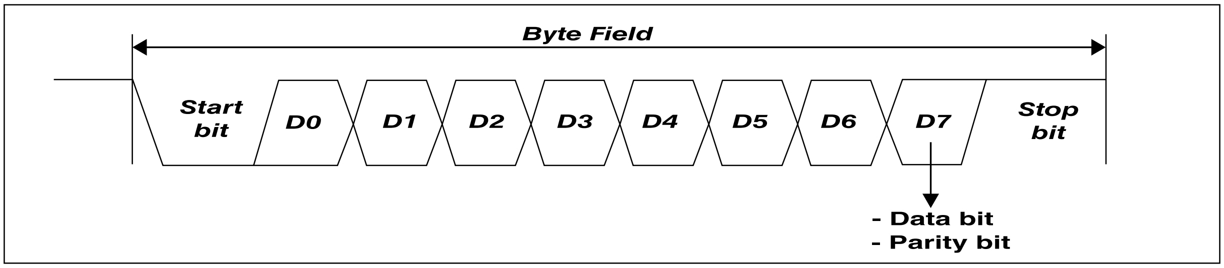

Figure 52-15. UART mode 8-bit data frame

52.3.4.2 9-bit frames

The ninth bit should be a parity bit. Even/Odd/0/1 Parity can be selected by the PC[1:0] field in the same register. An even parity will be set if the modulo-2 sum of the seven data bits is one. An odd parity will be cleared in this case. Parity 0 forces a zero logical value. Parity 1 forces a high logical value.

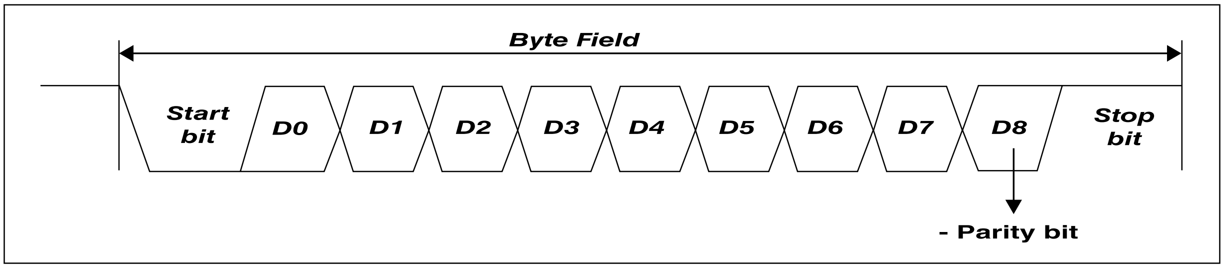

Figure 52-16. UART mode 9-bit data frame

52.3.4.3 16-bit data frames

The sixteenth bit can be a data or a parity bit. Even/Odd/0/1 Parity bit can be selected by the PC[1:0] bit in the same register. Parity 0 forces a zero logical value. Parity 1 forces a high logical value.

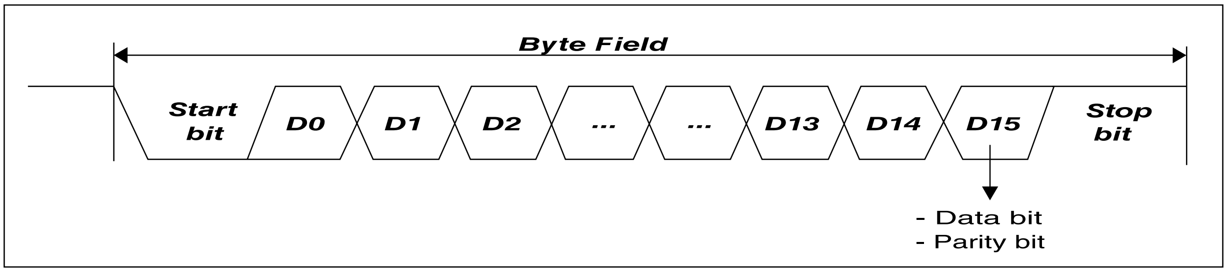

Figure 52-17. UART mode 16-bit data frame

52.3.4.4 17-bit frames

The seventeenth bit is the parity bit. Even/Odd/0/1 Parity bit can be selected by the PC[1:0] bit in the same register. Parity 0 forces a zero logical value. Parity 1 forces a high logical value.

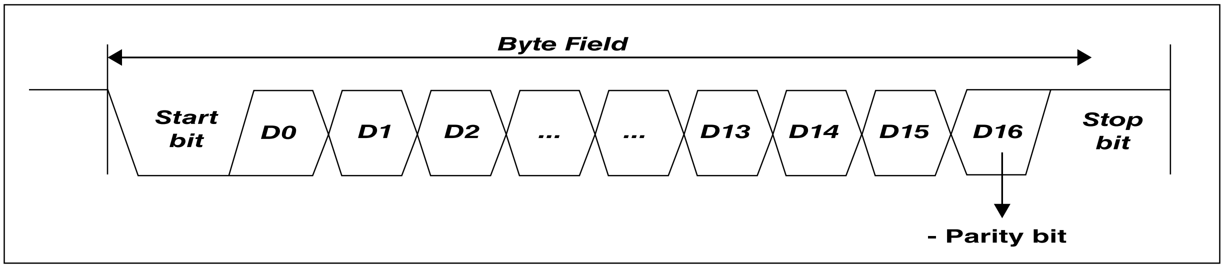

Figure 52-18. UART mode 17-bit data frame

52.3.4.5 13-bit frames

Whenever WLS is one, special word length is selected in UART mode. This bit enables 12-bit + parity bit reception only in FIFO mode.

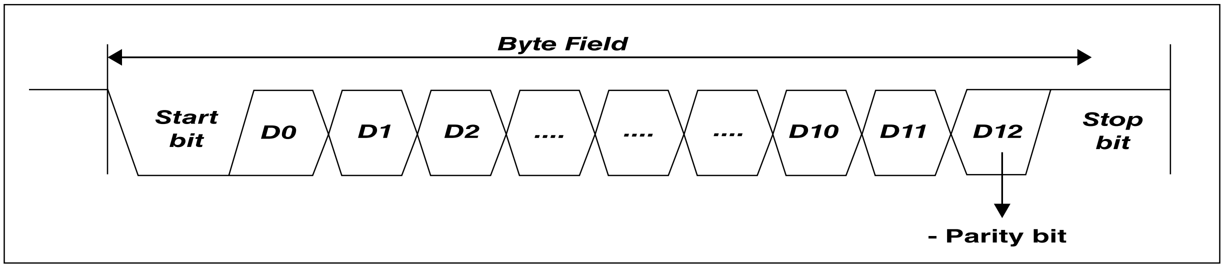

Figure 52-19. UART mode 13-bit data frame

52.3.4.6 Buffer in UART mode

The 8-byte buffer is divided into two parts: one for receiver and one for transmitter, as shown in the following figure:

Tx0	BDR0
Tx1	BDR1
Tx2	BDR2
Tx3	BDR3
Rx0	BDR4
Rx1	BDR5
Rx2	BDR6
Rx3	BDR7

Figure 52-20. Structure of 8-byte buffer

For 16-bit frames, the lower eight bits are written in BDR0 and upper eight bits in BDR1.

The same applies for reception.

52.3.4.7 UART transmitter

UART transmitter

In order to start transmission in the UART mode, UART bit should be set and the transmitter enable bit should be set. Transmission starts when the BDR0 (least significant data byte) is programmed and continues until the number of bytes/halfwords transmitted is equal to the value in the TDFL bits in UARTCR.

The transmit buffer is four bytes (when UARTCR[WL1] = 0) or two halfwords (when UARTCR[WL1] = 1), hence a maximum of four bytes (two halfwords) transmission can be triggered. Once the programmed number of bytes (halfwords) has been transmitted, the DTF flag is set in UARTSR. If the TxEn bit of UART is reset in the middle of a transmission, then the current transmission is completed and no further transmissions can be invoked.

The buffer can be configured in FIFO mode (mandatory when the DMA Tx is enabled) by setting the control bit UARTCR[TFBM].

NOTE

If TFF bit is set and a write is performed to the FIFO, the data transmitted may be erroneous.

Table 52-3. BDRL access in UART mode

IPS operation	Register	Mode (UARTCR[TFBM])	Word length (UARTCR[WL])	IPS operation result
Write Byte0	BDRL	FIFO	Byte	OK
Write Byte1-2-3	BDRL	FIFO	Byte	IPS transfer error
Write Half-word0-1	BDRL	FIFO	Byte	IPS transfer error
Write Word	BDRL	FIFO	Byte	IPS transfer error
Write Byte0-1-2-3	BDRL	FIFO	Half-word	IPS transfer error
Write Half-word0	BDRL	FIFO	Half-word	OK
Write Half-word1	BDRL	FIFO	Half-word	IPS transfer error
Write Word	BDRL	FIFO	Half-word	IPS transfer error
Read Byte0-1-2-3	BDRL	FIFO	Byte/Half-word	IPS transfer error
Read Half-word0-1	BDRL	FIFO	Byte/Half-word	IPS transfer error
Read Word	BDRL	FIFO	Byte/Half-word	IPS transfer error
Write Byte0-1-2-3	BDRL	BUFFER	Byte/Half-word	OK
Write Half-word0-1	BDRL	BUFFER	Byte/Half-word	OK
Write Word	BDRL	BUFFER	Byte/Half-word	OK
Read Byte0-1-2-3	BDRL	BUFFER	Byte/Half-word	OK
Read Half-word0-1	BDRL	BUFFER	Byte/Half-word	OK
Read Word	BDRL	BUFFER	Byte/Half-word	OK

In UART FIFO mode (UARTCR[TFBM] = 1), any read operation causes an IPS transfer error.

52.3.4.8 UART receiver

UART receiver

The reception of a data byte is started as soon as the user exits initialization mode, sets the RxEn bit, and detects start bit. There is a dedicated 4-byte (if UARTCR[WL1] = 0) or 2-half-words (if UARTCR[WL1] = 1) data buffer for received data. Once the programmed number (RDFL bits) of bytes have been received, the DRF flag is set in UARTSR and the current reception gets completed. RxEn bit needs to be set only to start the reception.The reception is automatically completed as soon as the programmed number (RDFL bits) of bytes have been received.

The buffer can be configured in FIFO mode (mandatory when the DMA Rx is enabled) by setting the control bit UARTCR[RFBM].

Table 52-4. BDRM access in UART mode

IPS operation	Register	Mode (UARTCR[RFBM])	Word length (UARTCR:WL)	IPS operation result
Read Byte4	BDRM	FIFO	Byte	OK
Read Byte5-6-7	BDRM	FIFO	Byte	IPS transfer error
Read Half-word2-3	BDRM	FIFO	Byte	IPS transfer error
Read Word	BDRM	FIFO	Byte	IPS transfer error
Read Byte4-5-6-7	BDRM	FIFO	Half-word	IPS transfer error
Read Half-word2	BDRM	FIFO	Half-word	OK
Read Half-word3	BDRM	FIFO	Half-word	IPS transfer error
Read Word	BDRM	FIFO	Half-word	IPS transfer error
Write Byte4-5-6-7	BDRM	FIFO	Byte/Half-word	IPS transfer error
Write Half-word2-3	BDRM	FIFO	Byte/Half-word	IPS transfer error
Write Word	BDRM	FIFO	Byte/Half-word	IPS transfer error
Read Byte4-5-6-7	BDRM	BUFFER	Byte/Half-word	OK
Read Half-word2-3	BDRM	BUFFER	Byte/Half-word	OK
Read Word	BDRM	BUFFER	Byte/Half-word	OK
Write Byte4-5-6-7	BDRM	BUFFER	Byte/Half-word	IPS transfer error
Write Half-word2-3	BDRM	BUFFER	Byte/Half-word	IPS transfer error
Write Word	BDRM	BUFFER	Byte/Half-word	IPS transfer error

Note

Refer to the layout of the registers BDRL and BDRM to identify the mapping between byte x and data bits of the registers BDRL/BDRM.

Note

- If the user does not know in advance how many bytes are to be received, RDFL should not be programmed in advance. The reset value of RDFL is zero. This will ensure that the reception will happen byte by byte. The state machine will move to the Idle state after each byte reception.
- If RDFL is programmed for a certain value but that number of bytes are not received, then reception will hang. In that case, software needs to take care of timeout by seeing the flag. Software has to set the sleep bit to move to Idle state.
- If a STOP request arrives in the middle of one reception, it is only acknowledged after all the programmed number of data bytes have received; it is not served immediately. If the programmed number of data bytes are not received, then software has to take care of timeout. When the state machine moves to Idle state, then only a stop request is served.
- If during reception of any byte a parity error occurs, then the corresponding PEx bit in UARTSR is set. No interrupt is generated in this case. If a framing error occurs in any byte (FE bit in UARTSR is set) then an interrupt is generated if FEIE bit in LINIER is set. As there is only one register bit for framing error, this interrupt will be helpful in identifying which byte has framing error.
- If the last received frame has not been read from the buffer (in other words, RMB is not reset by the user), then upon reception of the next byte, an overrun error occurs (BOF bit in UARTSR will be set) and one message is depending on RBLM bit of LINCR1. An interrupt is generated if the BOIE bit in LINIER is set.
- When WLS bit = 1, BDRM access depends on WL bit setting.

- When WLS bit = 1, WL = 0 or 1 should not be used, since this will lead to incorrect reception of data.
- When IPG_STOP is requested, for UART in FIFO mode, SW has to set the INIT bit in order to send the receiver to idle. This ensures that IPG_STOP_ACK is generated and IP enters STOP mode.

52.3.5 DMA interface

52.3.5.1 Main features

The LINFlexD DMA offers a parametric and programmable solution with the following distinctive features:

- LIN Master node, TX mode: single DMA channel
- LIN Master node, RX mode: single DMA channel
- LIN Slave node, TX mode: 1 to N DMA channel where N = max number of ID filters
- LIN Slave node, RX mode: 1 to N DMA channel where N = max number of ID filters
- UART node, TX mode: single DMA channel
- UART node, RX mode: single DMA channel + time-out

52.3.5.2 Definitions

Control/status register fields of the LINFlexD macrocell are described in Table 52-5 and Table 52-6.

Table 52-5. LINFlexD control/status fields description

Register	Field	Level	Description
LINCR2	DDRQ	High	Data discard request in reception mode
	DTRQ	High	Data transmission request (slave mode) of the LIN data field stored in BDRL/BDRM
	HTRQ	High	Header transmission request (master mode)

Table continues on the next page...

Table 52-5. LINFlexD control/status fields description (continued)

Register	Field	Level	Description
BIDR	DFL [5:0]	—	Data field length: • 1 to 8 bytes: normal frames • 1 to 64 bytes: extended frames
	DIR	—	Direction of the data field: • 0 => reception • 1 => transmission
	CCS	—	Checksum type: • 0 enhanced • 1 classic
	ID[5:0]	—	Identifier.
LINSR	RMB	—	Buffer data ready to be read via CPU/DMA. • 0 buffer data is free • 1 buffer data is ready
	DBFF	High	Data buffer full (8 bytes received) and DFL > 7. Used for the extended frames.
	DBEF	High	Data buffer empty (8 bytes have been transmitted) and DFL > 7. Used for the extended frames.
	DRF	High	Data reception completed
	DTF	High	Data transmission completed
	HRF	High	Header received. Used in slave mode in case of Tx filter match.
IFMI	IFMIx	!= zero	Filter match index (slave mode).
UARTCR	FBM	—	FIFO/Buffer mode • 0 Buffer mode • 1 FIFO mode (mandatory in DMA mode)
UARTSR	RFE	—	Rx FIFO empty • 0 Rx FIFO not empty • 1 Rx FIFO empty
	TFF	—	Tx FIFO full • 0 Tx FIFO not full • 1 Tx FIFO full

DMATXE[2**TX_CH_NUM][1]		High	DMA Tx channel enable (read/write). In UART or LIN master mode only the channel 0 can be programmed.
			In LIN slave mode: # DMA TX channel = IFMI[3:0] -1.
			DMATXE[x] = 0b => TX channel x disabled
			DMATXE[x] = 1b => TX channel x enabled

DMARXE[2**RX_CH_NUM][1]		High	DMA Rx channel enable (read/write). In UART or LIN master mode only the channel 0 can be programmed.

Table 52-5. LINFlexD control/status fields description

Register	Field	Level	Description

			In LIN slave mode: # DMA RX channel = IFMI[3:0] -1.
			DMARXE[x] = 0b => RX channel x disabled
			DMARXE[x] = 1b => RX channel x enabled

1. ** stands for exponentiation.

1. ** stands for exponentiation

Table 52-6. LINFlexD DMA control fields description

Field	Mode	Value	Level	Description
DMA_TEN	LIN master Tx or UART Tx	DMATXE[0]	High	Logical AND between the 2 DMA enable bits (LINFlexD and eDMA).
DMA_TEN	LIN slave Tx	DMATXE[x] x = IFMI — 1	High	
DMA_REN	LIN master Rx or UART Rx	DMARXE[0]	High	
DMA_REN	LIN slave Rx	DMARXE[x] x = IFMI — 1	High	

Control/status fields of the TCD descriptors referred to in this document are described in Table 52-7.

Table 52-7. TCD control fields description

TCD Field	Level	Description
CITER[14:0]	—	Current "major" iteration count
BITER[14:0]	—	Beginning "major" iteration count
NBYTES[31:0]	—	Inner "minor" byte transfer count. Number of bytes to be transferred in each service request of the channel.
SADDR[31:0]	—	Source address
SOFF[15:0]	—	Source address signed offset applied to the current source address as each source read is completed.
SSIZE[2:0]	—	Source data transfer size 000 => 8-bit 001 => 16-bit 010 => 32-bit 011 => 64-bit
SLAST[31:0]	—	Last source address adjustment
DADDR[31:0]	—	Destination address

Table continues on the next page...

Table 52-7. TCD control fields description (continued)

TCD Field	Level	Description
DOFF[15:0]	—	Destination address signed offset applied to the current destination address as each destination write is completed.
DSIZE[2:0]	—	Destination data transfer size 000 => 8-bit 001 => 16-bit 010 => 32-bit 011 => 64-bit
DLAST_SGA[31:0]	—	Last destination address adjustment or the memory address for the next TCD to be loaded into this channel (scatter/gather)
INT_MAJ	High	Enable an interrupt when major iteration count completes
START	High	The channel is explicitly started via a software initiated service request.
DONE	High	Channel done (the DMA has completed the outer major loop).
D_REQ	High	Disable request. If this flag is set the DMA hardware automatically clears the corresponding DMAERQ bit when the current major iteration count reaches zero.

52.3.5.3 Master node –TX mode

On a master node, in TX mode the DMA interface requires a single TX channel. Each TCD controls a single frame except for the extended frames (multiple TCDs). The memory map associated with the TCD chain (RAM area and LINFlexD registers) is given in the following figure.

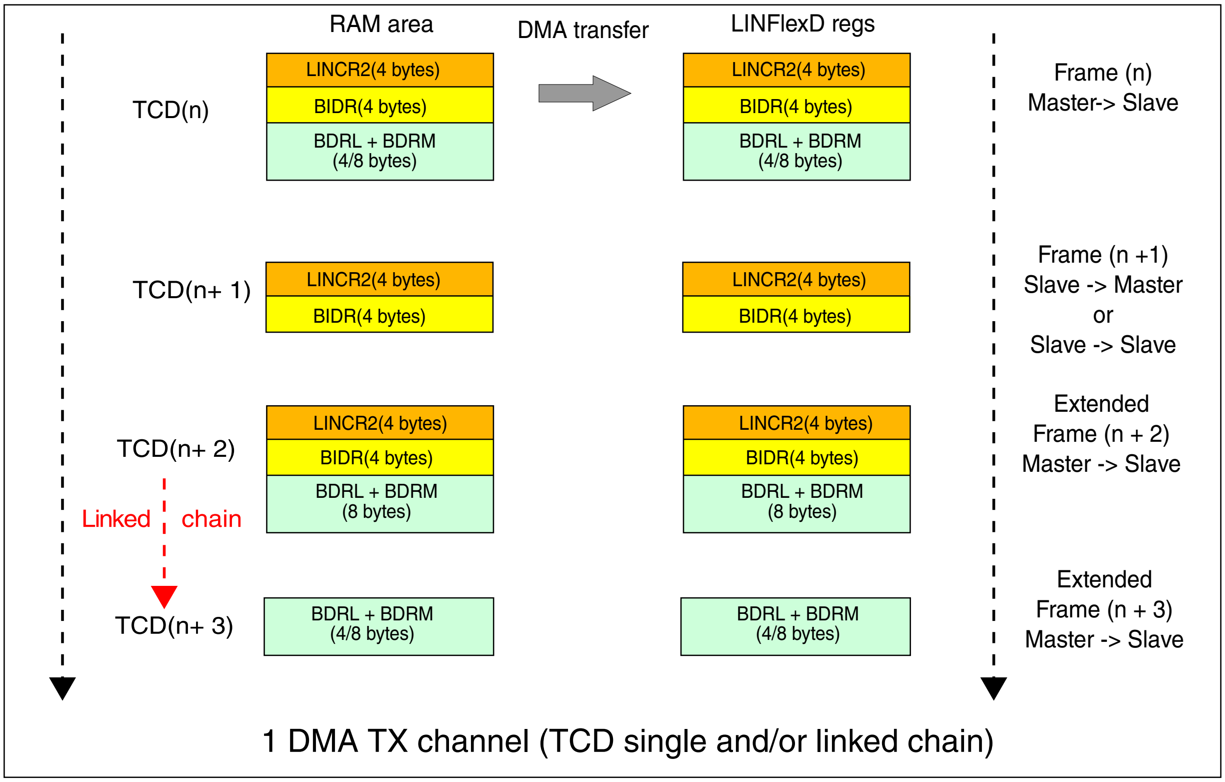

Figure 52-21. Master node –TX memory map

The TCD chain of the DMA Tx channel on a master node supports:

- Master to Slave: transmission of the entire frame (header + data)
- Slave to Master: transmission of the header; the data reception is controlled by the Rx channel on the master node
- Slave to Slave: transmission of the header

The following table provides the register settings of the LINCR2 and BIDR for each class of LIN frame.

Table 52-8. Master node – Tx mode – Register setting

LIN frame	LINCR2	BIDR

Master to Slave	DDRQ = 1
	DTRQ = 0
	HTRQ = 0
		DFL = payload size
		ID = address
		CCS = checksum
		DIR = 1 (TX)

Slave to Master	DDRQ = 0
	DTRQ = 0
	HTRQ = 0
		DFL = payload size
		ID = address
		CCS = checksum
		DIR = 0 (RX)

Table continues on the next page...

Slave to Slave	DDRQ = 1
	DTRQ = 0
	HTRQ = 0
		DFL = payload size
		ID = address
		CCS = checksum
		DIR = 0 (RX)

The concept FSM to control the DMA Tx interface is given in the following figure. DMA TX FSM moves to Idle state immediately at next clock edge if DMATXE[0] = 0. The TCD setting (word transfer) is given in Table 52-9. All other TCD fields = 0. TCD settings based on halfword or byte transfer are allowed.

Table 52-9. TCD setting – Master node – Tx mode

52.3.5.4 Master node - RX mode

On a master node in RX mode, the DMA interface requires a single RX channel. Each TCD controls a single frame , except for the extended frames (multiple TCDs). The memory map associated with the TCD chain (RAM area and LINFlexD registers) is given in the following figure.

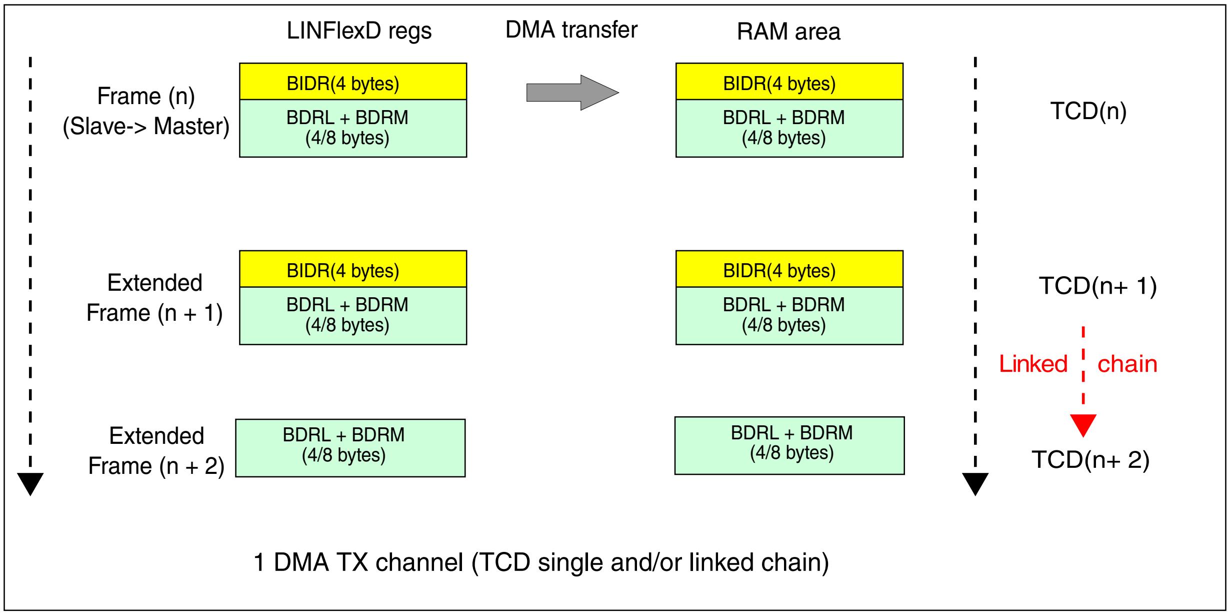

Figure 52-23. Master node – RX memory map

The TCD chain of the DMA Rx channel on a master node supports Slave to Master: reception of the data field of the header

The BIDR register is optionally copied into the RAM area. This BIDR field (part of FIFO data) contains the ID of each message, which only allows the CPU to figure out which ID the LINFlexD DMA received if the single DMA channel setup is used.

The concept FSM to control the DMA Rx interface is given in the following figure. DMA RX FSM moves to Idle state immediately at the next clock edge if DMARXE[0] = 0. The TCD setting (word transfer) is given in the next table. All other TCD fields = 0. TCD settings based on halfword or byte transfer are allowed.

Table 52-10. TCD setting – Master node – Rx mode

TCD Field	Value	Description

52.3.5.5 Slave node – TX mode

On a slave node in TX mode, the DMA interface requires a DMA TX channel for each ID filter programmed in TX mode. In case a single DMA TX channel is available, a single ID field filter must be programmed in TX mode. Each TCD controls a single frame, except for the extended frames (multiple TCDs). The memory map associated with the TCD chain (RAM area and LINFlexD registers) is given in the following figure.

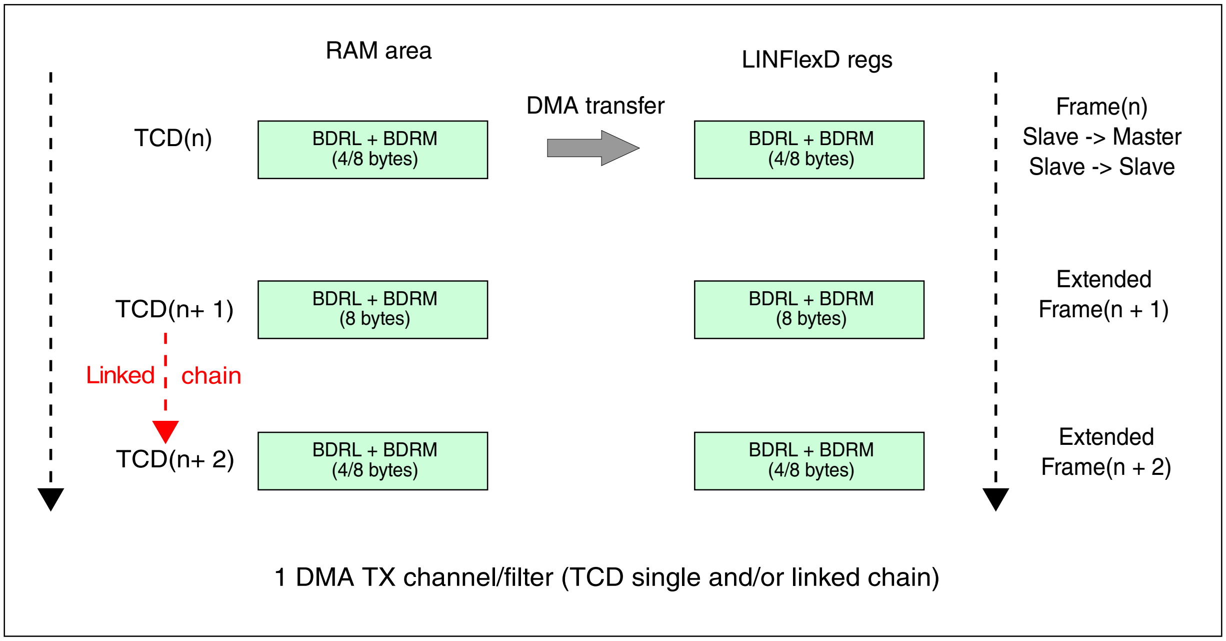

Figure 52-25. Slave node – TX memory map

The TCD chain of the DMA Tx channel on a slave node supports:

- Slave to Master: transmission of the data field
- Slave to Slave: transmission of the data field

The register setting of the LINCR2, IFER, IFMR, and IFCR registers is given in Table 52-11.

Table 52-11. Slave node – Tx mode – Register setting

52.3.5.7 UART – TX mode

In UART TX mode, the DMA interface requires a DMA TX channel. A single TCD can control the transmission of an entire Tx buffer. The memory map associated with the TCD chain (RAM area and LINFlexD registers) is given in Figure 52-29.

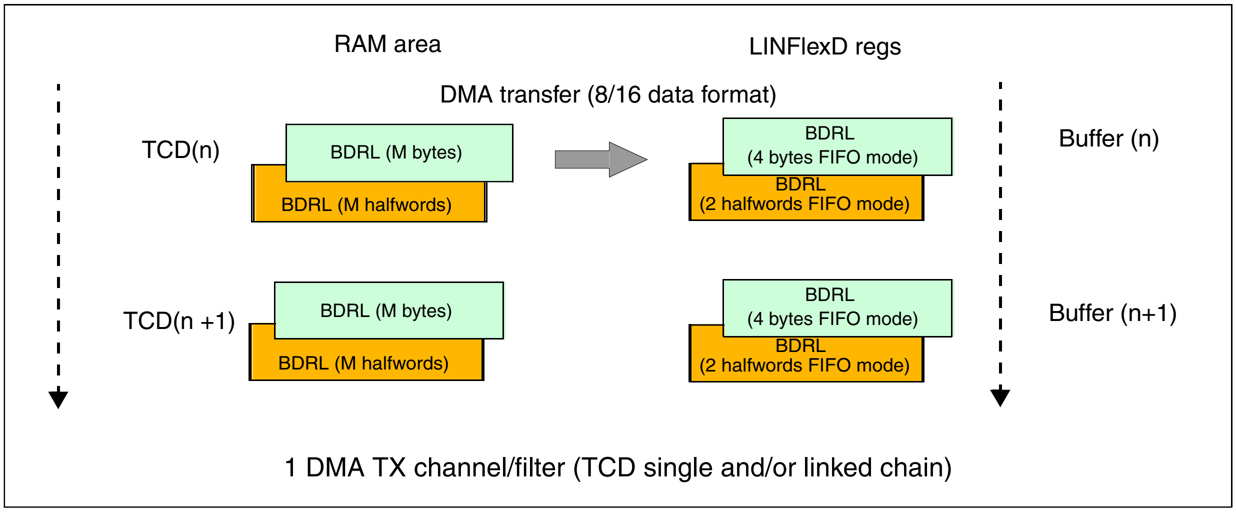

Figure 52-29. UART – TX memory map

The UART TX buffer must be configured in FIFO mode in order to:

- Allow the transfer of large data buffer by a single TCD
- Adsorb the latency, following a DMA request (due to the DMA arbitration), to move data from the RAM to the FIFO
- Use low priority DMA channels

The Tx FIFO size is:

- 4 bytes in 8 bit data format
- 2 halfwords in 16-bit data format

A DMA request is triggered by FIFO-not-full (TX) status signals.

The concept FSM to control the DMA Tx interface is given in Figure 52-30. DMA Tx FSM will move to Idle state if DMATXE[0] = 0.The TCD setting (typical case) is given in Table 52-15. All other TCD fields = 0. The minor loop transfers a single byte/halfword as soon as a free entry is available in the Tx FIFO.

Table 52-15. TCD setting – UART – Tx mode

TCD Field	Value		Description
	8 bits data	16 bits data	
CITER[14:0]	M		Multiple iterations for the "major" loop
BITER[14:0]	M		Multiple iterations for the "major" loop
NBYTES[31:0]	1	2	Minor loop transfer = 1 or 2 bytes
SADDR[31:0]	-		RAM address
SOFF[15:0]	1	2	Byte/Half-word increment
SSIZE[2:0]	0	1	Byte/Half-word transfer
SLAST[31:0]	–M	–M × 2	-
DADDR[31:0]	-		BDRL address
DOFF[15:0]	0		No increment (FIFO)
DSIZE[2:0]	0	1	Byte/Half-word transfer
DLAST_SGA[31:0]	0		No scatter/gather processing
INT_MAJ	0/1		Interrupt disabled/enabled
D_REQ	1		Only on the last TCD of the chain.
START	0		No SW request

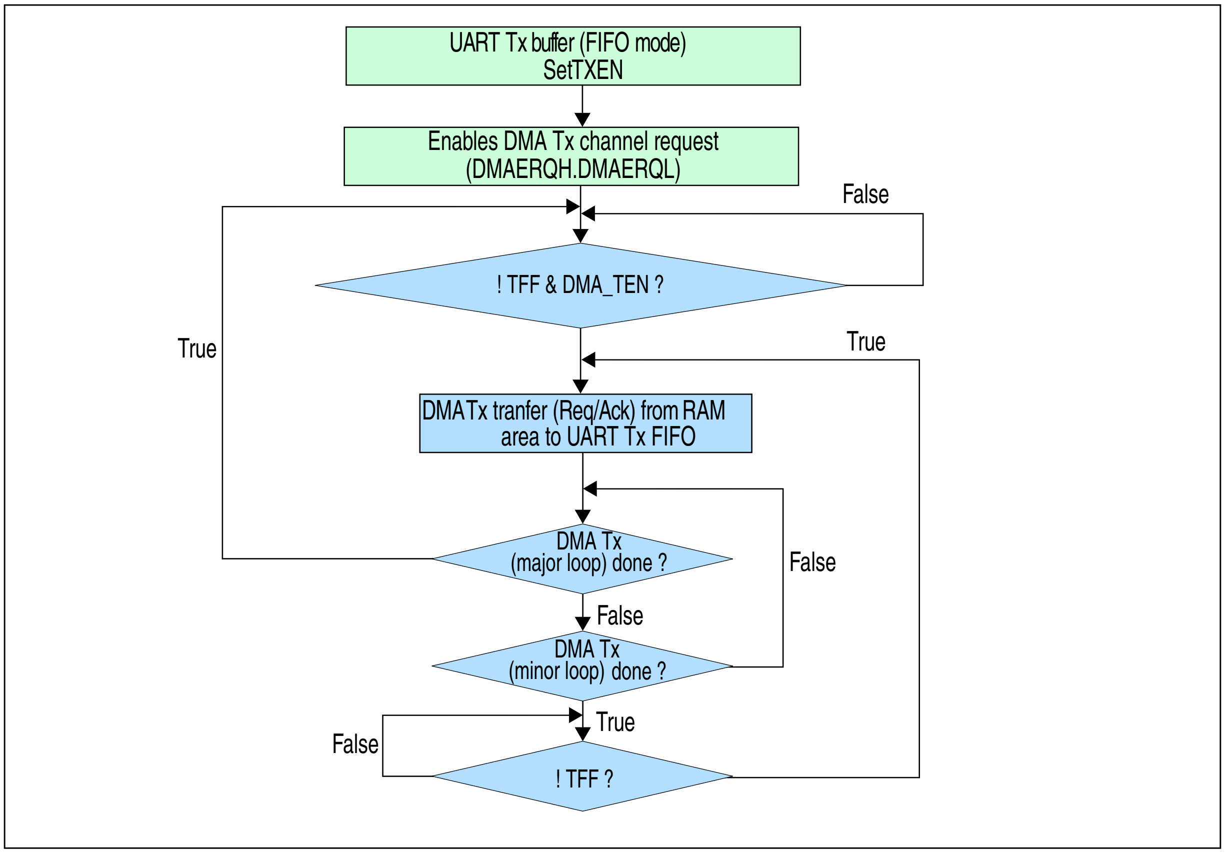

Figure 52-30. UART – DMA Tx FSM (concept scheme)

52.3.5.8 UART – RX mode

In UART RX mode, the DMA interface requires a DMA RX channel. A single TCD can control the reception of an entire Rx buffer. The memory map associated with the TCD chain (RAM area and LINFlexD registers) is given in Table 52-16.

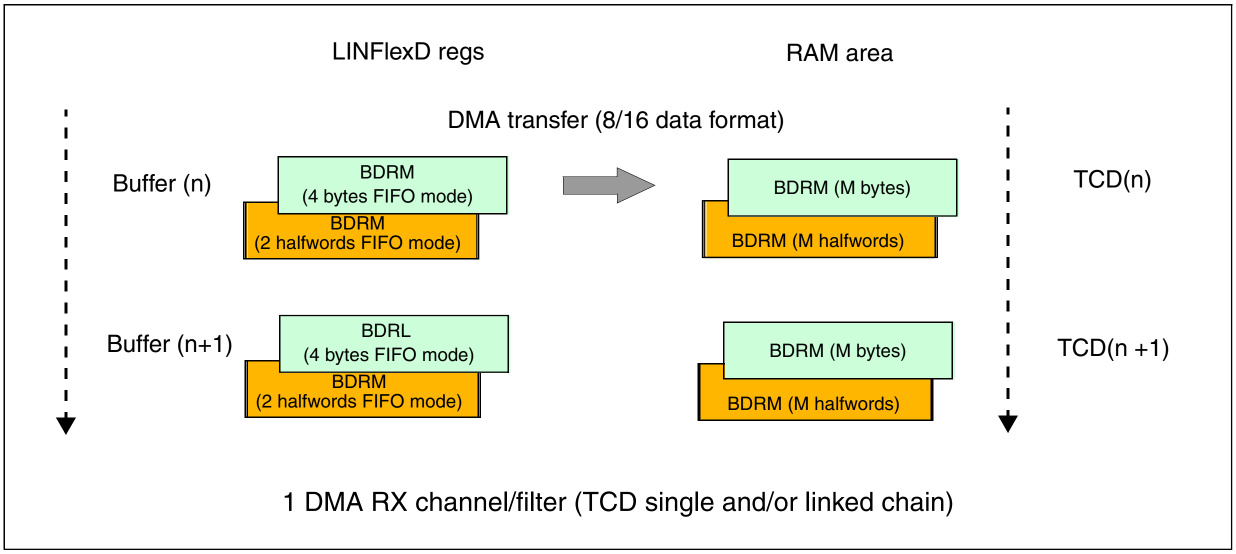

Figure 52-31. UART – RX memory map

The UART RX buffer must be configured in FIFO mode in order to:

- Allow the transfer of large data buffer by a single TCD
- Adsorb the latency, following a DMA request (due to the DMA arbitration), to move data from the FIFO to the RAM
- Use low priority DMA channels

The Rx FIFO size is:

- 4 bytes in 8-bit data format

This will sufficient because just one byte allows a reaction time of about 3.8 µs (at 2 Mbit/s) (~450 clock cycles at 120 MHz) before the transmission is affected. A DMA request is triggered by FIFO and not by empty (Rx) status signals.

The concept FSM to control the DMA Rx interface is given in Figure 52-32. DMA Rx FSM will move to Idle state if DMARXE[0] = 0.The TCD setting (typical case) is given in the next table. All other TCD fields equal zero. The minor loop transfers a single byte/ halfword as soon an entry is available in the Rx FIFO. A new software reset bit is required that allows the LINFlexD FSMs to be reset in case this timeout state is reached or in any other case. The timeout counter can be re-written by software at any time to extend the timeout period.

Table 52-16. TCD setting – UART – Rx mode

TCD Field	Value		Description
	8 bits data	16 bits data	
CITER[14:0]	M		Multiple iterations for the "major" loop
BITER[14:0]	M		Multiple iterations for the "major" loop
NBYTES[31:0]	1	2	Minor loop transfer = 1 or 2 bytes
SADDR[31:0]	-		BDRM address
SOFF[15:0]	0		No increment (FIFO)
SSIZE[2:0]	0	1	Byte/Half-word transfer
SLAST[31:0]	0		
DADDR[31:0]	-		RAM address
DOFF[15:0]	1	2	Byte/Half-word increment
DSIZE[2:0]	0	1	Byte/Half-word transfer
DLAST_SGA[31:0]	–M	–M × 2	No scatter/gather processing
INT_MAJ	0/1		Interrupt disabled/enabled
D_REQ	1		Only on the last TCD of the chain.
START	0		No SW request

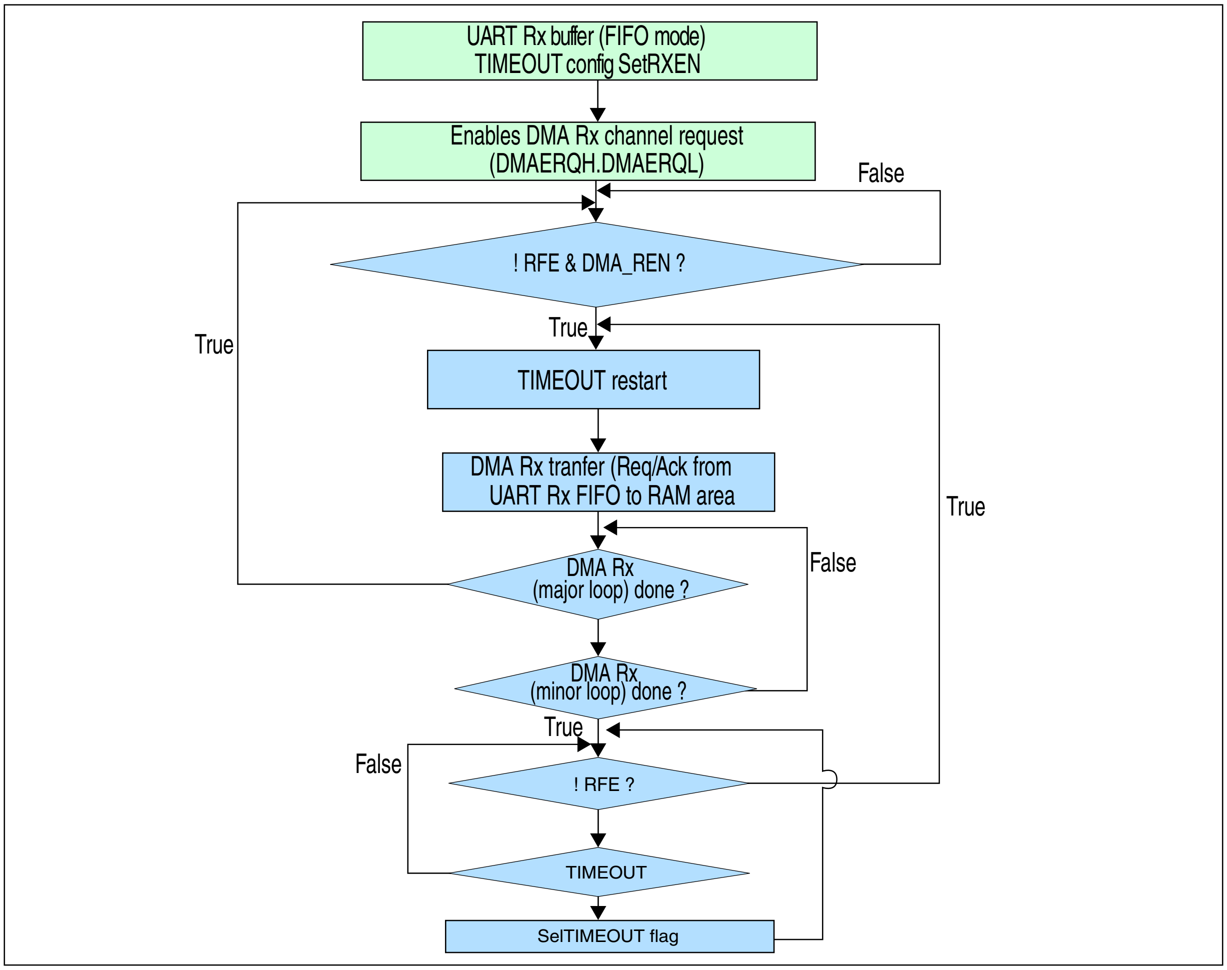

Figure 52-32. UART – DMA Rx FSM (concept scheme)

52.3.5.9 Use cases and limitations

- In LIN slave mode, the DMA capability can be used only if the ID filtering mode is activated. The number of ID filters enabled must be equal to the number of DMA channels enabled. The correspondence between channel number and ID filter is based on IFMI (identifier filter match index)
- In LIN master mode both the DMA channels (TX and RX) must be enabled in case the DMA capability is required
- In UART mode the DMA capability can be used only if the UART Tx/Rx buffers are configured as FIFOs
- DMA and CPU operating modes are mutually exclusive for the data/frame transfer on a UART or LIN node. Once a DMA transfer is finished the CPU can manage subsequent accesses

- Error management must always be executed via the CPU enabling the related error interrupt sources. DMA capability does not provide support for error management. Error management means checking status bits, handling IRQs, and potentially canceling DMA transfers
- The DMA programming model must be coherent with the TCD setting defined in this document
- When IPG_STOP is requested, SW has to first disable DMATXE/DMARXE channel registers, after the current minor loop finishes (indicated by the clearing of ACTIVE bit in DMA TCD register). This ensures that IPG_STOP_ACK is generated and IP enters STOP mode.

52.4 Memory map and register description

The following points should be considered for the below mentioned LINFlexD registers:

- Reset values are with-slave/without-slave (master only) format
- If not specified, then the bit can be configured for both master only and master/slave format; in other words, for both values of generic slave = 0 and slave = 1.

NOTE

In Master mode, the registers IFCR0-IFCR15 are not present and the corresponding absolute address of the below register changes as shown in the following table.

Table 52-17. Offsets of the register from offsets 8C to 9C

Register name	Master/slave mode	Master only mode
LINFlexD_GCR	0x8C	0x4C
LINFlexD_UARTPTO	0x90	0x50
LINFlexD_UARTCTO	0x94	0x54
LINFlexD_DMATXE	0x98	0x58
LINFlexD_DMARXE	0x9C	0x5C

NOTE

In Master Mode, read access to IFMI register and read/write access to IFER and IFMR registers would result in transfer error.

NOTE

Any access to A0 location will not generate a transfer error.

52.4.1 LIN Control Register 1 (LINFlexD_LINCR1)

LINCR1 consists of control bits used to configure features of the LINFlexD.

NOTE

> When accessing the LINCR1 register, each reserved bit should be written to its original reset value.

Address: 0h base + 0h offset = 0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

W										▨						
Reset	0	0	0	0	0	0	0	0	1	0	0	*	0	0	1	0

* Notes:
- MME field: If slave = 0, then MME bit is 1, else MME bit is 0

LINFlexD_LINCR1 field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 CCD	Checksum Calculation disable This bit can be written during Initialization mode only. It is read-only in Normal mode. 0 Checksum calculation is done by hardware. When this bit is reset the LINCFR register is read only. 1 Checksum calculation is disabled. When this bit is set the LINCFR register is read/write. User can program this register to sent a software calculated checksum/CRC (provided CFD is reset).
17 CFD	Checksum field disable This bit can be configured during Initialization mode only. It is read-only in Normal mode. 0 Checksum field is sent after the required number of data bytes are sent 1 No checksum field is sent in the frame
18 LASE	LIN Autosynchronization Enable This bit can be programmed in Initialization mode only. It is read-only in Normal mode. (Note: If generic auto_sync = 0, then this bit will always read a 0). 0 Autosynchronization disabled 1 Autosynchronization enabled
19 AUTOWU	Auto Wakeup This bit can be configured during Initialization mode only. This bit is utilized in UART mode also. 0 Sleep bit is cleared by software only 1 Sleep bit gets cleared by hardware whenever WUF bit of LINSR is set
20–23 MBL	Master Break Length These bits choose the length of the Sync break to be generated by the master. These bits can be programmed in Initialization mode only. They are read-only in Normal mode. 0000 10-bit break length 0001 11-bit break length 0010 12-bit break length 0011 13-bit break length 0100 14-bit break length 0101 15-bit break length 0110 16-bit break length

Table continues on the next page...

LINFlexD_LINCR1 field descriptions (continued)

Field	Description
	0111 17-bit break length 1000 18-bit break length 1001 19-bit break length 1010 20-bit break length 1011 21-bit break length 1100 22-bit break length 1101 23-bit break length 1110 36-bit (cooling) break length 1111 50-bit break length
24 BF	By-pass filter This bit can be programmed during Initialization mode only. **NOTE:** If generic slave = 0 or no_of_filters = 0, then this bit will always read a 1, and cannot be programmed. 0 No IRQ if ID does not match any filter 1 A RX IRQ is generated on ID not matching any filter
25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 LBKM	Loop Back mode Refer to "Loop back mode" in Test mode . Note that this bit can be programmed only in Initialization mode. This bit is utilized in UART mode also. 0 Loop Back Mode disabled 1 Loop Back mode enabled
27 MME	Master mode enable This bit can be programmed in Initialization mode only. It is read-only in Normal mode. **NOTE:** If generic slave = 0, then this bit will read a '1' always, and cannot be programmed. 0 Slave Mode 1 Master Mode
28 SSBL	Slave Mode Sync Break Length This bit can be programmed in Initialization mode only. It is read only in Normal mode. 0 11 bit break length 1 10 bit break length
29 RBLM	Receiver Buffer Locked mode This bit can be programmed in Initialization mode only. It is read-only in Normal mode. This bit is utilized in UART mode also. 0 Receiver Buffer not locked, next incoming message will overwrite the old one 1 Receiver buffer locked against overrun. Once the buffer is full the next incoming message will be discarded if buffer is not released — in other words, RMB is not reset by software.
30 SLEEP	Sleep Mode Request This bit is set by software to request LINFlexD to enter Sleep mode. This bit is cleared by software or hardware (if AUTOWU bit in LINCR1 and WUF bit in LINSR are set) to exit sleep mode. This bit is utilized in UART mode also.

Table continues on the next page...

LINFlexD_LINCR1 field descriptions (continued)

Field	Description
31 INIT	Initialization Mode Request The software sets this bit to switch the hardware into Initialization mode. On clearing this bit (and if SLEEP bit is also zero) LINFlexD enters normal mode. This bit is utilized in UART mode also.

52.4.2 LIN Interrupt enable register (LINFlexD_LINIER)

Address: 0h base + 4h offset = 4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

LINFlexD_LINIER field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 SZIE	Stuck at zero Interrupt Enable An interrupt is generated if this bit is set and the Stuck at Zero Flag (SZF) in LINESR or UARTSR is set. 0 No interrupt 1 Interrupt enabled
17 OCIE	Output Compare Interrupt Enable 0 No interrupt 1 Interrupt generated when OCF bit in LINESR or UARTSR is set
18 BEIE	Bit Error Interrupt Enable 0 No interrupt 1 Interrupt generated when BEF bit in LINESR is set
19 CEIE	Checksum Error Interrupt Enable An interrupt is generated if this bit is set and the Checksum Error Flag (CEF) is set in LINESR.

Table continues on the next page...

LINFlexD_LINIER field descriptions (continued)

Field	Description
	0 No interrupt 1 Interrupt enabled
20 HEIE	Header Error Interrupt Enable An interrupt is generated when this bit is set and either of the following flags are set SFEF, SDEF, IDPEF in LINESR are set. **NOTE:** If generic slave = 0, then this bit will always read a 0 and cannot be programmed. 0 No interrupt 1 Interrupt enabled
21–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 FEIE	Frame Error Interrupt Enable 0 No interrupt 1 Interrupt generated if Frame Error Flag (FEF) bit is set in LINESR or UARTSR
24 BOIE	Buffer Overrun Error Interrupt Enable An interrupt is generated if this bit is set and the Buffer Overrun Flag (BOF) is set in LINESR or UARTSR. 0 No interrupt 1 Interrupt enabled
25 LSIE	LIN state Interrupt enable Interrupt is generated only when entering the above fields. This interrupt can mainly be used for debugging purposes. The interrupt has no status flag. 0 No interrupt 1 Interrupt generated on entering the following states: Sync Del, Sync Field, Identifier field, Checksum
26 WUIE	Wakeup interrupt enable If this bit is set and the WUF in LINSR or UARTSR is set then an interrupt is generated. 0 No interrupt 1 Interrupt enabled
27 DBFIE	Data Buffer Full Interrupt enable An interrupt is generated if this bit is set and the DBFF bit in LINSR is also set. 0 No interrupt 1 Interrupt enabled
28 DBEIETOIE	Data Buffer Empty Interrupt enable/Timeout Interrupt Enable An interrupt is generated if this bit is set and LINSR[DBEF] status bit is set (in LIN mode) or if this bit is set and UARTSR[TO] status bit is set (in UART mode). 0 No interrupt 1 Interrupt enabled
29 DRIE	Data Reception complete Interrupt enable An interrupt is generated when this bit is set and Data Received flag (DRF) in LINSR or UARTSR is set. 0 No interrupt 1 Interrupt enabled

Table continues on the next page...

LINFlexD_LINIER field descriptions (continued)

Field	Description
30 DTIE	Data Transmitted Interrupt enable An interrupt is generated when this bit is set and Data Transmitted flag (DTF) in LINSR or UARTSR is set. 0 No interrupt 1 Interrupt enabled
31 HRIE	Header Received Interrupt An interrupt is generated when this bit is set and the Header Received flag (HRF) in LINSR is set. **NOTE:** If generic slave = 0, then this bit will always read a 0, and cannot be programmed. 0 No interrupt 1 Interrupt enabled

52.4.3 LIN Status Register (LINFlexD_LINSR)

This register consists of status bits indicating the state of the LINFlexD hardware.

Address: 0h base + 8h offset = 8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0												AUTOSYNC_COMP	RDC		
W													w1c			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	LINS				0		RMB	DRBNE	RXbusy	RDI	WUF	DBFF	DBEF	DRF	DTF	HRF
W	1						w1c	w1c			w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0	0	*	0	0	0	0	0	0

* Notes:

- RDI field: Reset value of RDI reflects the RX pin state

LINFlexD_LINSR field descriptions

Field	Description
0–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 AUTOSYNC_ COMP	AUTOSYNC_COMP This bit is set after autosynchronization is complete and when the LASE bit in LINCR1 register is enabled. Only after this bit is set, the contents of LINIBRR and LINFBRR registers can be read in autosynchronization mode. **NOTE:** If autosynchronization is disabled, this bit is reserved.
13–15 RDC	Receive Data Byte Count RDC contains the number of entries (bytes) in the Receive data buffer in LIN mode. RDCx is a read-only field available for debug purposes. 000 1 byte 001 2 bytes 010 3 bytes 011 4 bytes 100 5 bytes 101 6 bytes 110 7 bytes 111 8 bytes

Table continues on the next page...

LINFlexD_LINSR field descriptions (continued)

Field	Description
16–19 LINS	LIN state In UART mode Idle, Init, Sleep, and Data Transmission/Reception states are flagged by the LIN status bits. **NOTE:** The value of this bit field doesn't change by any write operation to it. Writing 0xF to this bit field clears the Rx interrupt, only when set due to the LIN state event. 0000 Sleep mode: LINFlexD is in Sleep mode, to save power consumption. 0001 Init mode: This mode is entered when: SLEEP bit and INIT bit are reset by software; Wakeup pulse has been received on RX pin (AUTOWU set); Previous frame transmission/reception has been completed/aborted 0010 Idle mode: This mode is entered when: SLEEP bit and INIT bit are reset by software; Wakeup pulse has been received on RX pin (AUTOWU set); Previous frame transmission/reception has been completed/aborted 0011 Sync break: In slave mode, a falling edge followed by a dominant state has been detected. Receiving sync break. In slave mode, a falling edge followed by a dominant state has been detected. Receiving sync break. In master mode, sync break transmission ongoing. Note: In slave mode upon any error LIN state could be either Idle or Rec Break, depending on last bit detected on LIN_RX. If last bit detected is dominant then Rec_Break, otherwise Idle. 0100 Sync Del: In Slave mode, valid Sync break has been detected (10 bit or 11 bit). Waiting for a rising edge. In Master mode, Sync break transmission has been completed, sync delimiter transmission is ongoing. 0101 Sync Field: In Slave mode, a valid sync Del has been detected (recessive state for at least one bit time). Receiving sync field. In Master mode, sync field transmission ongoing. 0110 Identifier Field: In Slave mode, a valid sync field has been received. Receiving ID field. In Master mode, identifier transmission is ongoing. 0111 Header Reception/Transmission: In Slave mode, a valid header has been received and Identifier field is available in the BIDR. In Master mode, header transmitted. 1000 Data Reception/Data Transmission: In Receiver mode, reception ongoing. In Transmitter mode, response transmission ongoing. 1001 Checksum: Data transmission/reception completed, checksum transmission/reception ongoing.
20–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 RMB	Release Message Buffer 0 Buffer data is free. Reset by hardware in when in Initialization mode 1 Buffer data ready to be read by software. This bit should be cleared by software after reading the data received in the buffer.
23 DRBNE	Data Reception Buffer Not Empty Flag This bit is set by hardware as soon as the first byte of response has been received and stored in BDRL (when there is at least one data byte in reception buffer). Software should clear it after reading all the buffers. This bit is also reset by hardware in Initialization mode. This flag could be checked by software in case of a response timeout event.
24 RXbusy	Receiver Busy flag In Slave mode after header reception, if DIR bit is reset and reception starts, then this bit is set. In this case user cannot set the DTRQ bit. 0 Receiver is idle 1 Reception ongoing

Table continues on the next page...

LINFlexD_LINSR field descriptions (continued)

Field	Description
25 RDI	LIN Receive signal This bit reflects the current status of the Rx pin. **NOTE:** After reset is released, RDI reflects the actual value of Rx pin.
26 WUF	Wakeup flag This bit is set by hardware when a falling edge is detected on the Rx pin. 1. When slave is in Sleep mode 2. When master is in Sleep mode or Idle mode It can be cleared by software. It gets reset by hardware in Initialization mode.
27 DBFF	Data Buffer full flag This bit is set by hardware when the buffer is full (8 bytes received) and DFL > 7. It should be cleared by software. This bit is also reset by hardware in Initialization mode.
28 DBEF	Data Buffer empty flag This bit is set by hardware when the buffer is empty (8 bytes have been transmitted) and DFL > 7. It should be cleared by software after data buffer is refilled by software. Transmission of next 8 bytes will not start unless this bit is reset by software. This bit is also reset by hardware in Initialization mode.
29 DRF	Data Reception Completed flag This bit is set by hardware and indicates that data reception has been completed. This flag should be cleared by software. This bit is also reset by hardware in Initialization mode. **NOTE:** In case framing error or checksum error occurs then this flag is not set.
30 DTF	Data Transmission Completed flag This bit is set by hardware and indicates that data transmission is completed. This flag should be cleared by software. This bit is also reset by hardware in Initialization mode. **NOTE:** For LIN mode, in case a bit error occurs (and IOBE is reset) then this flag is not set.
31 HRF	Header Received flag This bit is set when the header reception is completed. It should be cleared by software. This bit is set only when: a) All filters are inactive and Bypass filter (BF) bit is set b) No match in any filter and Bypass filter (BF) bit is set c) TX filter match At end of frame or frame aborted, if HRF is still set, it gets reset by hardware. This bit is also reset by hardware in Initialization mode. **NOTE:** If generic slave = 0, then this bit will always read a 0, and cannot be programmed.

52.4.4 LIN Error Status Register (LINFlexD_LINESR)

Refer to Errors for detailed description of all errors.

Address: 0h base + Ch offset = Ch

LINFlexD_LINESR field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 SZF	Stuck at Zero flag This bit is set when there is a stuck-at-zero timeout error. It should be reset by software.
17 OCF	Output Compare Flag 0: No output compare event occurred 1: In master mode, LINESR[OCF] flag is set when counter LINTCSR[CNT] has matched the content of LINOCR[OC2]. In slave mode, LINESR[OCF] is set when the content of the counter LINTCSR[CNT] has matched the content of LINOCR[OC1] or LINOCR[OC2]. This bit should be cleared by software. If this bit is set, MODE bit in LINTCSR is cleared, and the IOT bit of LINTCSR is set, then LINFlexD moves to Idle state. If the MODE bit in LINTCSR is clear, then OCF gets reset by hardware in Initialization mode; if the MODE bit is set, then OCF maintains its status irrespective of the LIN state.
18 BEF	Bit Error flag This bit is set by hardware when there is a bit error. It should be cleared by software. Reset by hardware in Initialization mode.

Table continues on the next page...

LINFlexD_LINESR field descriptions (continued)

Field	Description
19 CEF	Checksum Error flag This bit is set by hardware if the received checksum does not match the hardware-calculated checksum. It should be cleared by software. This error will never occur if CCD or CFD bit of LINCR1 is set. Reset by hardware in Initialization mode.
20 SFEF	Sync Field Error flag This bit is set by hardware when the received Sync Field is inconsistent. It should be cleared by software. Reset by hardware in Initialization mode. If generic slave = 0, then this bit will always read a 0, and cannot be programmed.
21 SDEF	Sync Delimiter Error flag This bit is set by hardware when the delimiter is too short (in other words, less than one bit time). It should be cleared by software. Reset by hardware in Initialization mode. **NOTE:** If generic slave = 0, then this bit will always read a 0, and cannot be programmed.
22 IDPEF	ID Parity Error flag This bit is set by hardware when there is an error in the ID parity. It should be cleared by software. **NOTE:** Header Error Interrupt is triggered for SFEF or SDEF or IDPEF flag is set and HEIE is set. If generic slave = 0, then this bit will always read a 0, and cannot be programmed. For generic slave = 1,this bit is reset by hardware in Initialization mode.
23 FEF	Framing Error flag This bit is set by hardware when there is a framing error (invalid stop bit). It should be cleared by software. Reset by hardware in initialization mode.
24 BOF	Buffer overrun flag This bit is set by hardware when there is a new byte received and RMB bit is not cleared. It can be cleared by software. Reset by hardware in initialization mode.
25–30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 NF	Noise flag This bit is set by hardware when noise is detected in the received character. It should be cleared by software. Reset by hardware in Initialization mode.

52.4.5 UART Mode Control Register (LINFlexD_UARTCR)

NOTE

When accessing the UARTCR register, reserved bits should always be written to zero.

NOTE

- The LINFlexD module in UART mode does not support communication with Special Word Length (UARTCR[WLS] = 1) in buffer mode.
- The LINFlexD module in UART mode supports communication with Special Word Length (UARTCR[WLS] = 1) in FIFO mode only with UARTCR[WL1, WL0] = 1,1.

Address: 0h base + 10h offset = 10h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0	0								NEF			DTU_PCETX	SBUR		WLS

LINFlexD_UARTCR field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–11 NEF	Number of expected frame These bits are used to configure the number of expected frames in UART reception mode. If the DTU bit is set, then the UART timeout counter will be reset after the configured number of frames have been received. Register bit can be read in any mode, written only in Initialization mode.
12 DTU_PCETX	Disable Timeout in UART mode This bit can be programmed in Initialization mode only when the UART bit is set. There is an internal counter that gives the number of frames received. **In Buffer mode:** This timer gets reset whenever the number of bytes received (rec_byte_cnt) is equal to RDFL. At this point the DRF bit is also set and num_of_frames (number of frames received), rec_byte_cnt are reset. When num_of_frames equals NEF, Disable Timeout is generated. But this clears num_of_frames also. Thus the timer restarts again. The value of counter is 0 when it restarts. **In FIFO mode:**

Table continues on the next page...

LINFlexD_UARTCR field descriptions (continued)

Field	Description
	When num_of_frames equals NEF, Disable Timeout is generated which clears num_of_frames and causes the timer to restart again. The value of counter is 0 when it restarts. Notes: • Disable Timeout causes only the Timer to restart which enables Timeout again. • Timer reset means it resets and starts counting again and the Timeout is enabled. 0 Timeout has to be handled by software 1 Timeout in UART mode is disabled after the configured number of data frames are received
13–14 SBUR	Stop bits in UART reception mode When the UART is used for transmission and reception we have to set the same number of stop bits in GCR and SBUR. When the UART is used only as receiver, it is enough to set SBUR bits only. This bit can be programmed in the initialization mode only, when the UART bit is set. 00 1 stop bit 01 2 stop bits 10 3 stop bits 11 reserved
15 WLS	Special Word Length in UART mode This bit can be programmed in initialization mode only when the UART bit is set. If this bit is set, setting WL and PCE bits has no effect in UART reception although parity check is enabled by default in this mode and PC0/1 bits can be used to select the parity control. This bit is given the highest priority in UART reception mode. 0 This bit is disabled. 1 This bit enables 12-bit + parity bit in reception (UART mode) for MSC (Micro Second Channel upstream frame) support.
16–18 TDFL_TFC	Transmitter Data Field Length/TX FIFO Counter TDFL defines the number of bytes to be transmitted in UART buffer mode (TFBM = 0). TDFL is a read/write field. Bit 15 is reserved and not implemented. When the UART data length is configured as halfword (WL = 10 or WL = 11), only the configurations TDFL = x01 or TDFL = x11 are allowed. x00 : 1 byte x01 : 2 bytes x10 : 3 bytes x11 : 4 bytes Register bit is a read/write field. TFC contains the number of entries (bytes) of the Tx FIFO in UART FIFO mode (TFBM = 1). TFCx is a read-only field available for debug purposes. 000 : empty 001 : 1 byte 010 : 2 bytes 011 : 3 bytes 100 : 4 bytes Others : reserved TDFLTFC can be programmed and are significative only when the UART bit is set.

Table continues on the next page...

LINFlexD_UARTCR field descriptions (continued)

Field	Description
	Register bit can be read in any mode, written only in Initialization mode. **NOTE:** When a debugger is connected, this counter will decrement if TxFIFO is being read through the debugger. **NOTE:** In case of data path is functioning normally, RFC/TFC counters will be cleared internally by HW.
19–21 RDFL_RFC	Reception Data Field Length /RX FIFO Counter RDFL defines the number of bytes to be received in UART buffer mode (RFBM = 0). RDFL is a read/write field. Bit 19 is reserved and not implemented. When the UART data length is configured as halfword (WL = 10 or WL = 11), only the configurations RDFL = x01 or RDFL = x11 are allowed. x00 : 1 byte x01 : 2 bytes x10 : 3 bytes x11 : 4 bytes RFC contains the number of entries (bytes) of the Rx FIFO in UART FIFO mode (RFBM = 1). RFCx is a read-only field available for debug purposes. 000 : Empty 001 : 1 byte 010 : 2 bytes/1.5 byte in case of WLS bit setting 011 : 3 bytes 100 : 4 bytes/2x1.5 byte in case of WLS bit setting Others - Reserved RDFLRFC can be programmed and are significative only when the UART bit is set. **NOTE:** In buffer mode, RDFL should be programmed to be greater than or equal to NEF (number of expected frames). In FIFO mode, there is no such constraint. **NOTE:** When a debugger is connected, this counter will decrement if RxFIFO is being read through the debugger. **NOTE:** In case of data path is functioning normally, RFC/TFC counters will be cleared internally by HW.
22 RFBM	RFBM Rx Fifo/Buffer mode This bit can be programmed in Initialization mode, only when the UART bit is set. Register bit can be read in any mode, written only in initialization mode. 0 Rx Buffer mode enabled 1 Rx Fifo mode enabled (mandatory in DMA Rx mode)
23 TFBM	Tx Fifo/Buffer mode This bit can be programmed in initialization mode, only when the UART bit is set. Register bit can be read in any mode, written only in initialization mode. 0 Tx Buffer mode enabled 1 Tx Fifo mode enabled (mandatory in DMA Tx mode)
24 WL1	Word Length in UART mode This bit can be programmed in Initialization mode only, when the UART bit is set. Register bit can be read in any mode, written only in initialization mode.

LINFlexD_UARTSR field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 SZF	Stuck at Zero flag This bit is set by hardware when 100 dominant bits are detected. It should be cleared by software. An interrupt will be generated if the SZIE bit in LINIER is set. This bit will reflect the same value as in LINESR, when in Initialization mode and the UART bit is set.
17 OCF	Output Compare Flag An interrupt will be generated if the OCIE bit in LINIER is set. This bit will reflect the same value as in LINESR, when in Initialization mode and the UART bit is set. **NOTE:** For Baud rate above 1 Mbit/s, this flag is not usable. 0 No output compare event occurred 1 The content of the counter has matched the content of LINOCR

Table continues on the next page...

LINFlexD_UARTSR field descriptions (continued)

Field	Description
18–21 PE	Parity Error flag These bits indicate if there is a Parity Error in the corresponding byte. No interrupt is generated if this error occurs. This bit will reflect the same value as in LINESR, when in initialization mode and UART bit set. **NOTE:** Parity is checked only after complete frame is received. Following are the conditions when WL bits = 01 or 11 (either PE0 or PE2 is only set). • When PE0 is set, it indicates Parity error in either first or second byte received • When PE2 is set, it indicates Parity error in either third or fourth byte received 0 No parity error 1 Parity error in the corresponding received byte
22 RMB	Release Message Buffer This bit should be cleared by software. This bit will reflect the same value as in LINSR, when in Initialization mode and the UART bit is set. 0 Buffer data is free 1 Buffer data ready to be read by software
23 FEF	Framing Error flag This bit is set by hardware when there is a framing error (invalid stop bit). It should be cleared by software. It will generate an interrupt if the FEIE bit of LINIER is set. This bit will reflect the same value as in LINESR, when in Initialization mode and the UART bit is set.
24 BOF	FIFO/Buffer overrun flag This bit is set by hardware when there is a new byte received and the RMB bit is not cleared in UART buffer mode. In UART FIFO mode this bit is set when there is a new byte and the Rx FIFO is full. In UART FIFO mode, once Rx FIFO is full, the new received message will be discarded irrespective of the new value of the RBLM bit. In UART Rx Buffer mode, if RBLM is set then the new message received will be discarded; if RBLM is reset then the new message will overwrite the buffer. It can be cleared by software writing a 1. An interrupt is generated if the BOIE bit of LINIER is set. This bit will reflect the same value as in LINESR, when in Initialization mode and the UART bit is set.
25 RDI	Receiver Data Input signal This bit reflects the current status of the RX pin.
26 WUF	Wakeup flag This bit is set by hardware when a falling edge is detected on the RX pin in sleep mode. It should be cleared by software. An interrupt will be generated if the WUIE bit in LINIER is set. This bit will reflect the same value as in LINESR when in Initialization mode and the UART bit is set.
27 RFNE	Receive FIFO Not Empty RFNE bit is set by hardware in UART FIFO mode (RFBM = 1), when there is at least one data byte present in the receive FIFO. RFNE is a read-only bit for debugging purposes. This flag can be used by software in case of a timeout event.
28 TO	Timeout This bit is set by hardware when a UART timeout occurs — in other words, the value of UARTCTO becomes equal to the preset value of the timeout (UARTPTO register setting). TO should be cleared by software. The SR bit should be used to reset the receiver fsm to Idle state in case of UART TIMEOUT for UART reception, depending on the application, in both buffer and FIFO mode.

Table continues on the next page...

LINFlexD_UARTSR field descriptions (continued)

Field	Description
	An interrupt will be generated when LINIER.DBEIE/TOIE bit is set on the Error interrupt line in UART mode.
29 DRFRFE	Data Reception Completed Flag /Rx FIFO Empty Flag DRF is set by hardware in UART buffer mode (RFBM = 0) and indicates that the number of bytes programmed in RDFL have been received. DRF should be cleared by software. An interrupt will be generated if the DRIE bit in LINIER is set. DRF bit is set when the configured number of valid stop bits are received for the last frame (number of frames is configurable by RDFL bits). DRF is set irrespective of framing error in case framing error is in the last STOP bit configured, parity error or overrun error. This bit will reflect the same value as in LINSR when in Initialization mode and the UART bit is set. Register bit can be read/cleared by software. Writing 1 clears contents. RFE is set by hardware in UART FIFO mode (RFBM = 1) when the RX FIFO is empty. RFE is a read-only bit for debugging purposes. It is internally used by the DMA RX interface.
30 DTFTFF	Data Transmission Completed Flag/ TX FIFO Full Flag DTF is set by hardware in UART buffer mode (TFBM = 0) and indicates that data transmission is completed. DTF should be cleared by software. An interrupt will be generated if the DTIE bit in LINIER is set. This bit will reflect the same value as in LINSR when in Initialization mode and the UART bit is set. Register bit can be read/cleared by software. Writing 1 clears contents. TFF is set by hardware in UART FIFO mode (TFBM = 1) when TX FIFO is full. TFF is a read-only bit for debugging purposes. It is internally used by the DMA TX interface.
31 NF	Noise flag This bit is set by hardware when noise is detected in the received character. It should be cleared by software. This bit will reflect the same value as in LINESR when in Initialization mode and the UART bit is set.

52.4.7 LIN Time-Out Control Status Register (LINFlexD_LINTCSR)

This register contains control and status bits for timeout feature.

NOTE

When the MODE bit is 0, any activity on the transmit or receive pins will cause an unwanted change in the value of the 8-bit field Output Compare Value 2 (OC2) of the LIN Output Compare register (LINOCR). The LINFlexD module is enabled in LIN mode and the value of the MODE bit of the LIN Timeout Control Status register (LINTCSR) is changed from ‘1’ to ‘0’, then the old value of the Output Compare Value 1 (OC1) and Output Compare Value 2 (OC2) of the LIN Output Compare register (LINOCR) is retained. As a consequence, if the module is reconfigured from UART to LIN mode, or LINTCSR MODE bit is changed from ‘1’ to ‘0’, an incorrect timeout exception is generated when a LIN communication starts. To avoid this, set mode bit to '1', then reconfigure the LINFlexD in LIN mode and then reset the MODE bit. Before switching LINTCSR[MODE] from 1 to 0 in between frames, load LINOCR with 0xFFFF.

Address: 0h base + 18h offset = 18h

Reset	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

LINFlexD_LINTCSR field descriptions

Field	Description
0–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 MODE	Time-out counter mode This bit can be configured only during initialization. Register bit can be read in any mode, written only in initialization mode. **NOTE:** Always set LINTCSR[MODE] to 1 when UARTCR[UART] is 1. **NOTE:** Before switching LINTCSR[MODE] from 1 to 0 in between frames, load LINOCR to 0xFFFF. 0 LIN mode 1 Output compare mode
22 IOT	Idle on timeout Register bit can be read in any mode, written only in initialization mode. This feature is applicable only when MODE bit in LINTCSR is cleared.

Table continues on the next page...

LINFlexD_LINTCSR field descriptions (continued)

Field	Description
	0 LIN state machine does not reset to Idle on timeout 1 LIN state machine resets to Idle on timeout event
23 TOCE	Time-out counter enable TOCE is always configurable by software in Initialization mode. If LIN state is other than INIT and if timer is configured in LIN mode, then hardware takes control of TOCE. 0 Time-out counter disable. OCF flag is not set on an output compare event. 1 Time-out counter enable. OCF flag is set if an output compare event occurs.
24–31 CNT	Counter Value These bits reflect the value of a counter used for timeout. **NOTE:** For proper functionality of this counter, LINIBRR should be >= 5.

52.4.8 LIN Output Compare Register (LINFlexD_LINOCR)

This register contains the value to be compared to the LINTCSR:CNT value. This register is writable by software only in Output Compare Mode.

Address: 0h base + 1Ch offset = 1Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

  HTO resets to 0011100b in Master only mode, if generic slave = 0.

  HTO resets to 0101100b in Master/Slave mode, if generic slave = 1.

LINFlexD_LINTOCR field descriptions

Field	Description
0–19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–23 RTO	Response timeout value This is the response timeout duration (in bit time) for 1 byte. The reset value is 0Eh = 14, corresponding to T $_{\text{Response\_Maximum}}$ = 1.4 x T $_{\text{Response\_Nominal}}$
24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25–31 HTO	Header timeout value This register contains the header timeout duration (in bit time). This register can be written only for Slave mode. If Master mode is enabled then these bits will always reflect 28 (1.4 x 10 bits of sync + 1.4 x 10 bits of ID). For slave, these bits should be programmed without considering 11 bits of break.

52.4.10 LIN Fractional Baud Rate Register (LINFlexD_LINFBRR)

This register consists of bits that decide the fractional part of the LIN Baud Rate. It can be programmed only in Initialization mode.

NOTE

When LASE bit is set, this register should be read only after AUTOSYNC_COMP bit in LINSR register is set to obtain the correct value.

Address: 0h base + 24h offset = 24h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_LINFBRR field descriptions

Field	Description
0–27 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28–31 FBR	Fractional Baud rates Register bit can be read in any mode, written only in initialization mode. 0000 Fraction(LDIV) = 0 0001 Fraction(LDIV) = 1/16 0010 Fraction(LDIV) = 2/16 0011 Fraction(LDIV) = 3/16 0100 Fraction(LDIV) = 4/16 0101 Fraction(LDIV) = 5/16 0110 Fraction(LDIV) = 6/16 0111 Fraction(LDIV) = 7/16 1000 Fraction(LDIV) = 8/16 1001 Fraction(LDIV) = 9/16 1010 Fraction(LDIV) = 10/16 1011 Fraction(LDIV) = 11/16 1100 Fraction(LDIV) = 12/16 1101 Fraction(LDIV) = 13/16 1110 Fraction(LDIV) = 14/16 1111 Fraction(LDIV) = 15/16

52.4.11 LIN Integer Baud Rate Register (LINFlexD_LINIBRR)

This register consists of control bits that decide the baud rate along with the LINFBRR. It can be programmed only in Initialization mode.

NOTE

When LASE bit is set, this register should be read only after AUTOSYNC_COMP bit in LINSR register is set to obtain the correct value.

Address: 0h base + 28h offset = 28h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_LINIBRR field descriptions

Field	Description
0–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

12–31
IBR
	Integer Baud rates
	These bits along with the fractional baud rate bits decide the LIN baud rate.
	IBR = 0h: LIN clock disabled
	IBR = 1h: Mantissa (LDIV) = 1
	...
	IBR = FFFFEh: Mantissa (LDIV) = 1048574
	IBR = FFFFFh: Mantissa (LDIV) = 1048575
	Register bit can be read in any mode, written only in initialization mode.

52.4.12 LIN Checksum Field Register (LINFlexD_LINCFR)

NOTE

> There is a delay between 4 to 6 clock cycles of PBRIDGEx_CLK for the internal checksum's value (which is clocked with LIN_CLK/16 * LDIV) to reflect on LINCFR.

This register consists of checksum bits.

CFD	CCD	LINCHKSUM Read/write	Checksum sent
1	1	read/write	None
1	0	read-only	None
0	1	read/write	Programmed checksum
0	0	read-only	Calculated checksum

Address: 0h base + 2Ch offset = 2Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_LINCFR field descriptions

Field	Description
0–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–31 CF	Checksum bits When the CCD bit is reset these bits are read-only and are calculated by hardware. When the CCD bit is set, these bits can be written by software.

52.4.13 LIN Control Register 2 (LINFlexD_LINCR2)

This register includes control status bits related to buffer operations.

NOTE

When accessing the LINCR2 register, each reserved bit should be written to its original reset value.

Address: 0h base + 30h offset = 30h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

W																
Reset	0	1	*	0	0	0	0	0	0	0	0	0	0	0	0	0

* Notes:

- IOPE field: When slave = 0, this field always reads ‘0’ and cannot be programmed else this bit is programmable and reset value is 1.

LINFlexD_LINCR2 field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 TBDE	Two Bit delimiter bit This bit can be set in Initialization mode only. Register bit can be read in any mode, written only in initialization mode. 0 Delimiter length in break field is 1 bit 1 Delimiter length in break field is 2 bits
17 IOBE	Idle on Bit Error This bit can be set in Initialization mode only. Register bit can be read in any mode, written only in initialization mode. 0 Bit Error does not reset LIN state machine 1 Bit Error resets LIN state machine
18 IOPE	Idle on Identifier Parity Error This bit can be set in Initialization mode only.

Table continues on the next page...

LINFlexD_LINCR2 field descriptions (continued)

Field	Description
	Register bit can be read in any mode, written only in initialization mode. If generic slave = 0, then this bit will always read a 1 else 0, and cannot be programmed. 0 Parity Error does not reset LIN state machine 1 Parity Error resets LIN state machine
19 WURQ	Wakeup Generate Request Setting this bit will generate a wakeup pulse. It is reset by hardware when the wakeup character has been transmitted. The character sent during wakeup is copied from BDRL (DATA0). Note that this bit cannot be set in Sleep mode — software has to exit Sleep mode before setting this bit. Bit Error is not checked when transmitting the wakeup request. Register bit can be read/set by software
20 DDRQ	Data Discard request Set by software to stop data reception if the frame does not concern the node. This bit is reset by hardware once LINFlexD ignores the response and moves to Idle state. For LIN slave this bit can be set only when HRF bit is set and Identifier is software-filtered. Register bit can be read/set by software
21 DTRQ	Data Transmission Request Set by software in slave mode to request the transmission of the LIN Data field stored in the Buffer data register. This bit can be set only when the HRF bit is set (to ensure that data transmission is requested only after a header reception). Cleared by hardware when the request has been completed, or on abort request or error condition. In Master mode, this bit is set by hardware when the DIR bit is set and header transmission is complete. Register bit can be read/set by software
22 ABRQ	Abort Request Set by software to abort the current transmission. Cleared by hardware when the transmission has been aborted. LINFlexD aborts the transmission at the end of the current bit. This bit can abort a wakeup request also and can be used in UART mode also. Register bit can be read/set by software Register bit can be read/set by software
23 HTRQ	Header Transmission Request Set by software to request the transmission of the LIN Header. Cleared by hardware when the request has been completed or on abort request. This bit has no effect in UART mode. **NOTE:** In master mode, if both HTRQ and ABRQ are set at the same time then ABRQ has no effect. Similarly, in slave mode after header reception, if DTRQ and ABRQ are simultaneously set then ABRQ has no effect.
24–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

52.4.14 Buffer Identifier Register (LINFlexD_BIDR)

This register contains the bits which provide information about the identifier of the transaction and other related information.

NOTE

All the fields (ID, CSS, DIR, DFL) of the BIDR register must be updated when an ID filter (enabled) in Slave mode (Tx or Rx) matches the ID received.

Address: 0h base + 34h offset = 34h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	DFL						DIR	CCS	0		ID					
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LINFlexD_BIDR field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–21 DFL	Data Field Length Number of data bytes in the response part of the frame. DFL = Number of data bytes - 1 **NOTE:** DFL[5:3] is provided for extended frames. Normally LIN mode will use DFL[2:0]. Identifier filters are now compatible with DFL[5:0] also.
22 DIR	Direction This bit controls the direction of the data field. 0 LINFlexD receives the data and copy them in the BDR registers 1 LINFlexD transmits the data from the BDR registers
23 CCS	Classic Checksum This bit controls the type of checksum applied on the current message. 0 Enhanced Checksum covering Identifier and Data fields. This is compatible with LIN specification rev. 2.0 and higher. 1 Classic Checksum covering Data filed only. This is compatible with LIN specification 1.3 and lower.
24–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26–31 ID	Identifier Identifier part of the identifier field without the identifier parity. This field can be written only in Master mode (MME = '1').

52.4.15 Buffer Data Register Least Significant (LINFlexD_BDRL)

This register is a part of an 8-byte data buffer.

Address: 0h base + 38h offset = 38h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_IFER field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 FACT	Filter active The software sets the bit FACT[x] to activate the filter x in Identifier list mode. Register bit can be read in any mode, written only in initialization mode. 1. In Identifier mask mode, FACT (2n+1) have no effect on the corresponding filters as they act as mask for the Identifier 2n. 2. The length of this field depends on the value of no_of_filters. 3. The register diagram depicts the maximum no_of_filters, which can be up to 16. **NOTE:** Refer to chip configuration details to see the number of filters used in the device.

52.4.18 Identifier Filter Match Index (LINFlexD_IFMI)

This register contains the index corresponding to the received ID. It can be used to read or write the data directly in RAM.

Address: 0h base + 44h offset = 44h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_IFMR field descriptions

Field	Description
0–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–31 IFM	Filter mode Register bit can be read in any mode, written only in initialization mode. 0 Filters 2n and 2n+1 are in identifier list mode 1 Filters 2n and 2n+1 are in mask mode, where filter 2n+1 is the mask for filter 2n

52.4.20 Identifier Filter Control Register (LINFlexD_IFCR*n*)

This register is read-only in normal mode and can be programmed only in Initialization mode.

Even-numbered instances (IFCR0, IFCR2, IFCR4, ...) of this register act as filters in both Identifier list and Identifier mask modes.

Odd-numbered instances (IFCR1, IFCR3, IFCR5, ...) of this register act:

- As filters in Identifier list mode
- As a mask for the preceding-numbered register in identifier mask mode

Refer to chip configuration details to see the number of filters used in the device.

Address: 0h base + 4Ch offset + (4d × i), where i=0d to 15d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

LINFlexD_IFCR*n* field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–21 DFL	Data Field Length Number of data bytes in the response part of the frame. DFL[5:0] = Number of data bytes - 1 Register bit can be read in any mode, written only in initialization mode.
22 DIR	Direction This bit controls the direction of the data field. Register bit can be read in any mode, written only in initialization mode. 0 LINFlexD receives data and copies to the BDR registers 1 LINFlexD transmits data from the BDR registers
23 CCS	Classic Checksum This bit controls the type of checksum applied on the current message. Register bit can be read in any mode, written only in initialization mode.

Table continues on the next page...

LINFlexD_IFCR*n* field descriptions (continued)

Field	Description
	0 Enhanced Checksum covering Identifier and Data fields. This is compatible with LIN specification rev. 2.0 and higher. 1 Classic Checksum covering Data field only. This is compatible with LIN specification 1.3 and lower.
24–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26–31 ID	Identifier Identifier part of the identifier field without the identifier parity. Register bit can be read in any mode, written only in initialization mode.

52.4.21 Global Control Register (LINFlexD_GCR)

This register is read-only in Normal mode and can be programmed only in Initialization mode. This is a global control register — in other words, the register configuration will be applied in LIN mode as well as in UART mode.

The address offset depends on the no_of_filters. Refer to the chip configuration details for the number of filters used in this device.

Table 52-18. Register fields reset by SR

Register	Comment
LINSR	All fields except RXbusy and AUTOSYNC_COMP are reset
LINESR	All fields are reset
LINTCSR	Only CNT[0:7] is reset
UARTSR	All fields except RFE & TFF are reset
UARTCR	Only TFC & RFC are reset
UARTCTO	All fields are reset

Address: 0h base + 8Ch offset = 8Ch

LINFlexD_GCR field descriptions

Field	Description
0–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 TDFBM	Transmit data first bit MSB This bit controls the first bit of transmit data (payload only) as MSB/LSB in both UART and LIN modes. Register bit can be read in any mode, written only in initialization mode. 0 The first bit of transmitted data is LSB — in other words, the first bit transmitted is mapped on LSB bit (BDR (0), BDR (8), BDR (16), BDR (24)) 1 The first bit of transmitted data is MSB — in other words, the first bit transmitted is mapped on MSB bit (BDR (7), BDR (15), BDR (23), BDR (31))
27 RDFBM	Received data first bit MSB This bit controls the first bit of received data (payload only) as MSB/LSB both in UART and LIN modes. Register bit can be read in any mode, written only in initialization mode. 0 The first bit of received data is LSB — in other words, the first bit received is mapped on LSB bit (BDR (0), BDR (8), BDR (16), BDR (24)) 1 The first bit of received data is MSB — in other words, the first bit received is mapped on MSB bit (BDR (7), BDR (15), BDR (23), BDR (31))
28 TDLIS	Transmit data level inversion selection This bit controls the data inversion of transmitted data (payload only) in both UART and LIN modes. Register bit can be read in any mode, written only in initialization mode. 0 Transmitted data is not inverted 1 Transmitted data is inverted
29 RDLIS	Received data level inversion selection This bit controls the data inversion of received data (payload only) in both UART and LIN modes. Register bit can be read in any mode, written only in initialization mode. 0 Received data is not inverted 1 Received data is inverted
30 STOP	1/2 stop bit configuration This bit controls the number of stop bit transmitted data in both UART and LIN modes. The stop bit is configured for all the fields (Delimiter, Sync, ID, Checksum, Payload). Register bit can be read in any mode, written only in initialization mode. 0 1 stop bit 1 2 stop bits
31 SR	Soft reset SR executes a soft reset of the LINFlexD controller (FSMs, FIFO pointers, counters, timers, status and error registers) without modifying the configuration registers when a 1 write operation is performed. This bit should be cleared by software to perform further operations (this bit is not cleared by hardware). Register bit can be written only be software in initialization mode. Bit is always read 0 by software. Table 52-18 describes the register fields reset by SR.

52.4.22 UART Preset Timeout Register (LINFlexD_UARTPTO)

This register contains the preset value of the timeout register in UART mode and is programmed according to the number of bits to be received. This register can be written by software any time.

The address offset depends on no_of_filters. Refer to the chip configuration details to see the number of filters used in the device.

Address: 0h base + 90h offset = 90h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_UARTPTO field descriptions

Field	Description
0–19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–31 PTO	Preset Timeout PTO defines the preset value of timeout counter. A zero-value is forbidden, otherwise the UARTSR[TO] status bit is immediately set. Refer also to register UARTCTO.

52.4.23 UART Current Timeout Register (LINFlexD_UARTCTO)

This register contains the current timeout value in UART mode, and is used in conjunction with the UARTPTO register (see UART Preset Timeout Register (LINFlexD_UARTPTO) to monitor the number of bits received by UART. UART timeout works in both CPU and DMA modes.

The timeout counter:

- Starts at zero and counts upward
- Is clocked with LIN_CLK / (16 * LDIV) synchronized to PBRIDGEx_CLK
- Is automatically enabled when UARTCR[RXEN] = 1

It is reset when:

- Number of frames received is equal to NEF bits
- UARTCTO becomes equal to UARTPTO

- Whenever UARTPTO is written
- When DRF is set and DTU bit = 1

The address offset depends on no_of_filters. Refer to chip configuration details to see the number of filters used in the device.

Address: 0h base + 94h offset = 94h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_UARTCTO field descriptions

Field	Description
0–19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–31 CTO	Current Timeout CTO defines the current value of the timeout counter. CTO is a read-only field. CTO is reset every time UARTPTO is re-initialized, or UARTCTO = UARTPTO, or by hard/soft reset. When the CTO value matches the preset value (UARTPTO), the status bit UARTSR[TO] is set.

52.4.24 DMA Tx Enable Register (LINFlexD_DMATXE)

This register enables the DMA TX interface. This register can be written and read by software anytime.

The address offset depends on no_of_filters. Refer to chip configuration details to see the number of filters used in the device.

Address: 0h base + 98h offset = 98h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

LINFlexD_DMATXE field descriptions

Field	Description
0–15 Reserved	This field is reserved. Reserved

Table continues on the next page...

LINFlexD_DMATXE field descriptions (continued)

Field	Description
	NOTE: The number of reserved bits varies, and is equal to 32 - $2^{TX\_CH\_NUM}$. These lies from 0 to (31 - $2^{TX\_CH\_NUM}$). Refer to the chip configuration details for the value of TX_CH_NUM used in this device.
16–31 DTE	DMA Tx channel Y enable **NOTE:** The actual size of the register DMATXE depends on the value of the static parameter TX_CH_NUM. The size is [$2^{TX\_CH\_NUM}$ - 1 : 0]. The position of these bits are (32 - $2^{TX\_CH\_NUM}$) to 31. When DMATXE = 0x00000000, the DMA TX interface FSM is forced (soft reset) in Idle state. **NOTE:** Refer to the chip configuration details for the value of TX_CH_NUM used in this device. 0 DMA Tx channel Y disabled 1 DMA Tx channel Y enabled

52.4.25 DMA Rx Enable Register (LINFlexD_DMARXE)

This register enables the DMA RX interface. This register can be written and read by software any time.

The address offset depends on no_of_filters. Refer to device configuration chapter to see the number of filters used in the device.

Address: 0h base + 9Ch offset = 9Ch

LINFlexD_DMARXE field descriptions

Field	Description
0–15 Reserved	This field is reserved. Reserved **NOTE:** The number of reserved bits varies, and is equal to 32 - $2^{RX\_CH\_NUM}$. These lies from 0 to (31 - $2^{RX\_CH\_NUM}$). Refer to the chip configuration details for the value of RX_CH_NUM used in this device.
16–31 DRE	DMA Rx channel Y enable **NOTE:** The actual size of the register DMARXE depends on the value of the static parameter RX_CH_NUM. The size is [$2^{RX\_CH\_NUM}$ -1 : 0]. The position of these bits are (32 - $2^{RX\_CH\_NUM}$) to 31. When DMARXE = 0x00000000, the DMA RX interface FSM is forced (soft reset) in Idle state. **NOTE:** Refer to the chip configuration details for the value of RX_CH_NUM used in this device. 0 DMA Rx channel Y disabled 1 DMA Rx channel Y enabled

52.5 Programming considerations

The next subsections describe the various configurations in which the LINFlexD module can be used.

52.5.1 Master node

LINFlexD acts as Master when the MME bit is set.

52.5.1.1 Transmitter

Transmitter Master Node - Transmitter configuration.

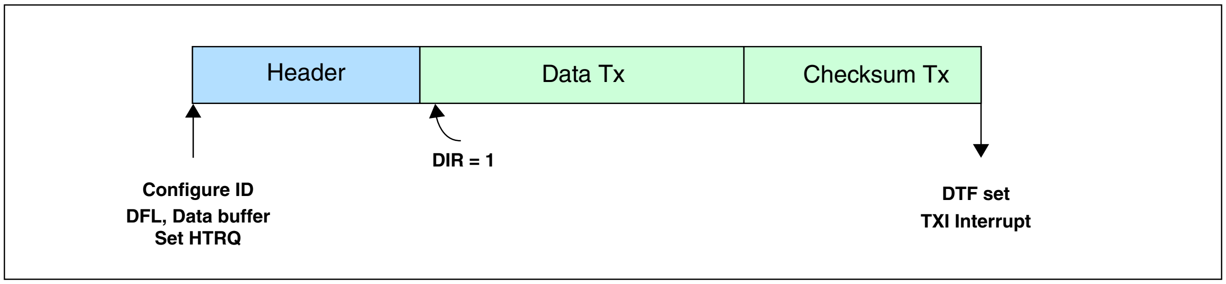

Figure 52-33. Master node – Transmitter configuration

52.5.1.2 Receiver

Receiver Master Mode - RX Configuration

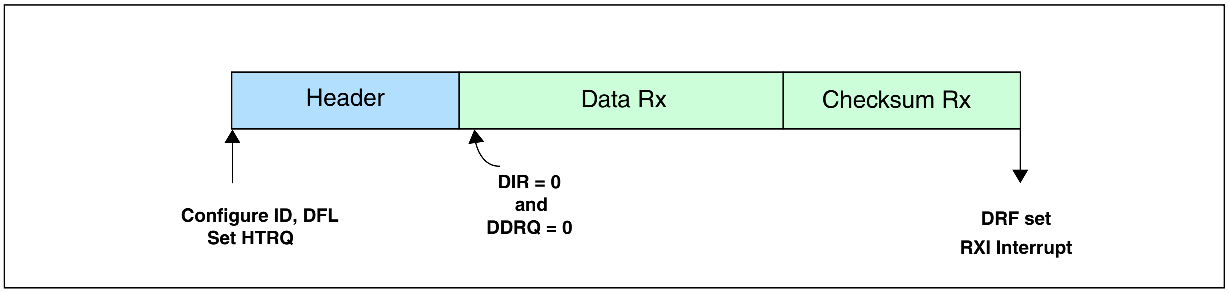

Figure 52-34. Master node – Receiver configuration

52.5.1.3 Transmitter, Bit Error

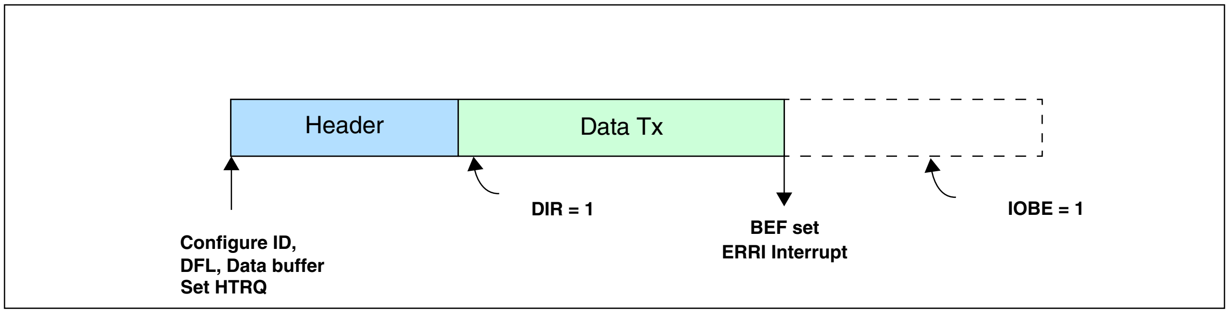

Figure 52-35. Master node – Transmitter, Bit Error configuration

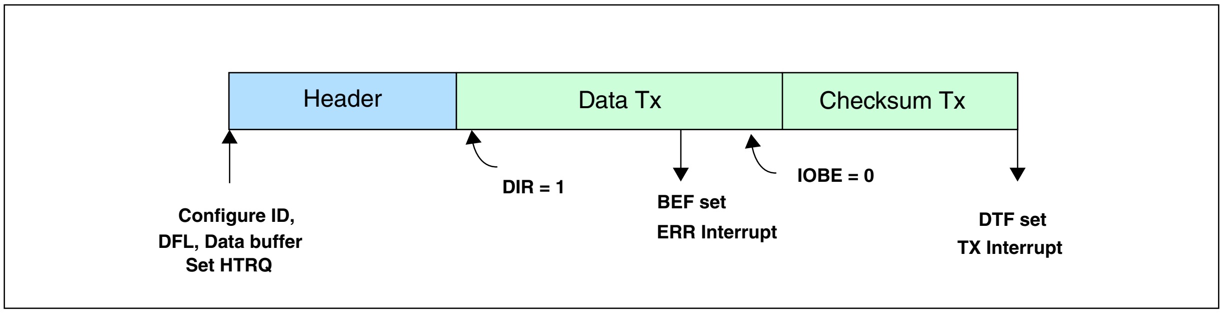

Figure 52-36. Master node – Transmitter, Checksum Error configuration

52.5.1.4 Receiver, Checksum Error

Checksum Error for Receiver.

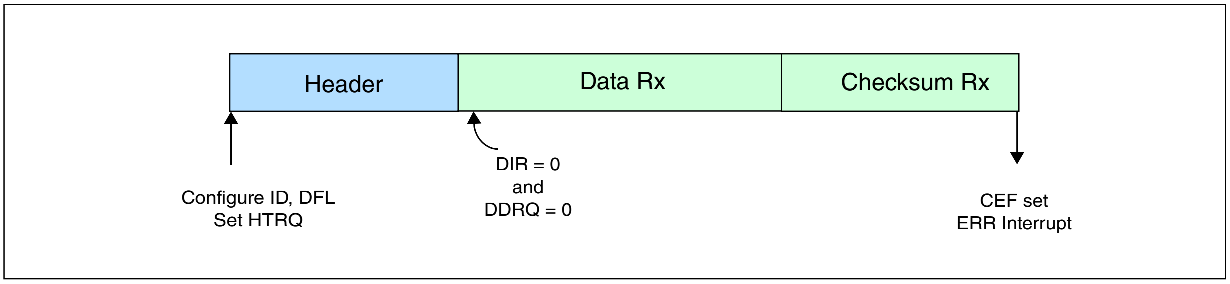

Figure 52-37. Master node – Receiver, Checksum Error configuration

52.5.2 Slave node

Slave node (transmitter).

52.5.2.1 Transmitter (no identifier filters)

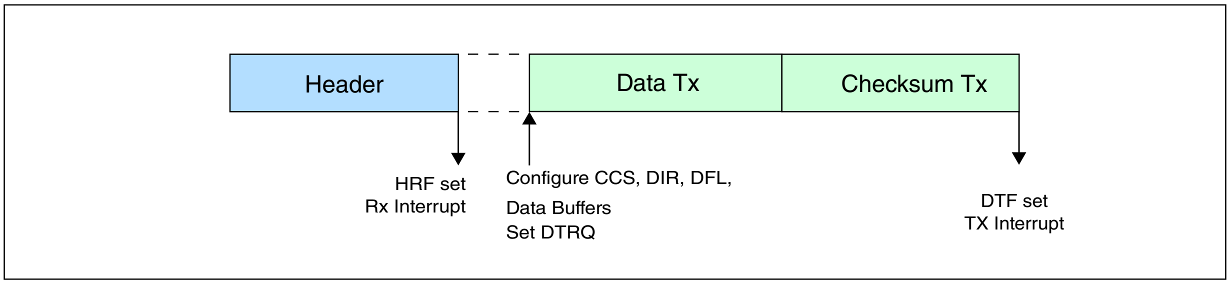

Figure 52-38. Slave node – Transmitter (no identifier filters) configuration

52.5.2.2 Receiver (no identifier filters)

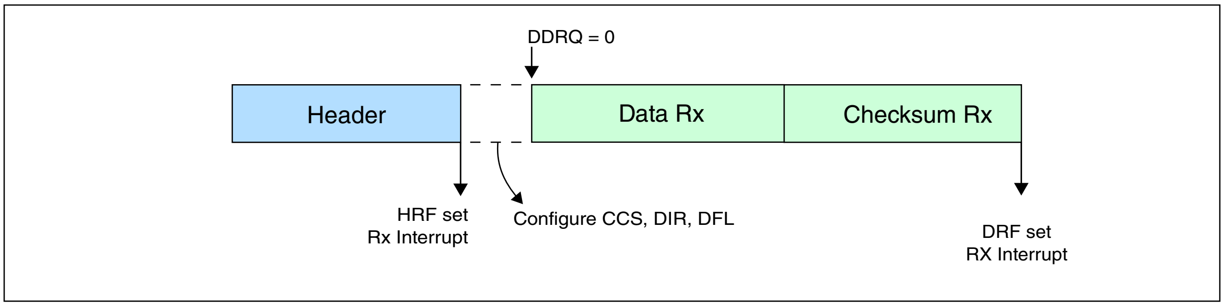

Figure 52-39. Slave node – Receiver (no identifier filters) configuration

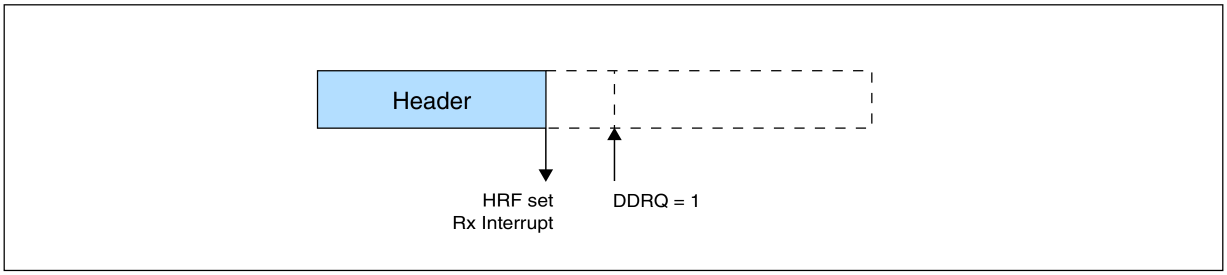

Figure 52-40. Slave node – Receiver (no identifier filters) configuration

52.5.2.3 No filters, Transmitter, Bit error

The following figure shows Slave node - No filters, Transmitter, Bit error configuration.

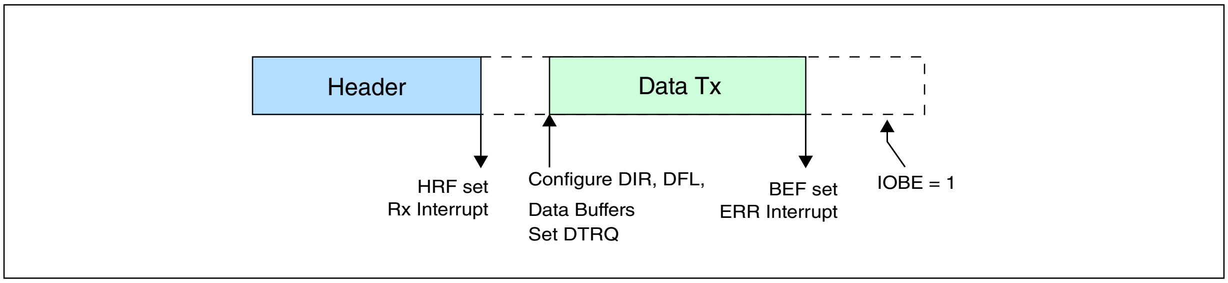

Figure 52-41. Slave node – No filters, Transmitter, Bit error configuration

52.5.2.4 No filters, Receiver, Checksum Error

The following figure shows Slave node - No filters, Receiver, Checksum error configuration.

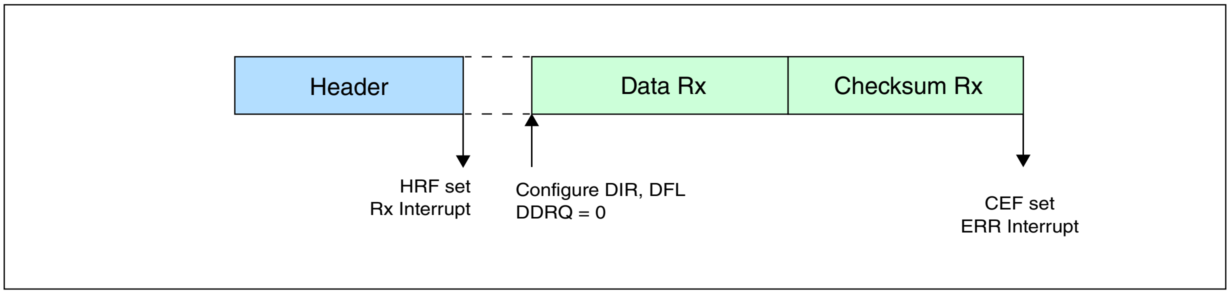

Figure 52-42. Slave node – No filters, Receiver, Checksum error configuration

52.5.2.5 At least one TX filter, BF is reset, ID matches filter

This configuration can be used in case slave never receives data, for example, sensor.

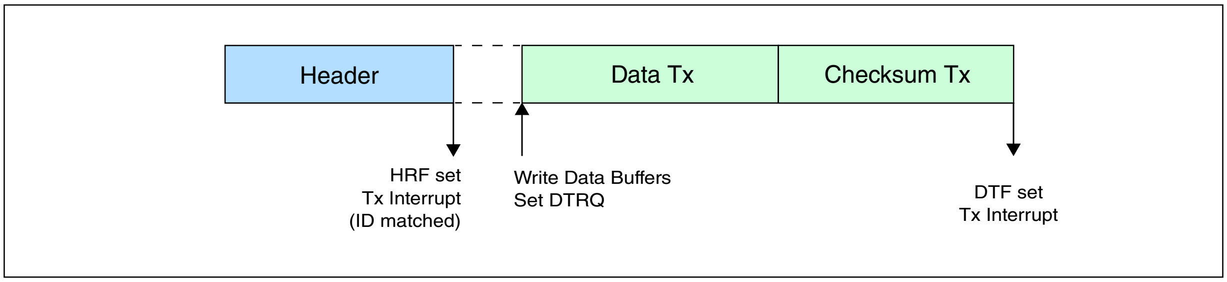

Figure 52-43. Slave node – one TX filter configuration

52.5.2.6 At least one RX filter, BF reset, ID matches filter

The following figure shows Slave node - one RX filter configuration.

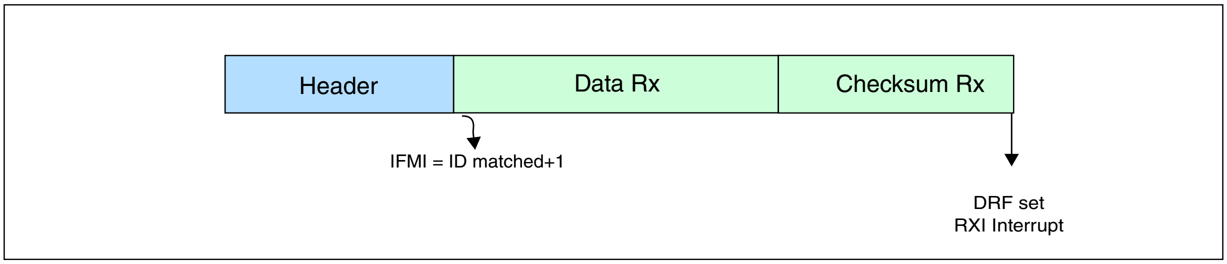

Figure 52-44. Slave node – one RX filter configuration

52.5.2.7 RX only, TX only, RX & TX filters, ID not matching filter, BF reset

The following figure shows RX only, TX only, RX and TX filters configuration.

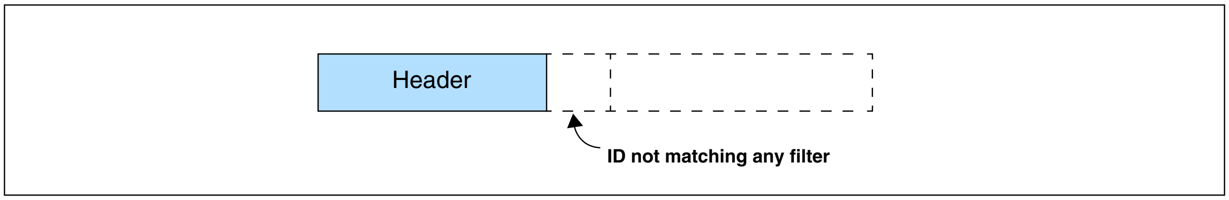

Figure 52-45. RX only, TX only, RX & TX filters configuration

52.5.2.8 TX filter, BF is set

This configuration is used when:

- All TX IDs are handled by filters.
- There are not enough other filters to handle all reception IDs.

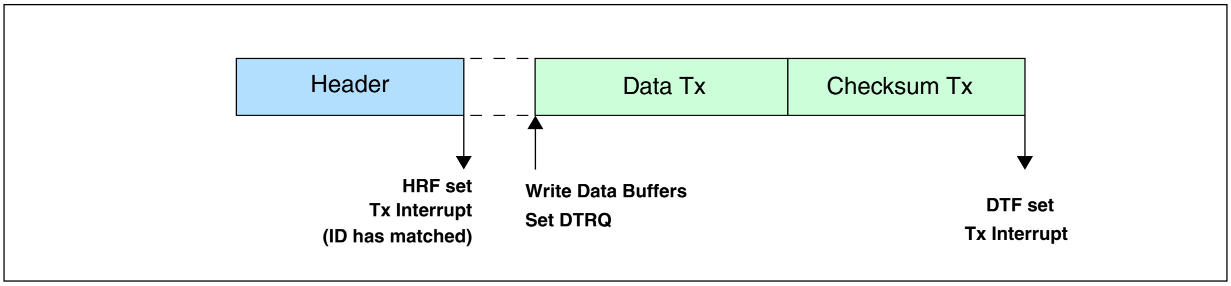

Figure 52-46. TX filter, BF is set configuration – ID has matched

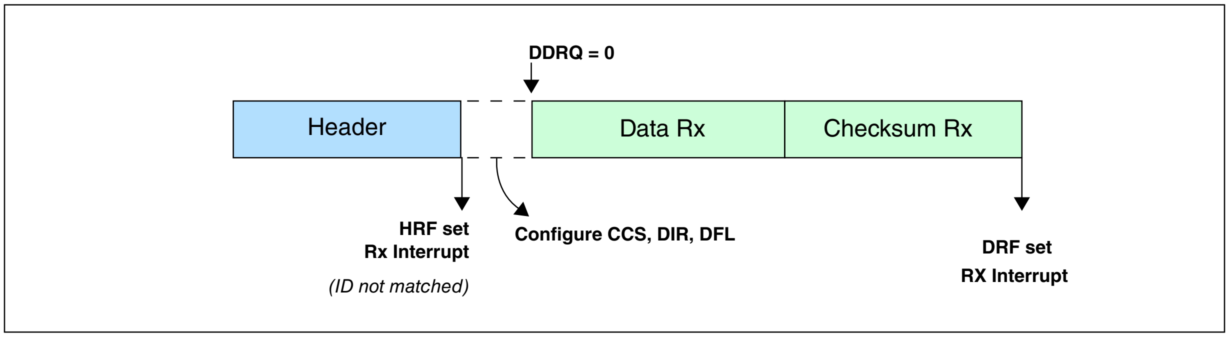

Figure 52-47. TX filter, BF is set configuration – ID not matched

52.5.2.9 RX filter, BF is set

The following figures show RX filter configurations.

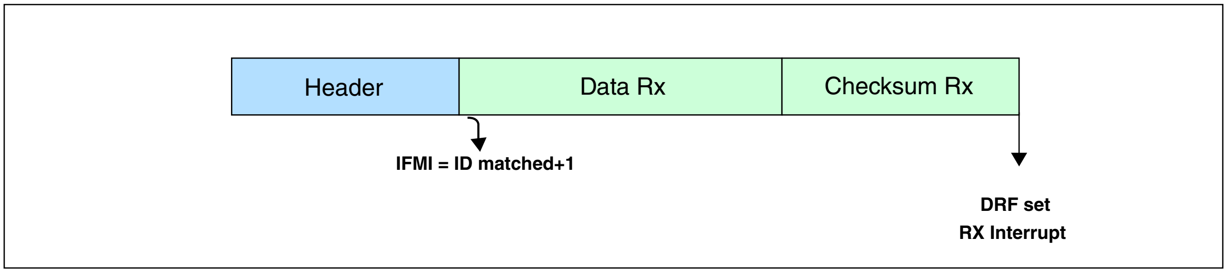

Figure 52-48. RX filter, BF is set configuration – ID matched

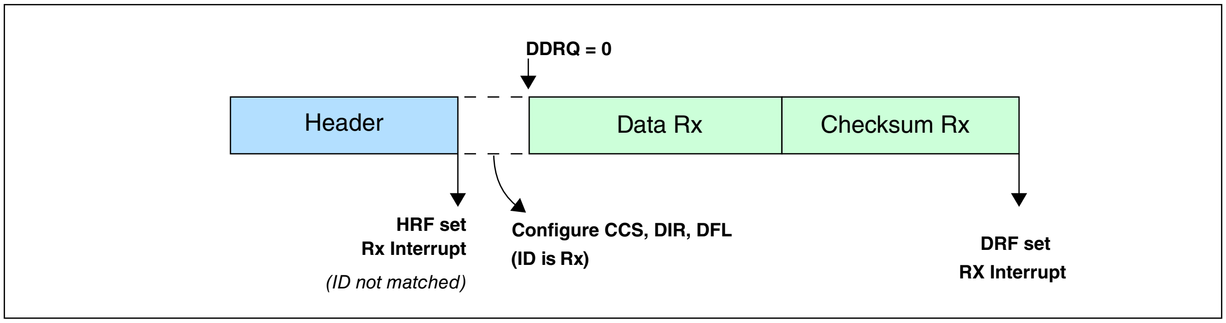

Figure 52-49. RX filter, BF is set configuration – ID not matched (ID is Rx)

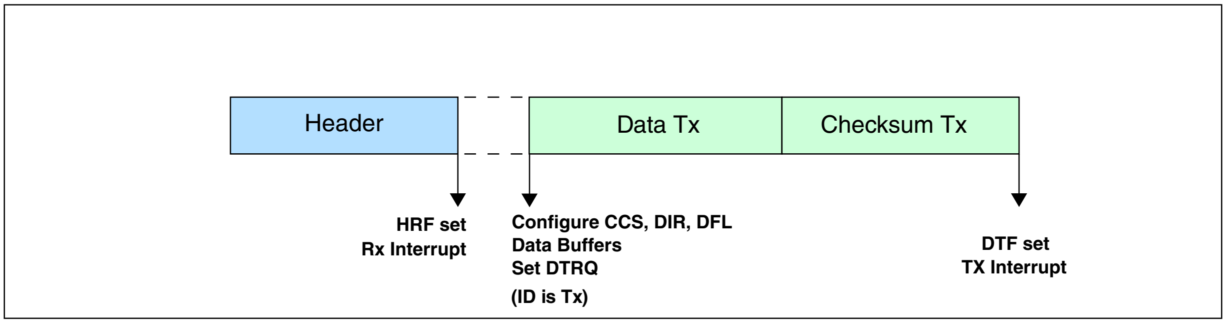

Figure 52-50. RX filter, BF is set configuration – (ID is Tx)

52.5.2.10 TX filter, RX filter, BF set

This configuration is used when:

- There are not enough filters.
- The filters are used for most frequently used IDs to reduce CPU usage.

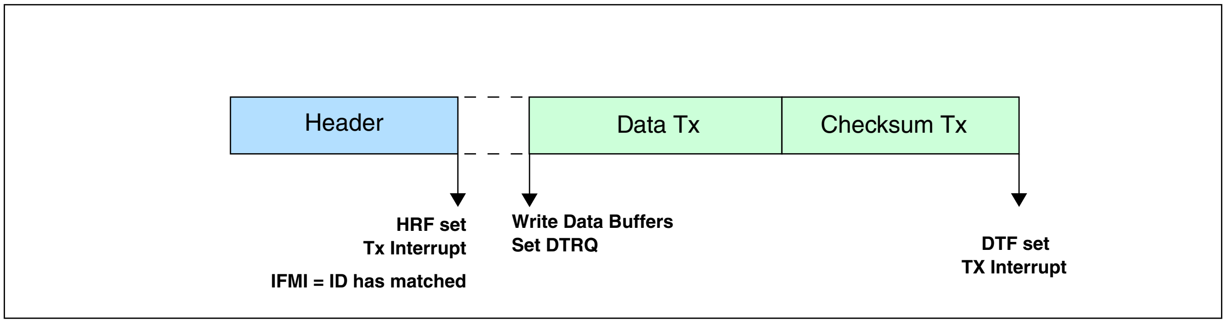

Figure 52-51. TX filter, RX filter, BF set configuration – (ID matched)

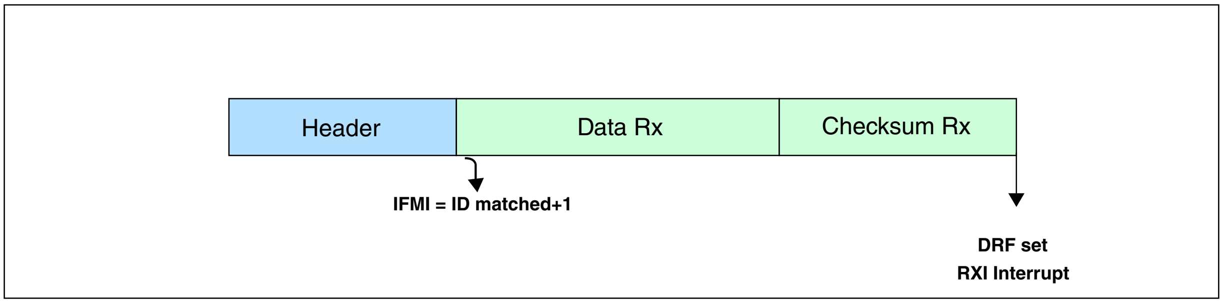

Figure 52-52. TX filter, RX filter, BF set configuration – (ID matched + 1)

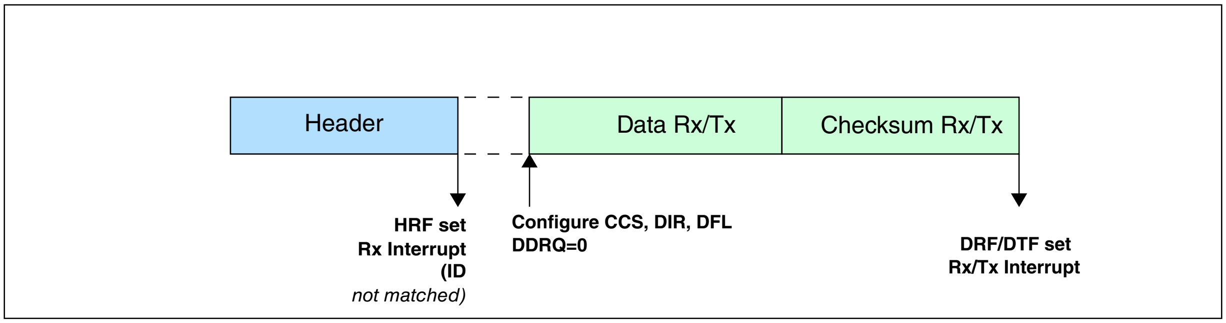

Figure 52-53. TX filter, RX filter, BF set configuration – (ID not matched, RX/TX Interrupt)

52.5.3 Extended frames

The following figure shows Extended frames (RX Interrupt).

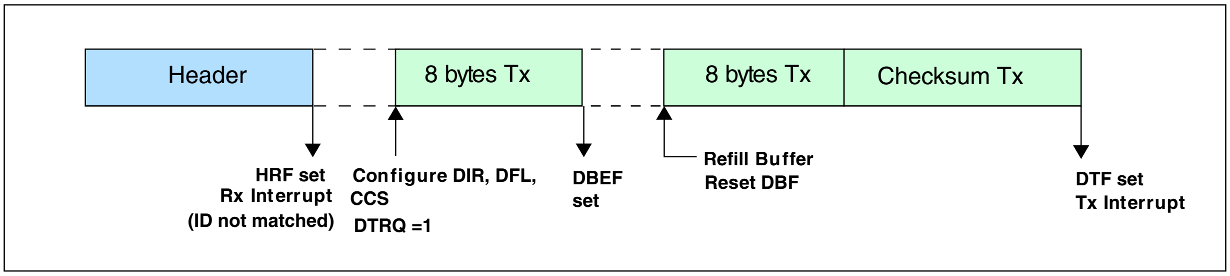

Figure 52-54. Extended frames (TX Interrupt)

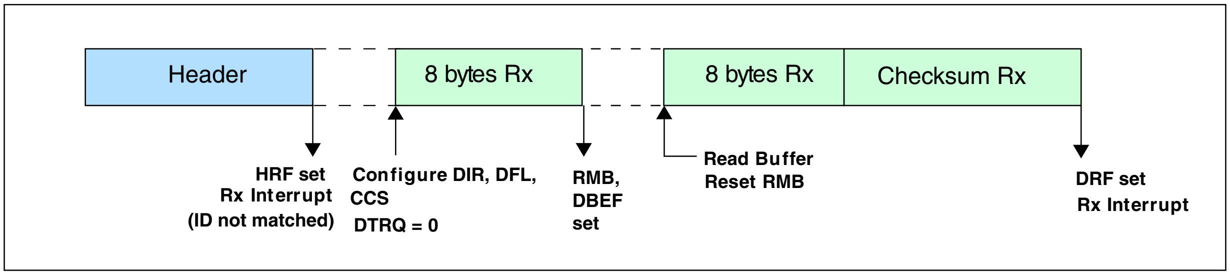

Figure 52-55. Extended frames (RX Interrupt)

52.5.4 Timeout

Master Node: Response (during reception only) and frame timeout are checked.

Slave Node: Header, Response (during reception only), and frame timeout are checked.

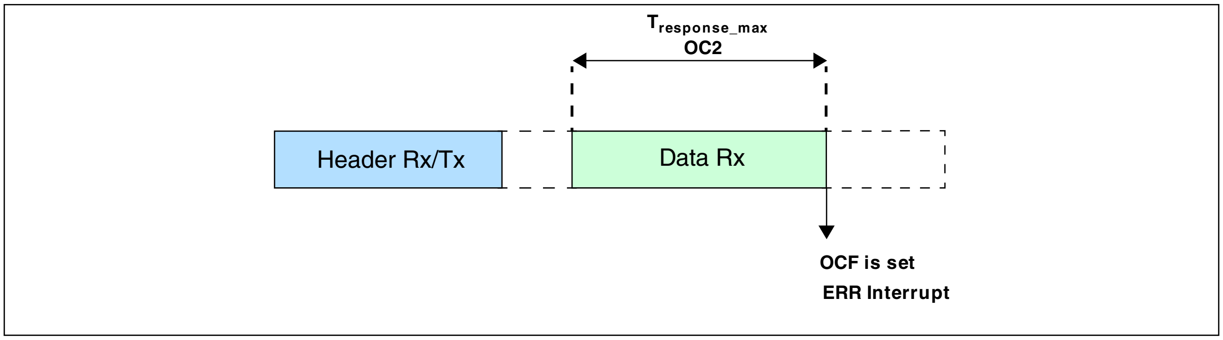

Figure 52-56. Response timeout

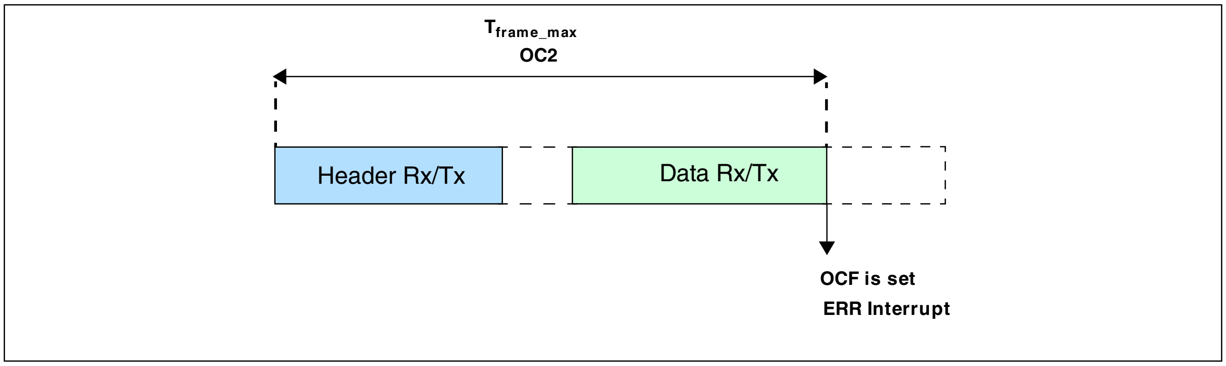

Figure 52-57. Frame timeout

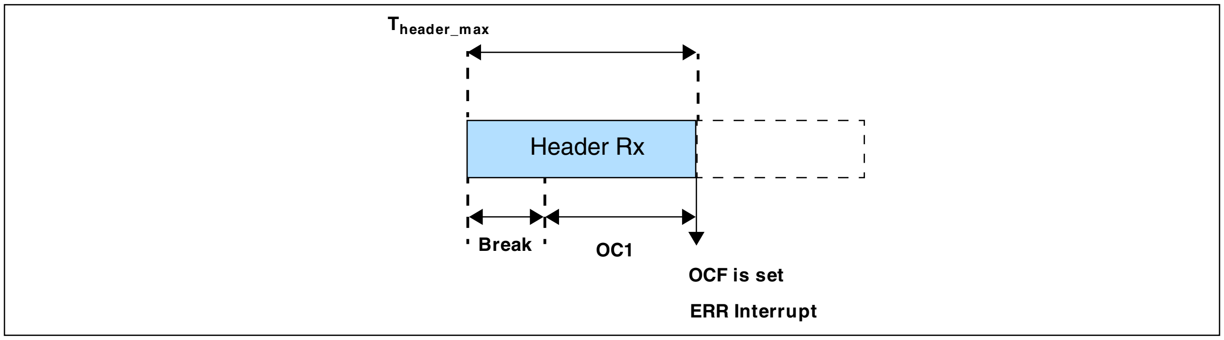

Figure 52-58. Header timeout

52.5.5 UART mode

The following figure shows UART mode configuration.

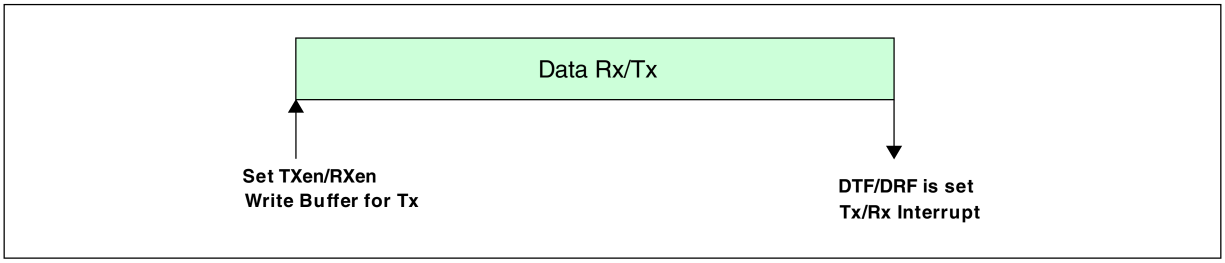

Figure 52-59. UART mode configuration

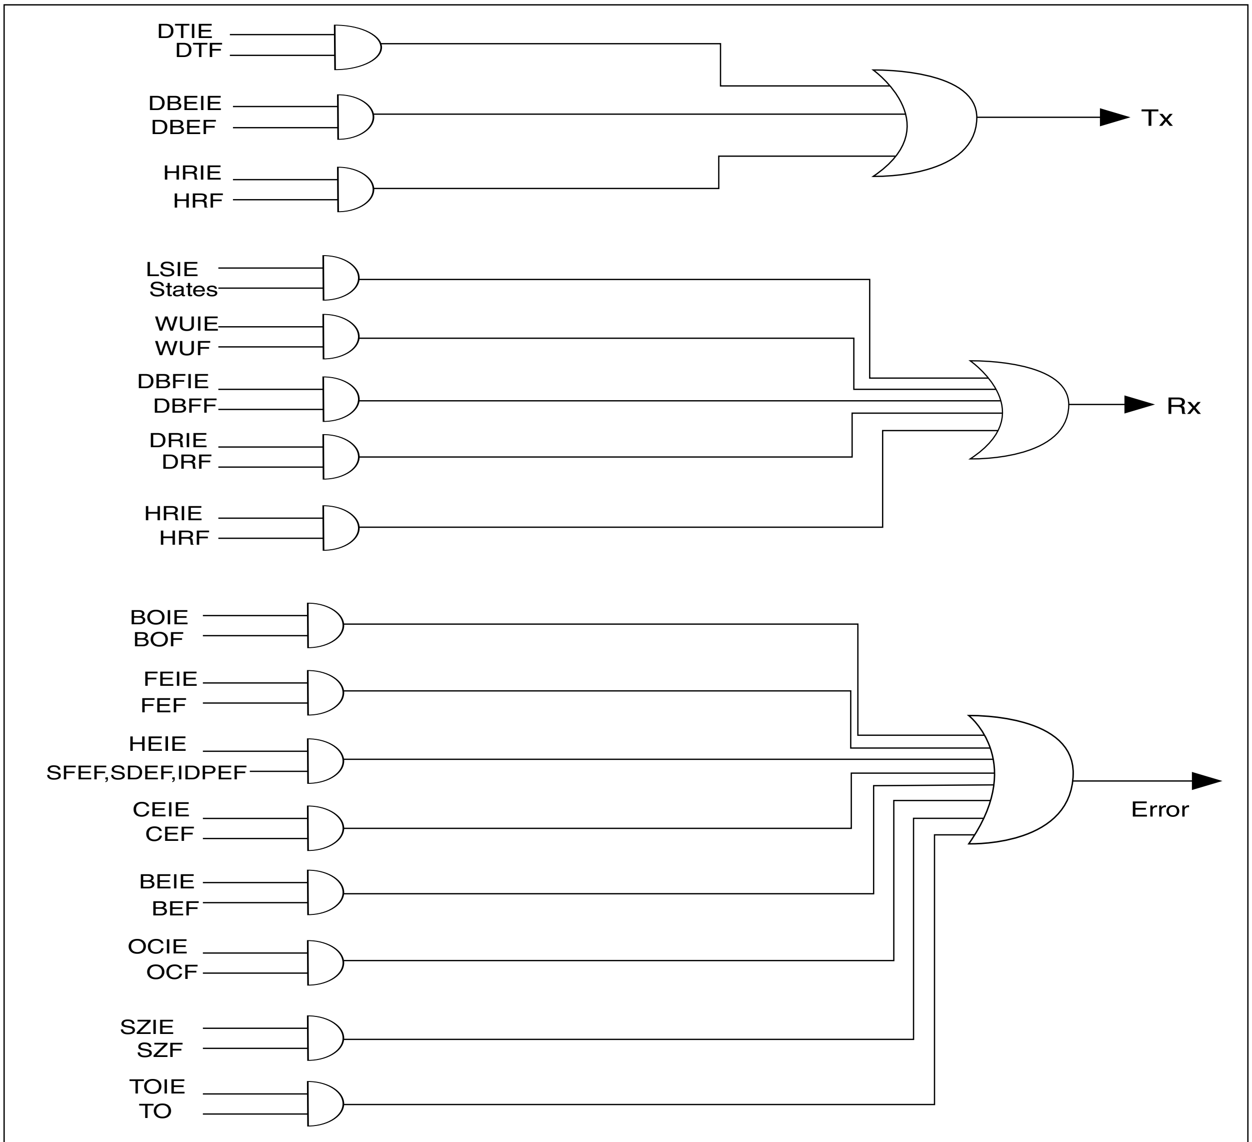
52.5.6 Interrupts

Interrupt section.

Table 52-19. Interrupts

Interrupt Event	Event flag	Enable control bit	Interrupt vector
Stuck at zero	SZF	SZIE	Error
Output compare	OCF	OCIE	Error
Bit error	BEF	BEIE	Error
Checksum error	CEF	CEIE	Error
Header error	SFEF orSDEF orIDPEF	HEIE	Error
Frame error	FEF	FEIE	Error
Buffer Overrun error	BOF	BOIE	Error
UART Timeout error	TO	TOIE	Error
Lin state	Sync Del, Sync Field,Identifier field or Checksum Field	LSIE	Rx
Wakeup	WUF	WUIE	Rx
Data buffer full	DBFF	DBFIE	Rx
Data buffer empty	DBEF	DBEIE	Tx
Data Reception Complete	DRF	DRIE	Rx
Data transmitted	DTF	DTIE	Tx
Header received	HRF	HRIE	Rx
Header received	HRF	HRIE	Tx (if there is a filter match for Tx identifier)

The following figure shows an Interrupt Flow Diagram.



Note: Rx interrupt due to LIN state event is cleared by writing LINSR[LINS] field with 0xF when LSIE is enabled

Figure 52-60. Interrupt diagram

52.5.7 LINFlexD Clock Tolerance

1. **Faster receiver tolerance:**
   In this case the receiver has a higher baud rate than the transmitter, thus the stop bit sampling starts already in the last transmitted payload bit. To ensure the correct noise and framing error free reception bit , the samples RS8, RS9, and RS10 must be located in the transmitted stop bit as shown in the following figure.

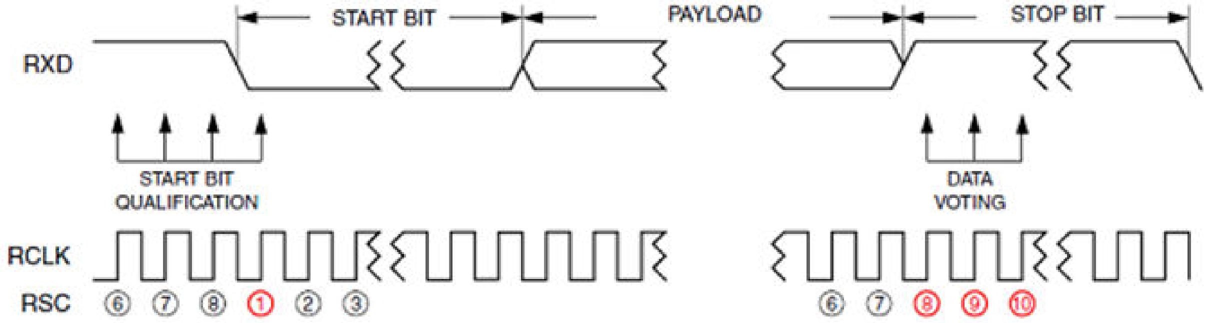


Figure 52-61. Faster receiver

2. **Slower receiver tolerance:**
   In this case the receiver has a slower baud rate than the transmitter, thus the stop bit sampling is still running while the next start bit is already transmitted. To ensure the correct noise and framing error free reception bit , the samples RS8, RS9, and RS10 must be located in the transmitted stop bit as shown in the following figure.

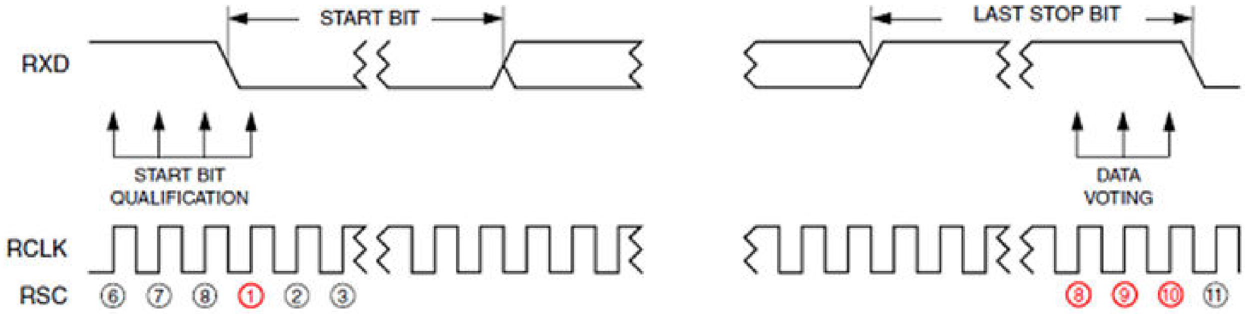

Figure 52-62. Slower receiver

Chapter 53
10/100-Mbps Ethernet MAC (ENET)

53.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The MAC-NET core, in conjunction with a 10/100-Mbit/s MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

53.2 Overview

The core implements a dual-speed 10/100-Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100-Mbit/s Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

53.2.1 Features

53.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100-Mbit/s operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
    - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
    - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
    - a 2-bit Reduced MII (RMII) operating at 50 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
    - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
    - Pause quanta used to form pause frames — dynamically programmable
    - Pause frame generation additionally controllable by user application offering flexible traffic flow control
    - Optional forwarding of received pause frames to the user application
    - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q

- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)
- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors

53.2.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers

- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodifed/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

53.2.1.3 IEEE 1588 features

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

53.3 External signal description

NOTE

The MII column pertains only to devices that support MII.

MII	RMII	Description	I/O
MII_COL	—	Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for full-duplex mode.	I
MII_CRS	—	Carrier sense. When asserted, indicates transmit or receive medium is not idle. In RMII mode, this signal is present on the RMII_CRS_DV pin.	I

Table continues on the next page...

MII	RMII	Description	I/O
MII_MDC	RMII_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	O
MII_MDIO	RMII_MDIO	Transfers control information between the external PHY and the media-access controller. Data is synchronous to MDC. This signal is an input after reset.	I/O
MII_RXCLK	—	In MII mode, provides a timing reference for RXDV, RXD[3:0], and RXER.	I
MII_RXDV	RMII_CRS_DV	Asserting this input indicates the PHY has valid nibbles present on the MII. RXDV must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RXDV must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal.	I
MII_RXD[3:0]	RMII_RXD[1:0]	Contains the Ethernet input data transferred from the PHY to the media-access controller when RXDV is asserted.	I
MII_RXER	RMII_RXER	When asserted with RXDV, indicates the PHY detects an error in the current frame.	I
MII_TXCLK	—	Input clock, which provides a timing reference for TXEN, TXD[3:0], and TXER.	I
MII_TXD[3:0]	RMII_TXD[1:0]	Serial output Ethernet data. Only valid during TXEN assertion.	O
MII_TXEN	RMII_TXEN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TXCLK following the final nibble of the frame.	O
MII_TXER	—	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	O

Table continues on the next page...

MII	RMII	Description	I/O
—	RMII_REF_CLK	In RMII mode, this signal is the reference clock for receive, transmit, and the control interface.	I
1588_TMR*n*	1588_TMR*n*	Capture/Compare block input/output event bus. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCR*n* register for inspection by software. When configured for compare, the corresponding signal 1588_TMR*n* is asserted for one cycle when the timer reaches the compare value programmed in ENET_TCCR*n*. An interrupt can be triggered if ENET_TCSR*n*[TIE] is set. A DMA request can be triggered if ENET_TCSR*n*[TDRE] is set.	I/O
ENET_1588_CLKIN	ENET_1588_CLKIN	Alternate IEEE 1588 Ethernet clock input; Clock period should be an integer number of nanoseconds	I

53.4 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

Table 53-1. Register map summary

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

ENET memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
4	Interrupt Event Register (ENET_EIR)	32	w1c	0000_0000h	53.4.1/2052

53.4.1 Interrupt Event Register (ENET_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

ENET_EIR field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
2 BABT	Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
3 GRA	Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. **NOTE:** The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
4 TXF	Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
5 TXB	Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated.
6 RXF	Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated.

Table continues on the next page...

ENET_EIR field descriptions (continued)

Field	Description
7 RXB	Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated.
8 MII	MII Interrupt. Indicates that the MII has completed the data transfer requested.
9 EBERR	Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
10 LC	Late Collision Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
11 RL	Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
12 UN	Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. A bad CRC is appended to the frame fragment and the remainder of the frame is discarded.
13 PLR	Payload Receive Error Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
14 WAKEUP	Node Wakeup Request Indication Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
15 TS_AVAIL	Transmit Timestamp Available Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
16 TS_TIMER	Timestamp Timer The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
17–18 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
19 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

23 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
24–31 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

53.4.2 Interrupt Mask Register (ENET_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Address: 0h base + 8h offset = 8h

ENET_EIMR field descriptions

Field	Description
0 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
1 BABR	BABR Interrupt Mask Corresponds to interrupt source EIR[BABR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
2 BABT	BABT Interrupt Mask Corresponds to interrupt source EIR[BABT] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABT field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
3 GRA	GRA Interrupt Mask Corresponds to interrupt source EIR[GRA] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The

Table continues on the next page...

ENET_EIMR field descriptions (continued)

Field	Description
	corresponding EIR GRA field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
4 TXF	TXF Interrupt Mask Corresponds to interrupt source EIR[TXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
5 TXB	TXB Interrupt Mask Corresponds to interrupt source EIR[TXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
6 RXF	RXF Interrupt Mask Corresponds to interrupt source EIR[RXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
7 RXB	RXB Interrupt Mask Corresponds to interrupt source EIR[RXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXB field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
8 MII	MII Interrupt Mask Corresponds to interrupt source EIR[MII] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
9 EBERR	EBERR Interrupt Mask Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
10 LC	LC Interrupt Mask Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

Table continues on the next page...

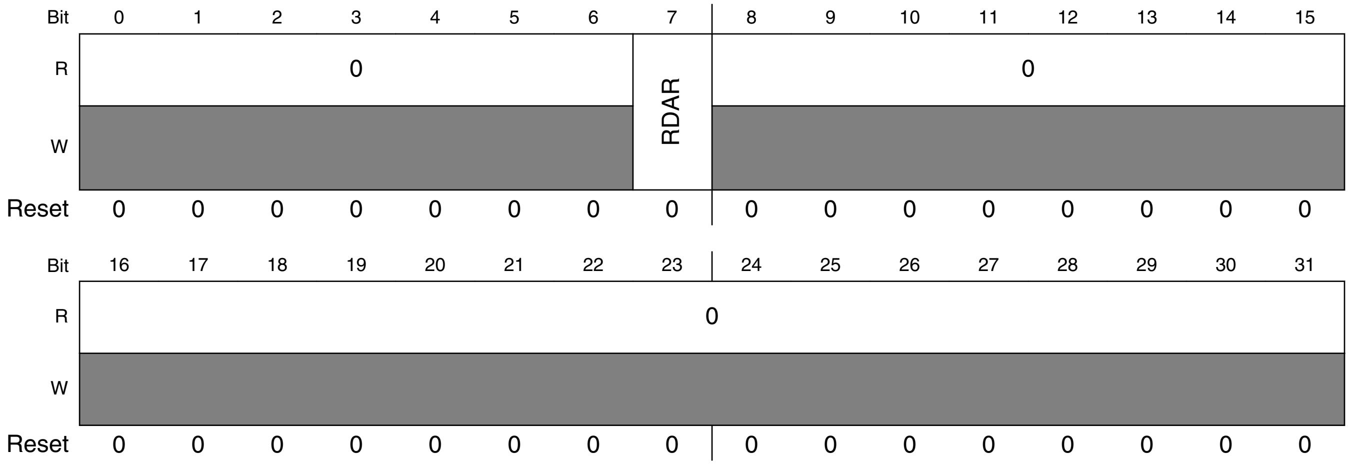
ENET_EIMR field descriptions (continued)

Field	Description
11 RL	RL Interrupt Mask Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
12 UN	UN Interrupt Mask Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
13 PLR	PLR Interrupt Mask Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
14 WAKEUP	WAKEUP Interrupt Mask Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
15 TS_AVAIL	TS_AVAIL Interrupt Mask Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
16 TS_TIMER	TS_TIMER Interrupt Mask Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
17–18 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
19 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
20–22 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
23 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
24–31 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

53.4.3 Receive Descriptor Active Register (ENET_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 0h base + 10h offset = 10h



ENET_RDAR field descriptions

Field	Description
0–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
8–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

53.4.4 Transmit Descriptor Active Register (ENET_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: 0h base + 14h offset = 14h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0							TDAR	0

R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TDAR field descriptions

Field	Description
0–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
8–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

53.4.5 Ethernet Control Register (ENET_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: 0h base + 24h offset = 24h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	Reserved															
W																
Reset	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	Reserved				0	0	0	DBSWP	STOPEN	DBGEN		EN1588	SLEEP	MAGICEN	ETHEREN	RESET
W											0					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_ECR field descriptions

Field	Description
0–19 Reserved	This field is reserved. This field must be set to F_0000h.
20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors. **NOTE:** This field resets to 0 and must not be changed. 0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.
24 STOPEN	STOPEN Signal Control Controls device behavior in doze mode. In doze mode, if this field is set then all the clocks of the ENET assembly are disabled, except the RMII /MII clock. Doze mode is similar to a conditional stop mode entry for the ENET assembly depending on ECR[STOPEN]. **NOTE:** If module clocks are gated in this mode, the module can still wake the system after receiving a magic packet in stop mode. MAGICEN must be set prior to entering sleep/stop mode.
25 DBGEN	Debug Enable Enables the MAC to enter hardware freeze mode when the device enters debug mode. 0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.
26 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
27 EN1588	EN1588 Enable Enables enhanced functionality of the MAC. 0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.
28 SLEEP	Sleep Mode Enable 0 Normal operating mode. 1 Sleep mode.
29 MAGICEN	Magic Packet Detection Enable Enables/disables magic packet detection. **NOTE:** MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection. 0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.

Table continues on the next page...

ENET_ECR field descriptions (continued)

Field	Description
30 ETHEREN	Ethernet Enable Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers. Hardware clears this field under the following conditions: • RESET is set by software • An error condition causes the EBERR field to set. **NOTE:** • ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only *after* all other ENET-related registers have been configured. • If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts. 0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.
31 RESET	Ethernet MAC Reset When this field is set, it clears the ETHEREN field.

53.4.6 MII Management Frame Register (ENET_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: 0h base + 40h offset = 40h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENET_MMFR field descriptions

Field	Description
0–1 ST	Start Of Frame Delimiter See Table 53-39 (Clause 22) or Table 53-41 (Clause 45) for correct value.

Table continues on the next page...

ENET_MMFR field descriptions (continued)

Field	Description
2–3 OP	Operation Code See Table 53-39 (Clause 22) or Table 53-41 (Clause 45) for correct value.
4–8 PA	PHY Address See Table 53-39 (Clause 22) or Table 53-41 (Clause 45) for correct value.
9–13 RA	Register Address See Table 53-39 (Clause 22) or Table 53-41 (Clause 45) for correct value.
14–15 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
16–31 DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

53.4.7 MII Speed Control Register (ENET_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

For example, if the internal module clock (i.e., IPS bus clock) is 25 MHz, programming MII_SPEED to 0x4 results in an MDC as given in the following equation:

MII clock frequency = 25 MHz / ((4 + 1) x 2) = 2.5 MHz

The following table shows the optimum values for MII_SPEED as a function of IPS bus clock frequency.

Table 53-2. Programming Examples for MSCR

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz

Table continues on the next page...

Table 53-2. Programming Examples for MSCR (continued)

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
66 MHz	0xD	2.36 MHz

Address: 0h base + 44h offset = 44h

ENET_MSCR field descriptions

Field	Description
0–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21–23 HOLDTIME	Hold time On MDIO Output IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased. 000 1 internal module clock cycle 001 2 internal module clock cycles 010 3 internal module clock cycles 111 8 internal module clock cycles
24 DIS_PRE	Disable Preamble Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it. 0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.
25–30 MII_SPEED	MII Speed Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of: 1/((MII_SPEED + 1) x 2) of the internal module clock frequency
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

53.4.8 MIB Control Register (ENET_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB_DIS field resets to 1.

Address: 0h base + 64h offset = 64h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

W					0				0	0						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

ENET_RCR field descriptions

Field	Description
0 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped.
1 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLC] field.
2–15 MAX_FL	Maximum Frame Length Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
16 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame. 0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
17 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. **NOTE:** If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed. 0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
18 PAUFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded. 0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
19 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames. 0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
20–21 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
22 RMII_10T	Enables 10-Mbit/s mode of the RMII . 0 100-Mbit/s operation. 1 10-Mbit/s operation.

Table continues on the next page...

ENET_RCR field descriptions (continued)

Field	Description
23 RMII_MODE	RMII Mode Enable Specifies whether the MAC is configured for MII mode or RMII operation . 0 MAC configured for MII mode. 1 MAC configured for RMII operation.
24 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
25 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
26 FCE	Flow Control Enable If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.
27 BC_REJ	Broadcast Frame Reject If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.
28 PROM	Promiscuous Mode All frames are accepted regardless of address matching. 0 Disabled. 1 Enabled.
29 MII_MODE	Media Independent Interface Mode This field must always be set. 0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.
30 DRT	Disable Receive On Transmit 0 Receive path operates independently of transmit. Used for full-duplex or to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. Normally used for half-duplex mode.
31 LOOP	Internal Loopback This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0. 0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.

53.4.10 Transmit Control Register (ENET_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: 0h base + C4h offset = C4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0					Reserved	CRCFWD	ADDINS	ADDSEL			RFC_PAUSE	TFC_PAUSE	FDEN		GTS
W															0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TCR field descriptions

Field	Description
0–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 Reserved	This field is reserved. This field is read/write and must be set to 0.
22 CRCFWD	Forward Frame From Application With CRC

Table continues on the next page...

ENET_TCR field descriptions (continued)

Field	Description
	0 TxBD[TC] controls whether the frame has a CRC from the application. 1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.
23 ADDINS	Set MAC Address On Transmit 0 The source MAC address is not modified by the MAC. 1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.
24–26 ADDSEL	Source MAC Address Select On Transmit If ADDINS is set, indicates the MAC address that overwrites the source MAC address. 000 Node MAC address programmed on PADDR1/2 registers. 100 Reserved. 101 Reserved. 110 Reserved.
27 RFC_PAUSE	Receive Frame Control Pause This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.
28 TFC_PAUSE	Transmit Frame Control Pause Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame. 0 No PAUSE frame transmitted. 1 The MAC stops transmission of data frames after the current transmission is complete.
29 FDEN	Full-Duplex Enable If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.
30 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
31 GTS	Graceful Transmit Stop When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.

53.4.11 Physical Address Lower Register (ENET_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: 0h base + E4h offset = E4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R W	PADDR1																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_PALR field descriptions

Field	Description
0–31 PADDR1	Pause Address Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

53.4.12 Physical Address Upper Register (ENET_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: 0h base + E8h offset = E8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENET_PAUR field descriptions

Field	Description
0–15 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
16–31 TYPE	Type Field In PAUSE Frames These fields have a constant value of 0x8808.

53.4.13 Opcode/Pause Duration Register (ENET_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: 0h base + ECh offset = ECh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENET_GALR field descriptions

Field	Description
0–31 GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

53.4.18 Transmit FIFO Watermark Register (ENET_TFWR)

If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR_FWD is set to ‘0’, the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR_FWD to ‘1’. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

Address: 0h base + 144h offset = 144h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

ENET_TFWR field descriptions

Field	Description
0–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 STRFWD	Store And Forward Enable 0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
24–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26–31 TFWR	Transmit FIFO Write If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins. **NOTE:** If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given. 000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. ... ... 011111 1984 bytes written.

53.4.19 Receive Descriptor Ring Start Register (ENET_RDSR)

RDSR points to the beginning of the circular receive buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 29–31 must be zero); however, it is recommended to be 128-bit aligned, that is, evenly divisible by 16.

NOTE

This register must be initialized prior to operation

Address: 0h base + 180h offset = 180h

30–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

53.4.21 Maximum Receive Buffer Size Register (ENET_MRBR)

The MRBR is a user-programmable register that dictates the maximum size of all receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- R_BUF_SIZE is concatentated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To allow one maximum size frame per buffer, MRBR must be set to RCR[MAX_FL] or larger.
- To properly align the buffer, MRBR must be evenly divisible by 16. To ensure this, the lower four bits are set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR greater than or equal to 256 bytes.

NOTE

This register must be initialized before operation.

Address: 0h base + 188h offset = 188h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENET_RSEM field descriptions

Field	Description
0–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11–15 STAT_ SECTION_ EMPTY	RX Status FIFO Section Empty Threshold Defines number of frames in the receive FIFO, independent of its size, that can be accepted. If the limit is reached, reception will continue normally, however a pause frame will be triggered to indicate a possible congestion to the remote device to avoid FIFO overflow. A value of 0 disables automatic pause frame generation
16–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–31 RX_SECTION_ EMPTY	Value Of The Receive FIFO Section Empty Threshold Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued.

Table continues on the next page...

ENET_RSEM field descriptions (continued)

Field	Description
	A value of 0 disables automatic pause frame generation. When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client. **NOTE:** The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.

53.4.24 Receive FIFO Almost Empty Threshold (ENET_RAEM)

Address: 0h base + 198h offset = 198h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENET_RAEM field descriptions

Field	Description
0–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–31 RX_ALMOST_EMPTY	Value Of The Receive FIFO Almost Empty Threshold Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.

53.4.25 Receive FIFO Almost Full Threshold (ENET_RAFL)

Address: 0h base + 19Ch offset = 19Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENET_TAEM field descriptions

Field	Description
0–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–31 TX_ALMOST_ EMPTY	Value of Transmit FIFO Almost Empty Threshold Value, in 64-bit words, of the transmit FIFO almost empty threshold.

Table continues on the next page...

ENET_TAEM field descriptions (continued)

Field	Description
	When the FIFO level reaches the value programmed in this field, and no end-of-frame is available for the frame, the MAC transmit logic, to avoid FIFO underflow, stops reading the FIFO and transmits a frame with an MII error indication. See Transmit FIFO for more information. A minimum value of 4 should be set.

53.4.28 Transmit FIFO Almost Full Threshold (ENET_TAFL)

Address: 0h base + 1A8h offset = 1A8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0																								TX_ALMOST_FULL							
W

ENET_TAFL field descriptions

Field	Description
0–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–31 TX_ALMOST_FULL	Value Of The Transmit FIFO Almost Full Threshold Value, in 64-bit words, of the transmit FIFO almost full threshold. A minimum value of six is required . A recommended value of at least 8 should be set allowing a latency of two clock cycles to the application. If more latency is required the value can be increased as necessary (latency = TAFL - 5). When the FIFO level comes close to the maximum, so that there is no more space for at least TX_ALMOST_FULL number of words, the pin ff_tx_rdy is deasserted. If the application does not react on this signal, the FIFO write control logic, to avoid FIFO overflow, truncates the current frame and sets the error status. As a result, the frame will be transmitted with an GMII/MII error indication. See Transmit FIFO for more information. **NOTE:** A FIFO overflow is a fatal error and requires a global reset on the transmit datapath or at least deassertion of ETHEREN.

53.4.29 Transmit Inter-Packet Gap (ENET_TIPG)

Address: 0h base + 1ACh offset = 1ACh

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENET_FTRL field descriptions

Field	Description
0–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18–31 TRUNC_FL	Frame Truncation Length Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL]. **NOTE:** Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

53.4.31 Transmit Accelerator Function Configuration (ENET_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Address: 0h base + 1C0h offset = 1C0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

ENET_TACC field descriptions

Field	Description
0–26 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
27 PROCHK	Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
28 IPCHK	Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.
29–30 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
31 SHIFT16	TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

53.4.32 Receive Accelerator Function Configuration (ENET_RACC)

Address: 0h base + 1C4h offset = 1C4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

W	0										0					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_RACC field descriptions

Field	Description
0–23 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
24 SHIFT16	RX FIFO Shift-16 When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary. **NOTE:** This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received. 0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
25 LINEDIS	Enable Discard Of Frames With MAC Layer Errors 0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.
26–28 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
29 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum 0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
30 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum 0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
31 PADREM	Enable Padding Removal For Short IP Frames 0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.

53.4.33 Reserved Statistic Register (ENET_RMON_T_DROP)

W								0		0	1				0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_ATCR field descriptions

Field	Description
0–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18 SLAVE	Enable Timer Slave Mode 0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20 CAPTURE	Capture Timer Value When this field is set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. **NOTE:** To ensure that the correct time value is read from the ATVR register, a minimum amount of time must elapse from issuing this command to reading the ATVR register. This minimum time is defined by the greater of either six register clock cycles or six 1588/timestamp clock cycles. 0 No effect. 1 The current time is captured and can be read from the ATVR register.
21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 RESTART	Reset Timer Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. **NOTE:** The Reset Timer command requires at least 6 clock cycles of either the register clock or the 1588/timestamp clock, whichever is greater, to complete.
23 Reserved	This field is reserved.
24 PINPER	Enables event signal output assertion on period event. **NOTE:** Not all devices contain the event signal output. See the chip configuration details. 0 Disable. 1 Enable.
25 Reserved	This field is reserved.
26 Reserved	This field is reserved. **NOTE:** This field must be written always with one.
27 PEREN	Enable Periodical Event 0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit. **NOTE:** Not all devices contain the event signal output. See the chip configuration details.

Table continues on the next page...

ENET_ATCR field descriptions (continued)

Field	Description
28 OFFRST	Reset Timer On Offset Event 0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
29 OFFEN	Enable One-Shot Offset Event 0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
30 Reserved	This field is reserved.
31 EN	Enable Timer 0 The timer stops at the current value. 1 The timer starts incrementing.

53.4.88 Timer Value Register (ENET_ATVR)

Address: 0h base + 404h offset = 404h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

Reset	0	0	1	1	1	0	1	1	1	0	0	1	1	0	1	0	1	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0

ENET_ATPER field descriptions

Field	Description
0–31 PERIOD	Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10^9) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter. **NOTE:** The value of PERIOD has the following constraint: 2^{32} – ENET_ATINC[INC_COR] – 3×ENET_ATINC[INC] ≥ PERIOD > 0.

53.4.91 Timer Correction Register (ENET_ATCOR)

Address: 0h base + 410h offset = 410h

ENET_ATCOR field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1–31 COR	Correction Counter Wrap-Around Value

Table continues on the next page...

ENET_ATCOR field descriptions (continued)

Field	Description
	Defines after how many timer clock cycles (ts_clk) the correction counter should be reset and trigger a correction increment on the timer. The amount of correction is defined in ATINC[INC_CORR]. A value of 0 disables the correction counter and no corrections occur. **NOTE:** This value is given in clock cycles, not in nanoseconds as all other values.

53.4.92 Time-Stamping Clock Period Register (ENET_ATINC)

Address: 0h base + 414h offset = 414h

ENET_TCSR*n* field descriptions

Field	Description
0–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TF	Timer Flag Sets when input capture or output compare occurs. This flag is double buffered between the module clock and 1588 clock domains. When this field is 1, it can be cleared to 0 by writing 1 to it. 0 Input Capture or Output Compare has not occurred. 1 Input Capture or Output Compare has occurred.
25 TIE	Timer Interrupt Enable 0 Interrupt is disabled 1 Interrupt is enabled
26–29 TMODE	Timer Mode Updating the Timer Mode field takes a few cycles to register because it is synchronized to the 1588 clock. The version of Timer Mode returned on a read is from the 1588 clock domain. When changing Timer Mode, always disable the channel and read this register to verify the channel is disabled first. 0000 Timer Channel is disabled. 0001 Timer Channel is configured for Input Capture on rising edge. 0010 Timer Channel is configured for Input Capture on falling edge. 0011 Timer Channel is configured for Input Capture on both edges. 0100 Timer Channel is configured for Output Compare - software only. 0101 Timer Channel is configured for Output Compare - toggle output on compare. 0110 Timer Channel is configured for Output Compare - clear output on compare. 0111 Timer Channel is configured for Output Compare - set output on compare. 1000 Reserved 1010 Timer Channel is configured for Output Compare - clear output on compare, set output on overflow. 10X1 Timer Channel is configured for Output Compare - set output on compare, clear output on overflow. 110X Reserved

Table continues on the next page...

ENET_TCSR*n* field descriptions (continued)

Field	Description
	1110 Timer Channel is configured for Output Compare - pulse output low on compare for one 1588-clock cycle. 1111 Timer Channel is configured for Output Compare - pulse output high on compare for one 1588-clock cycle.
30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 TDRE	Timer DMA Request Enable 0 DMA request is disabled 1 DMA request is enabled

53.4.96 Timer Compare Capture Register (ENET_TCCR*n*)

Address: 0h base + 60Ch offset + (8d × i), where i=0d to 3d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TCCR*n* field descriptions

Field	Description
0–31 TCC	Timer Capture Compare This register is double buffered between the module clock and 1588 clock domains. When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag. The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow. When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.

53.5 Functional description

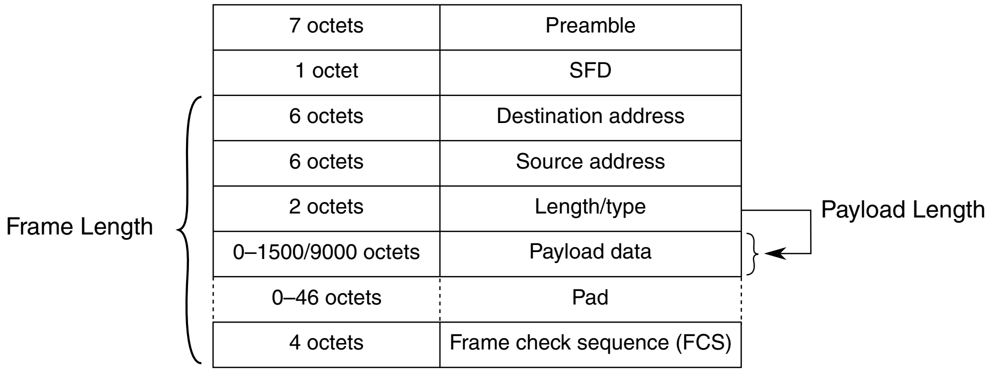
This section provides a complete functional description of the MAC-NET core.

53.5.1 Ethernet MAC frame formats

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

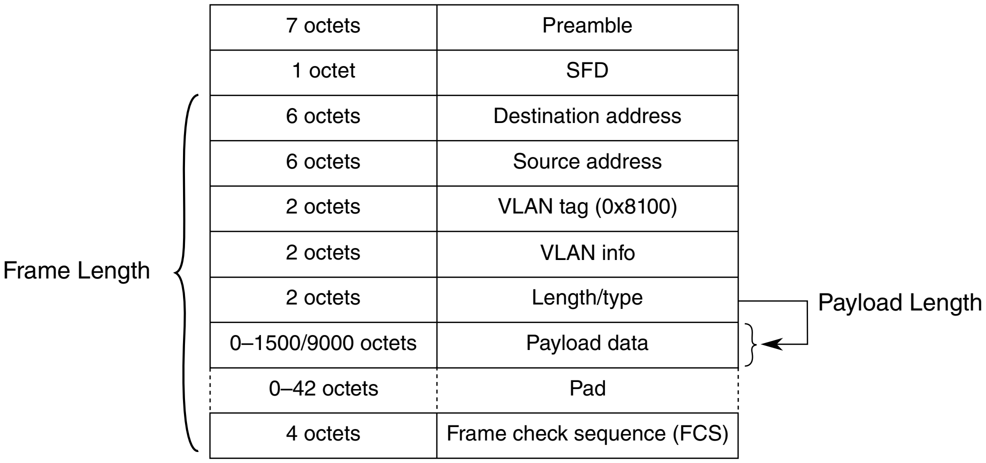
- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)



7 octets	Preamble
1 octet	SFD
6 octets	Destination address
6 octets	Source address
2 octets	Length/type
0–1500/9000 octets	Payload data
0–46 octets	Pad
4 octets	Frame check sequence (FCS)

Figure 53-2. MAC frame format overview

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.



7 octets	Preamble
1 octet	SFD
6 octets	Destination address
6 octets	Source address
2 octets	VLAN tag (0x8100)
2 octets	VLAN info
2 octets	Length/type
0–1500/9000 octets	Payload data
0–42 octets	Pad
4 octets	Frame check sequence (FCS)

Figure 53-3. VLAN-tagged MAC frame format overview

Table 53-3. MAC frame definition

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. • If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame. • If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in MAC address check.

Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

53.5.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

Table 53-4. Pause Frame Format (Values in Hex)

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
Preamble							SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27 –68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
Source Address						Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
CRC-32													

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see Full-duplex flow control operation for details).

53.5.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions.

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

53.5.2 IP and higher layers frame format

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

53.5.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

Table 53-5. Ethernet type value examples

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

53.5.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

Table 53-6. IPv4 header format

<table>
<tr><td colspan="4">31 30 29 28</td><td colspan="4">27 26 25 24</td><td colspan="4">23 22 21 20</td><td colspan="4">19 18 17 16</td><td colspan="4">15 14 13 12</td><td colspan="4">11 10 9 8</td><td colspan="4">7 6 5 4</td><td colspan="4">3 2 1 0</td></tr>
<tr><td colspan="4">Version</td><td colspan="4">IHL</td><td colspan="8">TOS</td><td colspan="16">Length</td></tr>
<tr><td colspan="16">Fragment ID</td><td colspan="3">Flags</td><td colspan="13">Fragment offset</td></tr>
<tr><td colspan="8">TTL</td><td colspan="8">Protocol</td><td colspan="16">Header checksum</td></tr>
<tr><td colspan="32">Source address</td></tr>
<tr><td colspan="32">Destination address</td></tr>
<tr><td colspan="32">Options</td></tr>
</table>

Table 53-7. IPv4 header fields

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

53.5.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly.The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/ traffic class fields).

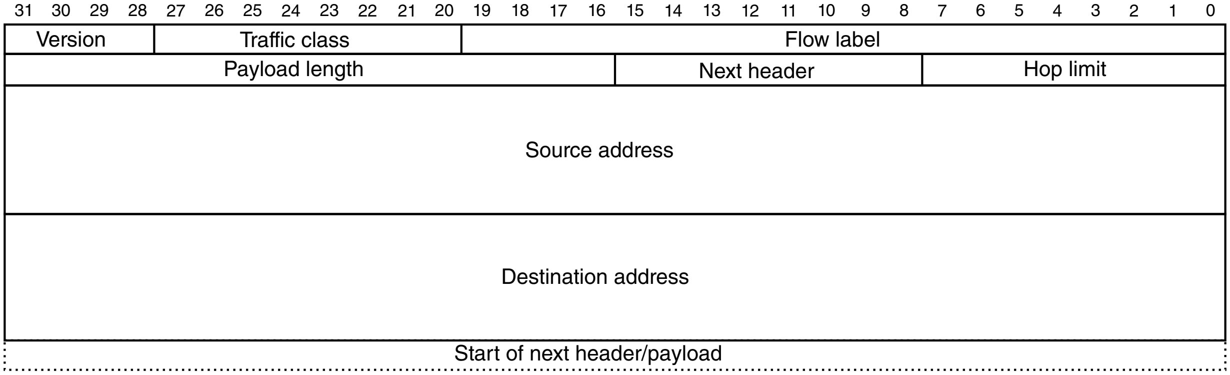


Figure 53-4. IPv6 header format

Table 53-8. IPv6 header fields

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

53.5.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

Table 53-9. ICMP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Type		Code		Checksum			
ICMP message data							

Table 53-10. IP header fields

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

53.5.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

Table 53-11. UDP header format

<table>
<tr><td colspan="4">31 30 29 28</td><td colspan="4">27 26 25 24</td><td colspan="4">23 22 21 20</td><td colspan="4">19 18 17 16</td><td colspan="4">15 14 13 12</td><td colspan="4">11 10 9 8</td><td colspan="4">7 6 5 4</td><td colspan="4">3 2 1 0</td></tr>
<tr><td colspan="16">Source port</td><td colspan="16">Destination port</td></tr>
<tr><td colspan="16">Length</td><td colspan="16">Checksum</td></tr>
</table>

Table 53-12. UDP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

53.5.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

Table 53-13. TCP header format

<table>
<tr><td colspan="4">31 30 29 28</td><td colspan="4">27 26 25 24</td><td colspan="4">23 22 21 20</td><td colspan="4">19 18 17 16</td><td colspan="4">15 14 13 12</td><td colspan="4">11 10 9 8</td><td colspan="4">7 6 5 4</td><td colspan="4">3 2 1 0</td></tr>

<tr><td colspan="32">Acknowledgement number</td></tr>
<tr><td colspan="4">Offset</td><td colspan="6">Reserved</td><td colspan="6">Flags</td><td colspan="16">Window</td></tr>
<tr><td colspan="16">Checksum</td><td colspan="16">Urgent pointer</td></tr>
<tr><td colspan="32">Options</td></tr>
</table>

Table 53-14. TCP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5

Table continues on the next page...

Table 53-14. TCP header fields (continued)

Field name	Description
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

53.5.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

53.5.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

53.5.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

Table 53-15 shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

Table 53-15. UDP/IP multicast domains

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

Table 53-16. UDP port numbers

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

53.5.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

Table 53-17. PTPv2 multicast domains

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

53.5.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

53.5.3.2.1 PTPv1 header

Table 53-18. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							

Table continues on the next page...

Table 53-18. Common PTPv1 message header (continued)

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in Table 53-19 :

Table 53-19. PTPv1 message type identification

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

53.5.3.2.2 PTPv2 header

Table 53-20. Common PTPv2 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	1	transportSpecific				messageId			
1	1	reserved				versionPTP = 0x2			
2	2	messageLength							
4	1	domainNumber							
5	1	reserved							
6	2	flags							
8	8	correctionField							
16	4	reserved							
20	10	sourcePortIdentity							
30	2	sequenceId							
32	1	control							
33	1	logMeanMessageInterval							

The type of message is encoded in the field messageId as follows:

Table 53-21. PTPv2 message type identification

messageId	Message name	Message
0x0	SYNC	Event message
0x1	DELAY_REQ	Event message
0x2	PATH_DELAY_REQ	Event message
0x3	PATH_DELAY_RESP	Event message
0x4–0x7	—	Reserved
0x8	FOLLOW_UP	General message
0x9	DELAY_RESP	General message
0xa	PATH_DELAY_FOLLOW_UP	General message
0xb	ANNOUNCE	General message
0xc	SIGNALING	General message
0xd	MANAGEMENT	General message

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the TWO_STEP bit in the first octet of the flags field as shown below. Reserved bits are cleared.

Table 53-22. PTPv2 message flags field definitions

Bit	Name	Description
0	ALTERNATE_MASTER	See IEEE 1588 Clause 17.4
1	TWO_STEP	1 Two-step clock 0 One-step clock
2	UNICAST	1 Transport layer address uses a unicast destination address 0 Multicast is used
3	—	Reserved
4	—	Reserved
5	Profile specific	
6	Profile specific	
7	—	Reserved

53.5.4 MAC receive

- Check frame framing
- Remove frame preamble and frame SFD field

- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

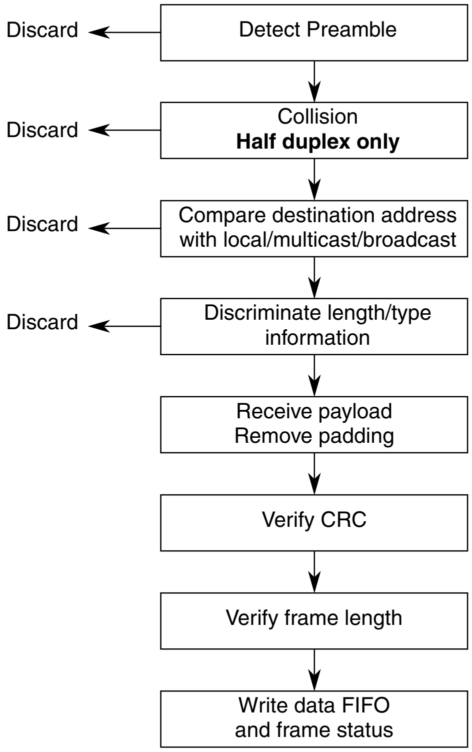

Figure 53-5. MAC receive flow

53.5.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

53.5.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100-Mbit/s operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

53.5.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

53.5.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled (RCR[PROM] = 1) no address checking is performed and all unicast frames are accepted.

53.5.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in ENET*n*_GAUR/GALR (group address hash match) or ENET*n*_IAUR/IALR (individual address hash match).

- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET*n*_GAUR (msb = 1) or ENET*n*_GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32}+ x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^{8}+ x^{7}+ x^{5}+ x^{4}+ x^{2}+ x^{1}+ 1$

If Promiscuous mode is enabled (ENET*n*_RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET*n*_GAUR/GALR and ENET*n*_IAUR/IALR settings.

53.5.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC_REJ is cleared or ENET*n*_RCR[PROM] is set. If PROM is cleared when ENET*n*_RCR[BC_REJ] is set, all broadcast frames are rejected.

Table 53-23. Broadcast address reject programming

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

53.5.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC_REJ is set
- A unicast is received that does not match either:
  - Node address (PALR[PADDR1] and PAUR[PADDR2])
  - Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

53.5.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

53.5.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET*n*_FTRL[TRUNC_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

53.5.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[NO]) indicates that the current frame is VLAN tagged.

53.5.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET*n*_RCR[FCE] is cleared and are forwarded to the client interface when ENET*n*_RCR[PAUFWD] is set.

53.5.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET*n*_RCR[CRCFWD] is cleared and ENET*n*_RCR[PADEN] is set.

When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32}+ x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^{8}+ x^{7}+ x^{5}+ x^{4}+ x^{2}+ x^{1}+ 1$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the x^{31} term as right-most bit of the first octet. The CRC bits are thus received in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

53.5.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of ENET*n*_RCR[PADEN].

Note

> If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

53.5.5 MAC transmit

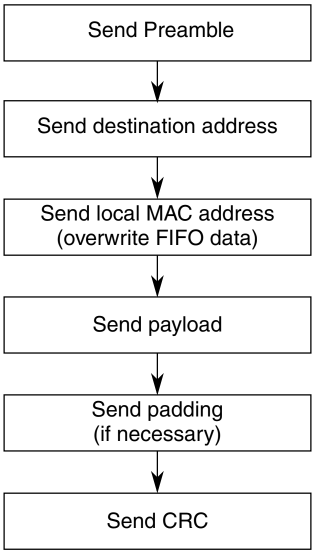
Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if ENET*n*_TCR[TFC_PAUSE] is set with ENET*n*_OPD[PAUSE_DUR] set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if TFC_PAUSE is set with PAUSE_DUR cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires



Send Preamble
Send destination address
Send local MAC address (overwrite FIFO data)
Send payload
Send padding (if necessary)
Send CRC

Figure 53-6. Frame transmit overview

53.5.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC (TxBD[TC] = 1), the user application is responsible for providing frames with a minimum length of 64 octets.

53.5.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields (ENET*n*_TCR[ADDINS] = 1)
- Transparently forwarded to the Ethernet line (ENET*n*_TCR[ADDINS] = 0)

53.5.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32}+ x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^{8}+ x^{7}+ x^{5}+ x^{4}+ x^{2}+ x^{1}+ 1$

The 32 bits of the CRC value are placed in the FCS field so that the x^{31} term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

53.5.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in ENET*n*_TIPG) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS de-assertion.

53.5.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

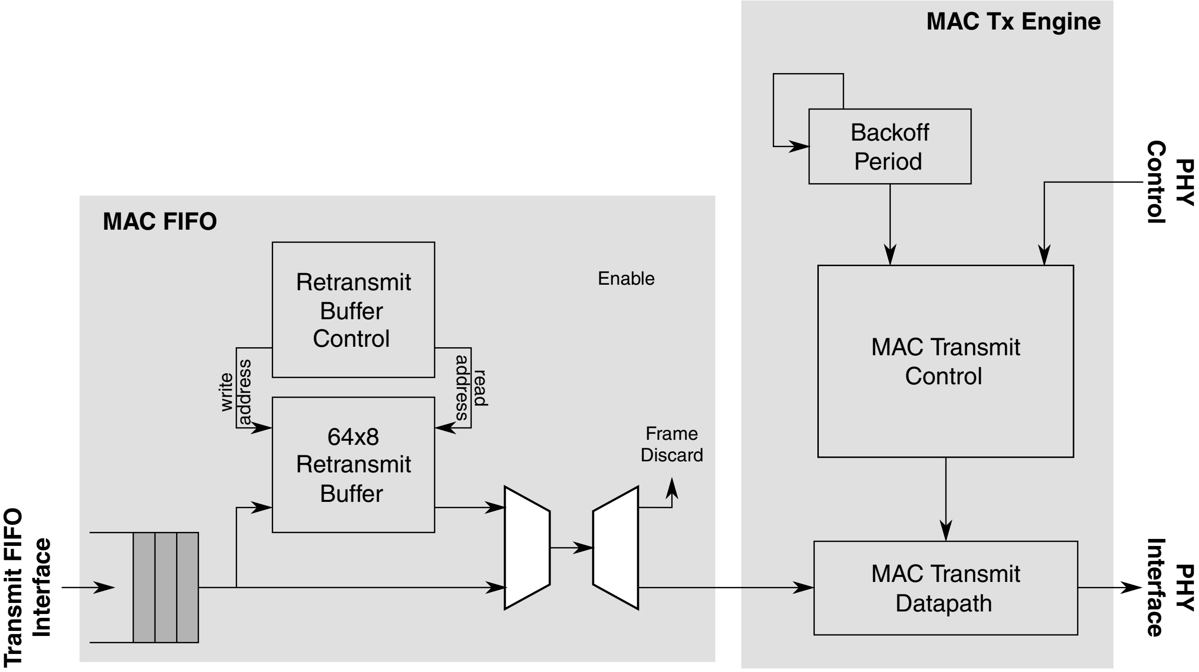


Figure 53-7. Packet re-transmit overview

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the *n*th re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- k = min(*n*, N); where *n* is the number of retransmissions and N = 10

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by N = 10 as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET*n*_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

warning

> Ethernet PHYs that support the SQE Test, or "heartbeat," feature must disable this feature. When this feature is enabled, the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

53.5.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

53.5.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if ENET*n*_RCR[FCE] is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets ENET*n*_TCR[RFC_PAUSE].

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets RFC_PAUSE to zero.

If ENET*n*_RCR[FCE] cleared, the MAC ignores received pause frames.

Optionally and independent of ENET*n*_RCR[FCE], pause frames are forwarded to the client interface if PAUFWD is set.

53.5.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET*n*_TCR[TFC_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET*n*_OPD[PAUSE_DUR].

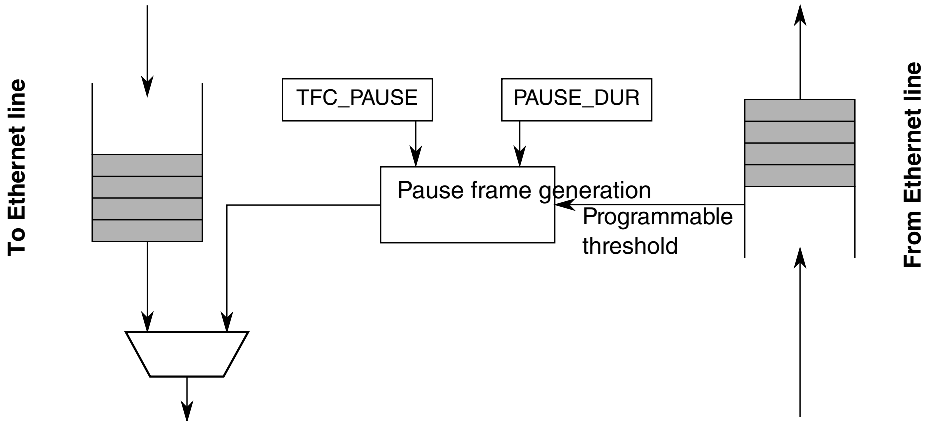

Figure 53-8. Pause frame generation overview

Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

53.5.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

53.5.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET*n*_ECR[SLEEP]. At the same time ENET*n*_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, when the processor is in Stop mode, Sleep mode is entered, without affecting the ENET*n*_ECR register bits.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

53.5.7.2 Magic packet detection

The core is designed to detect magic packets with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

53.5.7.3 Wakeup

When a magic packet is detected, indicated by ENET*n*_EIR[WAKEUP], ENET*n*_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET*n*_ECR[MAGICEN], disabling magic packet detection.

53.5.8 IP accelerator functions

53.5.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

Table 53-24. IPv4 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
Zero		Protocol		TCP/UDP length			

Table 53-25. IPv6 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
TCP/UDP length							
Zero						Next header	

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/ received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

53.5.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

53.5.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET*n*_TACC and ENET*n*_RACC registers.

When enabled, the valid frame data is arranged as shown in Table 53-26.

Table 53-26. 64-bit interface data structure with SHIFT16 enabled

63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

53.5.8.3.1 Receive processing

When ENET*n*_RACC[SHIFT16] is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

Note

> SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

53.5.8.3.2 Transmit processing

When ENET*n*_TACC[SHIFT16] is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

53.5.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (ENET*n*_RSFL cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than MAX_FL
  - Frame received with a CRC-32 error
  - Frame truncated due to receive FIFO overflow
  - Frame is corrupted as PHY signaled an error (RX_ERR asserted during reception)
- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET*n*_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

53.5.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBD[FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBD[Payload checksum].

Note

> After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.
>
> For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

53.5.8.6 IPv6 support

The following sections describe the IPv6 support.

53.5.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing.

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

53.5.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

53.5.9 Resets and stop controls

53.5.9.1 Hardware reset

To reset the Ethernet module, set ENET*n*_ECR[RESET].

53.5.9.2 Soft reset

When ENET*n*_ECR[ETHER_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting TXER to the PHY.

- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

53.5.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

53.5.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

53.5.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET*n*_TCR[GTS] is set by software.
- ENET*n*_TCR[TFC_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see Sleep mode).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

53.5.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see Magic packet detection). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set

- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
    - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
    - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

Note

> The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

53.5.9.4.3 Graceful stop interrupt (GRA)

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

53.5.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set ENET*n*_ECR[EN1588] to enable 1588 support.

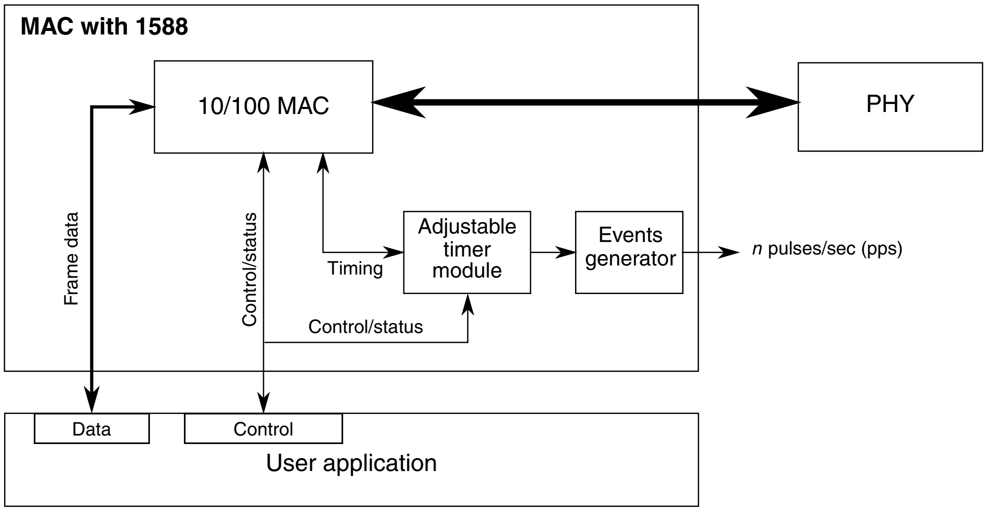

Figure 53-9. IEEE 1588 functions overview

53.5.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to (1 × 10^9)-1. The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

53.5.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

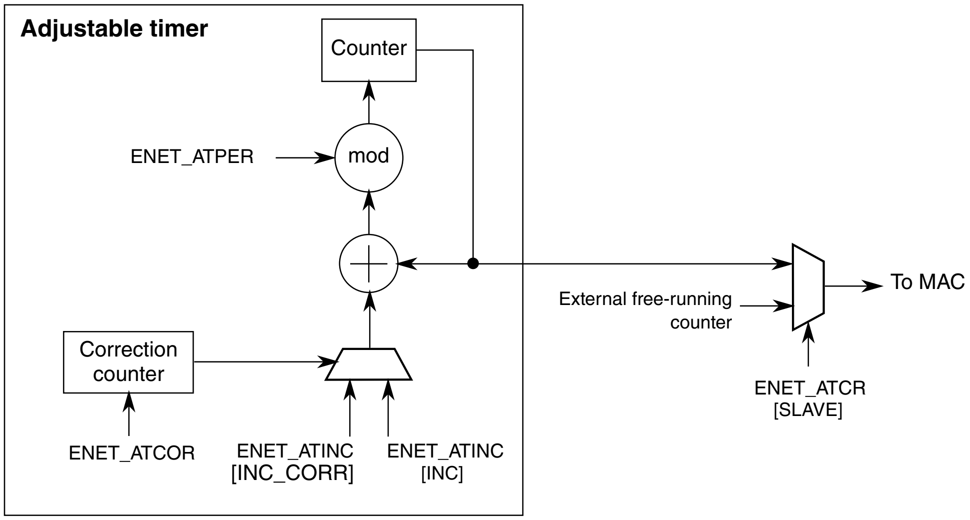

Figure 53-10. Adjustable timer implementation detail

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in ENET*n*_ATINC. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in ENET*n*_ATPER, defines the modulo when the counter wraps. In a typical implementation, the period is set to 1×10^9 so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value (Current + Inc –(1×10^9)), assuming the period is set to 1×10^9.

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in ENET*n*_ATCOR, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in ENET*n*_ATINC. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode (ENET*n*_ATCR[SLAVE] = 1), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules within the system must operate from a single timer. When slave mode is enabled, you still must set ENET*n*_ATINC[INC] to the value of the master, since it is used for internal comparisons.

53.5.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET*n*_ATSTMP. ENET*n*_EIR[TS_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET*n*_EIR[TS_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET*n*_ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

53.5.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBD[1588 timestamp]. This is done for all received frames.

53.5.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to $(1 \times 10^9)–1$. In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at 1×10^9.

53.5.10.5 Input Capture and Output Compare

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

53.5.10.5.1 Input capture

The TCCR*n* capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the 1588_TMR*n* signals. An event will cause the corresponding TCSR*n*[TF] timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the TCSR*n*[TIE] field, an interrupt can be generated.

53.5.10.5.2 Output compare

The TCCR*n* compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the TCCR*n* register, the corresponding flag, TCSR*n*[TF], is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by TCSR*n*[TIE], will be generated.The corresponding 1588_TMR*n* output signal will be asserted according to TCSR*n*[TMODE].

53.5.10.5.3 DMA requests

A DMA request can be enabled by setting TCSR*n*[TDRE]. The corresponding DMA request is generated when the TCSR*n*[TF] timer flag is set. When the DMA has completed, the corresponding TCSRn[TF] flag is cleared.

53.5.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 256 words.

53.5.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation.

Table 53-27. Receive FIFO thresholds definition

Register	Description
ENET*n*_RSFL [RX_SECTION_FULL]	When the FIFO level reaches the ENET*n*_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENET*n*_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again. If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted. To enable store and forward on the receive path, clear ENET*n*_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO. When programming a non-zero value to ENET*n*_RSFL (cut-through operation) it should be greater than ENET*n*_RAEM.
ENET*n*_RAEM [RX_ALMOST_EMPTY]	When the FIFO level reaches the ENET*n*_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. Set ENET*n*_RAEM to a minimum of six.
ENET*n*_RAFL [RX_ALMOST_FULL]	When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow. The corresponding error status is set when the frame is delivered to the application. Set ENET*n*_RAFL to a minimum of 4.
ENET*n*_RSEM [RX_SECTION_EMPTY]	When the FIFO level reaches the ENET*n*_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client. When the FIFO level goes below the value programmed in ENET*n*_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client. Clearing ENET*n*_RSEM disables any pause frame generation.

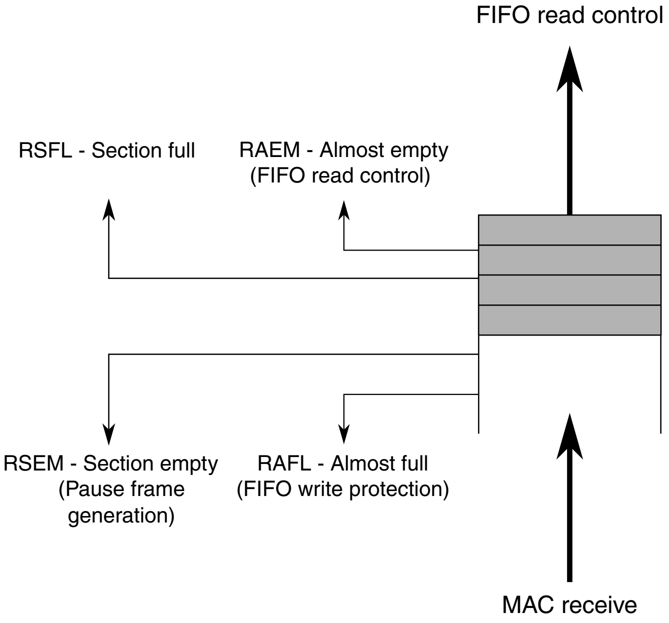

Figure 53-11. Receive FIFO overview

53.5.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation.

Table 53-28. Transmit FIFO thresholds definition

Register	Description
ENET*n*_TAEM [TX_ALMOST _EMPTY]	When the FIFO level reaches the ENET*n*_TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENET*n*_TAEM to a minimum of 4.
ENET*n*_TAFL [TX_ALMOST _FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET*n*_TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an MII error indication. Set ENET*n*_TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET*n*_TSEM [TX_SECTION _EMPTY]	When the FIFO level reaches the ENET*n*_TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENET*n*_TSEM is 0, the signal is never deasserted.
ENET*n*_TFWR	When the FIFO level reaches the ENET*n*_TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

Table 53-28. Transmit FIFO thresholds definition

Register	Description
	If a complete frame has a size smaller than the ENET*n*_TFWR threshold, the MAC also transmits the frame to the line. To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.

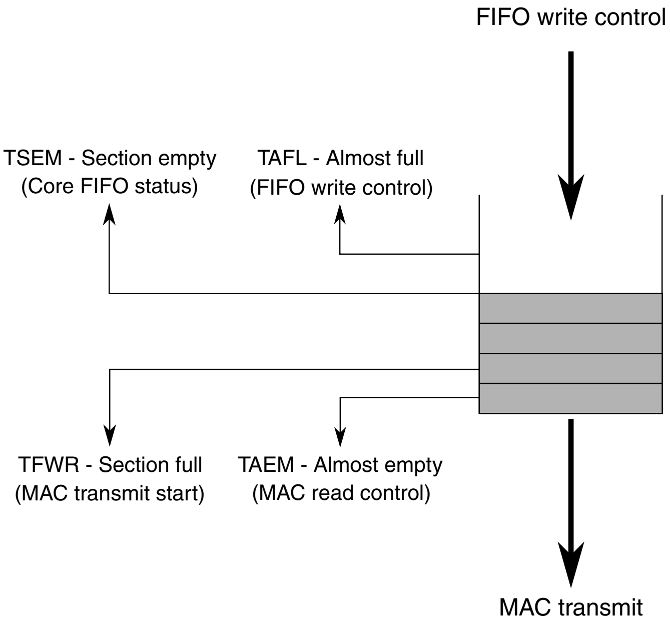

Figure 53-12. Transmit FIFO overview

53.5.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET*n*_RCR register fields found here.

Table 53-29. Loopback options

Register field	Description
LOOP	Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces. In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s))

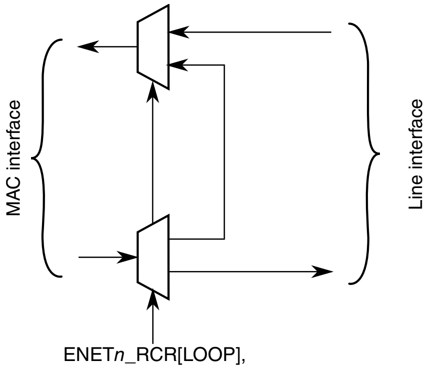

Figure 53-13. Loopback options

53.5.13 Legacy buffer descriptors

To support the Ethernet controller on previous Freescale devices, legacy FEC buffer descriptors are available. To enable legacy support, clear ENET*n*_ECR[1588EN].

NOTE

- The legacy buffer descriptor tables show the byte order for big-endian chips. DBSWP must be set to 0 after reset to enable big-endian mode.

53.5.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. Table 53-33 contains the descriptions for each field.

Table 53-30. Legacy FEC receive buffer descriptor (RxBD)

	Byte 0								Byte 1							
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Offset + 0	E	RO1	W	RO2	L	—	—	M	BC	MC	LG	NO	—	CR	OV	TR
Offset + 2	Data length															
Offset + 4	Rx data buffer pointer — high halfword															
Offset + 6	Rx data buffer pointer — low halfword															

53.5.13.2 Legacy transmit buffer descriptor

The following table shows the legacy FEC transmit buffer descriptor. Table 53-35 contains the descriptions for each field.

Table 53-31. Legacy FEC transmit buffer descriptor (TxBD)

	Byte 0								Byte 1							
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Offset + 4	Tx Data Buffer Pointer — high halfword															
Offset + 6	Tx Data Buffer Pointer — low halfword															

[1] This field is not supported by the uDMA.

53.5.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET*n*_ECR[1588EN].

NOTE

> The enhanced buffer descriptor tables show the byte order for big-endian chips. DBSWP must be set to 0 after reset to enable big-endian mode.

53.5.14.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. Table 53-33 contains the descriptions for each field.

Table 53-32. Enhanced uDMA receive buffer descriptor (RxBD)

	Byte 0								Byte 1

Table 53-33. Receive buffer descriptor field definitions

Word	Field	Description
Offset + 0	0 E	Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required. 1 The data buffer associated with this BD is empty, or reception is currently in progress.
Offset + 0	1 RO1	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 0	2 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location. 1 The next buffer descriptor is found at the location defined in ENET*n*_RDSR.
Offset + 0	3 RO2	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 0	4 L	Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame. 1 The buffer is the last in a frame.
Offset + 0	5–6	Reserved, must be cleared.
Offset + 0	7 M	Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM fields are set to 1. 0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode. The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 0	8 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).

Table continues on the next page...

Table 53-33. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 0	9 MC	Set if the DA is multicast and not BC.
Offset + 0	10 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 0	11 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 0	12	Reserved, must be cleared.
Offset + 0	13 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 0	14 OV	Overrun. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, and CR, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 0	15 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 2	0–15 Data Length	Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed.
0ffset + 4	0–15 Data buffer pointer high	Receive data buffer pointer, high halfword[1]
Offset + 6	0–15 Data buffer pointer low	Receive data buffer pointer, low halfword
Offset + 8	0 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + 8	1–4	Reserved, must be cleared.
Offset + 8	5 PE	PHY Error. This field is written by the uDMA. Set to "1"when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + 8	6 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + 8	7 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + 8	8 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the *dma_int_rxb* / *dma_int_rxfevent*.
Offset + 8	9–15	Reserved, must be cleared.

Table continues on the next page...

Table 53-33. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + A	0–2 VPCP	VLAN priority code point. This field is written by the uDMA to indicate the frame priority level. Valid values are from 0 (best effort) to 7 (highest). This value can be used to prioritize different classes of traffic (e.g., voice, video, data). This field is only valid if the L field is set.
Offset + A	3–9	Reserved, must be cleared.
Offset + A	10 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + A	11 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + A	12	Reserved, must be cleared.
Offset + A	13 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.
Offset + A	14 IPV6	IPV6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + A	15 FRAG	IPv4 Fragment.This is an accelerator option.This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.
Offset + C	0–4 Header length	Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: • ICMP/IP: 6 (5 IP header, 1 ICMP header) • UDP/IP: 7 (5 IP header, 2 UDP header) • TCP/IP: 10 (5 IP header, 5 TCP header) This field is only valid if the L field is set.
Offset + C	5–7	Reserved, must be cleared.
Offset + C	8–15 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + E	0–15 Payload checksum	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.
Offset + 10	0 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 10	1–15	Reserved, must be cleared.
Offset + 12	0–15	Reserved, must be cleared.
Offset + 14	0–15 1588 timestamp	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		
Offset + 18	0–15	Reserved, must be cleared.

Table 53-33. Receive buffer descriptor field definitions

Word	Field	Description
– Offset + 1E		

1. The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 16. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

53.5.14.2 Enhanced transmit buffer descriptor

Table 53-34. Enhanced transmit buffer descriptor (TxBD)

	Byte 0								Byte 1

Table 53-35. Enhanced transmit buffer descriptor field definitions

Word	Field	Description
Offset + 0	0 R	Ready. Written by the MAC and user. 0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.
Offset + 0	1	Transmit software ownership. This field is reserved for software use. This read/ write field is not modified by hardware and its value does not affect hardware.

Table continues on the next page...

Table 53-35. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
	TO1	
Offset + 0	2 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in ETDSR.
Offset + 0	3 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 0	4 L	Last in frame. Written by user. 0 The buffer is not the last in the transmit frame 1 The buffer is the last in the transmit frame
Offset + 0	5 TC	Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte This field is valid only when the L field is set.
Offset + 0	6 ABC	Append bad CRC. **Note:** This field is not supported by the uDMA and is ignored.
Offset + 0	7–15	Reserved, must be cleared.
Offset + 2	0–15 Data Length	Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 4	0–15 Data buffer pointer high	Tx data buffer pointer, high halfword. The transmit buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 8. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller.
Offset + 6	0–15 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 8	0	Reserved, must be cleared.
Offset + 8	1 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + 8	2 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + 8	3 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + 8	4 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by

Table continues on the next page...

Table 53-35. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
		the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + 8	5–15	Reserved, must be cleared.
Offset + A	0 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + A	1	Reserved, must be cleared.
Offset + A	2 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + A	3 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.
Offset + A	4 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + A	5 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + A	6 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + A	7 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type then a timestamp frame. This field is valid only when the L field is set.
Offset + A	8–15	Reserved, must be cleared.
Offset + C	0–15	Reserved, must be cleared.
Offset + E	0–15	Reserved, must be cleared.
Offset + 10	0 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 10	1–15	Reserved, must be cleared.
Offset + 12	0–15	Reserved, must be cleared.
Offset + 14	0–15 1588 timestamp	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16		
Offset + 18–Offset + 1E	0–15	Reserved, must be cleared.

53.5.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

53.5.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

Table 53-36. FIFO interface data structure

	63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8
...	...							

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

Note

On transmit, if ENET*n*_TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET*n*_PAUR and ENET*n*_PALR registers.

Table 53-37. FIFO interface frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

Table 53-38. FIFO interface VLAN frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

Note

The standard defines that the LSB of the MAC address is sent/ received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

53.5.15.2 Data structure examples

	63	55	47	39	31	23	15	7
Word 0	Source address		Destination address					
1	Payload		Length (low)	Length (high)	Source address (cont.)			
2	Payload (cont.)							
3	Payload (cont.)							
...	...							
N	Unused (0x00)					Payload (last)	Payload (last-1)	Payload (last-2)

Figure 53-14. Normal Ethernet frame 64-bit mapping example

	63	55	47	39	31	23	15	7
Word 0	Source address		Destination address					
1	VLAN info (low)	VLAN info (high)	VLAN tag (0x00)	VLAN tag (0x81)	Source address (cont.)			
2	Payload						Length (low)	Length (high)
3	Payload (cont.)							
...	...							
N	Unused (0x00)					Payload (last)	Payload (last-1)	Payload (last-2)

Figure 53-15. VLAN-tagged frame 64-bit mapping example

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

53.5.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxBD[ME] is also set with the last data of the frame.

53.5.16 FIFO protection

53.5.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII_TXER) (1 in Figure 53-16) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

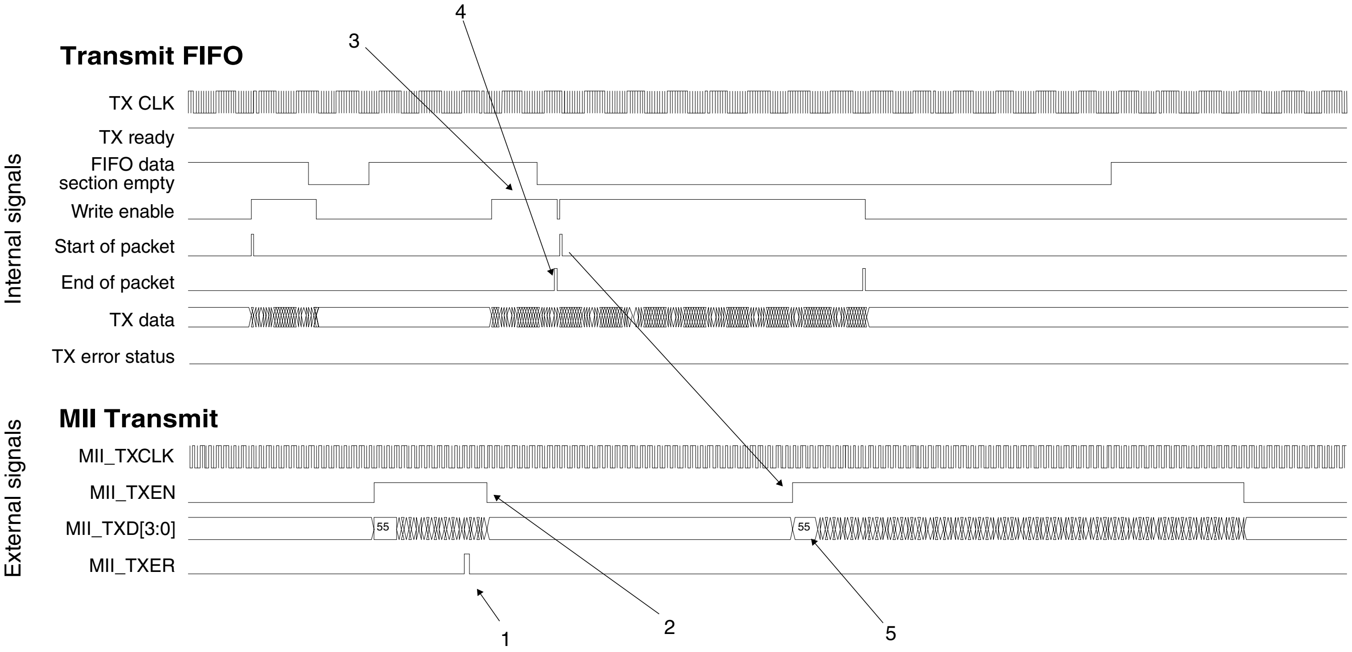

Figure 53-16. Transmit FIFO underflow protection

53.5.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurence.

Note

> Overflow is a fatal error and must be addressed by resetting the core or clearing ENET*n*_ECR[ETHER_EN], to clear the FIFOs and prepare for normal operation again.

53.5.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

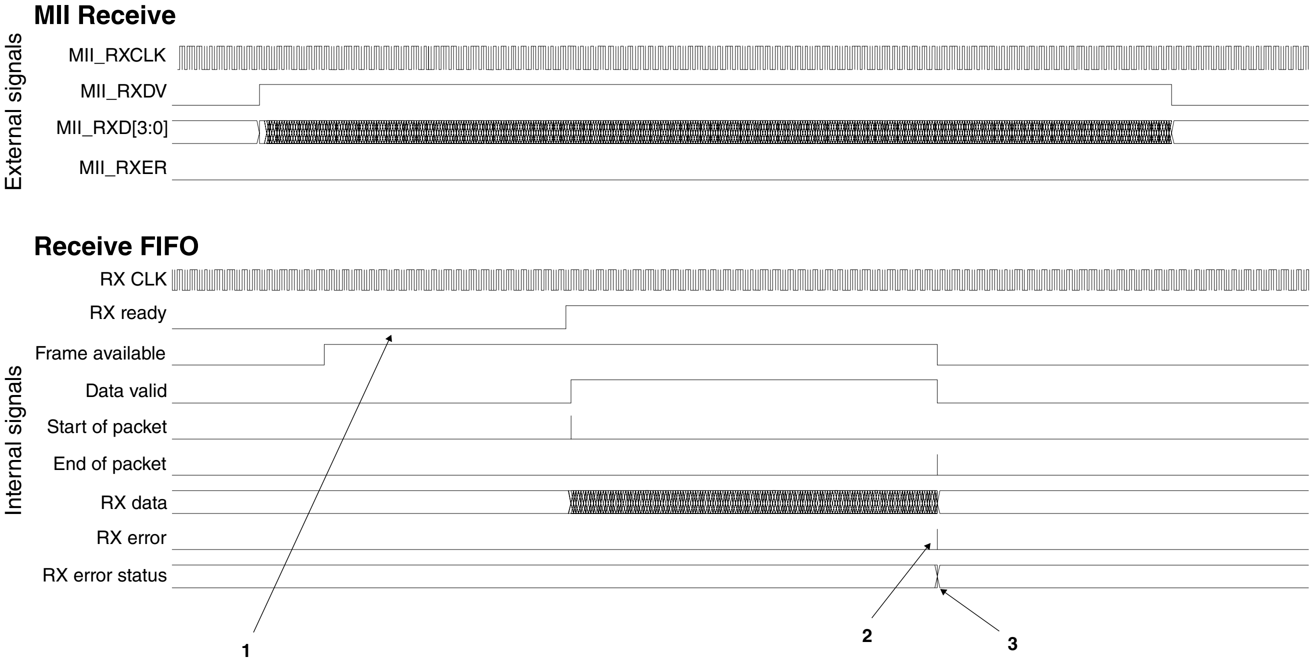

Figure 53-17. Receive FIFO overflow protection

53.5.17 Reference clock

The input clocks to the ENET module must meet the specifications in the following table.

Ethernet speed mode	Ethernet bus clock	Minimum ENET system clock
10 Mbit/s	2.5 MHz	5 MHz
100 Mbit/s	25.0 MHz	50 MHz

53.5.18 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

53.5.18.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

Table 53-39. MDIO clause 22 frame structure

ST	OP	PHYADR	REGADR	TA	DATA

Table 53-40. MDIO frame field descriptions

Field	Description
ST (2 bits)	Start indication field, programmed with ENET*n*_MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET*n*_MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET*n*_MMFR[PA]. Up to 32 devices can be addressed.

Table continues on the next page...

Table 53-40. MDIO frame field descriptions (continued)

Field	Description
REGADR (5 bits)	Five-bit register address, programmed with ENET*n*_MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data (16 bits)	Data, set by ENET*n*_MMFR[DATA]. Written to or read from the PHY

53.5.18.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

Table 53-41. MDIO clause 45 frame structure

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

Table 53-42. MDIO clause 45 frame field descriptions

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET*n*_MMFR[OP]. See Table 53-43 for more information. 00 Address write 01 Write operation 10 Read inc. operation

Table continues on the next page...

Table 53-42. MDIO clause 45 frame field descriptions (continued)

Field	Description
	11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
ADDR/DATA	16-bit address (for address write) or data, set by ENET*n*_MMFR[DATA], written to or read from the PHY.

Table 53-43. MDIO Clause 45 Transactions

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

53.5.18.3 MDIO clock generation

The MDC clock is generated from the internal bus clock (i.e., IPS bus clock) divided by the value programmed in ENET*n*_MSCR[MII_SPEED].

53.5.18.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET*n*_MMFR) according to the description provided in MII Management Frame Register (ENETn_MMFR).

To check when the programmed access completes, read the ENET*n*_EIR[MII] field.

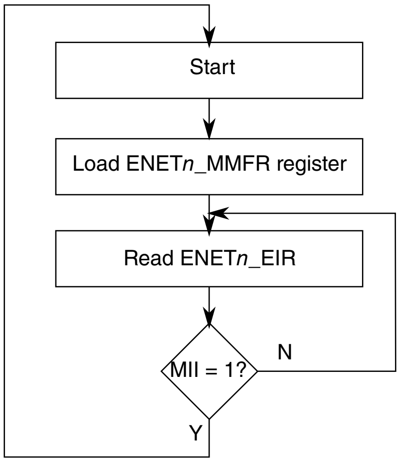

Figure 53-18. MDIO access overview

53.5.19 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

Mode	ECR[SLEEP]	RCR[RMII_10T]	RCR[RMII_MODE]
MII - 10 Mbit/s	0	—	0
MII - 100 Mbit/s	0	—	0
RMII - 10 Mbit/s	0	1	1
RMII - 100 Mbit/s	0	0	1

53.5.19.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

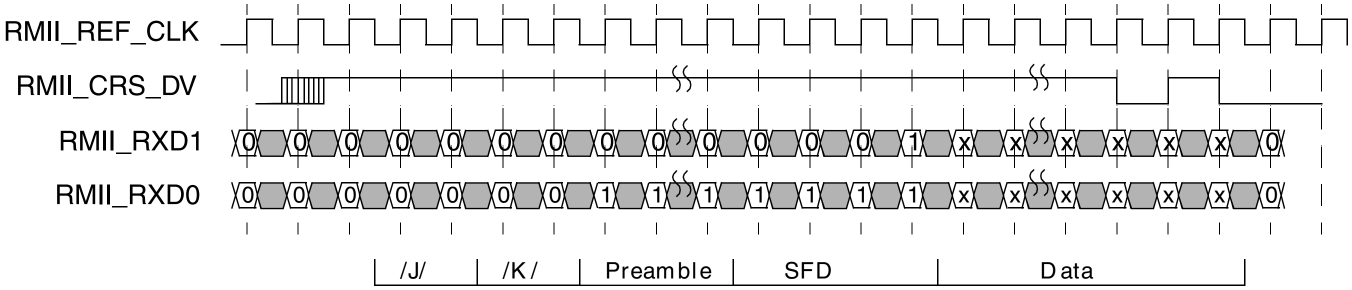

Figure 53-19. RMII receive operation

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

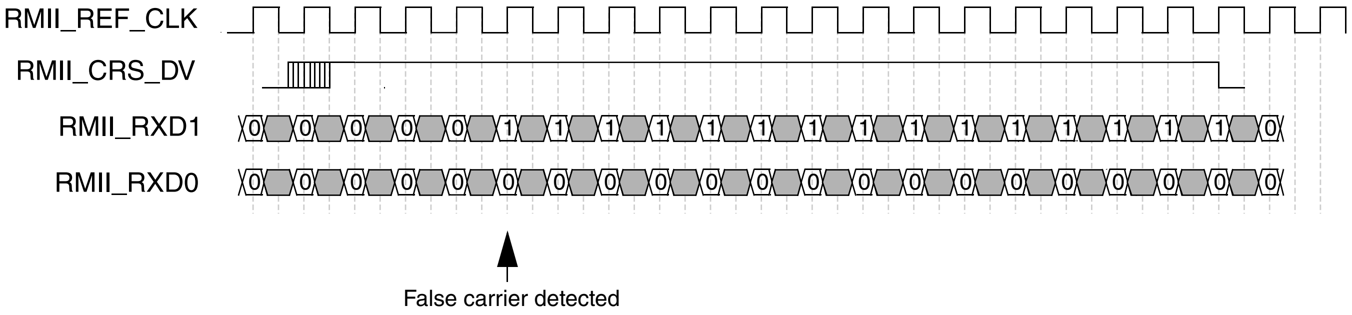

Figure 53-20. RMII receive operation with false carrier

In RMII transmit mode, TXD[1:0] provides valid data for each REF_CLK period while TXEN is asserted.

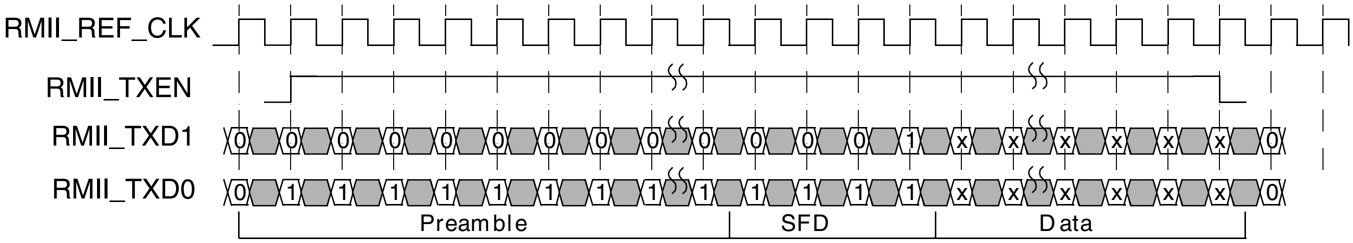

Figure 53-21. RMII transmit operation

53.5.19.2 MII Interface — transmit

On transmit, all data transfers are synchronous to MII_TXCLK rising edge. The MII data enable signal MII_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII_TXD[3:0] bus.

Between frames, MII_TXEN remains deasserted.

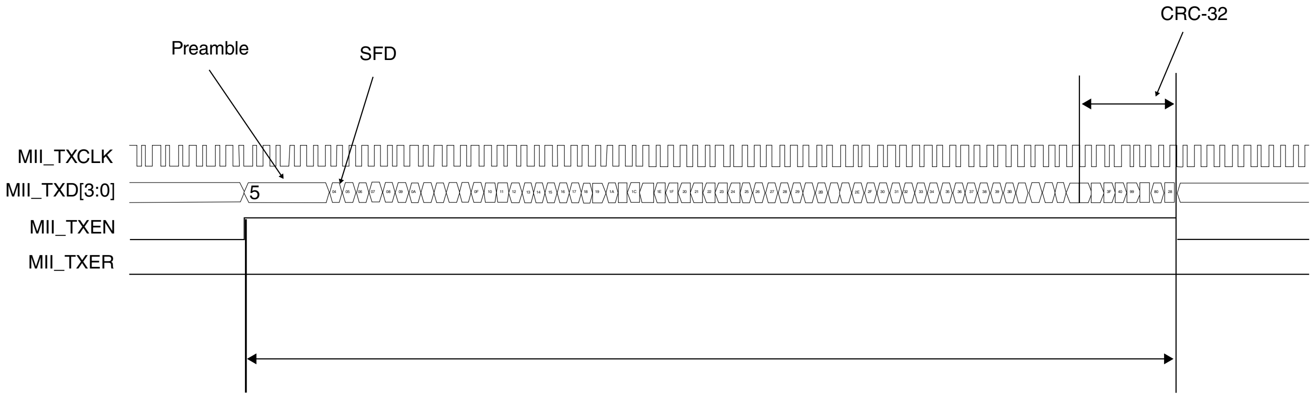

Figure 53-22. MII transmit operation

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII_TXER error signal for one clock cycle at any time during the packet transfer.

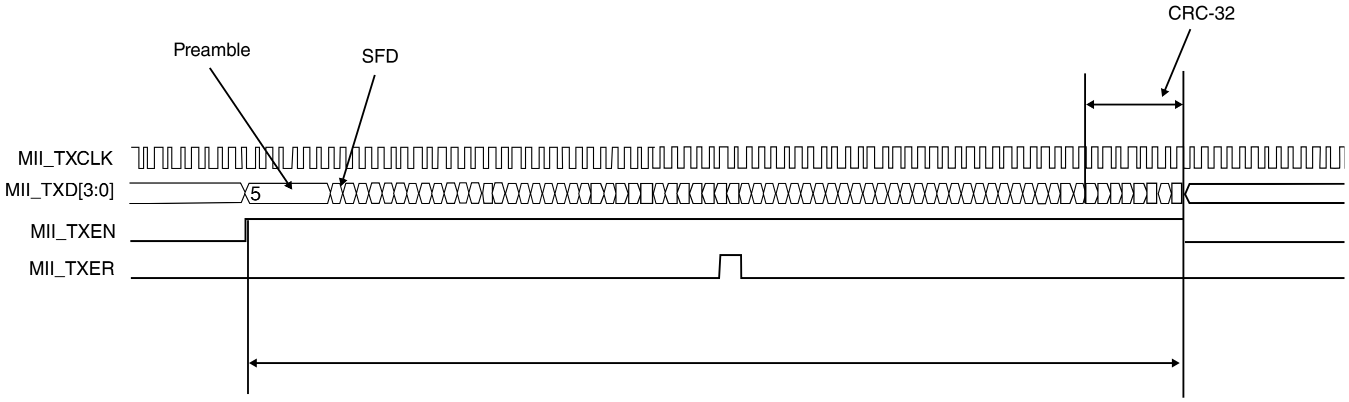

Figure 53-23. MII transmit operation — errored frame

53.5.19.2.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

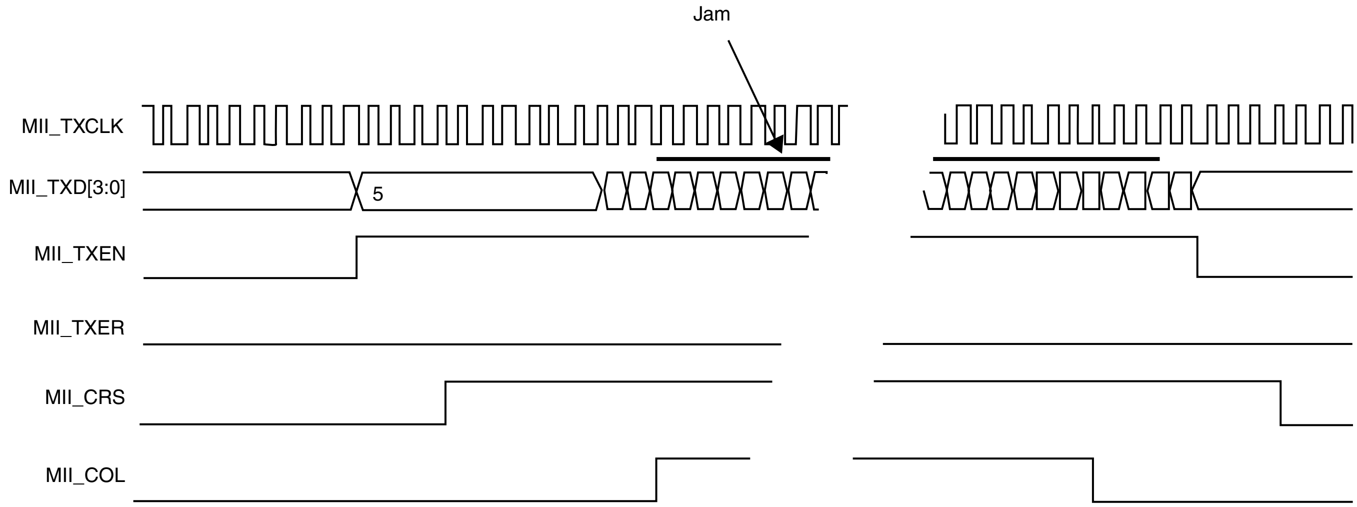

Figure 53-24. MII transmit operation — transmission with collision

53.5.19.3 MII interface — receive

On receive, all signals are sampled on the MII_RXCLK rising edge. The MII data enable signal, MII_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII_RXD[3:0] bus.

Between frames, MII_RXDV remains deasserted.

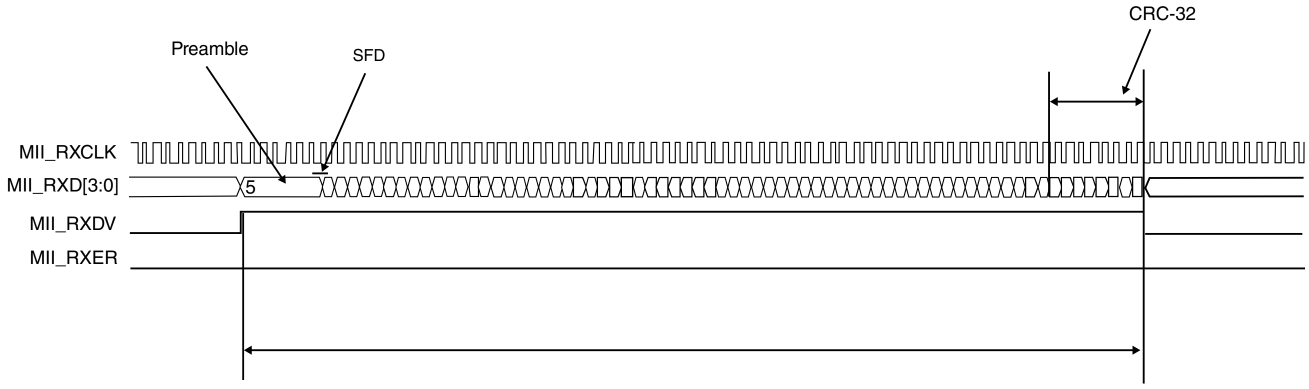

Figure 53-25. MII receive operation

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII_RXER, for at least one clock cycle at any time during the packet transfer.

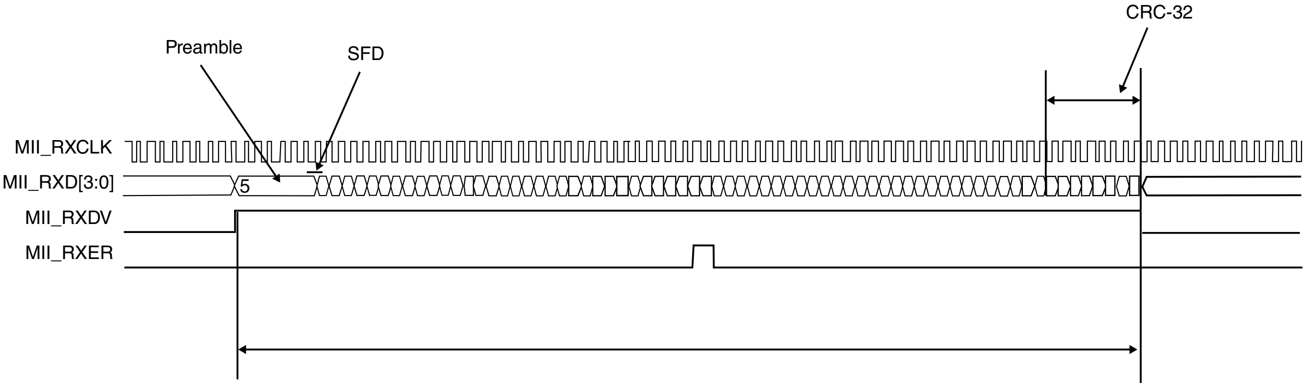

Figure 53-26. MII receive operation — errored frame

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

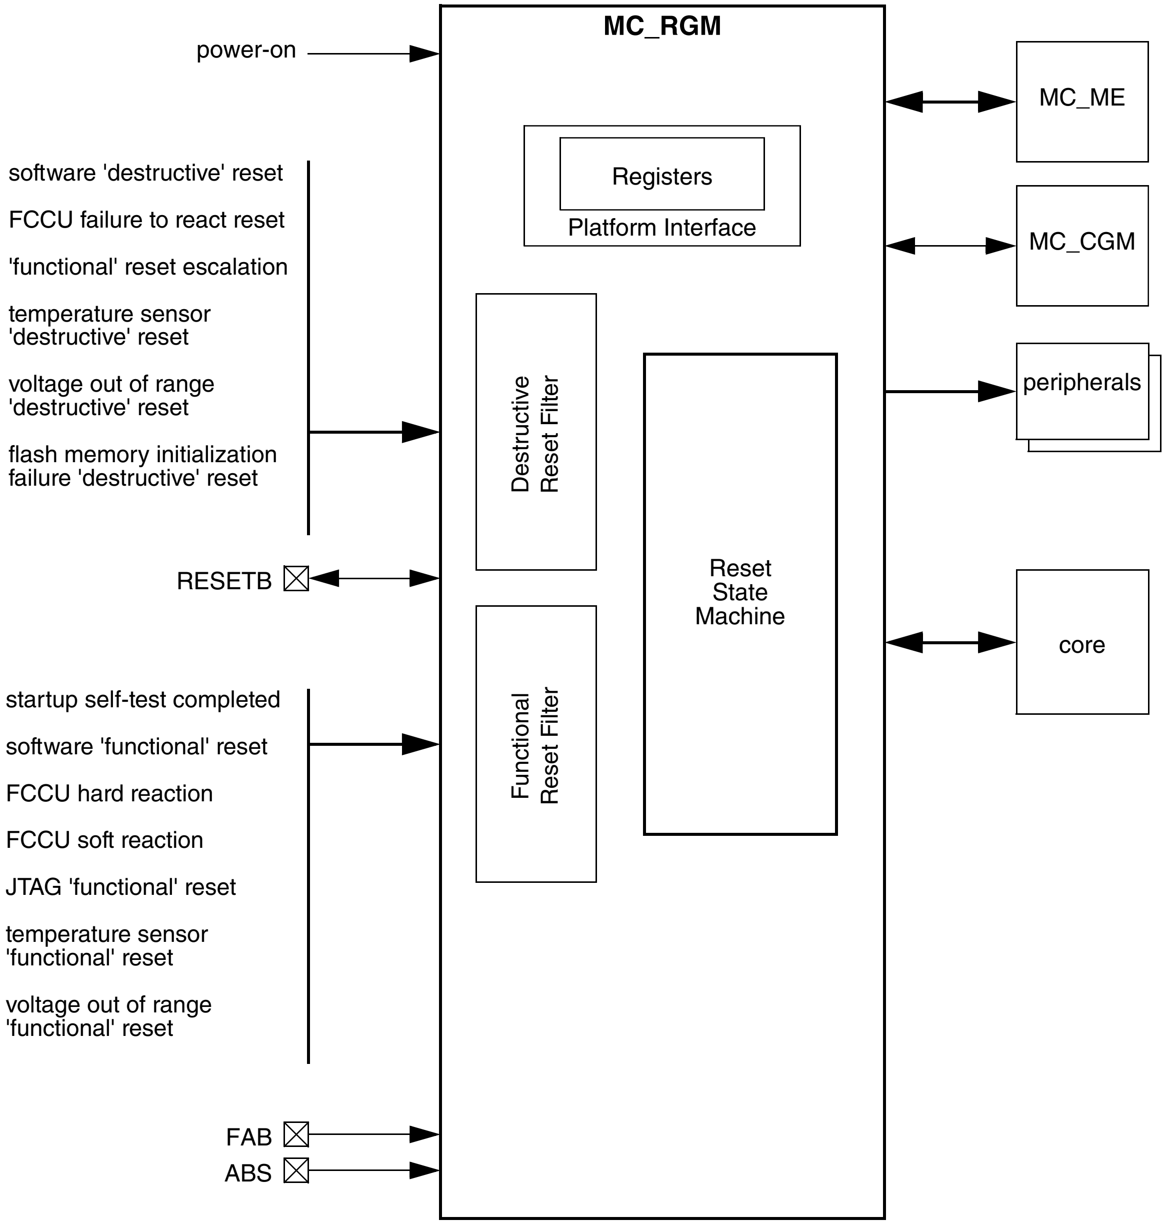
Chapter 54
Reset Generation Module (MC_RGM)

54.1 Introduction

54.1.1 Overview

The reset generation module (MC_RGM) centralizes the different reset sources and manages the reset sequence of the chip. It provides a register interface and the reset sequencer. Various registers are available to monitor and control the chip reset sequence. The reset sequencer is a state machine which controls the different phases (PHASE0, PHASE1, PHASE2, PHASE3, and IDLE) of the reset sequence and controls the reset signals generated in the system.

The following figure shows the MC_RGM block diagram.



MC_RGM

Figure 54-1. MC_RGM Block Diagram

54.1.2 Features

The MC_RGM contains the functionality for the following features:

- 'destructive' resets management
- 'functional' resets management
- signalling of reset events after each reset sequence (reset status flags)
- conversion of reset events to SAFE mode or interrupt request events

- short reset sequence configuration
- bidirectional reset behavior configuration
- boot mode capture on RESETB deassertion
- configurable escalation of recurring ‘functional’ resets to ‘destructive’ reset

54.1.3 Reset Sources

The different reset sources are organized into two families: 'destructive' and 'functional'.

- A 'destructive' reset source is associated with an event related to a critical - usually hardware - error or dysfunction. When a 'destructive' reset event occurs, the full reset sequence is applied to the chip starting from PHASE0. This resets the full chip ensuring a safe start-up state for both digital and analog modules, and the memory content must be considered to be unknown. 'Destructive' resets are
    - power-on reset
    - software 'destructive' reset
    - FCCU failure to react reset
    - 'functional' reset escalation
    - temperature sensor 'destructive' reset
    - voltage out of range 'destructive' reset

NOTE

POR occurs when the voltage starts from 0 or the voltage drops below the absolute minimum operating level. It remains active until the voltage is above the operating threshold. After that, the device is no longer in the POR state (although the POR flag remains set until software clears it), and other reset events can potentially occur.

- A 'functional' reset source is associated with an event related to a less-critical - usually non-hardware - error or dysfunction. When a 'functional' reset event occurs, a partial reset sequence is applied to the chip starting from PHASE1. In this case, most digital modules are reset normally, while the state of analog modules or specific digital modules (e.g., debug modules, flash modules) as well as the system memory content is preserved. 'Functional' resets are

- external reset
- start-up self test completed
- software 'functional' reset
- FCCU hard reaction
- FCCU soft reaction
- JTAG 'functional' reset
- temperature sensor 'functional' reset
- voltage out of range 'functional' reset

When a reset is triggered, the MC_RGM state machine is activated and proceeds through the different phases (i.e., PHASEn states). Each phase is associated with a particular chip reset being provided to the system. A phase is completed when all corresponding phase completion gates from either the system or internal to the MC_RGM are acknowledged. The chip reset associated with the phase is then released, and the state machine proceeds to the next phase up to entering the IDLE phase. During this entire process, the MC_ME state machine is held in RESET mode. Only at the end of the reset sequence, when the IDLE phase is reached, does the MC_ME enter the DRUN mode.

Alternatively, it is possible for software to configure some reset source events to be converted from a reset to either a SAFE mode request issued to the MC_ME or to an interrupt issued to the core (see 'Functional' Event Reset Disable Register (MC_RGM_FERD) and 'Functional' Event Alternate Request Register (MC_RGM_FEAR)).

54.2 External Signal Description

The MC_RGM interfaces to the bidirectional reset pin RESETB.

54.3 Memory Map and Register Definition

Any access to unused registers as well as write accesses to read-only registers will:

- not change register content
- cause a transfer error

Unless otherwise noted, all registers may be accessed as 32-bit words, 16-bit half-words, or 8-bit bytes. The bytes are ordered according to big endian. For example, the RGM_DES[8:15] register bits may be accessed as a word at address offset 0x000, as a half-word at address offset 0x002, or as a byte at address offset 0x003.

Some fields may be read-only, and their reset value of '1' or '0' and the corresponding behavior cannot be changed.

MC_RGM memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	'Destructive' Event Status Register (MC_RGM_DES)	32	w1c	0000_0001h	54.3.1/2181

54.3.1 'Destructive' Event Status Register (MC_RGM_DES)

This register contains the status of the 'destructive' reset sources. It can be accessed as read/write in either supervisor mode or test mode. It can be accessed as read-only in user mode. Register bits are cleared on write '1'.

This register is reset only on power-on.

29–30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 F_POR	Flag for Power-On reset 0 No power-on event has occurred since the last clear 1 A power-on event has occurred

54.3.2 ‘Destructive’ Event Reset Disable Register (MC_RGM_DERD)

This register provides dedicated bits to disable particular ‘destructive’ reset sources. It can be accessed as read/write in either supervisor mode or test mode. It can be accessed as read-only in user mode. Each byte can be written only once after a ‘destructive’ or power-on reset.

This register is reset only on power-on.

WARNING

It is important to clear the RGM_DES register before setting any of the bits in the RGM_DERD register to ‘1’. Otherwise a redundant SAFE mode request or interrupt request may occur.

Address: 0h base + 10h offset = 10h

29–30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 D_POR	Disable Power-On reset 0 A power-on event triggers a reset sequence

54.3.3 Destructive’ Bidirectional Reset Enable Register (MC_RGM_DBRE)

This register enables the generation of an external reset on ‘destructive’ reset. It can be accessed in read only in all modes. Since all ‘destrutcive’ resets assert RESETB, all the bits in this register are always ‘0’.

This register is reset only on power-on.

Address: 0h base + 30h offset = 30h

MC_RGM_DBRE field descriptions (continued)

Field	Description
8 BE_TSR_DEST	Bidirectional Reset Enable for temperature sensor 'destructive' reset 0 RESETB is asserted on a temperature sensor 'destructive' reset event if the reset is enabled
9–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 F_FIF	Flash initialization failure 0 RESETB is asserted on a flash memory initialization failure event
23 BE_EDR	Bidirectional Reset Enable for ‘functional’ reset escalation 0 RESETB is asserted on a ‘functional’ reset escalation event
24–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 F_SUF	STCU unrecoverable fault 0 RESETB is asserted on an STCU unrecoverable fault event
27 BE_FFRR	Bidirectional Reset Enable for FCCU failure to react reset 0 RESETB is asserted on a FCCU failure to react reset event
28 BE_SOF_DEST	Bidirectional Reset Enable for software ‘destructive’ reset 0 RESETB is asserted on asoftware ‘destructive’ reset event
29–30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 BE_POR	Bidirectional Reset Enable for Power-On reset 0 RESETB is asserted on a Power-On reset event

54.3.4 'Functional' Event Status Register (MC_RGM_FES)

This register contains the status of the 'functional' reset sources, including those configured to not generate a reset sequence. It can be accessed as read/write in either supervisor mode or test mode. It can be accessed as read-only in user mode. Register bits are cleared on write '1' if the triggering event has already been cleared at the source.

This register is reset only on power-on.

NOTE

If a 'functional' reset source is configured to generate a SAFE mode request or an interrupt request, software needs to clear the event in the source module at least three system clock cycles before it clears the associated RGM_FES status bit in order to avoid multiple SAFE mode requests or interrupts for the same event. In order to avoid having to count cycles, it is good practice for software to check whether the RGM_FES has been properly cleared, and if not, clear it again.

29 F_ST_DONE	Flag for self test completed 0 No self test completed event has occurred since either the last clear or the last power-on reset assertion 1 A self test completed event has occurred
30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 F_EXR	Flag for external reset 0 No external reset event has occurred since either the last clear or the last power-on reset assertion 1 An external reset event has occurred

54.3.5 'Functional' Event Reset Disable Register (MC_RGM_FERD)

This register provides dedicated bits to disable 'functional' reset sources.When a 'functional' reset source is disabled, the associated 'functional' event will trigger either a SAFE mode request or an interrupt request (see 'Functional' Event Alternate Request Register (MC_RGM_FEAR)). It can be accessed as read/write in either supervisor mode or test mode. It can be accessed as read-only in user mode. Each byte can be written only once after power-on reset.

This register is reset only on power-on and any 'destructive' reset.

Warning

It is important to clear the RGM_FES register before setting any of the bits in the RGM_FERD register to '1'. Otherwise a redundant SAFE mode request or interrupt request may occur.

30–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

54.3.6 'Functional' Event Alternate Request Register (MC_RGM_FEAR)

This register defines an alternate request to be generated when a reset on a 'functional' event has been disabled. The alternate request can be either a SAFE mode request to MC_ME or an interrupt request to the system. It can be accessed as read/write in either supervisor mode or test mode. It can be accessed in read only in user mode.

This register is reset only on power-on and any 'destructive' reset.

54.3.8 'Functional' Event Short Sequence Register (MC_RGM_FESS)

This register defines which reset sequence will be done when a 'functional' reset sequence is triggered. The 'functional' reset sequence can either start from PHASE1 or from PHASE3, skipping PHASE1 and PHASE2.

NOTE

This could be useful for fast reset sequence, for example to skip flash reset.

It can be accessed as read/write in either supervisor mode or test mode. It can be accessed in read in user mode.

This register is reset only on power-on and any 'destructive' reset.

Address: 0h base + 340h offset = 340h

54.3.9 'Functional' Reset Escalation Threshold Register (MC_RGM_FRET)

This register sets the threshold for 'functional' reset escalation to a 'destructive' reset. It can be accessed as read/write in either supervisor mode or test mode. It can be accessed as read-only in user mode.

Writing a non-zero value to the FRET field will enable the 'functional' reset escalation function. Writing any value to this register will reset the 'functional' reset counter. See 'Functional' Reset Escalation for details on the 'functional' reset escalation function.

This register is reset only on power-on and any 'destructive' reset.

Address: 0h base + 604h offset = 604h

Bit	0	1	2	3	4	5	6	7
Read	0				FRET			
Write								
Reset	0	0	0	0	1	1	1	1

MC_RGM_FRET field descriptions

Field	Description
0–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4–7 FRET	'Functional' Reset Escalation Threshold - If the value of this field is 0, the 'functional' reset escalation function is disabled. Any other value is the number of 'functional' resets which will cause a 'destructive' reset if the RGM_FRET register isn't written to beforehand.

54.3.10 'Destructive' Reset Escalation Threshold Register (MC_RGM_DRET)

This register sets the threshold for 'destructive' reset escalation to keep the chip in the reset state until the next power-on reset triggers a new reset sequence. The register can be accessed as read/write in either supervisor mode or test mode. It can be accessed as read-only in user mode.

Writing a non-zero value to the DRET field enables the 'destructive' reset escalation function. Writing any value to this register resets the 'destructive' reset counter. See 'Destructive' Reset Escalation for details on the 'destructive' reset escalation function.

This register is reset only on power-on.

Address: 0h base + 608h offset = 608h

Bit	0	1	2	3	4	5	6	7
Read	0				DRET			
Write								
Reset	0	0	0	0	0	0	0	0

MC_RGM_DRET field descriptions

Field	Description
0–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

MC_RGM_DRET field descriptions (continued)

Field	Description
4–7 DRET	'Destructive' Reset Escalation Threshold - If the value of this field is 0, the 'destructive' reset escalation function is disabled. Any other value is the number of 'destructive' resets that will keep the chip in the reset state until the next power-on reset triggers a new reset sequence if the RGM_DRET register is not written beforehand.

54.4 Functional Description

54.4.1 Reset State Machine

The main role of the MC_RGM is the generation of the reset sequence which ensures that the correct parts of the chip are reset based on the reset source event. This is summarized in the following table.

Table 54-1. MC_RGM Reset Implications

Source	What Gets Reset	External Reset Assertion[1]	Boot Mode Capture
power-on reset	all	yes	yes
'destructive' resets	all except some clock/reset management	yes	yes
external reset	all except some clock/reset management and debug	programmable	yes
'functional' resets	all except some clock/reset management, STCU, FCCU, and debug	programmable[2]	programmable
shortened external or shortened 'functional' resets	flip-flops except some clock/reset management, STCU, FCCU, and debug	programmable[2]	programmable[3]

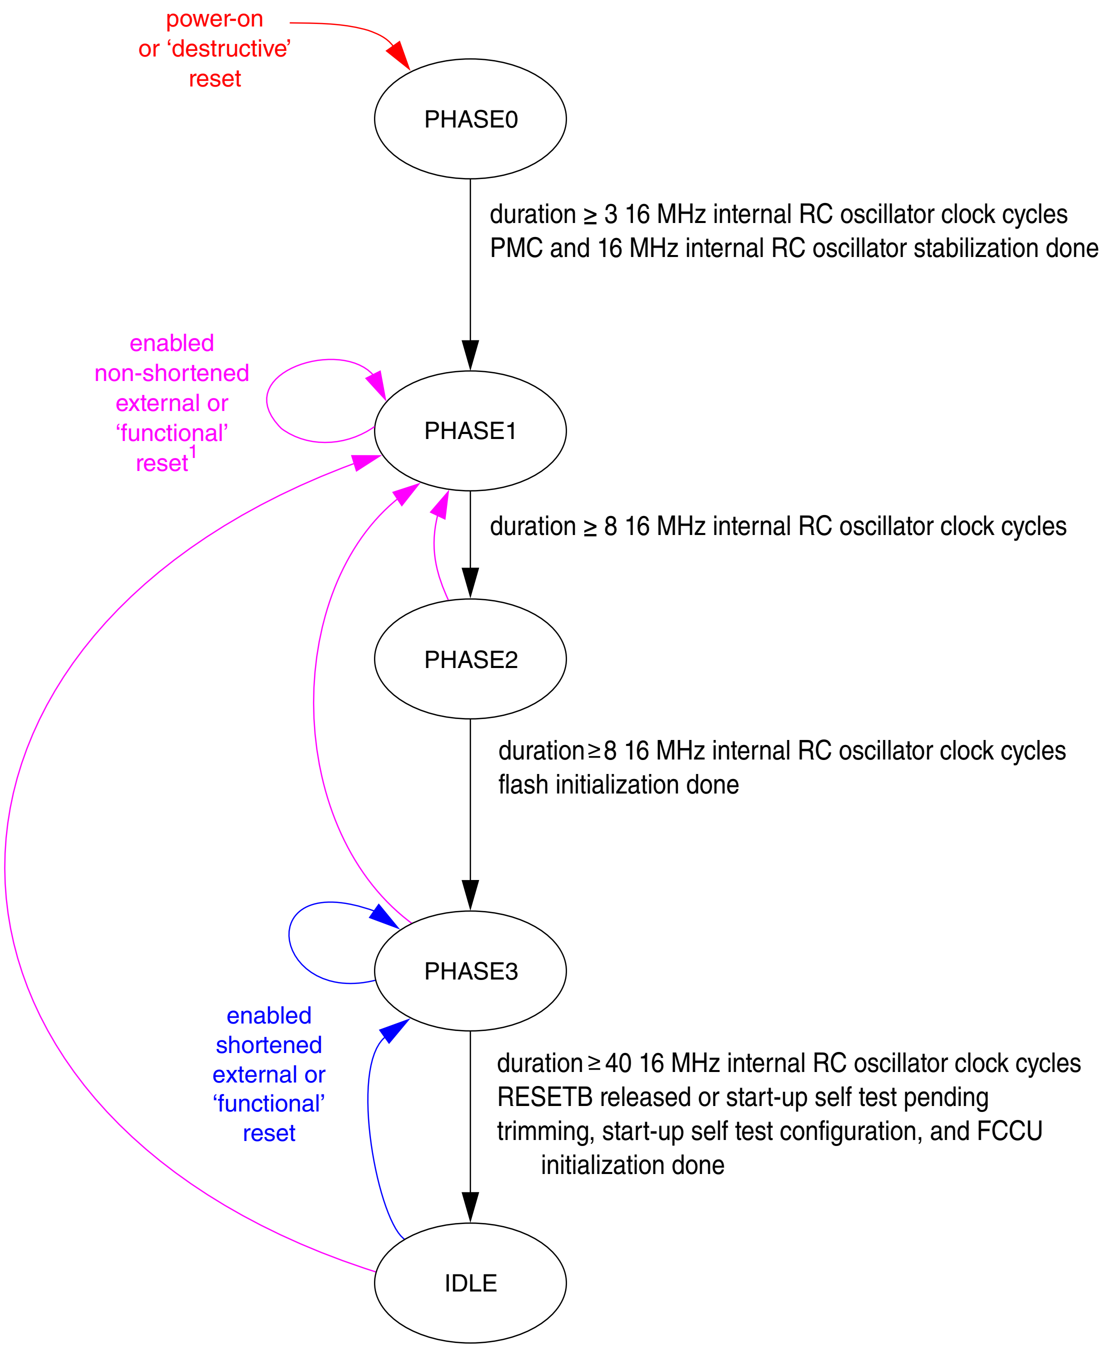
1. 'external reset assertion' means that the RESETB pin is asserted by the MC_RGM from the start of the reset sequence until the end of reset PHASE3
2. the assertion of the external reset is controlled via the RGM_FBRE register
3. the boot mode is captured if the external reset is asserted

Note

> JTAG logic has its own independent reset control and is not controlled by the MC_RGM in any way.

The reset sequence is comprised of five phases managed by a state machine, which ensures that all phases are correctly processed through waiting for a minimum duration and until all processes that need to occur during that phase have been completed before proceeding to the next phase.

The state machine used to produce the reset sequence is shown in the following figure.



power-on
or 'destructive'
reset
PHASE0
duration ≥ 3 16 MHz internal RC oscillator clock cycles
PMC and 16 MHz internal RC oscillator stabilization done
enabled
non-shortened
external or
'functional'
reset[1]
PHASE1
duration ≥ 8 16 MHz internal RC oscillator clock cycles
PHASE2
duration≥8 16 MHz internal RC oscillator clock cycles
flash initialization done
PHASE3
enabled
shortened
external or
'functional'
reset
duration≥40 16 MHz internal RC oscillator clock cycles
RESETB released or start-up self test pending
trimming, start-up self test configuration, and FCCU
initialization done
IDLE

Figure 54-2. MC_RGM State Machine

54.4.1.1 PHASE0 Phase

This phase is entered immediately from any phase on a power-on or enabled 'destructive' reset event. The reset state machine exits PHASE0 and enters PHASE1 on verification of the following:

- all enabled 'destructive' resets have been processed

- all processes that need to be done in PHASE0 are completed
    - PMC and 16 MHz internal RC oscillator stabilization
- a minimum of 3 16 MHz internal RC oscillator clock cycles have elapsed since power-up completion and the last enabled 'destructive' reset event

54.4.1.2 PHASE1 Phase

This phase is entered either on exit from PHASE0 or immediately from PHASE2, PHASE3, or IDLE on a non-masked external or 'functional' reset event if it has not been configured to trigger a 'short' sequence. The reset state machine exits PHASE1 and enters PHASE2 on verification of the following:

- all enabled, non-shortened 'functional' resets have been processed
- a minimum of 8 16 MHz internal RC oscillator clock cycles have elapsed since the last enabled external or non-shortened 'functional' reset event

54.4.1.3 PHASE2 Phase

This phase is entered on exit from PHASE1. The reset state machine exits PHASE2 and enters PHASE3 on verification of the following:

- all processes that need to be done in PHASE2 are completed
    - flash initialization
- a minimum of 8 16 MHz internal RC oscillator clock cycles have elapsed since entering PHASE2

54.4.1.4 PHASE3 Phase

This phase is a entered either on exit from PHASE2 or immediately from IDLE on an enabled, shortened 'functional' reset event. The reset state machine exits PHASE3 and enters IDLE on verification of the following:

- all processes that need to be done in PHASE3 are completed
    - trimming, start-up self test configuration, and FCCU initialization

- a minimum of 40 16 MHz internal RC oscillator clock cycles have elapsed since the last enabled, shortened 'functional' reset event
- RESETB is not asserted, except if a start-up self test is to be executed on exit of the current reset sequence

54.4.1.5 IDLE Phase

This is the final phase and is entered on exit from PHASE3. When this phase is reached, the MC_RGM releases control of the system to the platform and waits for new reset events that can trigger a reset sequence.

54.4.2 'Destructive' Resets

A 'destructive' reset indicates that an event has occurred after which critical register or memory content can no longer be guaranteed.

The status flag associated with a given 'destructive' reset event (RGM_DES.F_<destructive reset> bit) is set when the 'destructive' reset is asserted and the power-on reset is not asserted. It is possible for multiple status bits to be set simultaneously, and it is software's responsibility to determine which reset source is the most critical for the application.

A 'destructive' reset will trigger a reset sequence starting from the beginning of PHASE0.

54.4.3 External Reset

The MC_RGM manages the external reset coming from RESETB. The detection of a falling edge on RESETB will start the reset sequence.

The status flag associated with the external reset falling edge event (RGM_FES.F_EXR bit) is set when the external reset is asserted and the power-on reset is not asserted.

An external reset will normally trigger a reset sequence starting from the beginning of PHASE1. Nevertheless, the RGM_FESS register enables the further configuring of the reset sequence triggered by the external reset. When RGM_FESS.SS_EXR is set, the external reset will trigger a reset sequence starting directly from the beginning of PHASE3, skipping PHASE1 and PHASE2. This can be useful especially when an external reset should not reset the flash.

The MC_RGM may also assert the external reset if the reset sequence was triggered by one of the following:

- a power-on reset
- a 'destructive' reset event
- an external reset event if configured via the RGM_FBRE register to assert the external reset
- a 'functional' reset event configured via the RGM_FBRE register to assert the external reset

In this case, RESETB is asserted until all conditions for exiting PHASE3 have been met with the exception of the RESETB assertion check.

In addition, the MC_RGM asserts RESETB while the start-up self test is being executed.

The RESETB input is disabled immediately as of the RESETB output being asserted in order to prevent a falling edge from being detected while the pin is being driven from the chip. The input is then re-enabled 4µs after the RESETB output stops being driven by the chip in order to allow the pull-up on the pin to take effect.

54.4.4 'Functional' Resets

A 'functional' reset indicates that an event has occurred after which it can be guaranteed that critical register and memory content is still intact.

The status flag associated with a given 'functional' reset event (RGM_FES.F_<functional reset> bit) is set when the 'functional' reset is asserted and the power-on reset is not asserted. It is possible for multiple status bits to be set simultaneously, and it is software's responsibility to determine which reset source is the most critical for the application.

A given 'functional' reset can be optionally disabled by software writing bit RGM_FERD.D_<functional reset>.

Note

> The RGM_FERD register can be written only once between two power-on reset events.

An enabled 'functional' reset will normally trigger a reset sequence starting from the beginning of PHASE1. Nevertheless, the RGM_FESS register enables the further configuring of the reset sequence triggered by a 'functional' reset. When RGM_FESS.SS_<functional reset> is set, the associated 'functional' reset will trigger a reset sequence starting directly from the beginning of PHASE3, skipping PHASE1 and PHASE2. This can be useful especially in case a 'functional' reset should not reset the flash module.

See the MC_ME chapter for details on the STANDBY0 and DRUN modes.

54.4.5 Alternate Event Generation

The MC_RGM provides alternative events to be generated on reset source assertion. When a reset source is asserted, the MC_RGM normally enters the reset sequence. Alternatively, it is possible for some reset source events to be converted from a reset to either a SAFE mode request issued to the MC_ME or to an interrupt request issued to the core.

Alternate event selection for a given reset source is made via the RGM_FERD and RGM_FEAR registers as shown in the following table.

Table 54-2. MC_RGM Alternate Event Selection

RGM_FERD Bit Value	RGM_FEAR Bit Value	Generated Event
0	X	reset
1	0	SAFE mode request
1	1	interrupt request

The alternate event is cleared by deasserting the source of the request (that is, at the reset source that caused the alternate request) and also clearing the appropriate RGM_FES status bit.

Note

SAFE mode requests are generated regardless of whether the system clock is running. Interrupt requests are generated with the system clock; therefore, if the system clock was disabled at the time of the event, the interrupt request is not asserted until the system clock is re-enabled.

Note

If a masked 'destructive' reset event which is configured to generate a SAFE mode/interrupt request occurs during PHASE0, it is ignored, and the MC_RGM will not send any safe mode/interrupt request to the MC_ME.

Note

If a masked 'functional' reset event which is configured to generate a SAFE mode/interrupt request occurs during PHASE1, it is ignored, and the MC_RGM will not send any safe mode/interrupt request to the MC_ME.

54.4.6 'Functional' Reset Escalation

'Functional' reset escalation can be used to generate a 'destructive' reset if a number of 'functional' or external resets has occurred between software writes to the RGM_FRET register. This function is enabled by writing a non-zero value to the FRET field of this register.

Once 'functional' reset escalation has been enabled, the MC_RGM increases a counter on each 'functional' or external reset which causes a reset sequence to be initiated (i.e., entrance into PHASE1 or PHASE3 from the IDLE phase). This counter is cleared on a write of any value to the RGM_FRET register and on any power-on or 'destructive' reset. If the counter reaches the value in the RGM_FRET register's FRET field, the MC_RGM starts a reset sequence at PHASE0 and asserts the F_EDR bit in the RGM_DES register.

54.4.7 'Destructive' Reset Escalation

'Destructive' reset escalation can be used to keep the chip in the reset state until the power-on triggers a reset sequence if a number of 'destructive' resets has occurred between software writes to the RGM_DRET register. This function is enabled by writing a non-zero value to the DRET field of this register.

After 'destructive' reset escalation has been enabled, the MC_RGM increases a counter on each 'destructive' reset that is enabled to increment the escalator and that causes a reset sequence to be initiated (i.e., entrance into PHASE0 from the IDLE phase) or an ongoing reset sequence to restart (i.e., entrance into PHASE0 from PHASE1, PHASE2, or PHASE3). This counter is cleared on a write of any value to the RGM_DRET register and on any power-on reset. If the counter reaches the value in the RGM_DRET register's DRET field, the MC_RGM enters reset PHASE0 and remains there until the next power-on reset occurs.

On a power-on reset, the dest_rst_escalation output is deasserted. It is asserted by the MC_RGM when the counter reaches the value in the RGM_DRET register’s DRET field. It is not deasserted until the next power-on reset.

54.4.8 Boot Mode Capturing

The MC_RGM samples FAB/ABS whenever RESETB is asserted until five 16 MHz internal RC oscillator clock cycles before its deassertion edge. The result of the sampling is used at the beginning of reset PHASE3 for boot mode selection and is retained after RESETB has been deasserted for subsequent boots after reset sequences during which RESETB is not asserted.

NOTE

In order to ensure that the boot mode is correctly captured, the application needs to apply the valid boot mode value the entire time that RESETB is asserted and to keep applying it for 5 µs after RESETB is deasserted. For non-alternate boot modes, it is recommended to use a dedicated pin for the FAB pin and to keep it asserted to ‘0’ at all times.

NOTE

RESETB can be asserted as a consequence of the internal reset generation. This will force re-sampling of the boot mode pins. (See Table 54-1 for details.)

Chapter 55
Boot Assist Module (BAM)

55.1 Overview

The Boot Assist Module (BAM) is a block of read-only memory containing VLE code which is executed according to the boot mode of the device. The code stored in the BAM is not executed when booting in Single Chip mode, except when entering the "Static mode" in case no valid bootable section has been found.

The BAM downloads code into internal SRAM through the following serial protocols and executes it afterwards:

- UART (using LINFlexD)
- CAN (using FlexCAN)

Depending on the selected boot mode (see Entering boot modes), any download is performed with a fixed baud rate.

55.2 Features

The BAM provides the following features:

- Programmable 64-bit password protection for serial boot mode
- Serial boot loads the application boot code from a FlexCAN or LINFlexD bus into internal SRAM
- Censorship protection for internal flash module

55.3 Memory map

The BAM code resides in 8 KB of ROM mapped from address 0xFFFF_C000. The address space and memory used by the BAM is shown in the following table.

Table 55-1. BAM memory organization

Entity	Address
BAM entry point	0xFFFF_C000
RAM area used by the BAM code (do not use)	0x4000_0000–0x4000_00FF
Downloaded code base address	0x4000_0100

The RAM location where to download the code can be any 8 byte-aligned location in the SRAM starting from the address 0x4000_0100.

Caution

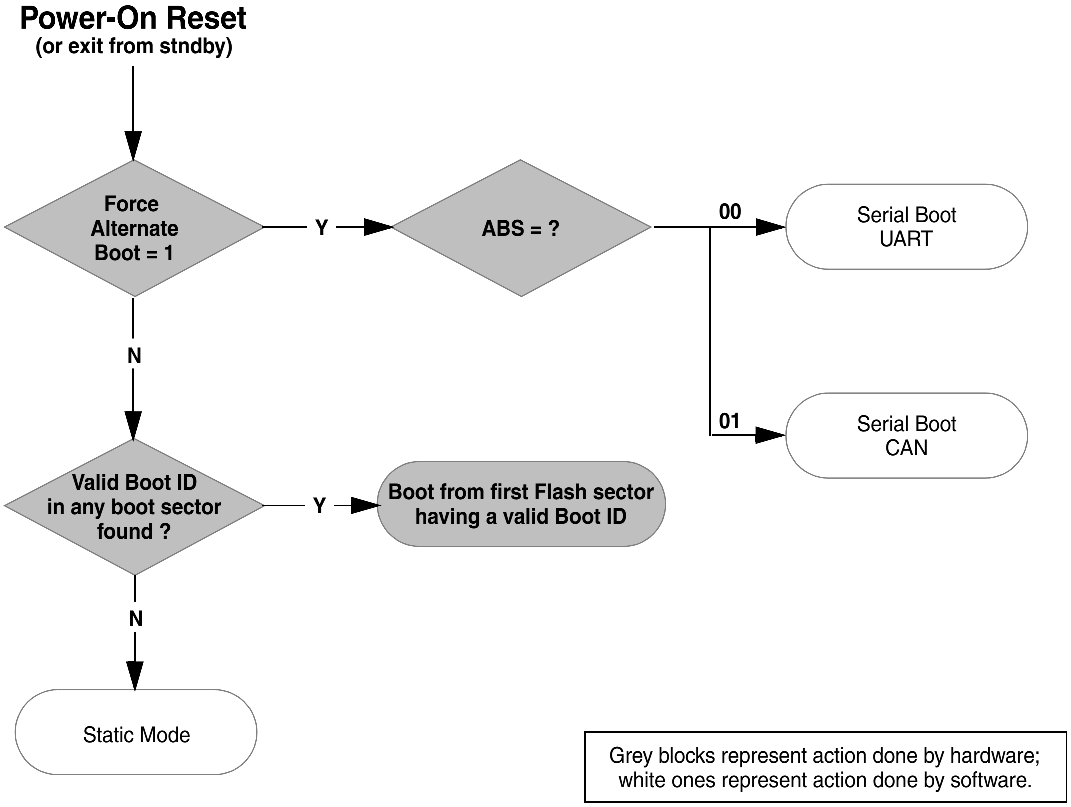
Do not use the RAM area used by the BAM code as indicated in the preceding table.

55.4 Functional description

55.4.1 Entering boot modes

The device detects the boot mode based on external pins and device status. The following sequence applies (see the following figure):

1. To boot either from FlexCAN or LINFlexD, the device must be forced into an Alternate Boot Loader Mode via the FAB (Force Alternate Boot Mode) pin which must be asserted before initiating the reset sequence. The type of alternate boot mode is selected according to the ABS (Alternate Boot Selector) pins (see the following table).
2. If FAB is not asserted, the device boots from the first flash-memory sector which contains a valid boot signature.
3. If no flash memory sector contains a valid boot signature, the device will go into static mode.



Power-On Reset
(or exit from stndby)
Force Alternate Boot = 1
Y
ABS = ?
00
Serial Boot UART
01
Serial Boot CAN
N
Valid Boot ID in any boot sector found ?
Y
Boot from first Flash sector having a valid Boot ID
N
Static Mode
Grey blocks represent action done by hardware; white ones represent action done by software.

Figure 55-1. Boot mode selection

Table 55-2. Hardware configuration to select boot mode

FAB	ABS[2,0]	Standby-RAM Boot Flag	Boot ID	Boot Mode
1	00	0	-	UART
1	01	0	-	CAN

55.4.2 Boot through BAM

55.4.2.1 Executing BAM

Single chip boot mode (selecting the first bootable flash memory sector) is managed by hardware and BAM does not participate in it.

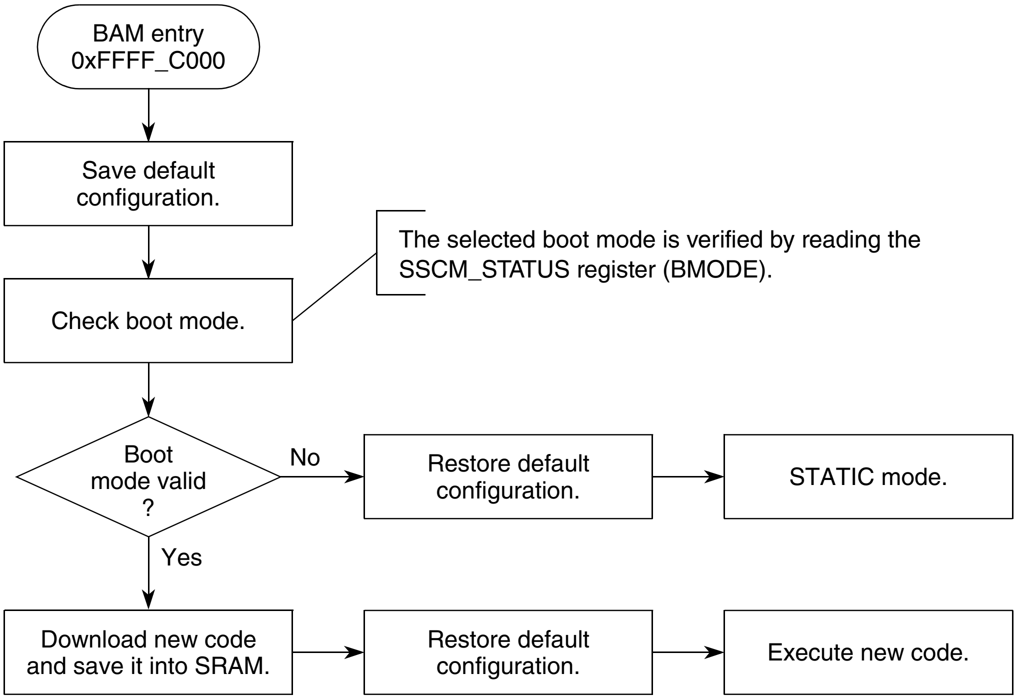
BAM is executed only in one or both of the following cases:

- Serial boot mode has been selected by Force Alternate Boot (FAB) pin.
- Hardware has not found a valid Boot ID in any flash memory boot locations.

If one of these conditions is true, the device fetches code at location 0xFFFF_C000 and the BAM application starts.

55.4.2.2 BAM software flow

The following figure describes the BAM logic flow.



BAM entry
0xFFFF_C000
Save default configuration.
The selected boot mode is verified by reading the SSCM_STATUS register (BMODE).
Check boot mode.
Boot mode valid ?
No
Restore default configuration.
STATIC mode.
Yes
Download new code and save it into SRAM.
Restore default configuration.
Execute new code.

Figure 55-2. BAM logic flow

The first action is to save the initial device configuration. In this way it is possible to restore the initial configuration after downloading the new code but before executing it. This allows the new code to be executed as the device was just coming out of reset.

The SSCM_STATUS[BMODE] field indicates which boot has to be executed (see the following table).

If BMODE field shows either a single chip value (011) or the reserved values, the boot mode is not considered valid and the BAM pushes the device into static mode.

In all other cases data is downloaded in serial boot mode and saved into the correct SRAM location.

Table 55-3. Fields of SSCM_STATUS register read by BAM to detect the chosen boot mode

Field	Description
BMODE	BMODE Device Boot Mode 001 CAN Serial Boot Loader using FlexCAN

Table 55-3. Fields of SSCM_STATUS register read by BAM to detect the chosen boot mode

Field	Description
	010 UART Serial Boot Loader using LINFlexD 011 Single Chip other values are reserved

Then, the initial device configuration is restored and the code jumps to the address provided for the downloaded code. At this point BAM has just finished its task.

If there is any error (that is, communication error, wrong boot selected, etc.), BAM restores the default configuration and puts the device into static mode. Static mode means the device enters the low power mode SAFE and the processor executes a wait instruction. It is needed if the device can not boot in the mode which was selected. During BAM execution and after, the mode reported by the field S_CURRENT_MODE of the register ME_GS in the module MC_ME Module is "DRUN".

55.4.2.3 BAM resources

BAM uses/initializes the following MCU resources:

- MC_ME and MC_CGM modules to initialize mode and clock sources
- CAN_0, LINFlex_0 and their pins when performing serial boot mode
- SWT is disabled in case of a serial boot mode or when entering static mode
- PIT for some time measurement when performing serial boot mode
- SSCM to check the boot mode and during password check (see Table 55-3)
- External oscillator (XOSC)
- SIUL to perform programming of the required GPIO pins

The frequency of the external oscillator defines the baud rate for serial interfaces used to download the user application. For a LINFlexD transmission, the selected baud rate is f_{XOSC} / 832. For a FlexCAN transmission, the selected baud rate is f_{XOSC} / 40.

55.4.2.4 Download and execute the new code

From high level perspective, the download protocol follows these steps:

1. Transmit 64-bit password.
2. Transmit start address, size of downloaded code in bytes and VLE bit.
3. Transmit download data.
4. Execute code from start address.

Each step must be completed before the next step starts.

The communication is done in half duplex manner; any transmission from the host is followed by the MCU transmission.

- Host sends data to MCU and starts waiting
- MCU echoes to host the data received
- Host verifies if echoes are correct
    - if data is correct, the host can continue to send data
    - if data is not correct, the host stops to transmit and MCU must be reset

All multi-byte data structures are sent with MSB first.

A more detailed description of these steps follows.

NOTE

> There must be no stringent timeout condition while the host waits for the echoed data from the MCU; especially after step 2. After receiving the actual size of the data to be transmitted, the BAM must initialize the memory receiving the transmitted data with 64 bit writes to avoid ECC errors due to uninitialized memory.

55.4.2.5 Download 64-bit password and password check

The first 64 bits received represent the password. This password is sent to the Password Check procedure which verifies whether it is correct. The actual processing of the provided password by the Password Check procedure is described in the following table. The Password Check procedure performs the check with a time limiting condition that ensures no more than one check occurs within a certain timeframe. The corresponding timeout by the hardware performing the check works in parallel to the actual download to minimize the download time. In case of secured flash memory, after the timer that locks the hardware checking the password expires:

- If the correct password was supplied, flash memory is now unsecured and BAM continues its task.
- If an incorrect password was supplied, flash memory is still secured; BAM puts the device into static mode.

Table 55-4. Password Check procedure

Flash Secured	Public Password	Password requested	Comment
Yes	No	Password must match the password recorded in the corresponding DCF client	Flash is unsecured when providing the correct private password.
Yes	Yes	FEED_FACE_CAFE_BEEF	Flash is unsecured when providing the correct public password.
No	No	(password is not verified)	There is no benefit in checking the password, since the Flash is readable.
No	Yes	FEED_FACE_CAFE_BEEF	Password is checked, Flash is already unsecured

55.4.2.6 Download start address, VLE bit and code size

The next 8 bytes received by the MCU contain a 32-bit Start Address, the VLE mode bit and a 31-bit code Length as shown in the following figure.

The VLE bit (Variable Length Instruction) is used to indicate for which instruction set the code has been compiled. The BAM supports the download of VLE code.

The Start Address defines where the received data will be stored and where the MCU will branch after the download is finished. The two LSB bits of the Start Address are ignored by the BAM program, such that the loaded code should be 32-bit word aligned.

The Code Length defines the number of data bytes to be loaded.

<table>
<tr><td colspan="2">START_ADDRESS[31:16]</td></tr>
<tr><td colspan="2"></td></tr>
</table>

<table>
<tr><td colspan="2">START_ADDRESS[15:0]</td></tr>
<tr><td colspan="2"></td></tr>
</table>

<table>
<tr><td>VLE</td><td>CODE_LENGTH[30:16]</td></tr>
<tr><td colspan="2"></td></tr>
</table>

<table>
<tr><td colspan="2">CODE_LENGTH[15:0]</td></tr>
<tr><td colspan="2"></td></tr>
</table>

Figure 55-3. Start address, VLE bit and download size in bytes

55.4.2.7 Download data

Each byte of data received is stored into device's SRAM, starting from the address specified in the previous protocol step. It is not verified whether the provided address is a valid address in SRAM or is writable.

The address increments until the number of bytes of data received matches the number of bytes specified in the previous protocol step.

Since the SRAM is protected by a 64-bit wide Error Correction Code (ECC), the BAM performs a series of 64 bit writes to initialize the SRAM are required for the downloaded data. The actual writes are performed in chunks of 32-bit writes. If the last byte received does not fall onto a 32-bit boundary, the BAM fills it with 0 bytes.

Since the SRAM is protected by 32-bit wide Error Correction Code (ECC), BAM always writes bytes into SRAM grouped into 32-bit words. If the last byte received does not fall onto a 32-bit boundary, the BAM fills it with 0 bytes.

Finally a "dummy" word (0x0000_0000) is written to avoid a possible ECC error during core prefetch.

55.4.2.8 Execute code

The BAM program waits for the last echo message transmission being completed.

Then it restores the initial MCU configuration and jumps to the code loaded at Start Address which was received in step 2 of the protocol.

At this point BAM has finished its tasks and MCU is controlled by new code executing from SRAM.

55.4.3 UART Boot

55.4.3.1 Configuration

Boot using the UART protocol is implemented by LINFlex_0 module. Pins used are:

- LINFlex_TX corresponds to pin B[2]
- LINFlex_RX corresponds to pin B[3].

The LINFlexD controller is configured to operate at a baud rate of f_{XOSC} / 832, using 8 bit data frame without parity bit and 1 stop bit.

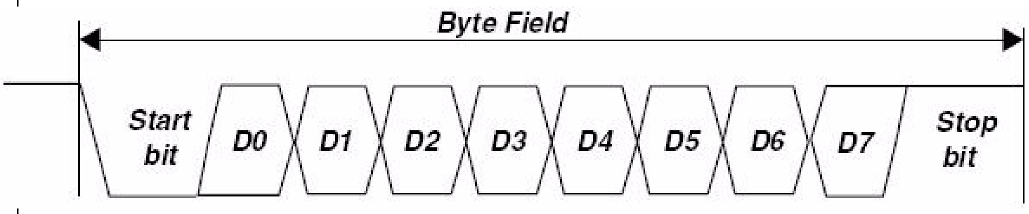


Figure 55-4. LINFlexD bit timing in UART mode

55.4.3.2 Protocol

The following table summarizes the protocol and BAM action during this boot mode.

Table 55-5. UART boot mode download protocol

Protocol step	Host sent message	BAM response message	Action
1	64-bit password (MSB first)	64-bit password	Password checked for validity and compared against stored password.
2	32-bit store address	32-bit store address	Load address is stored for future use.
3	VLE bit + 31-bit number of bytes (MSB first)	VLE bit + 31-bit number of bytes (MSB first)	Size of download is stored for future use. Verify VLE bit.
4	8 bits of raw binary data	8 bits of raw binary data	4 x 8 bits of data are packed into 32-bit words. These words are saved into SRAM starting from the "Load address". "Load address" increments until the number of data received and stored matches the size as specified in the previous step.
5	none	none	Branch to downloaded code

55.4.4 CAN Boot

55.4.4.1 Configuration

Boot using the CAN protocol is implemented by FlexCAN_0 module. Pins used are:

- CAN_TX corresponds to pin B[0]
- CAN_RX corresponds to pin B[1].

Boot from FlexCANuses the system clock driven by the external oscillator.

The FlexCAN controller is configured to operate at a baud rate = system clock frequency/40.

It uses the standard 11 bit identifier format detailed in FlexCAN 2.0A specification.

FlexCAN controller bit timing is programmed with 10 time quanta, and the sample point is 2 time quanta before the end, as shown in the following figure.

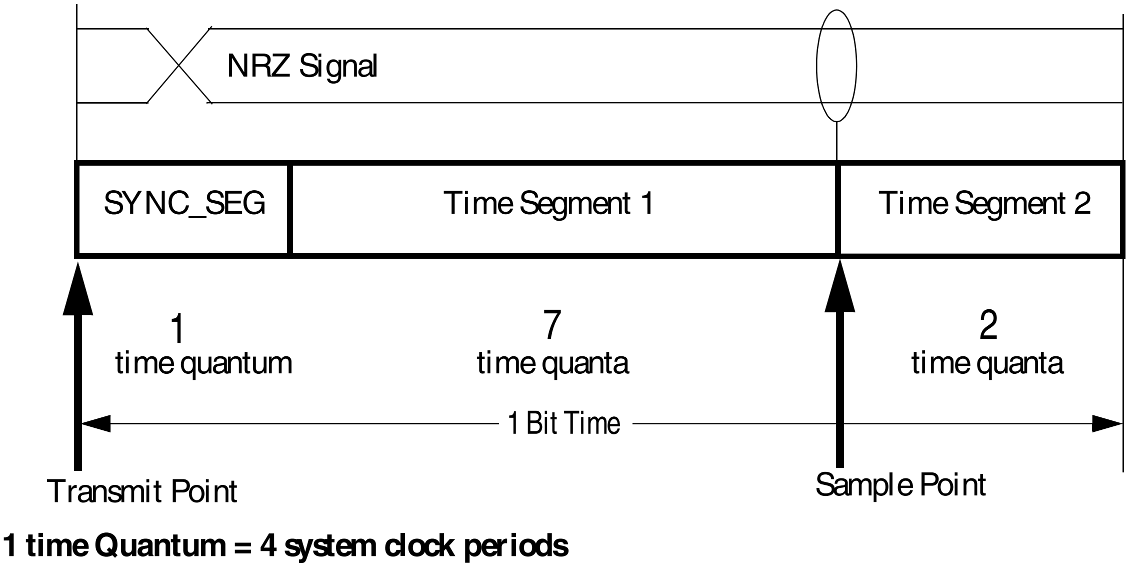

Figure 55-5. FlexCAN bit timing

55.4.4.2 Protocol

The following table summarizes the protocol and BAM action during this boot mode. All data is transmitted byte wise.

Table 55-6. FlexCAN boot mode download protocol

Protocol step	Host sent message	BAM response message	Action
1	FlexCAN ID 0x011+ 64-bit password	FlexCAN ID 0x001+ 64-bit password	Password checked for validity and compared against stored password.
2	FlexCAN ID 0x012+ 32-bit store address+ VLE bit+ 31-bit number of bytes	FlexCAN ID 0x002+ 32-bit store address+ VLE bit+ 31-bit number of bytes	Load address is stored for future use. Size of download are stored for future use. Verify VLE bit.

Table continues on the next page...

Table 55-6. FlexCAN boot mode download protocol (continued)

Protocol step	Host sent message	BAM response message	Action
3	FlexCAN ID 0x013+ 8 to 64 bits of raw binary data	FlexCAN ID 0x003+ 8 to 64 bits of raw binary data	4 x 8 bits of data are packed into 32-bit words. These words are saved into SRAM starting from the "Load address". "Load address" increments until the number of data received and stored matches the size as specified in the previous step.
4	none	none	Branch to downloaded code

55.4.5 Inhibiting BAM operation

Under certain circumstances, you may want to inhibit BAM operation. To do this, set to 1 the RAE field in the SSCM_ERROR register. After this change, any attempt to access the memory range occupied by the BAM results in an access error.

55.4.6 Interrupts

No interrupts are generated or enabled by the BAM.

Chapter 56
System Status and Configuration Module (SSCM)

56.1 Introduction

NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

56.1.1 Overview

The System Status and Configuration Module (SSCM) is pictured in the figure below.

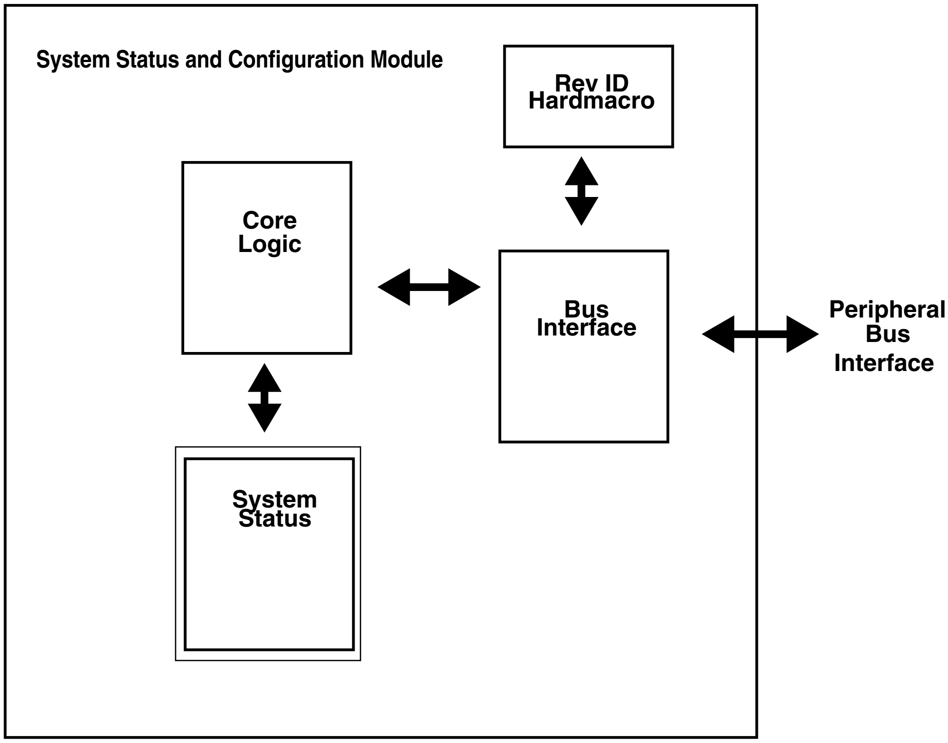

Figure 56-1. SSCM block diagram

56.1.2 Glossary

The table below shows a glossary of terms used through out the text.

Table 56-1. Glossary

Term	Definition
0011b	Binary numbers
0Fh	Hexadecimal numbers
Pin	External physical connection.
Signal	Electronic construct whose state or change in state conveys information.
X	In certain contexts, such as a signal encoding, this indicates a don't care. For example, if a field is binary coded X001b, the state of the first bit is a don't care.
y	y is used for a place holder of 1 hex digit for unknown values.

56.1.3 Features

The SSCM includes these distinct features:

- System Configuration and Status
  - Device Mode and System Status
  - Determine primary boot vector
- Debug Status Port enable and selection
- Bus abort enable/disable
- Peripheral abort enable/disable

56.1.4 Modes of operation

The SSCM operates identically in all system modes.

56.2 External signal description

The SSCM provides a set of pins for the debug port (see Debug Status Port Register (DEBUGPORT) for details).

56.3 Memory map and register definition

This section provides a detailed description of all memory-mapped registers in the SSCM.

The table below shows the memory map for the SSCM. Note that all addresses are offsets; the absolute address may be calculated by adding the specified offset to the base address of the SSCM.

NOTE

All registers are accessible via 8-bit, 16-bit or 32-bit reads and/or writes. However, 16-bit accesses must be aligned to 16-bit boundaries, and 32-bit accesses must be aligned to 32-bit boundaries. As an example, the STATUS register is accessible by a 16-bit read or write, SSCM Base + 02h, but performing a 16-bit access to SSCM Base + 0003h is illegal (that is, you should not make any transfer that is not aligned to burst size boundary).

NOTE

SSCM does not generate transfer errors in all memory holes.

SSCM memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	SSCM System Status (SSCM_STATUS)	16	R	See section	56.3.1/2222
2	SSCM System Memory and ID Register (SSCM_MEMCONFIG)	16	R	See section	56.3.2/2224
6	SSCM Error Configuration Register (SSCM_ERROR)	16	R/W	0000h	56.3.3/2225
8	SSCM Debug Status Port Register (SSCM_DEBUGPORT)	16	R/W	0000h	56.3.4/2225
20	User Option Status Register (SSCM_UOPS)	32	R	See section	56.3.5/2227
28	Processor Start Address Register (SSCM_PSA)	32	R	See section	56.3.6/2227

56.3.1 SSCM System Status (SSCM_STATUS)

The System Status register reflects the current state of the system.

Address: 0h base + 0h offset = 0h

Bit	0	1	2	3	4	5	6	7
Read	0	CER	CERS	0	NXEN	PUB	SEC	0
Write		w1c	w1c					
Reset	0	0	0	0	*	*	*	0

Bit	8	9	10	11	12	13	14	15
Read	BMODE			VLE	0	0	0	
Write								
Reset	*	*	*	*	0	0	0	0

* Notes:

- VLE field: Reset value depends on the associated option bits in flash memory.
- BMODE field: Reset value depends on the device status after leaving reset.
- SEC field: Reset value depends on the device status after leaving reset.
- PUB field: Reset value depends on the device status after leaving reset.
- NXEN field: Reset value depends on the device status after leaving reset.

SSCM_STATUS field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 CER	Configuration Error This field indicates that the SSCM has detected a configuration error during reset while loading initial device configuration. See the chip-specific SSCM information for details about sources of the error. If a non-permanent error is detected, this bit can be cleared by writing a 1. Refer to CERS-DCF Mechanism section. 0 No configuration problem detected by the SSCM 1 Device configuration is not correct
2 CERS	Configuration Error for Safe DCF Clients This field indicates that the SSCM has detected a configuration error during reset while loading the Safe DCF Clients (DCF client with SPRD ADDR enabled, Triple Voting Enabled). If a non-permanent error is detected, this bit can be cleared by writing a 1. Refer to CERS-DCF Mechanism section. 0 No configuration problem detected by the SSCM 1 Device configuration is not correct
3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

SSCM_STATUS field descriptions (continued)

Field	Description
4 NXEN	Processor 0 Nexus enable status 0 Processor 0 Nexus disabled. 1 Processor 0 Nexus enabled
5 PUB	Public Serial Access Status This bit indicates whether serial boot mode with public password is allowed. **NOTE:** Reset value depends on the device status after leaving reset. 0 Serial boot mode with private flash memory password is allowed. 1 Serial boot mode with public password is allowed.
6 SEC	Security Status This bit reflects the current security state of the Flash. **NOTE:** Reset value depends on the device status after leaving reset. 0 The flash memory is not secured 1 The flash memory is secured
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8–10 BMODE	Device Boot Mode This field is only updated during reset. 001 CAN Serial Boot Loader 010 SCI Serial Boot Loader 011 Single Chip(no Boot flash memory)
11 VLE	Variable Length Instruction Mode When booting in SC mode, this field indicates that the code stored in the flash memory is using the VLE instruction set. The value of this field is determined by the RCHW field of the flash memory boot sector. **NOTE:** Reset value depends on the associated option bits in flash memory. 0 SC Boot Location contains standard PPC code 1 SC Boot Location contains VLE code
12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

56.3.2 SSCM System Memory and ID Register (SSCM_MEMCONFIG)

The System Memory and ID register is a read-only register which reflects the memory configuration of the system. It also contains the JTAG ID.

Address: 0h base + 2h offset = 2h

Bit	0	1	2	3	4	5	6	7
Read	JPIN							
Write								
Reset	*	*	*	*	*	*	*	*

Bit	8	9	10	11	12	13	14	15
Read	JPIN		IVLD	MREV				DVLD
Write								
Reset	*	*	*	*	*	*	*	*

* Notes:
- DVLD field: Reset value depends on boot mode and security status.
- MREV field: Reset value can be found in the SSCM Configuration section.
- IVLD field: Reset value depends on boot mode and security status.
- JPIN field: Reset value reflects the JTAG ID of the device.

SSCM_MEMCONFIG field descriptions

Field	Description
0–9 JPIN	JTAG Part ID Number **NOTE:** Reset value reflects the JTAG ID of the device.
10 IVLD	Instruction flash memory Valid This bit identifies whether or not the on-chip instruction flash memory is accessible in the system memory map. The Instruction flash memory may not be accessible due to security limitations, or because there is no instruction flash memory in the system. **NOTE:** Reset value depends on boot mode and security status. 0 Instruction Flash is not accessible 1 Instruction Flash is accessible
11–14 MREV	Minor Mask Revision
15 DVLD	Data flash memory Valid This bit identifies whether or not the on-chip data flash memory is visible in the system memory map. The data flash memory may not be accessible due to security limitations, or because there is no data flash memory in the system. **NOTE:** Reset value depends on boot mode and security status.

Table continues on the next page...

SSCM_MEMCONFIG field descriptions (continued)

Field	Description
	0 Data Flash is not visible 1 Data Flash is visible

56.3.3 SSCM Error Configuration Register (SSCM_ERROR)

The Error Configuration register is a read-write register that controls the error handling of the system.

Address: 0h base + 6h offset = 6h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Read	0														PAE	RAE
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SSCM_ERROR field descriptions

Field	Description
0–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 PAE	Peripheral Bus Abort Enable. This bit enables bus aborts on: • any access to a peripheral slot that is not used on the device. • This feature is intended to aid in debugging when developing application code. • illegal accesses to off-platform peripherals. • On platform peripherals cannot be controlled by SSCM peripheral abort. 0 Illegal accesses to non-existing peripherals do not produce a Prefetch or Data Abort exception 1 Illegal accesses to non-existing peripherals produce a Prefetch or Data Abort exception
15 RAE	Register Bus Abort Enable. This bit enables bus aborts on illegal accesses to off-platform peripherals. Illegal accesses are defined as reads or writes to reserved addresses within the address space for a particular peripheral. This feature is intended to aid in debugging when developing application code. **NOTE:** Transfers to peripheral bus resources may be aborted even before they reach the peripheral bus (in example, at the AIPS level). In this case, the PAE and RAE register bits have no effect on the abort. 0 Illegal accesses to peripherals do not produce a Prefetch or Data Abort exception 1 Illegal accesses to peripherals produce a Prefetch or Data Abort exception

56.3.4 SSCM Debug Status Port Register (SSCM_DEBUGPORT)

The Debug Status Port register is used to (optionally) provide debug data on a set of pins.

Table 56-2. Debug status port modes

Pin [1]	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7
0	STATUS[0]	STATUS[8]	MEMCONFIG[0]	MEMCONFIG[8]	Reserved	Reserved	Reserved
1	STATUS[1]	STATUS[9]	MEMCONFIG[1]	MEMCONFIG[9]	Reserved	Reserved	Reserved
2	STATUS[2]	STATUS[10]	MEMCONFIG[2]	MEMCONFIG[10]	Reserved	Reserved	Reserved
3	STATUS[3]	STATUS[11]	MEMCONFIG[3]	MEMCONFIG[11]	Reserved	Reserved	Reserved
4	STATUS[4]	STATUS[12]	MEMCONFIG[4]	MEMCONFIG[12]	Reserved	Reserved	Reserved
5	STATUS[5]	STATUS[13]	MEMCONFIG[5]	MEMCONFIG[13]	Reserved	Reserved	Reserved
6	STATUS[6]	STATUS[14]	MEMCONFIG[6]	MEMCONFIG[14]	Reserved	Reserved	Reserved
7	STATUS[7]	STATUS[15]	MEMCONFIG[7]	MEMCONFIG[15]	Reserved	Reserved	Reserved

[1] All signals are active high, unless otherwise noted

Address: 0h base + 8h offset = 8h

Bit	0	1	2	3	4	5	6	7
Read	Reserved							Reserved

* Notes:

- SADR field: Reset value is the start address

SSCM_PSA field descriptions

Field	Description
0–31 SADR	Processor Start Address The boot processor will start executing application code from this address.In SC mode this indicates the location determined by the RCHW search.In the case of a serial download, this register will point to the BAM start location.

56.4 Functional description

The primary purpose of the SSCM is to provide information about the current state and configuration of the system that may be useful for configuring application software and for debug of the system.

56.4.1 DCF mechanism

The DCF mechanism has been developed to handle settings of device parameters via OTP flash memory.

Starting at location UTEST_OFFSET the user can store a series of DCF records - the device will process these records during the system reset sequence before the CPU leaves reset. The first record needs to be a start record followed by an application-specific number of data records as required, and finally a stop record.

Each record is 64 bits in length. Table 56-3 shows the DCF start record. The start record must be placed at UTEST_OFFSET to indicate to the device that the following data records should be processed.

Table 56-3. DCF start record

0:31
05AA 55AFh
0:31
0000 0000h

The data records are structured similar to a CPU write instruction - 15 bits of client select, 15 bits of address, 32 bits of payload data plus a STOP bit - See Table 56-4. In a data record the STOP bit must always be programmed to 0. Some clients support a parity bit.

Table 56-4. Format of a DCF data record

0:31
WDATA[31:0]

0:14	15:29	30	31
CS[14:0]	ADDR[16:2]	PRTY	STOP

The stop record indicates that processing should stop. The general format of the stop record is shown in Table 56-5. Only the STOP bit needs to be 1 in order to form a stop record – All other bits are ignored. An unprogrammed location in UTEST flash will be interpreted as a stop record.

Table 56-5. DCF stop record

0:30	31
rsvd	1

0:31
rsvd

If *n* data records are to be stored in UTEST, the data structure must be as shown in Table 56-6.

Table 56-6. Series of DCF records in UTEST

ADDR offset	DATA			
00h	05AA 55AFh			
04h	0000 0000h			STOP=0
08h	WDATA[31:0]			
0Ch	CS[14:0]	ADDR[16:2]	PRTY	STOP=0
10h	WDATA[31:0]			
14h	CS[14:0]	ADDR[16:2]	PRTY	STOP=0
…	…			
8n - 1 + 0h	reserved			
8n - 1 + 4h	reserved			1
8n + 0h				
8n + 4h				

There must never be an unprogrammed record in the data structure, as that would be interpreted as a stop record, so subsequent records would be ignored. This allows programming the records in several sessions, each time appending new records at the end of the list, as shown in Figure 56-2.

Initial Programming

Extension

Figure 56-2. Appending DCF records

In this case, a record may overwrite a client's value which was already set by a previous record. However whether such an operation is allowed depends on the rules given for the client - some clients are write-once, only allow setting bits but not clearing, and so on.

The parity bit (PRTY) is required for some DCF records. The parity scheme used is even parity, so the number of 1s in the WDATA and PRTY fields needs to be even. (For example, if the WDATA field has the value 0000_0001h then the PRTY field needs to be set to 1, so that the total number of 1s is even.)

NOTE

When programming DCF records, ensure that programming is not interrupted and can complete without error.

56.4.2 CERS-DCF Mechanism

The figure below shows that a faulty DCF record has been loaded between the original DCF record set and the final DCF record set. When a faulty DCF record is encountered, the SSCM_STATUS[CERS] field indicates that the device configuration is not correct. In a situation like the one shown below, CERS can be cleared by writing 1 to it, as long as the final DCF record set is correct.

If there is an error in the final set of loaded DCF records, CERS cannot be cleared. This situation indicates that the final DCF record set has at least one error. To fix this, the user should update flash memory after the faulty DCF record with a correct DCF record of the same type. For example, if the faulty DCF record is DCF2, then the correct DCF record should also be DCF2.

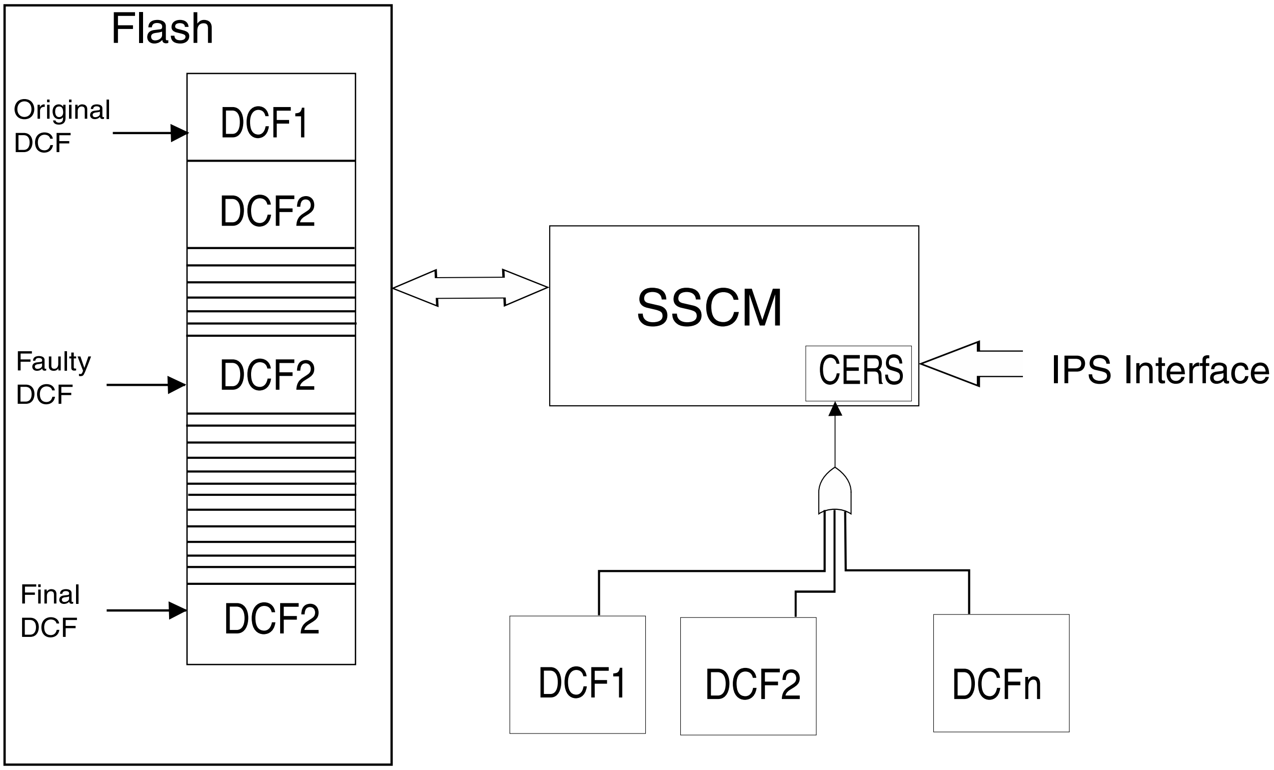

Figure 56-3. DCF Error and CERS Handling

56.4.3 Boot mode functionality

The device supports the following boot modes for the main boot core:

- Single Chip (SC) - The device will boot from the first bootable section of the flash memory main array.
- Serial Boot (SBL) - The device will download boot code from either SCI or CAN interface and then execute it.

If booting is not possible with the selected configuration (for example, no Boot ID is found in the selected boot location) then the device will enter static mode.

56.4.4 Hardware configuration

The device will detect the boot mode based on external pins and device status. The following sequence applies:

- If the FAB (Force Alternate Boot Mode) pin is set to boot in serial mode the device can be forced into an Alternate Boot Loader Mode. The type of alternate boot mode is selected according to the ABS (Alternate Boot Selector) pins (See Table 56-7). For details of the serial boot modes please refer to the BAM/System Boot chapter.
- If the device identifies a flash memory sector with a valid boot sector, it will boot from the lowest sector. (See Figure 56-4.)
- If none of the flash memory sectors contains a valid boot signature, the device will go into static mode.

Table 56-7. Hardware Configuration

FAB	ABS 2, 0	Boot ID	Boot Mode
1	0 0	–	Serial Boot SCI
1	0 1	–	Serial Boot CAN
0	–	valid	SC (Single Chip)
0	–	not found	Static Mode

NOTE

All combinations not listed in the table above are not supported.

56.4.5 Single Chip boot sector search

56.4.5.1 Potential boot sectors

As shown in Figure 56-4 in single chip mode, several locations are searched for a valid boot ID. The lowest sector that starts with a valid boot ID is used to boot the device.

For the flash memory locations that are searched on this device, see the chip-specific details about boot locations in flash memory.

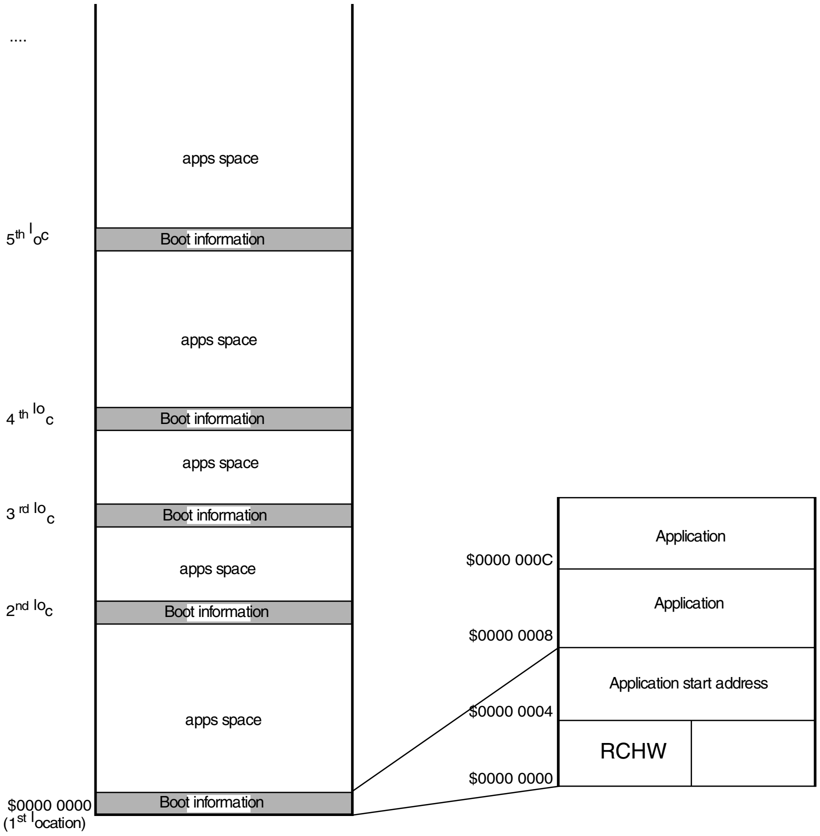

Figure 56-4. Flash memory partitioning and RCHW search

56.4.5.2 Reset Configuration Half-Word

Each boot sector in flash memory contains the Reset Configuration Half-Word (RCHW) at offset 00h. If the RCHW field BOOT_ID holds the value 5Ah then the sector is considered bootable. In addition, there is a flag which indicates that the code is VLE code. (If a device only supports VLE code for future compatibility the flag must always be set to 1.) All other bits are reserved.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0	0	0	0	0	0	0	VLE	BOOT_ID							
W	▨	▨	▨	▨	▨	▨	▨	▨	▨	▨	▨	▨	▨	▨	▨	▨
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

▨ = Reserved

Once the device detects that it needs to boot from flash memory, and finds a valid BOOT_ID, it will boot from the application start address at offset 04h within the boot sector.

NOTE

When programming any of the locations in the RCHW list, ensure that programming is not interrupted and can complete without error. When erasing any block containing any of the locations in the RCHW list, ensure that the erase is not interrupted (especially by reset or loss of power).

56.4.5.3 Boot and alternate boot sectors

Some applications require an alternate boot sector so that the main boot can be erased and reprogrammed in the field.

When an alternate boot is needed, the user can create two bootable sectors; the lowest sector shall be the main boot sector and the highest shall be the alternate boot sector. The alternate boot sector does not need to be consecutive to the main boot sector.

This scheme ensures that there is always one active boot sector by erasing one of the boot sectors only:

- Sector is activated (that is, program a valid BOOT_ID instead of FFh as initially programmed).
- Sector is deactivated by writing 0 to some bits of the BOOT_ID field (bit 1 and/or bit 3, and/or bit 4, and/or bit 6).

56.4.6 Serial boot loader mode

56.4.6.1 Serial boot loader mode - public password enabled

In Serial Boot Loader Mode, if public serial access is allowed, the MCU executes BAM code which will check for a valid public password on the chosen interface. The interface will be selected via FAB and ABS pins.

- Nexus/JTAG available
- Boot from BAM
- Flash memory main array and shadow block access disabled

56.4.6.2 Serial boot loader mode - flash memory password enabled

It's possible to boot in Serial Boot Loader Mode when serial access with password is selected. The MCU executes BAM code which will check for a valid flash memory password on the chosen interface. If the password is known, full access to the device is enabled.

- Nexus/JTAG available
- Boot from BAM
- Flash memory main array and UTEST block access possible

56.4.7 Security

The censorship mechanism implemented on the device is intended to increase the protection against unauthorized access to the device. The mechanisms employed does not provide a guarantee of a secure device. It can only be deemed effective if used in conjunction with an appropriately robust software and documentation infrastructure to assist in guarding against unauthorized access to device resources.

When the Flash is censored, the MCU is in the Secured state. This feature intends to prevent the unauthorized read and write of memory contents. Which device features are enabled or disabled is determined by the chip mode and security state in effect.

The user needs to keep in mind that part of the security must lie with the application code. As an extreme example: it would be possible to generate application code that dumps the contents of the internal program - obviously this code would defeat the purpose of security. However there may be good reasons to provide a back door in the application code. Care must be taken when implementing these backdoors, since they allow paths of attack to break security on the device.

56.4.7.1 Securing the microcontroller

The device can be secured by adding a Non-Volatile System Censorship Information (NVSCI) record to the DCF record list in the UTEST Flash block (Table 56-8).

Table 56-8. NVSCI DCF record

0:31	
Serial Boot Control	Censorship Control

0:31
0100_000Ch

A value of 55AAh in the censorship control word of the NVSCI record determines that the device is unsecured, any other value determines that the device is secured.

By factory default the device has been programmed with a DCF record in UTEST with the value 55AA_55AAh. (For the function of the Serial Boot Control word see Serial access security.)

The device supports a backdoor to unsecure the device via a 64 bit password, which is programmed in two records (Non-Volatile Password Low (NVPWDL) and Non-Volatile Password High (NVPWDH)). (Table 56-9 and Table 56-10).

Table 56-9. NVPWDH DCF record

0:31
Password High
0:31
0100_0008h

Table 56-10. NVPWDL DCF record

0:31
Password Low
0:31
0100_0004h

By default there is no backdoor password. In order to define one the two DCF records need to be added to the list.

To protect against voltage manipulations, each 16-bit halfword needs to contain both 1's and 0's. Below are examples for legal and illegal passwords:

Illegal Passwords	Legal Passwords
0000_0000_0000_0000h	0001_0010_0100_1000h
FFFF_FFFF_FFFF_FFFFh	FFFE_FFFE_FFFE_FFFEh
FFFF_0000_FFFF_FFFFh	FFF0_000F_0FFF_0FFFh
0000_0000_0000_FFFFh	1000_1000_1000_FFFEh
AAAA_AAAA_AAAA_0000h	AAAA_AAAA_AAAA_0001h

To deactivate the backdoor password ("swallowing the key") the records can be programmed to have the data value 0000_0000_0000_0000h.

However once this is done neither the manufacturer nor the user can unlock device security again, other than by triggering a factory erase mechanism. Of course, application code can still implement a different backdoor scheme if there are special requirements which are not covered by the available mechanism.

56.4.7.2 Unsecuring the microcontroller

To unsecure a secured device, the backdoor password needs to be provided. This can be done by booting in SBL mode and providing the backdoor password via the serial bootloader protocol (please refer to the BAM chapter) or via JTAG command.

If SBL mode was used in conjunction with the backdoor password, the password comparison result will only be known after a delay - this is in order to avoid brute-force attacks. The data can be downloaded into SRAM during this delay.

Note

> The scheme used here does not prohibit a malicious listener from capturing the password of a valid serial download, since the key is not in encrypted form. The user must take appropriate measures to protect against access by third parties during a valid download.

If the password is correct, the device is temporarily unsecured. In this state the a new backdoor password can be programmed by adding NVPWD records or new application data can be programmed into the flash memory.

It's also possible to unlock the device via JTAG. For this the device needs to be held in reset by asserting the external reset input. Once the flash memory has completed it's internal sequence, the JTAG register CENSOR_CTRL can be written with the password in bits 63:0 and with bit 64 set to 1. The password comparator will compare the password and unsecure the device if it's correct, if serial access with the backdoor password is allowed, and if the device hasn't swallowed the key. (Only one transition on bit 64 from 0 to 1 is allowed.) The debugger needs to wait until the device is unlocked, after that a breakpoint can be set if desired, and the debugger can release the reset. The device will remain unsecured until the next reset event occurs.

NOTE

> When external reset which is configured to generate long functional reset is applied, device will become secure until correct password is loaded by DCF again. Hence debugger will get disconnected on occurrence of long external reset.

56.4.7.3 Software unsecure

Since the security state of the device is determined solely by a set of DCF records in the UTEST block, any application may choose to implement a software unsecure method, through any interface.

56.4.8 Serial access security

If booted in SBL mode, the device can be accessed via a serial interface. It is possible to use either the public or backdoor password in SBL mode. The setting of the Serial Boot Control word in the NVSCI record determines which password will be used (see Hardware configuration). If it contains the value 55AAh, and the device is secured, the backdoor password must be used. If it contains any other value, the public password must be used.

NOTE

Any password is allowed if the device is unsecured.

Access to flash memory depends on the configuration of both the Serial Boot Control and Censorship Control fields in the NVSCI. An unsecured device always allows access to flash memory regardless of the Serial Boot Control field configuration. The flash memory will not be visible if public password access is used with a secured device. If backdoor password access is used, device security is disabled and flash memory will be visible.

The application may wish to prohibit access via the serial connection. On a secured device, this can be accomplished by programming Serial Boot Control field to 55AAh, which mandates the use of the backdoor password, or programming the NVPWD records so the password is 0000_0000_0000_0000h making the backdoor password invalid (swallowing the key) (see Table 56-10 and Table 56-9).

However, it should be carefully evaluated whether this scenario is desirable. If programmed as described above, there is no longer the possibility of allowing the manufacturer to run diagnostics on a returned device apart from erasing the flash memory. Also, it will not be possible to update application software. This does not apply if the user decides to implement an alternative backdoor scheme in software (see Software unsecure).

56.5 Initialization and application information

56.5.1 Reset

The reset state of each individual bit appears in the detailed register descriptions.

56.6 Additional safety measures

56.6.1 Spurious reset protection

The SSCM implements protection against spurious module resets (for example, resets which only effect the SSCM, but not other modules) by gating the state machines status with the expected status of the MC_RGM. If a spurious reset occurs, the SSCM will not interfere with the flash memory bus or overwrite configuration registers. However, internal SSCM status will be lost.

Chapter 57
Power Management Controller block (PMC)

57.1 Introduction

57.1.1 PMC Introduction

The power management controller (PMC) consists of two blocks: analog block and a digital block. This describes the digital block of the PMC.

The PMC block, shown below, contains all of the registers and digital logic to generate all of the enable signals, trim control bits, power on resets (PORs), and test mode logic for the analog block. The PMC digital logic also controls the PMC analog outputs that are to be sensed by the Analog-to-Digital Converter (ADC) module.

The PMC digital logic also provides the enable signals, trim bits and other registers for the temperature sensors.

Custom interfaces are provided to each of:

- The Reset Generation Module (MC_RGM) block, which receives low voltage detect (LVD) values that are used for phase transition conditions during POR.
- The Flash memory, via the SSCM (and DCF client blocks), provides trim values for use during initial POR.

:

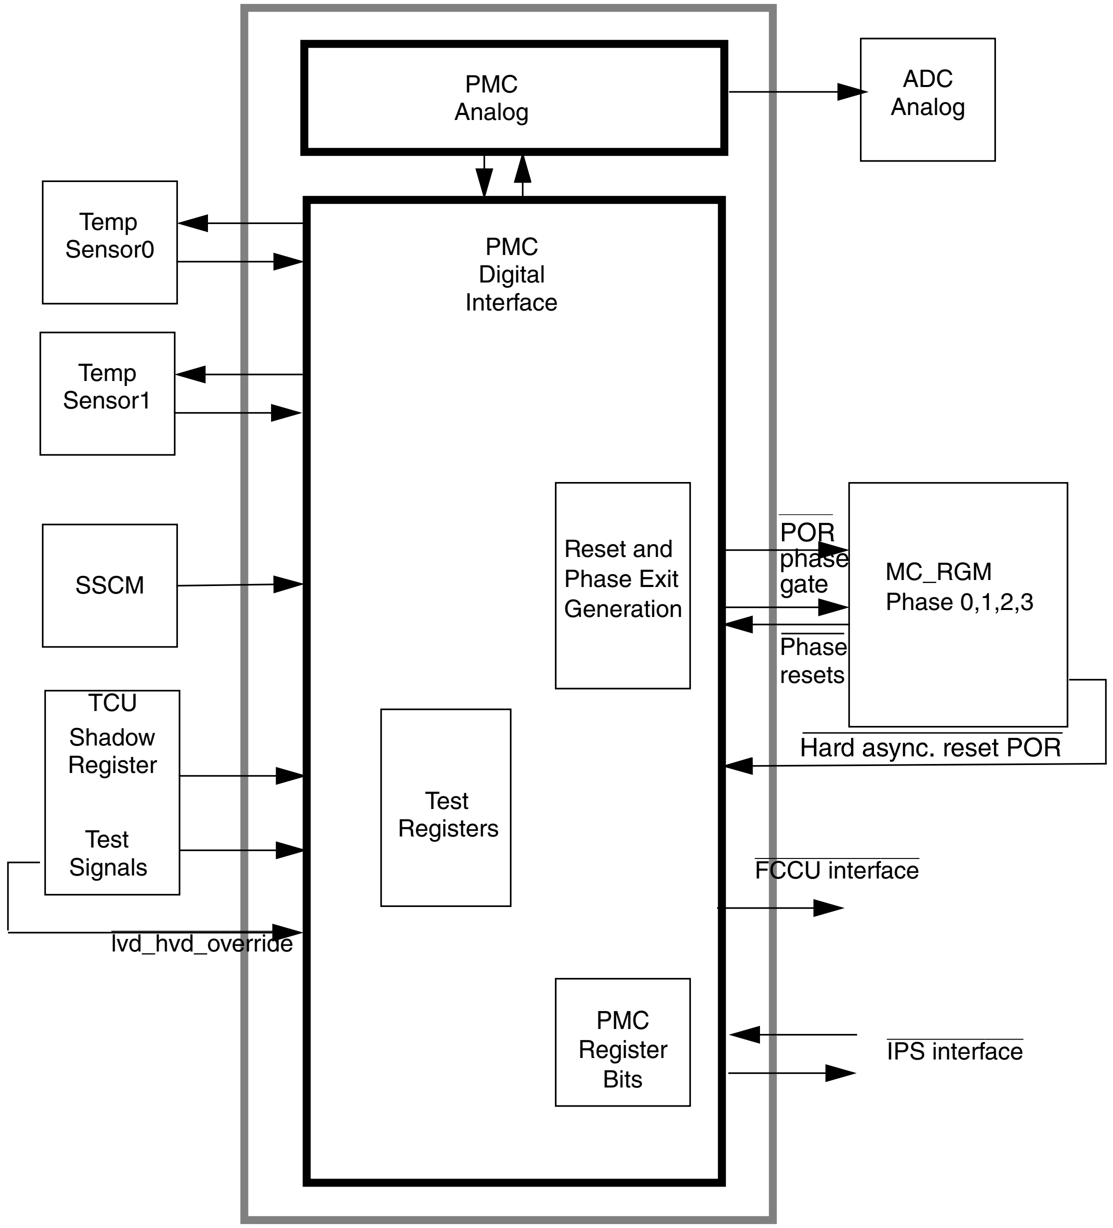

Figure 57-1. Digital PMC block diagram

57.1.2 Features

The PMC module provides:

- Configuration and control information to the analog PMC block.
- An interface with the TCU block for test related controls.

- An interface with Flash memory for retrieval of trim/control information, during POR, for HVDs, LVDs, regulators, and band gap filters.
- Necessary status and indication information to the MC_RGM block during power up.
- Configuration and monitoring of the two temperature sensors.
- Interrupt or reset generation for HVDs and LVDs (based on the configuration).
- Host access, via the IPS bus, to all register controls, configurations, and status.
- Self test logic for the LVDs and HVDs.
- Software triggered fault injection to the FCCU for LVDs, HVDs, temperature sensors, and LVD self test.

57.2 Memory Map and Registers

The PMC includes many registers for configuring, monitoring, and trimming the regulators and the LVD/HVD monitors.

Field	Description
21 Reserved	This field is reserved. Always write as 0.
22–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 Reserved	This field is reserved. Always write as 0.
25–26 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
27 Reserved	This field is reserved. Always write as 0.
28 Reserved	This field is reserved. Always write as 0.
29 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
30 INT_AUX_REG_ BYPASS	Internal Auxiliary Regulator Bypass. This bit indicates which Aux Regulator is selected for the device's operation. **NOTE:** The Internal Auxiliary Regulator is not required for normal operation. The user can enable it if undershoots or overshoots occur when operating with the Internal Regulator. 0 Internal Aux Regulator active 1 Internal Aux Regulator disabled
31 INT_REG_ BYPASS	Internal Regulator Bypass. This bit indicates the Regulator selected for the device's operation. 0 Internal Regulator active 1 Internal Regulator disabled, External Regulator active

57.2.4 Interrupt Enable Register (PMC_IER)

This configuration register contains a set of Interrupt Enable bits that correspond to each of the Event Status Registers (ESR_0). These bits indicate whether an interrupt occurs when the voltage event is seen. A '0' indicates that no interrupt is to be sent, and a '1' indicates that an interrupt is to occur when the voltage detect event occurs. These bits are enabled via a write of one to the MSB of this register (IE_EN). After this, these bits can be read or written at any time.

NOTE

If an interrupt is enabled for an LVD/HVD, the FCCU fault corresponding to the LVD/HVD must be disabled in the FCCU.

Address: 0h base + 10h offset = 10h

Field	Description
	0 No interrupt occurs. 1 An interrupt occurs.
6 TS0_2IE	Temperature Sensor 0 input 2 Interrupt Enable. This bit determines whether an interrupt is seen by the system when the temperature rises above its corresponding threshold (flag1). 0 No interrupt occurs. 1 An interrupt occurs.
7 TS0_0IE	Temperature Sensor 0 input 0 Interrupt Enable. This bit determines whether an interrupt is seen by the system when the temperature falls below its corresponding threshold. 0 No interrupt occurs. 1 An interrupt occurs.
8–16 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
17 VD6IE_O	Voltage Detect 6 Interrupt Enable Oscillator. This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs. 1 An interrupt occurs.
18 VD6IE_ADC	Voltage Detect 6 Interrupt Enable Analog-to-Digital Converter. This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs. 1 An interrupt occurs.
19 VD6IE_IM	Voltage Detect 6 Interrupt Enable Input-output Main. This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs. 1 An interrupt occurs.
20 VD6IE_F	Voltage Detect 6 Interrupt Enable Flash. This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs. 1 An interrupt occurs.
21 VD6IE_C	Voltage Detect 6 Interrupt Enable Cold. This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs. 1 An interrupt occurs.
22–23 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

PMC_IER field descriptions (continued)

Field	Description
24 VD4IE_C	Voltage Detect 4 Interrupt Enable Cold. This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs. 1 An interrupt occurs.
25–26 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
27 VD3IE_H	Voltage Detect 3 Interrupt Enable Hot This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs 1 An interrupt occurs
28 VD3IE_C	Voltage Detect 3 Interrupt Enable Cold. This bit determines whether an interrupt is seen by the system when the voltage detect event occurs. 0 No interrupt occurs. 1 An interrupt occurs.
29–31 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.

57.2.5 Event Status Register 0 (PMC_ESR_0)

This status register contains the latched status of the Voltage detect events. These bits indicate the state of the voltage detect events including whether a voltage level event has occurred at any time in the past but has not been cleared (via the writing '1'). These bits are read only, and they are cleared by writing a one to the corresponding ESR register.

Address: 0h base + 20h offset = 20h

PMC_ESR_0 field descriptions

Field	Description
0–9 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	Reserved This field is reserved.
11 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

PMC_ESR_0 field descriptions (continued)

Field	Description
12 Reserved	Reserved This field is reserved.
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 Reserved	Reserved This field is reserved.
15–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 VD6_O	Voltage Detect 6 Oscillator low-voltage detect flag. This read-only bit is the low-voltage status flag associated with the voltage level detect for the high voltage OSC supply. It is asserted when the supply falls below its corresponding LVD threshold, and clears on writing '1'. 0 No occurrence has happened 1 LVD occurrence detected on the high voltage OSC supply.
18 VD6_ADC	Voltage Detect 6 Analog-to-Digital low-voltage detect flag. This read-only bit is the low-voltage status flag associated with the voltage level detect for the high voltage ADC supply. It is asserted when the supply falls below its corresponding LVD threshold, and clears on writing '1'. 0 No occurrence has happened. 1 LVD occurrence detected on the high voltage I/O ADC supply.
19 VD6_IM	Voltage Detect 6 Input-output Main low-voltage detect flag. This read-only bit is the low-voltage status flag associated with the voltage level detect for the high voltage V I/O main supply. It is asserted when the supply falls below its corresponding LVD threshold, and clears on writing '1'. 0 No occurrence has happened. 1 LVD occurrence detected on the high voltage I/O main supply.
20 VD6_F	Voltage Detect 6 Flash low-voltage detect flag. This read-only bit is the low-voltage status flag associated with the voltage level detect for the high voltage flash supply. It is asserted when the supply falls below its corresponding LVD threshold, and clears on writing '1'. 0 No occurrence has happened. 1 LVD occurrence detected on the high voltage flash supply.
21 VD6_C	Voltage Detect 6 Cold low-voltage detect flag. This read-only bit is the low-voltage status flag associated with the voltage level detect for the high voltage cold point supply. It is asserted when the supply falls below its corresponding LVD threshold, and clears on writing '1'. 0 No occurrence has happened. 1 LVD occurrence detected on the high voltage cold point supply.
22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

PMC_ESR_0 field descriptions (continued)

Field	Description
23 Reserved	Reserved This field is reserved.
24 VD4_C	Voltage Detect 4 Cold high-voltage detect flag. This read-only bit is the high-voltage status flag associated with the voltage level detect for the high-voltage cold point supply. It is asserted when the supply rises above its corresponding HVD threshold, and clears on writing '1'. 0 No occurrence has happened. 1 HVD occurrence detected on the high-voltage supply.
25–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 VD3_H	Voltage Detect 3 Hot low-voltage detect flag. This read-only bit is the low-voltage status flag associated with the voltage level detect for the low voltage hot point supply. It is asserted when the supply falls below its corresponding LVD threshold, and clears on writing '1'. 0 No occurrence has happened. 1 LVD occurrence detected on the low voltage core supply.
28 VD3_C	Voltage Detect 3 Cold low-voltage detect flag. This read-only bit is the low-voltage status flag associated with the voltage level detect for the low voltage hot point supply. It is asserted when the supply falls below its corresponding LVD threshold, and clears on writing '1'. 0 No occurrence has happened. 1 LVD occurrence detected on the low voltage core supply.
29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 Reserved	Reserved This field is reserved.
31 Reserved	Reserved This field is reserved.

57.2.6 Reset Event Enable 0 (PMC_REE_0)

This Reset Event Enable Register controls whether the voltage detect signal event causes a reset. If the desired flag bit is enabled, the voltage detect event causes a reset to be generated when the selected voltage passes the trigger event.

The register's reset value applies until the portion of the boot sequence that loads a value for the register from a DCF record in the UTEST area of flash memory. The user can change the loaded value by programming a new DCF record in the UTEST area. If the loaded value programs any flag bit to be enabled (set to 1), the bit cannot be disabled (cleared to 0) by software through IPS programming.

Address: 0h base + 30h offset = 30h

20 VD6RE_F	Voltage Detect 6 Reset Enable Flash. This bit determines whether an reset is seen by the system when the voltage detect event occurs. 0 No reset occurs. 1 An reset occurs.

Table continues on the next page...

PMC_REE_0 field descriptions (continued)

Field	Description
21 VD6RE_C	Voltage Detect 6 Reset Enable Cold (PMU supply: 3.3 V) This bit determines whether an reset is seen by the system when the voltage detect event occurs. 0 No reset occurs. 1 An reset occurs.
22–23 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
24 VD4RE_C	Voltage Detect 4 Reset Enable Cold (Core HVD: 1.25 V). This bit determines whether an reset is seen by the system when the voltage detect event occurs. 0 No reset occurs. 1 An reset occurs.
25–26 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
27 VD3RE_H	Voltage Detect 3 Reset Enable Hot (Core LVD: 1.25 V). This bit determines whether an reset is seen by the system when the voltage detect event occurs. 0 No reset occurs. 1 An reset occurs.
28 VD3RE_C	Voltage Detect 3 Reset Enable Cold (Core LVD: 1.25 V). This bit determines whether an reset is seen by the system when the voltage detect event occurs. 0 No reset occurs. 1 An reset occurs.
29–31 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.

57.2.7 Reset Event Selection 0 (PMC_RES_0)

This Reset Event Select Register controls whether the voltage detect signal event causes a destructive or functional reset. If the desired flag bit is enabled, the voltage detect event causes either a destructive or functional reset to be generated when the selected voltage passes the trigger event.

NOTE

If a functional reset is enabled for an LVD/HVD, the FCCU fault corresponding to the LVD/HVD must be disabled in the FCCU. The user should configure a functional reset for an

LVD/HVD only for debugging purposes and never for any actual application.

28 VD3RES_C	Voltage Detect 3 Reset Event Select Cold. This bit determines whether a functional reset or destructive reset is generated when the voltage detect event occurs. 0 Destructive reset generated. 1 Functional reset generated.
29–31 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.

57.2.8 FCCU Fault Injection Register (PMC_FIR)

This FCCU Fault Injection register enables the user s/w to artificially generate FCCU faults corresponding to various Events, namely LVD, HVD, TEMP SENS and Self Test. A write '1' to these bits generates a single cycle pulsed fault to the FCCU block, this bit automatically gets cleared in the next cycle.

Address: 0h base + 70h offset = 70h

Field	Description
29 TSNS_Fault	Temperature Sensor Fault injection. A write to this bit sends a FCCU fault (single cycle) for TEMP SENSOR. 0 No fault is sent. 1 Single cycle fault injected.
30 HVD_Fault	High Voltage Detect Fault injection. A write to this bit sends a FCCU fault (single cycle) for HVD 0 No fault is sent 1 Single cycle fault injected.
31 LVD_Fault	Low Voltage Detect Fault injection. A write to this bit sends a FCCU fault (single cycle) for LVD 0 No fault is sent 1 Single cycle fault injected.

57.2.9 Temperature Event Status register (PMC_ESR_TD)

This Event Status Register indicates the present and past state of the two temperature sensor signals. If the temperature event has ever passed the trigger event since the last clearing event, the flag bit is set. In order to clear the flag, a one must be written to the flag bit that needs to be cleared.

Address: 0h base + 100h offset = 100h

PMC_ESR_TD field descriptions

Field	Description
0–3 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
4 TEMP1_3_OP	Temperature Sensor 1 Output 3 This bit reflects the output of the temperature for the temperature sensor 1 point (165°C). If IER[TS1_3IE] is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP1_3] is also asserted, a system reset is generated, which clears IER[TS1_3IE] and negates the interrupt request. If REE_TD[TEMP1_3] is asserted and a destructive reset is selected because RES_TD[TEMP1_3] is 0, then a destructive reset is generated; if RES_TD[TEMP1_3] is 1, then a functional reset is generated.
5 TEMP1_2_OP	Temperature Sensor 1 Output 2 This bit reflects the output of the temperature for the temperature sensor 1 point (150°C). If IER[TS1_2IE] is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP1_2] is also asserted, a system reset is generated, which clears IER[TS1_2IE] and negates the interrupt request. If REE_TD[TEMP1_2] is asserted and a destructive reset is selected because RES_TD[TEMP1_2] is 0, then a destructive reset is generated; if RES_TD[TEMP1_2] is 1, then a functional reset is generated.
6 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
7 TEMP1_0_OP	Temperature Sensor 1 Output 0 This bit reflects the output of the temperature for the cold temperature sensor 1 point. If IER[TS1_0IE] is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP1_0] is also asserted, a system reset is generated, which clears IER[TS1_0IE] and negates the interrupt request. If REE_TD[TEMP1_0] is asserted and a destructive reset is selected because RES_TD[TEMP1_0] is 0, then a destructive reset is generated; if RES_TD[TEMP1_0] is 1, then a functional reset is generated.
8–11 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
12 TEMP0_3_OP	Temperature Sensor 0 Output 3 This bit reflects the output of the temperature for the temperature sensor point (165°C). If IER[TS0_3IE] is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP0_3] is also asserted, a system reset is generated, which clears IER[TS0_3IE] and negates the interrupt request. If REE_TD[TEMP0_3] is asserted and a destructive reset is selected because RES_TD[TEMP0_3] is 0, then a destructive reset is generated; if RES_TD[TEMP0_3] is 1, then a functional reset is generated.
13 TEMP0_2_OP	Temperature Sensor 0 Output 2 This bit reflects the output of the temperature for the temperature sensor point (150°C). If IER[TS0_2IE] is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP0_2] is also asserted, a system reset is generated, which clears IER[TS0_2IE] and negates the interrupt request. If REE_TD[TEMP0_2] is asserted and a destructive reset is selected because RES_TD[TEMP0_2] is 0, then a destructive reset is generated; if RES_TD[TEMP0_2] is 1, then a functional reset is generated.
14 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

PMC_ESR_TD field descriptions (continued)

Field	Description
15 TEMP0_0_OP	Temperature Sensor 0 Output 0 This bit reflects the output of the temperature for the cold temperature sensor point. If IER[TS0_0IE] is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP0_0] is also asserted, a system reset is generated, which clears IER[TS0_0IE] and negates the interrupt request. If REE_TD[TEMP0_0] is asserted and a destructive reset is selected because RES_TD[TEMP0_0] is 0, then a destructive reset is generated; if RES_TD[TEMP0_0] is 1, then a functional reset is generated.
16–19 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
20 TEMP1_3	Temperature sensor 1 status flag 3. This bit is the temperature status flag associated with the temperature for the high temperature sensor 1 point (165C). Its value becomes 1 when the temperature exceeds its corresponding threshold, and that value clears to 0 when 1 is written to this location. 0 Currently no occurrence. 1 Temperature occurrence detected.
21 TEMP1_2	Temperature sensor 1 status flag 2. This bit is the temperature status flag associated with the temperature for the temperature sensor 1 point (150C). Its value becomes 1 when the temperature exceeds its corresponding threshold, and that value clears to 0 when 1 is written to this location. 0 Currently no occurrence. 1 Temperature occurrence detected.
22 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
23 TEMP1_0	Temperature sensor 1 status flag 0. This bit is the temperature status flag associated with the temperature for the cold temperature sensor 1 point. Its value becomes 1 when the temperature exceeds its corresponding threshold, and that value clears to 0 when 1 is written to this location. 0 Currently no occurrence. 1 Temperature occurrence detected.
24–27 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
28 TEMP0_3	Temperature sensor 0 status flag 3. This bit is the temperature status flag associated with the temperature for the high temperature sensor point (165C). Its value becomes 1 when the temperature exceeds its corresponding threshold, and that value clears to 0 when 1 is written to this location. 0 Currently no occurrence. 1 Temperature occurrence detected.
29 TEMP0_2	Temperature sensor 0 status flag 2.

Table continues on the next page...

PMC_ESR_TD field descriptions (continued)

Field	Description
	This bit is the temperature status flag associated with the temperature for the temperature sensor point (150C). Its value becomes 1 when the temperature exceeds its corresponding threshold, and that value clears to 0 when 1 is written to this location. 0 Currently no occurrence. 1 Temperature occurrence detected.
30 Reserved	Reserved This field is reserved. This read-only field is reserved and always has the value 0.
31 TEMP0_0	Temperature sensor 0 status flag 0. This bit is the temperature status flag associated with the temperature for the cold temperature sensor point. Its value becomes 1 when the temperature exceeds its corresponding threshold, and that value clears to 0 when 1 is written to this location. 0 Currently no occurrence. 1 Temperature occurrence detected.

57.2.10 Temperature Reset Event Enable register (PMC_REE_TD)

This Reset Event Enable register controls whether the temperature detect signal event causes a reset. If the desired flag bit is enabled, the temperature detect event causes a reset to be generated when the selected temperature passes the trigger event.

The register's reset value applies until the portion of the boot sequence that loads a value for the register from a DCF record in the UTEST area of flash memory. The DCF record for this register is PMC_LVD_MISC. The user can change the loaded value by programming a new DCF record for PMC_LVD_MISC in the UTEST area. If the loaded value programs any flag bit to be enabled (set to 1), the bit cannot be disabled (cleared to 0) by software through IPS programming.

NOTE

Programming a new value for PMC_LVD_MISC in the UTEST area of flash memory requires special care. In addition to the TEMPn_m bits, this DCF record contains the LVD trim values for the ADC, FLASH, IO, and OSC 3.3 V supplies. For these LVD trim bits, the user must not change the values in the factory-programmed DCF record for PMC_LVD_MISC.

1. Before programming a new value for PMC_LVD_MISC, read the factory-programmed value of the DCF record.

2. When programming a new DCF record for PMC_LVD_MISC:
   - Change only the values of the desired TEMPn_m bits.
   - Ensure that all other bits have the same values as in the factory-programmed value of PMC_LVD_MISC.

57.3 Analog PMC interface

The digital block uses the analog PMC interface to configure trim values for the regulators and LVDs that are in the analog block.

57.4 Temperature Sensor Interface Logic

The digital PMC block provides control and configuration information to the two temperature sensors. This information includes digital and analog enables, and trim values. A user adjustable trim control is also provided to fine tune the trimming (for more detail, see the detailed description of the Temperature Sensor module).

57.5 Power On Reset (MC_RGM Phase Gates)

The interface with the MC_RGM block is used during the power on sequence and startup. It provides various phase gates, thereby enabling the MC_RGM to properly complete the reset sequence.

It also provides functional and destructive reset sources, based on the configuration. Two types of resets are generated, based on LVD and HVD faults and the corresponding REE and RES enables:

- functional, and
- destructive.

The temperature sensor provides another reset source, based on the under/over temperature faults and the corresponding REE and RES enables.

57.6 Flash interface (DCF)

During power up, trim values for the regulators, LVDs, and HVDs are read from Flash memory by the SSCM, and are then provided to the digital PMC via the DCF interface.

The reset event enable (REE) configurations that are stored in Flash memory are also provided to the PMC via the DCF interface. These REEs configurations are used, by default, to generate various resets to the RGM.

57.7 FCCU Interface

The digital block generates various fault indications to the FCCU block:

- Separate corresponding, active-high, fault indications are generated whenever an LVD or HVD defect is detected in the analog block.
- A fault indication is generated when a self test task results in a failure.
- A fault condition is generated whenever over-temperature or under-temperature events occur in the temperature sensor.

The figures below show the exact logic for the generation fault indications to FCCU block.

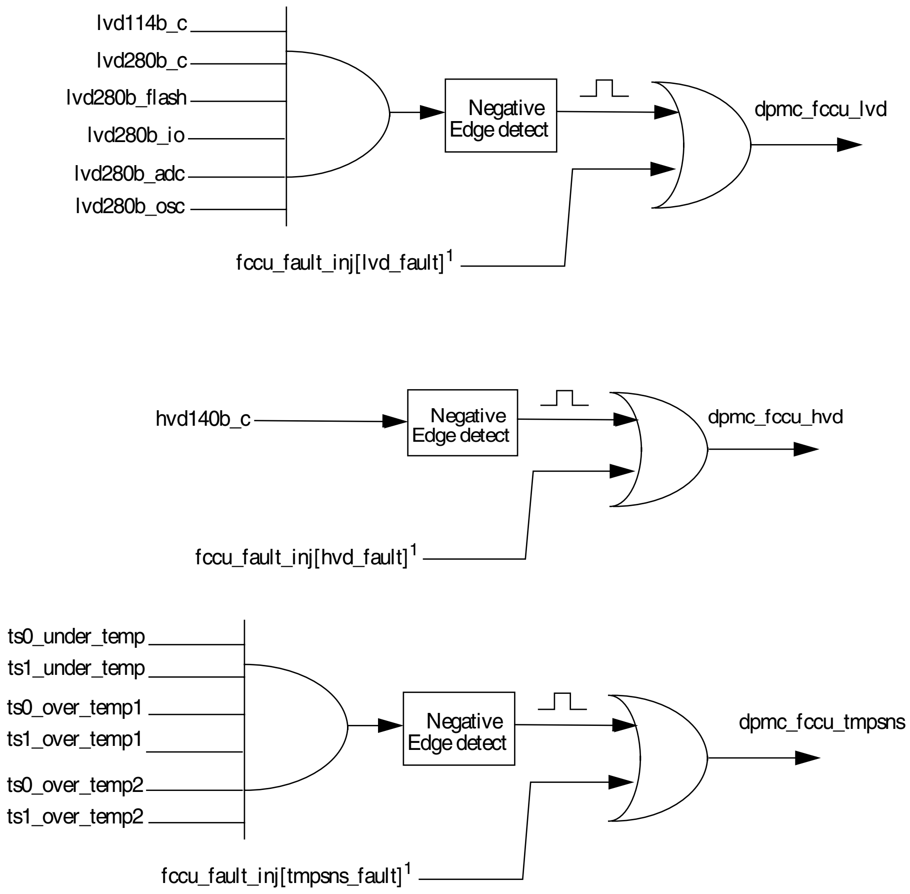

Figure 57-3. Fault generation to FCCU

:

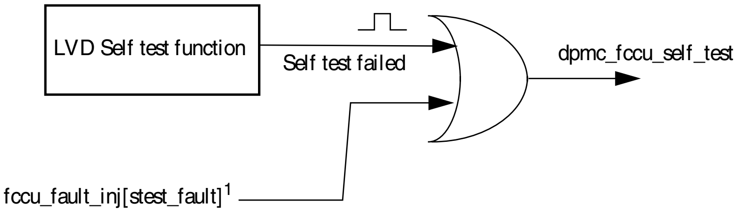

Figure 57-4. FCCU_fault_gen_LVD_Self_Test

[1] See “FCCU Fault Injection Register 0(FIR) for details.

57.8 LVD/HVD self test mechanism

The PMC implements an LVD/HVD self test mechanism for use in satisfying safety goals. The digital block assists and controls the analog block during it's performance of the self test.

Currently, three self test modes (described in the following sections) are supported by the analog block (based on the mode specified by the VD_UTST[ST_MODE] register bit).

The self test status and result are provided in the VD_UTST[ST_DONE, ST_RESULT] register fields, respectively.

57.8.1 Default Mode

The self test is always performed during startup (power on). The self test starts during the phase 3 MC_RGM state, when the SSCM has completed reads from the flash memory (that is, asserts ‘sscm_done’ signal). A counter is provided that starts from zero and increments by one after an 8 µs time gap.

Meanwhile, the LVD/HVD indication from the analog block is latched in the VD_UTST register. At the end of the self test (that is, when all of the LVDs/HVDs have been tested), the VD_UTST[ST_DONE] status bit is set to '1' and all of the bits in the VD_UTST register are checked for '1'. One or more bits not set to '1' generates a fault indication to the FCCU block, and the VD_UTST[ST_RESULT] register bit is set to '0'. In the case where all of the register bits are set to '1', the test is considered to be PASSED, the VD_UTST[ST_RESULT] register bit is set to '1', and no fault indications are provided to the FCCU.

NOTE

The total run time of the LVD self test is equal to: 'time required per LVD (8 µs)' multiplied by 'number of LVDs (14)' = 112 µs. Some of the 14 self tests are internal self tests that are listed as reserved in the description of VD_UTST[VD_ST_CTRL].

57.8.2 Software triggered self test

This mode is entered by software by writing '01' to the VD_UTST[ST_MODE] register 2-bit field. The complete self test, as is performed in default mode, is repeated. The difference is that the self test in this mode is initiated by the host while the self test in default mode is started automatically during power on.

NOTE

The LVD self test Time Window Register (STTW) has to be configured appropriately (based on the clock frequency used), before initiating software triggered self test. For example, the configuration for a 100MHz system clock and a 8us window should be 800 (decimal).

57.8.3 Single VD test

This mode is entered by software writing 10b to the 2-bit VD_UTST[ST_MODE] field, which results in the assertion of the pmc_lvd_self_test input. The test completes after the prescribed time gap has elapsed. The PASS/FAIL result is then updated based on whether or not the corresponding LVD output trips.

NOTE

The LVD Self Test Time Window Register (STTW) must to be configured appropriately as in Software triggered self test mode.

NOTE

During the running of the LVD self test, all of the LVD and HVD outputs are masked that are also under self test (see the LVD/HVD list in the definition of VD_UTST[VD_ST_CTRL]). Therefore, they have no effect on POR generation, or in any reset and/or fault generation.

Chapter 58
Power Control Unit (MC_PCU)

58.1 Introduction

58.1.1 Overview

The power control unit (MC_PCU) acts as a bridge for mapping the PMC peripheral to the MC_PCU address space.

The following figure depicts the MC_PCU block diagram.

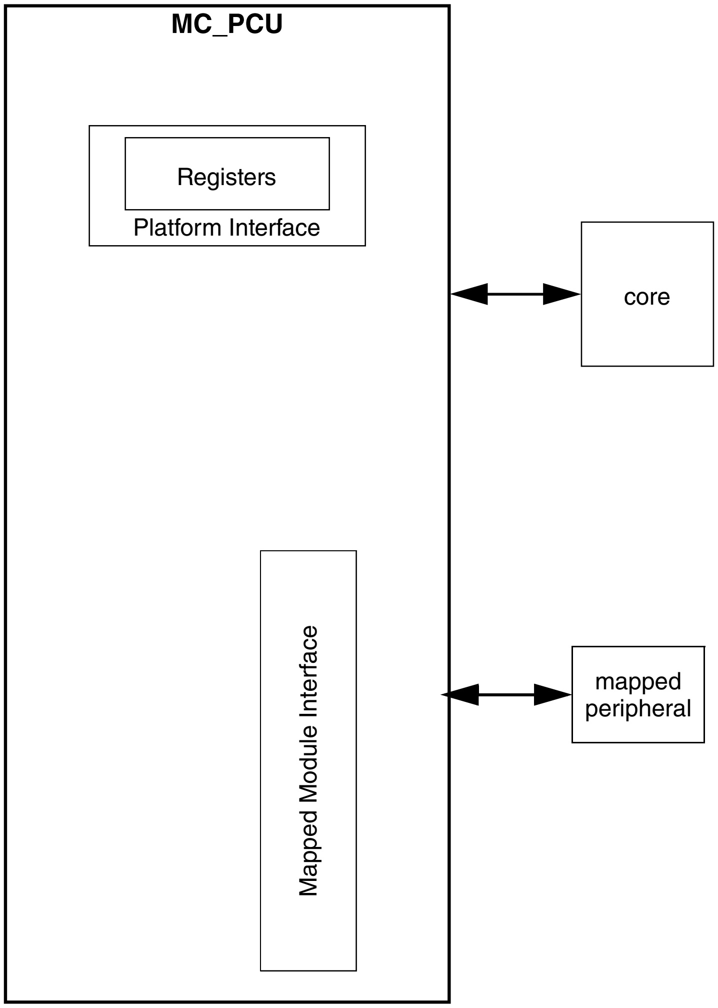

Figure 58-1. MC_PCU Block Diagram

58.1.2 Features

The MC_PCU includes the following features:

- maps the PMC registers to the MC_PCU address space

58.2 External Signal Description

The MC_PCU has no connections to any external pins.

58.3 Memory Map and Register Definition

Any access to unused registers as well as write accesses to read-only registers will:

- not change register content
- cause a transfer error

All registers may be accessed as 32-bit words, 16-bit half-words, or 8-bit bytes. The bytes are ordered according to big endian. For example, the PD0 field of the PCU_PSTAT register may be accessed as a word at address 0x0040, as a half-word at address 0x0042, or as a byte at address 0x0043.

MC_PCU memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	Power Domain #0 Configuration Register (MC_PCU_PCONF0)	32	R	0000_05FFh	58.3.1/2284
40	Power Domain Status Register (MC_PCU_PSTAT)	32	R	0000_0001h	58.3.2/2286

58.3.1 Power Domain #0 Configuration Register (MC_PCU_PCONF0)

This register defines for power domain #0 whether it is on or off in each chip mode. It can be read in user and supervisor mode. Because power domain #0 is always on, none of this register's bits are programmable. This register is available for completeness reasons.

Address: 0h base + 0h offset = 0h

Chapter 59
Mode Entry Module (MC_ME)

59.1 Introduction

59.1.1 Overview

The MC_ME controls the chip mode and mode transition sequences in all functional states. It also contains configuration, control and status registers accessible for the application.

The following figure shows the MC_ME block diagram.

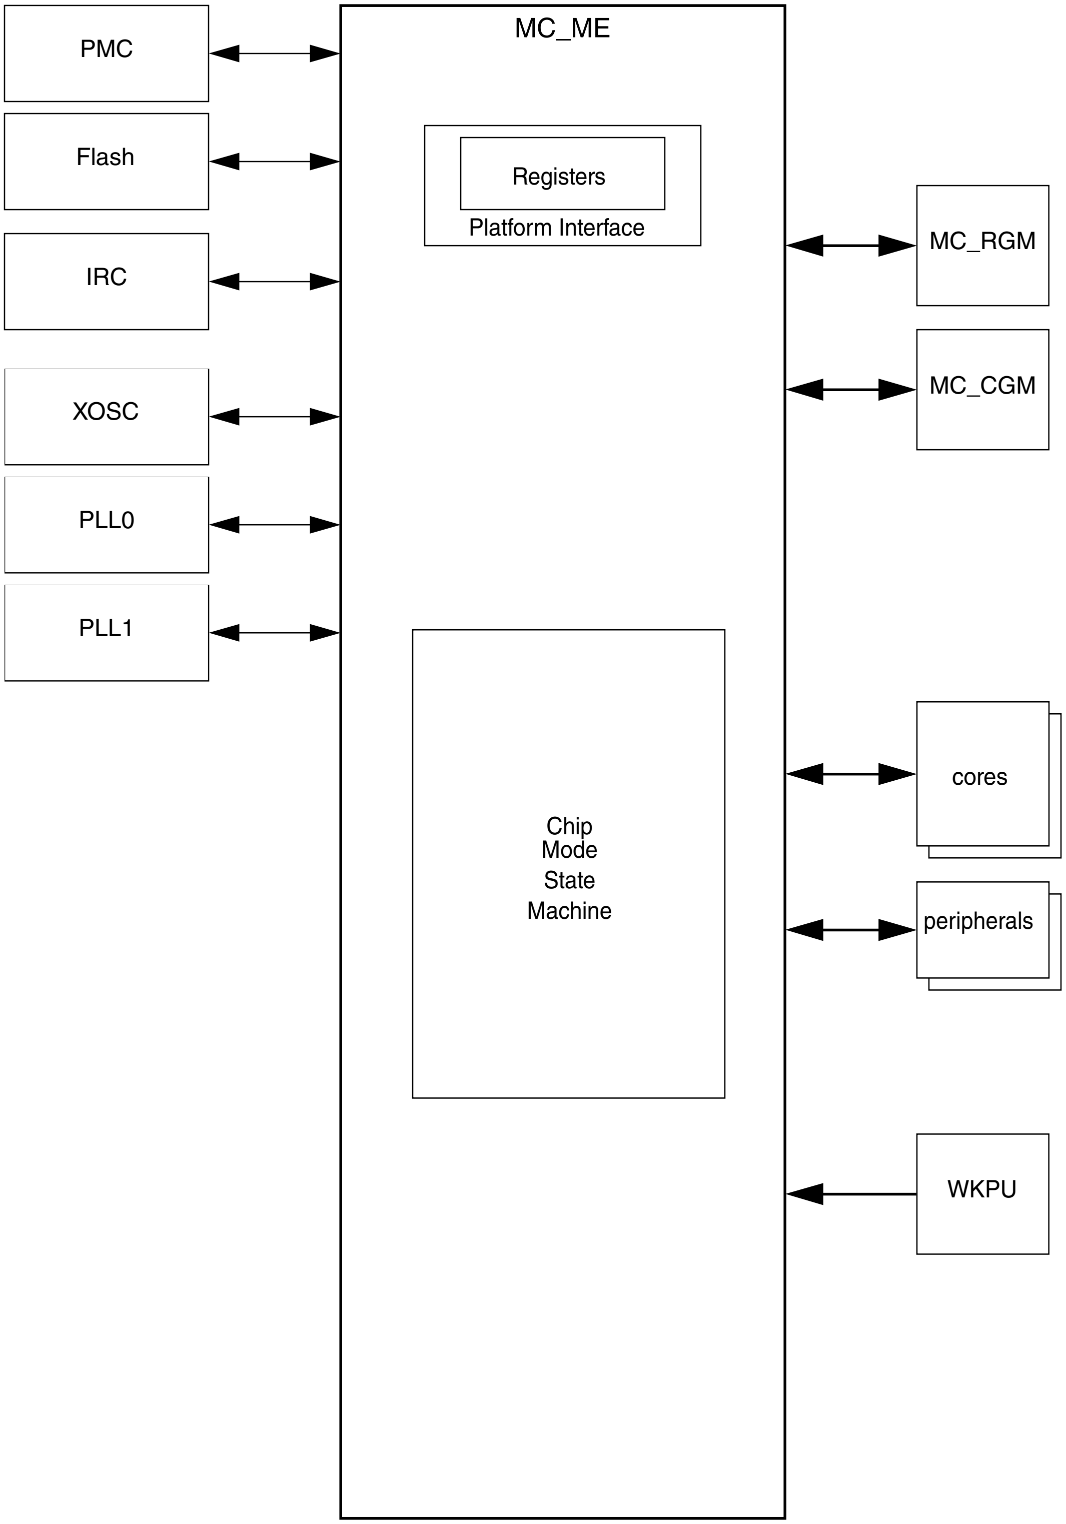

Figure 59-1. MC_ME Block Diagram

59.1.2 Features

The MC_ME includes the following features:

- control of the available modes by the ME_ME register
- definition of various chip mode configurations by the ME_<mode>_MC registers
- control of the actual chip mode by the ME_MCTL register
- capture of the current mode and various resource status within the contents of the ME_GS register
- optional generation of various mode transition interrupts
- status bits for each cause of invalid mode transitions
- peripheral clock gating control based on the ME_RUN_PC0…7, ME_LP_PC0…7, and ME_PCTLn registers
- additional core clock gating and boot address control based on the ME_CCTLn and ME_CADDR***n*** registers
- capture of current peripheral and additional core clock gated/enabled status
- progressive system clock switching when transitioning from a lower power consumption mode to a higher power consumption mode, and vice versa

59.1.3 Modes of Operation

The MC_ME is based on several chip modes corresponding to different usage models of the chip. Each mode is configurable and can define a policy for energy and processing power management to fit particular system requirements. An application can easily switch from one mode to another depending on the current needs of the system. The operating modes controlled by the MC_ME are divided into system and user modes. The system modes are modes such as RESET, DRUN, SAFE, and TEST. These modes aim to ease the configuration and monitoring of the system. The user modes are modes such as RUN0…3, HALT0, and STOP0 which can be configured to meet the application requirements in terms of energy management and available processing power. The modes DRUN, SAFE, TEST, and RUN0…3 are the chip software running modes.

The following table describes the MC_ME modes.

Table 59-1. MC_ME Mode Descriptions

Name	Description	Entry	Exit
RESET	This is a chip-wide virtual mode during which the application is not active. The system remains in this mode until all resources are available for the embedded software to take control of the chip. It manages hardware initialization of chip configuration, voltage regulators, clock sources, and flash modules.	system reset assertion from MC_RGM	system reset deassertion from MC_RGM
DRUN	This is the entry mode for the embedded software. It provides full accessibility to the system and enables the configuration of the system at startup. It provides the unique gate to enter user modes. BAM when present is executed in DRUN mode.	system reset deassertion from MC_RGM, software request from SAFE, TEST and RUN0…3	system reset assertion, RUN0…3, TEST via software, SAFE via software or hardware failure.
SAFE	This is a chip-wide service mode which may be entered on the detection of a recoverable error. It forces the system into a pre-defined safe configuration from which the system may try to recover.	hardware failure, software request from DRUN, TEST, and RUN0…3	system reset assertion, DRUN via software
TEST	This is a chip-wide service mode which is intended to provide a control environment for chip software testing.	software request from DRUN	system reset assertion, DRUN via software
RUN0…3	These are software running modes where most processing activity is done. These various run modes allow to enable different clock & power configurations of the system with respect to each other.	software request from DRUN or other RUN0…3, interrupt event from HALT0, interrupt or wakeup event from STOP0	system reset assertion, SAFE via software or hardware failure, DRUN and other RUN0…3 modes, HALT0, STOP0 via software
HALT0	This is a reduced-activity low-power mode during which the clock to the core is disabled. It can be configured to switch off analog peripherals like clock sources, flash, main regulator, etc. for efficient power management at the cost of higher wakeup latency.	software request from RUN0…3	system reset assertion, SAFE on hardware failure, RUN0…3 on interrupt event
STOP0	This is an advanced low-power mode during which the clock to the core is disabled. It may be configured to switch off most of the peripherals including clock sources for efficient power management at the cost of higher wakeup latency.	software request from RUN0…3	system reset assertion, SAFE on hardware failure, RUN0…3 on interrupt event or wakeup event

59.2 External Signal Description

The MC_ME has no connections to any external pins.

59.3 Memory Map and Register Definition

The MC_ME contains registers for:

- mode selection and status reporting

- mode configuration
- mode transition interrupts status and mask control
- scalable number of peripheral sub-mode selection and status reporting
- scalable number of additional core enabling and disabling control and status reporting

Unless otherwise noted, all registers may be accessed as 32-bit words, 16-bit half-words, or 8-bit bytes. The bytes are ordered according to big endian. For example, the ME_RUN_PC0 register may be accessed as a word at address 0x080, as a half-word at address 0x082, or as a byte at address 0x083.

Some fields may be read-only, and their reset value of '1' or '0' and the corresponding behavior cannot be changed.

Field	Description
	0 4-40 MHz crystal oscillator is not stable 1 4-40 MHz crystal oscillator is providing a stable clock
27 S_IRC	16 MHz internal RC oscillator status 0 16 MHz internal RC oscillator is not stable 1 16 MHz internal RC oscillator is providing a stable clock
28–31 S_SYSCLK	System clock switch status — These bits specify the system clock currently used by the system. 0000 16 MHz IRCOSC 0001 4-40 MHz XOSC 0010 primary PLL (PHI) 0011 reserved 0100 secondary PLL 0101 reserved 0110 reserved 0111 reserved 1000 reserved 1001 reserved 1010 reserved 1011 reserved 1100 reserved 1101 reserved 1110 reserved 1111 system clock is disabled

59.3.2 Mode Control Register (MC_ME_MCTL)

This register is used to trigger software-controlled mode changes. Depending on the modes as enabled by ME_ME register bits, configurations corresponding to unavailable modes are reserved and access to ME_<mode>_MC registers must respect this for successful mode requests.

NOTE

Byte and half-word write accesses are not allowed for this register as a predefined key is required to change its value.

Address: 0h base + 4h offset = 4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

MC_ME_MCTL field descriptions

Field	Description
0–3 TARGET_MODE	Target chip mode — These bits provide the target chip mode to be entered by software programming. The mechanism to enter into any mode by software requires the write operation twice: first time with key, and second time with inverted key. These bits are automatically updated by hardware while entering SAFE on hardware request. Also, while exiting from the HALT0 and STOP0 modes on hardware exit events, these are updated with the appropriate RUN0…3 mode value. 0000 RESET (triggers a ‘functional’ reset event) 0001 TEST 0010 SAFE 0011 DRUN 0100 RUN0 0101 RUN1 0110 RUN2 0111 RUN3 1000 HALT0 1001 reserved 1010 STOP0 1011 reserved 1100 reserved 1101 reserved 1110 reserved 1111 RESET (triggers a ‘destructive’ reset event)
4–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 KEY	Control key — These bits enable write access to this register. Any write access to the register with a value different from the keys is ignored. Read access will always return inverted key. KEY: 0101101011110000 (0x5AF0) INVERTED KEY: 1010010100001111 (0xA50F)

59.3.3 Mode Enable Register (MC_ME_ME)

This register allows a way to disable the chip modes which are not required for a given chip. RESET_FUNC, SAFE, DRUN, RUN0, and RESET_DEST modes are always enabled.

Address: 0h base + 8h offset = 8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MC_ME_IS field descriptions

Field	Description
0–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 I_ICONF_CC	Invalid mode configuration interrupt (core configuration) — This bit is set if a write access to one of the ME_CADDRn registers is attempted while a mode transition is in progress. 0 No write to an ME_CADDRn register was attempted during an ongoing mode transition 1 A write to an ME_CADDRn register was attempted during an ongoing mode transition
27 I_ICONF_CU	Invalid mode configuration interrupt (Clock Usage) — This bit is set during a mode transition if a clock which is required to be on by an enabled peripheral is configured to be turned off. It is cleared by writing a '1' to this bit. 0 No invalid mode configuration (clock usage) interrupt occurred 1 Invalid mode configuration (clock usage) interrupt is pending

Table continues on the next page...

MC_ME_IS field descriptions (continued)

Field	Description
28 I_ICONF	Invalid mode configuration interrupt — This bit is set whenever a write operation to ME_<mode>_MC registers with invalid mode configuration is attempted. It is cleared by writing a ‘1’ to this bit. 0 No invalid mode configuration interrupt occurred 1 Invalid mode configuration interrupt is pending
29 I_IMODE	Invalid mode interrupt — This bit is set whenever an invalid mode transition is requested. It is cleared by writing a ‘1’ to this bit. 0 No invalid mode interrupt occurred 1 Invalid mode interrupt is pending
30 I_SAFE	SAFE mode interrupt — This bit is set whenever the chip enters SAFE mode on hardware requests generated in the system. It is cleared by writing a ‘1’ to this bit. 0 No SAFE mode interrupt occurred 1 SAFE mode interrupt is pending
31 I_MTC	Mode transition complete interrupt — This bit is set whenever the mode transition process completes (S_MTRANS transits from 1 to 0). It is cleared by writing a ‘1’ to this bit. This mode transition interrupt bit will not be set while entering low-power modes HALT0, or STOP0. 0 No mode transition complete interrupt occurred 1 Mode transition complete interrupt is pending

59.3.5 Interrupt Mask Register (MC_ME_IM)

This register controls whether an event generates an interrupt or not.

Address: 0h base + 10h offset = 10h

MC_ME_IM field descriptions

Field	Description
0–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 M_ICONF_CC	Invalid mode configuration (core configuration) interrupt mask 0 Invalid mode configuration (core configuration) interrupt is masked 1 Invalid mode configuration (core configuration) interrupt is enabled
27 M_ICONF_CU	Invalid mode configuration (clock usage) interrupt mask 0 Invalid mode configuration (core configuration) interrupt is masked 1 Invalid mode configuration (core configuration) interrupt is enabled
28 M_ICONF	Invalid mode configuration interrupt mask 0 Invalid mode configuration (core configuration) interrupt is masked 1 Invalid mode configuration (core configuration) interrupt is enabled
29 M_IMODE	Invalid mode interrupt mask 0 Invalid mode interrupt is masked 1 Invalid mode interrupt is enabled
30 M_SAFE	SAFE mode interrupt mask 0 SAFE mode interrupt is masked 1 SAFE mode interrupt is enabled
31 M_MTC	Mode transition complete interrupt mask 0 Mode transition complete interrupt is masked 1 Mode transition complete interrupt is enabled

59.3.6 Invalid Mode Transition Status Register (MC_ME_IMTS)

This register provides the status bits for the possible causes of an invalid mode interrupt.

Address: 0h base + 14h offset = 14h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0

MC_ME_IMTS field descriptions

Field	Description
0–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 S_MRIG	Mode Request Ignored status — This bit is set whenever a new mode is requested while a transition to the SAFE mode is in progress. This bit is also set if a transition to STOP/HALT mode is requested when a wakeup is active. This bit is cleared by writing a ‘1’ to it. 0 Mode transition requested is not ignored 1 Mode transition requested is ignored
27 S_MTI	Mode Transition Illegal status — This bit is set whenever a new mode is requested while some other non-SAFE mode transition process is active (S_MTRANS is ‘1’). Please refer to Mode Transition Interrupts for the exceptions to this behavior. It is cleared by writing a ‘1’ to this bit. 0 Mode transition requested is not illegal 1 Mode transition requested is illegal
28 S_MRI	Mode Request Illegal status — This bit is set whenever the target mode requested is not a valid mode with respect to current mode. It is cleared by writing a ‘1’ to this bit.

Table continues on the next page...

MC_ME_IMTS field descriptions (continued)

Field	Description
	0 Target mode requested is not illegal with respect to current mode 1 Target mode requested is illegal with respect to current mode
29 S_DMA	Disabled Mode Access status — This bit is set whenever the target mode requested is one of those disabled modes determined by ME_ME register. It is cleared by writing a ‘1’ to this bit. 0 Target mode requested is not a disabled mode 1 Target mode requested is a disabled mode
30 S_NMA	Non-existing Mode Access status — This bit is set whenever the target mode requested is one of those non existing modes determined by ME_ME register. It is cleared by writing a ‘1’ to this bit. 0 Target mode requested is an existing mode 1 Target mode requested is a non-existing mode
31 S_SEA	SAFE Event Active status — This bit is set whenever the chip is in SAFE mode, SAFE event bit is pending and a new mode requested other than RESET/SAFE modes. It is cleared by writing a ‘1’ to this bit. 0 No new mode requested other than RESET/SAFE while SAFE event is pending 1 New mode requested other than RESET/SAFE while SAFE event is pending

59.3.7 Debug Mode Transition Status Register (MC_ME_DMTS)

This register provides the status of different factors which influence mode transitions. It is used to give an indication of why a mode transition indicated by ME_GS.S_MTRANS may be taking longer than expected. NOTE The ME_DMTS register does not indicate whether a mode transition is ongoing. Therefore, some ME_DMTS bits may still be asserted after the mode transition has completed.

Address: 0h base + 18h offset = 18h

MC_ME_DMTS field descriptions

Field	Description
0–3 PREVIOUS_ MODE	Previous chip mode — These bits show the mode in which the chip was prior to the latest change to the current mode. 0000 RESET 0001 TEST 0010 SAFE 0011 DRUN 0100 RUN0 0101 RUN1 0110 RUN2 0111 RUN3 1000 HALT0 1001 reserved 1010 STOP0 1011 reserved 1100 reserved 1101 reserved 1110 reserved 1111 reserved
4–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

MC_ME_DMTS field descriptions (continued)

Field	Description
8 MPH_BUSY	MC_ME/MC_PCU Handshake Busy indicator — This bit is set if the MC_ME has requested a mode change from the MC_PCU and the MC_PCU has not yet completed its power-up/down sequencing. It is cleared when the MC_PCU has power-up/down sequencing. 0 Handshake is not busy 1 Handshake is busy
9–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 PMC_PROG	MC_PCU Mode Change in Progress indicator — This bit is set if the MC_PCU is in the process of powering up or down power domains. It is cleared when all power-up/down processes have completed. 0 Power-up/down transition is not in progress 1 Power-up/down transition is in progress
12 DBG_MODE	Debug mode indicator — This bit is set while the chip is in debug mode. 0 The chip is not in debug mode 1 The chip is in debug mode
13 CCKL_PROG	Core Clock Enable/Disable in Progress — This bit is set while any core’s clock is in the process of being enabled or disabled. 0 No core clock is being enabled or disabled 1 A core clock is being enabled or disabled
14 PCS_PROG	Progressive System Clock Switching in Progress This bit is set under any of these conditions: • PCS is in progress • Peripheral clock switching is ongoing • Core clock switching is ongoing • Power sequence process is ongoing (provided the target mode is not STANDBY) 0 PCS is not in progress 1 PCS is in progress
15 SMR	SAFE mode request from MC_RGM is active indicator — This bit is set if a hardware SAFE mode request has been triggered. It is cleared when the hardware SAFE mode request has been cleared. 0 A SAFE mode request is not active 1 A SAFE mode request is active
16 CDP_PRPH_0_255	Clock Disable Process Pending status for Peripherals 0 to 255 This bit is set when any peripheral has been requested to have its clock disabled. It is cleared when all the peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled.
17 VREG_CSRC_SC	Main VREG dependent Clock Source State Change during mode transition indicator — This bit is set when a clock source which depends on the main voltage regulator to be powered-up is requested to change its power up/down state. It is cleared when the clock source has completed its state change. 0 No state change is taking place 1 A state change is taking place
18 CSRC_CSRC_SC	(Other) Clock Source dependent Clock Source State Change during mode transition indicator — This bit is set when a clock source which depends on another clock source to be powered-up is requested to change its power up/down state. It is cleared when the clock source has completed its state change.

Table continues on the next page...

MC_ME_DMTS field descriptions (continued)

Field	Description
	0 No state change is taking place 1 A state change is taking place
19 IRC_SC	IRC State Change during mode transition indicator — This bit is set when the 16 MHz internal RC oscillator is requested to change its power up/down state. It is cleared when the 16 MHz internal RC oscillator has completed its state change. 0 No state change is taking place 1 A state change is taking place
20 SCSRC_SC	Secondary Clock Sources State Change during mode transition indicator — This bit is set when a secondary clock source is requested to change its power up/down state. It is cleared when all secondary system clock sources have completed their state changes. (A ’secondary clock source’ is a clock source other than IRC.) 0 No state change is taking place 1 A state change is taking place
21 SYSCLK_SW	System Clock Switching pending status — 0 No system clock source switching is pending 1 A system clock source switching is pending
22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 FLASH_SC	FLASH State Change during mode transition indicator — This bit is set when the FLASH is requested to change its power up/down state. It is cleared when the DFLASH has completed its state change. 0 No state change is taking place 1 A state change is taking place
24 CDP_PRPH_ 224_255	Clock Disable Process Pending status for Peripherals 224…255 — This bit is set when any peripheral has been requested to have its clock disabled. It is cleared when all the peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. Peripheral n corresponds to the ME_PCTLn register. Please refer to the memory map for the ME_PCTLn locations actually occupied, which in turn indicates which peripherals are reported in the ME_DMTS register. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral
25 CDP_PRPH_ 192_223	Clock Disable Process Pending status for Peripherals 192…223 — This bit is set when any peripheral appearing in ME_PS6 has been requested to have its clock disabled. It is cleared when all these peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral
26 CDP_PRPH_ 160_191	Clock Disable Process Pending status for Peripherals 160…191 — This bit is set when any peripheral appearing in ME_PS5 has been requested to have its clock disabled. It is cleared when all these peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral

Table continues on the next page...

MC_ME_DMTS field descriptions (continued)

Field	Description
27 CDP_PRPH_ 128_159	Clock Disable Process Pending status for Peripherals 128…159 — This bit is set when any peripheral appearing in ME_PS4 has been requested to have its clock disabled. It is cleared when all these peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral
28 CDP_PRPH_96_ 127	Clock Disable Process Pending status for Peripherals 96…127 — This bit is set when any peripheral appearing in ME_PS3 has been requested to have its clock disabled. It is cleared when all these peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral
29 CDP_PRPH_64_ 95	Clock Disable Process Pending status for Peripherals 64…95 — This bit is set when any peripheral appearing in ME_PS2 has been requested to have its clock disabled. It is cleared when all these peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral
30 CDP_PRPH_32_ 63	Clock Disable Process Pending status for Peripherals 32…63 — This bit is set when any peripheral appearing in ME_PS1 has been requested to have its clock disabled. It is cleared when all these peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral
31 CDP_PRPH_0_ 31	Clock Disable Process Pending status for Peripherals 0…31 — This bit is set when any peripheral appearing in ME_PS0 has been requested to have its clock disabled. It is cleared when all these peripherals which have been requested to have their clocks disabled have entered the state in which their clocks may be disabled. 0 No peripheral clock disabling is pending 1 Clock disabling is pending for at least one peripheral

59.3.8 RESET Mode Configuration Register (MC_ME_RESET_MC)

This register configures system behavior during RESET mode.

NOTE

The following configuration values are set according to the chip configuration: XOSCON

Address: 0h base + 20h offset = 20h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0	PWRLVL			0				PDO	0		MVRON	0		FLAON

Field	Description
	1110 reserved 1111 system clock is disabled in TEST mode, reserved in all other modes

59.3.9 TEST Mode Configuration Register (MC_ME_TEST_MC)

This register configures system behavior during TEST mode.

NOTE

Byte write accesses are not allowed to this register.

WARNING

Although the IRCON bit is writable, writing a ‘0’ to this bit will not turn off the 16 MHz internal RC oscillator is always in use. Writing a ‘0’ to this bit will cause the mode transition to not complete, since it will wait forever for the 16 MHz internal RC oscillator to become free.

Address: 0h base + 24h offset = 24h

MC_ME_RUN0_MC field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1–3 PWRLVL	Power level — These bits indicate the relative power consumption level of this mode with respect to that of other modes. When switching between two modes with differing power levels, system clock progressive switching is enabled.
4–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 PDO	I/O output power-down control — This bit controls the output power-down of I/Os. 0 No automatic safe gating of I/Os used and pads power sequence driver is enabled 1 In SAFE/TEST modes, outputs of pads are forced to high impedance state and pads power sequence driver is disabled. The inputs are level unchanged. In STOP0 mode, only the pad power sequence driver is disabled, but the state of the output remains functional.
9–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 MVRON	Main voltage regulator control — This bit specifies whether main voltage regulator is switched off or not while entering this mode. 1 Main voltage regulator is switched on
12–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–15 FLAON	Flash power-down control — This bit specifies the operating mode of the code flash after entering this mode. 00 reserved 01 Flash is in power-down mode 10 Flash is in low-power mode 11 Flash is in normal mode
16–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 PLL1ON	secondary PLL control 0 secondary PLL is switched off 1 secondary PLL is switched on
25 PLL0ON	primary PLL control 0 primary PLL is switched off 1 primary PLL is switched on
26 XOSCON	4-40 MHz crystal oscillator control 0 4-40 MHz crystal oscillator is switched off 1 4-40 MHz crystal oscillator is switched on
27 IRCON	16 MHz internal RC oscillator control 0 16 MHz internal RC oscillator is switched off 1 16 MHz internal RC oscillator is switched on
28–31 SYSCLK	System clock switch control — These bits specify the system clock to be used by the system. 0000 16 MHz IRCOSC

Field	Description
1 S_ADC_1	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 S_ADC_3	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
4–19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20 S_FLEXRAY	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
21–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 S_SENT_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
24–27 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28 S_DSPI_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
29 S_DSPI_1	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
30–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

59.3.22 Peripheral Status Register 4 (MC_ME_PS4)

This register provides the status of the peripherals.

Address: 0h base + 70h offset = 70h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0													S_DMAMUX_1	0	S_PWM_1
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0		S_CTU_1	0			S_ETIMER_1	0								
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MC_ME_PS4 field descriptions

Field	Description
0–12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 S_DMAMUX_1	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15 S_PWM_1	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
16–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18 S_CTU_1	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
19–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 S_ETIMER_1	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
23–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

59.3.23 Peripheral Status Register 6 (MC_ME_PS6)

This register provides the status of the peripherals.

Address: 0h base + 78h offset = 78h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0									S_SENT_1	0				S_DSPI_2	S_DSPI_3
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0			S_LINFlex_0	0											
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MC_ME_PS6 field descriptions

Field	Description
0–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

MC_ME_PS6 field descriptions (continued)

Field	Description
9 S_SENT_1	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
10–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 S_DSPI_2	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
15 S_DSPI_3	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
16–18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 S_LINFlex_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
20–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

59.3.24 Peripheral Status Register 7 (MC_ME_PS7)

This register provides the status of the peripherals.

Address: 0h base + 7Ch offset = 7Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	S_PWM_0	0			S_CTU_0	0			S_ETIMER_0	0	S_ETIMER_2	0				
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MC_ME_PS7 field descriptions

Field	Description
0 S_PWM_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen

Table continues on the next page...

MC_ME_PS7 field descriptions (continued)

Field	Description
	1: Peripheral is active
1–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4 S_CTU_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
5–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 S_ETIMER_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 S_ETIMER_2	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
11–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 S_SGEN_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18 S_ADC_0	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20 S_ADC_2	Peripheral status — These bits specify the current status of each peripheral which is controlled by the MC_ME. 0: Peripheral is frozen 1: Peripheral is active
21–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

59.3.25 Run Peripheral Configuration Register (MC_ME_RUN_PC*n*)

The ME_RUN_PC0..7 registers configure eight different types of peripheral behavior during run modes.

Address: 0h base + 80h offset + (4d × i), where i=0d to 7d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0								RUN3	RUN2	RUN1	RUN0	DRUN	SAFE	TEST	RESET
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MC_ME_RUN_PC*n* field descriptions

Field	Description
0–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RUN3	Peripheral control during RUN3 0 Peripheral is frozen with clock gated 1 Peripheral is active
25 RUN2	Peripheral control during RUN2 0 Peripheral is frozen with clock gated 1 Peripheral is active

Table continues on the next page...

MC_ME_RUN_PC*n* field descriptions (continued)

Field	Description
26 RUN1	Peripheral control during RUN1 0 Peripheral is frozen with clock gated 1 Peripheral is active
27 RUN0	Peripheral control during RUN0 0 Peripheral is frozen with clock gated 1 Peripheral is active
28 DRUN	Peripheral control during DRUN 0 Peripheral is frozen with clock gated 1 Peripheral is active
29 SAFE	Peripheral control during SAFE 0 Peripheral is frozen with clock gated 1 Peripheral is active
30 TEST	Peripheral control during TEST 0 Peripheral is frozen with clock gated 1 Peripheral is active
31 RESET	Peripheral control during RESET 0 Peripheral is frozen with clock gated 1 Peripheral is active

59.3.26 Low-Power Peripheral Configuration Register (MC_ME_LP_PC*n*)

The MC_LP_PC registers configure eight different types of peripheral behavior during non-run modes.

Address: 0h base + A0h offset + (4d × i), where i=0d to 7d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0					STOP0	0	HALT0	0							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MC_ME_LP_PC*n* field descriptions

Field	Description
0–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 STOP0	Peripheral control during STOP0 0 Peripheral is frozen with clock gated 1 Peripheral is active
22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 HALT0	Peripheral control during HALT0 0 Peripheral is frozen with clock gated 1 Peripheral is active
24–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

59.3.27 LFAST_0 Peripheral Control Register (MC_ME_PCTL9)

This register selects the configurations during run and non-run modes for the associated peripheral.

Address: 0h base + C9h offset = C9h

Bit	0	1	2	3	4	5	6	7
Read	0	DBG_F	LP_CFG			RUN_CFG		
Write	▨							
Reset	0	0	0	0	0	0	0	0

MC_ME_PCTL9 field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 DBG_F	Peripheral control in debug mode — This bit controls the state of the peripheral in debug mode **NOTE:** This feature is useful to freeze the peripheral state while entering debug. For example, this may be used to prevent a reference timer from running while making a debug accesses. 0 Peripheral state depends on RUN_CFG/LP_CFG bits and the chip mode 1 Peripheral is frozen if not already frozen in chip modes.
2–4 LP_CFG	Peripheral configuration select for non-run modes — These bits associate a configuration as defined in the ME_LP_PC0…7 registers to the peripheral. 000 Selects ME_LP_PC0 configuration 001 Selects ME_LP_PC1 configuration 010 Selects ME_LP_PC2 configuration 011 Selects ME_LP_PC3 configuration 100 Selects ME_LP_PC4 configuration 101 Selects ME_LP_PC5 configuration 110 Selects ME_LP_PC6 configuration 111 Selects ME_LP_PC7 configuration
5–7 RUN_CFG	Peripheral configuration select for run modes — These bits associate a configuration as defined in the ME_RUN_PC0…7 registers to the peripheral. 000 Selects ME_RUN_PC0 configuration 001 Selects ME_RUN_PC1 configuration 010 Selects ME_RUN_PC2 configuration 011 Selects ME_RUN_PC3 configuration 100 Selects ME_RUN_PC4 configuration 101 Selects ME_RUN_PC5 configuration 110 Selects ME_RUN_PC6 configuration 111 Selects ME_RUN_PC7 configuration

59.3.28 SIPI_0 Peripheral Control Register (MC_ME_PCTL11)

This register selects the configurations during run and non-run modes for the associated peripheral.

Address: 0h base + CBh offset = CBh

Bit	0	1	2	3	4	5	6	7
Read	0	DBG_F	LP_CFG			RUN_CFG		
Write	▨							
Reset	0	0	0	0	0	0	0	0

MC_ME_PCTL11 field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 DBG_F	Peripheral control in debug mode — This bit controls the state of the peripheral in debug mode **NOTE:** This feature is useful to freeze the peripheral state while entering debug. For example, this may be used to prevent a reference timer from running while making a debug accesses. 0 Peripheral state depends on RUN_CFG/LP_CFG bits and the chip mode 1 Peripheral is frozen if not already frozen in chip modes.
2–4 LP_CFG	Peripheral configuration select for non-run modes — These bits associate a configuration as defined in the ME_LP_PC0…7 registers to the peripheral. 000 Selects ME_LP_PC0 configuration 001 Selects ME_LP_PC1 configuration 010 Selects ME_LP_PC2 configuration 011 Selects ME_LP_PC3 configuration 100 Selects ME_LP_PC4 configuration 101 Selects ME_LP_PC5 configuration 110 Selects ME_LP_PC6 configuration 111 Selects ME_LP_PC7 configuration
5–7 RUN_CFG	Peripheral configuration select for run modes — These bits associate a configuration as defined in the ME_RUN_PC0…7 registers to the peripheral. 000 Selects ME_RUN_PC0 configuration 001 Selects ME_RUN_PC1 configuration 010 Selects ME_RUN_PC2 configuration 011 Selects ME_RUN_PC3 configuration 100 Selects ME_RUN_PC4 configuration 101 Selects ME_RUN_PC5 configuration 110 Selects ME_RUN_PC6 configuration 111 Selects ME_RUN_PC7 configuration

59.3.29 ENET_0 Peripheral Control Register (MC_ME_PCTL12)

This register selects the configurations during run and non-run modes for the associated peripheral.

Address: 0h base + CCh offset = CCh

Bit	0	1	2	3	4	5	6	7
Read	0	DBG_F	LP_CFG			RUN_CFG		
Write	▨							
Reset	0	0	0	0	0	0	0	0

MC_ME_PCTL12 field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 DBG_F	Peripheral control in debug mode — This bit controls the state of the peripheral in debug mode **NOTE:** This feature is useful to freeze the peripheral state while entering debug. For example, this may be used to prevent a reference timer from running while making a debug accesses. 0 Peripheral state depends on RUN_CFG/LP_CFG bits and the chip mode 1 Peripheral is frozen if not already frozen in chip modes.

59.3.50 SENT_1 Peripheral Control Register (MC_ME_PCTL214)

This register selects the configurations during run and non-run modes for the associated peripheral.

Address: 0h base + 196h offset = 196h

Bit	0	1	2	3	4	5	6	7
Read	0	DBG_F	LP_CFG			RUN_CFG		
Write								
Reset	0	0	0	0	0	0	0	0

MC_ME_PCTL214 field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 DBG_F	Peripheral control in debug mode — This bit controls the state of the peripheral in debug mode **NOTE:** This feature is useful to freeze the peripheral state while entering debug. For example, this may be used to prevent a reference timer from running while making a debug accesses. 0 Peripheral state depends on RUN_CFG/LP_CFG bits and the chip mode 1 Peripheral is frozen if not already frozen in chip modes.
2–4 LP_CFG	Peripheral configuration select for non-run modes — These bits associate a configuration as defined in the ME_LP_PC0…7 registers to the peripheral. 000 Selects ME_LP_PC0 configuration 001 Selects ME_LP_PC1 configuration 010 Selects ME_LP_PC2 configuration 011 Selects ME_LP_PC3 configuration 100 Selects ME_LP_PC4 configuration 101 Selects ME_LP_PC5 configuration 110 Selects ME_LP_PC6 configuration 111 Selects ME_LP_PC7 configuration
5–7 RUN_CFG	Peripheral configuration select for run modes — These bits associate a configuration as defined in the ME_RUN_PC0…7 registers to the peripheral. 000 Selects ME_RUN_PC0 configuration 001 Selects ME_RUN_PC1 configuration 010 Selects ME_RUN_PC2 configuration 011 Selects ME_RUN_PC3 configuration 100 Selects ME_RUN_PC4 configuration 101 Selects ME_RUN_PC5 configuration 110 Selects ME_RUN_PC6 configuration 111 Selects ME_RUN_PC7 configuration

59.3.51 ADC_2 Peripheral Control Register (MC_ME_PCTL235)

This register selects the configurations during run and non-run modes for the associated peripheral.

Address: 0h base + 1ABh offset = 1ABh

Bit	0	1	2	3	4	5	6	7
Read	0	DBG_F	LP_CFG			RUN_CFG		
Write	▨							
Reset	0	0	0	0	0	0	0	0

MC_ME_PCTL235 field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 DBG_F	Peripheral control in debug mode — This bit controls the state of the peripheral in debug mode **NOTE:** This feature is useful to freeze the peripheral state while entering debug. For example, this may be used to prevent a reference timer from running while making a debug accesses. 0 Peripheral state depends on RUN_CFG/LP_CFG bits and the chip mode 1 Peripheral is frozen if not already frozen in chip modes.
2–4 LP_CFG	Peripheral configuration select for non-run modes — These bits associate a configuration as defined in the ME_LP_PC0…7 registers to the peripheral. 000 Selects ME_LP_PC0 configuration 001 Selects ME_LP_PC1 configuration 010 Selects ME_LP_PC2 configuration 011 Selects ME_LP_PC3 configuration 100 Selects ME_LP_PC4 configuration 101 Selects ME_LP_PC5 configuration 110 Selects ME_LP_PC6 configuration 111 Selects ME_LP_PC7 configuration

6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 HALT0	Core control during HALT0 — main and checker cores are always disabled during HALT0.
8 RUN3	Core control during RUN3 0 main and checker cores are disabled with clock gated 1 main and checker cores are running
9 RUN2	Core control during RUN2 0 main and checker cores are disabled with clock gated 1 main and checker cores are running
10 RUN1	Core control during RUN1 0 main and checker cores are disabled with clock gated 1 main and checker cores are running
11 RUN0	Core control during RUN0 0 main and checker cores are frozen with clock gated 1 main and checker cores are running
12 DRUN	Core control during DRUN

Table continues on the next page...

MC_ME_CCTL0 field descriptions (continued)

Field	Description
	0 main and checker cores are frozen with clock gated 1 main and checker cores are running
13 SAFE	Core control during SAFE 0 main and checker cores are frozen with clock gated 1 main and checker cores are running
14 TEST	Core control during TEST 0 main and checker cores are frozen with clock gated 1 main and checker cores are running
15 RESET	Core control during RESET — main and checker cores are always disabled during RESET.

59.3.60 CORE0 Address Register (MC_ME_CADDR0)

This registers gives the boot address for main and checker cores and a bit for controlling whether main and checker cores are to be reset on the next mode change that has main and checker cores configured to be running in the target mode.

This register can be written only as a word and cannot be written after a mode change request has been made until the mode transition has completed (that is, while the S_MTRANS bit of the ME_GS register = ‘1’). A write access to this register during this time will result in the ICONF_CC flag in the ME_IS register being asserted.

NOTE

> The reset value of the ADDR field of the ME_CADDR0 is determined by the chip configuration and boot mode.

Address: 0h base + 1E0h offset = 1E0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

* Notes:

- ADDR field: Determined by the chip configuration and boot mode

MC_ME_CADDR0 field descriptions

Field	Description
0–29 ADDR	Core Address — This field is used by main and checker cores as the boot address (32-bit word aligned) when main and checker cores next exits reset.
30 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
31 Reserved	This field is reserved. This read/write field is reserved, and must always be written with the value '0'. Writing a '1' will lead to unpredictable behavior.

59.4 Functional Description

59.4.1 Mode Transition Request

The transition from one mode to another mode is normally handled by software by accessing the mode control register ME_MCTL. But the in case of special events, the mode transition can be automatically managed by hardware. In order to switch from one mode to another, the application should access the ME_MCTL register twice by writing

- the first time with the value of the key (0x5AF0) into the KEY bit field and the required target mode into the TARGET_MODE bit field,
- and the second time with the inverted value of the key (0xA50F) into the KEY bit field and the required target mode into the TARGET_MODE bit field.

Once a valid mode transition request is detected, the target mode configuration information is loaded from the corresponding ME_<mode>_MC register.The mode transition request may require a number of cycles depending on the programmed configuration, and software should check the S_CURRENT_MODE bit field and the S_MTRANS bit of the global status register ME_GS to verify when the mode has been correctly entered and the transition process has completed. For a description of valid mode requests, please refer to Mode Transition Interrupts.

Any modification of the mode configuration register of the currently selected mode will not be taken into account immediately but on the next request to enter this mode. This means that transition requests such as RUN0…3 → RUN0…3, DRUN → DRUN, SAFE → SAFE, and TEST → TEST are considered valid mode transition requests. As soon as the mode request is accepted as valid, the S_MTRANS bit is set till the status in the ME_GS register matches the configuration programmed in the respective ME_<mode>_MC register.

Note

> Software should poll the S_MTRANS bit in the ME_GS register after requesting a transition to HALT0 or STOP0 modes.

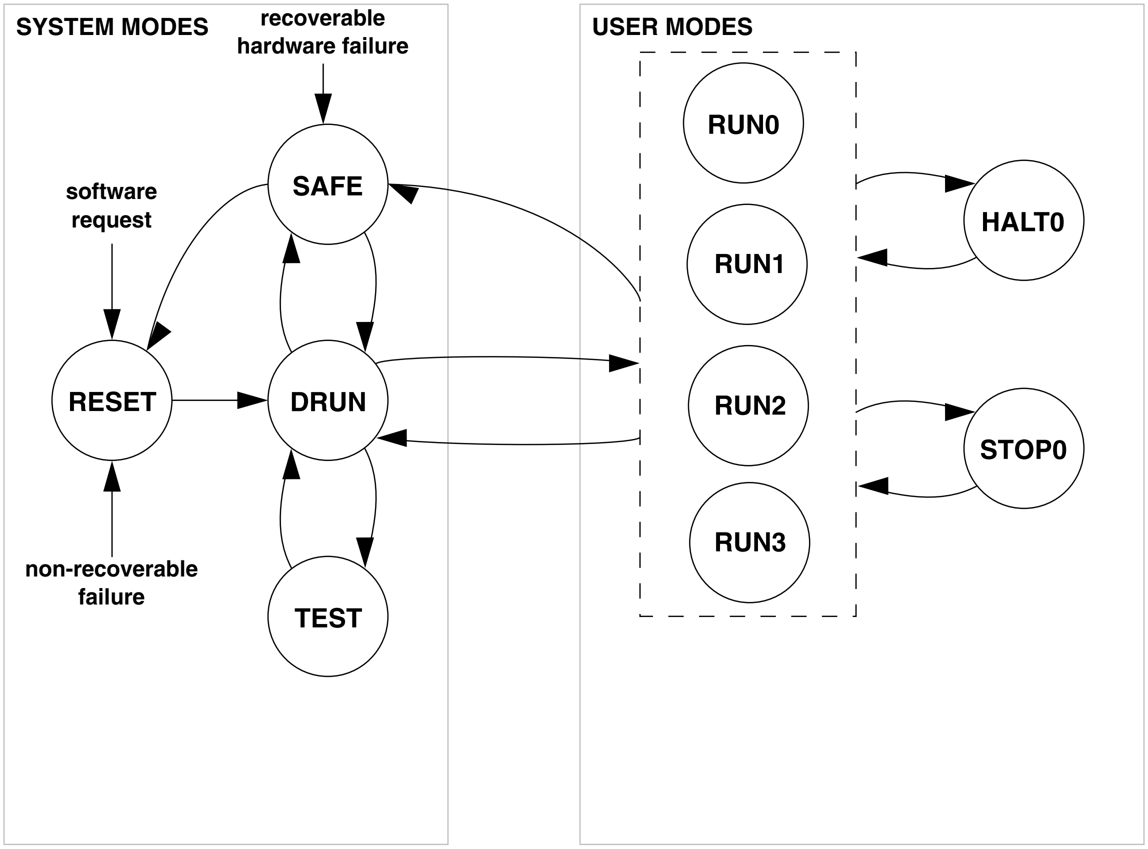

Figure 59-2. MC_ME Mode Diagram

59.4.2 Modes Details

59.4.2.1 RESET Mode

The chip enters this mode on the following events:

- from SAFE, DRUN, RUN0…3, or TEST mode when the TARGET_MODE bit field of the ME_MCTL register is written with either "0000" for a 'functional' reset or "1111" for a 'destructive' reset
- from any mode due to a system reset by the MC_RGM because of some non-recoverable hardware failure in the system (see the MC_RGM chapter for details)

Transition to this mode is instantaneous, and the system remains in this mode until the reset sequence is finished. The mode configuration information for this mode is provided by the ME_RESET_MC register. This mode has a pre-defined configuration, and the 16 MHz int. RC osc. is selected as the system clock.

59.4.2.2 DRUN Mode

The chip enters this mode on the following events:

- automatically from RESET mode after completion of the reset sequence
- from RUN0…3, SAFE, or TEST mode when the TARGET_MODE bit field of the ME_MCTL register is written with "0011"

As soon as any of the above events has occurred, a DRUN mode transition request is generated. The mode configuration information for this mode is provided by the ME_DRUN_MC register. In this mode, the flash, all clock sources, and the system clock configuration can be controlled by software as required. After system reset, the software execution starts with the default configuration selecting the 16 MHz int. RC osc. as the system clock. The clock source configuration except system clock source 0 can be chosen by preloaded information in flash memory. This information is loaded into the ME_DRUN_MC register during PHASE3 of the reset sequence.

This mode is intended to be used by software

- to initialize all registers as per the system needs

Note

> Software must ensure that the code executes from RAM before changing to this mode if the flash is configured to be in the low-power or power-down state in this mode.

59.4.2.3 SAFE Mode

The chip enters this mode on the following events:

- from any mode except RESET when the TARGET_MODE bit field of the ME_MCTL register is written with "0010"
- from any mode except RESET due to a SAFE mode request generated by the MC_RGM because of some potentially recoverable hardware failure in the system (see the MC_RGM chapter for details)

Note

> If a hardware SAFE mode request occurs during RESET, depending on the timing of the SAFE mode request, SAFE mode may be entered immediately after the normal completion of the reset sequence or several system clock cycles after DRUN entry. The SAFE mode request does not have any influence on the execution of the reset sequence itself.

As soon as any of the above events has occurred, a SAFE mode transition request is generated. The mode configuration information for this mode is provided by the ME_SAFE_MC register. This mode has a pre-defined configuration, and the 16 MHz int. RC osc. is selected as the system clock.

If the SAFE mode is requested by software while some other mode transition process is ongoing, the new target mode becomes the SAFE mode regardless of other pending requests or new requests during the mode transition. No new mode request made during a transition to the SAFE mode will cause an invalid mode interrupt.

Note

> If software requests to change to the SAFE mode and then requests to change back to the parent mode before the mode transition is completed, the chip's final mode after mode transition will be the SAFE mode, and an invalid mode transition interrupt will be generated.

As long as a SAFE event is active, the system remains in the SAFE mode, and any software mode request during this time is ignored and lost.

This mode is intended to be used by software

- to assess the severity of the cause of failure and then to either

- re-initialize the chip via the DRUN mode, or
- completely reset the chip via the RESET mode.

If the outputs of the system I/Os need to be forced to a high impedance state upon entering this mode, the PDO bit of the ME_SAFE_MC register should be set. The input levels remain unchanged.

59.4.2.4 TEST Mode

The chip enters this mode on the following events:

- from the DRUN mode when the TARGET_MODE bit field of the ME_MCTL register is written with "0001"

As soon as any of the above events has occurred, a TEST mode transition request is generated. The mode configuration information for this mode is provided by the ME_TEST_MC register. Except for the main voltage regulator, all resources of the system are configurable in this mode. The system clock to the whole system can be stopped by programming the SYSCLK bit field to "1111", and in this case, the only way to exit this mode is via a chip reset.

This mode is intended to be used by software

- to execute software test routines

Note

Software must ensure that the code executes from RAM before changing to this mode if the flash is configured to be in the low-power or power-down state in this mode.

59.4.2.5 RUN0…3 Modes

The chip enters one of these modes on the following events:

- from the DRUN or another RUN0…3 mode when the TARGET_MODE bit field of the ME_MCTL register is written with "0100…0111"
- from the HALT0 mode due to an interrupt event
- from the STOP0 mode due to an interrupt or wakeup event

As soon as any of the above events has occurred, a RUN0…3 mode transition request is generated. The mode configuration information for these modes is provided by the ME_RUN0…3_MC registers. In these modes, the flash, all clock sources, and the system clock configuration can be controlled by software as required.

These modes are intended to be used by software

- to execute application routines

Note

> Software must ensure that the code executes from RAM before changing to this mode if the flash is configured to be in the low-power or power-down state in this mode.

59.4.2.6 HALT0 Mode

The chip enters this mode on the following events:

- from one of the RUN0…3 modes when the TARGET_MODE bit field of the ME_MCTL register is written with "1000".

As soon as any of the above events has occurred, a HALT0 mode transition request is generated. The mode configuration information for this mode is provided by ME_HALT0_MC register. This mode is quite configurable, and the ME_HALT0_MC register should be programmed according to the system needs. The flash can be put in low-power or power-down mode as needed. If there is a HALT0 mode request while an interrupt request is active, the transition to HALT0 is aborted with the resultant mode being the current mode, SAFE (on SAFE mode request), or DRUN (on reset), and an invalid mode interrupt is not generated.

If a HALT0 mode transition request is generated at the same time that an interrupt request occurs there is a possibility that the system may hang requiring a power-on reset to recover. The application software should avoid the conditions where this system hang is possible. Before entering HALT0 mode the application software should disable all interrupts. If this is not easily manageable by software then the software should ensure that any transaction which can potentially generate an interrupt should be finished and all interrupts serviced before requesting HALT0 transition. As a result the wake up source from HALT0 mode should always be executed by an external interrupt and not from internal interrupts from the peripheral modules.

This mode is intended as a first-level low-power mode with

- the core clocks frozen the additional core clocks frozen
- XBAR masters cannot operate in system HALT0 mode as they are clock gated. Also, NPC should be enabled if mode transition is initiated while debugger is connected
- only a few peripherals running

and to be used by software

- to wait until it is required to do something and then to react quickly (i.e., within a few system clock cycles of an interrupt event)

Note

It is good practice for software to ensure that the S_MTRANS bit in the ME_GS register has been cleared on HALT0 mode exit to ensure that the previous RUN0…3 mode configuration has been fully restored before executing critical code.

59.4.2.7 STOP0 Mode

The chip enters this mode on the following events:

- from one of the RUN0…3 modes when the TARGET_MODE bit field of the ME_MCTL register is written with "1010".

As soon as any of the above events has occurred, a STOP0 mode transition request is generated. The mode configuration information for this mode is provided by the ME_STOP0_MC register. This mode is fully configurable, and the ME_STOP0_MC register should be programmed according to the system needs. The following clock sources are switched off in this mode:

- the primary PLL
- the secondary PLL

The flash memory can be put in power-down mode as needed.

If there is a STOP0 mode request while any interrupt or wakeup event is active, the transition to STOP0 is aborted—with the resulting mode being the current mode—and an invalid mode transition interrupt is generated. The reason for this interrupt is S_MRIG (Mode request ignored): If a transition to SAFE (on SAFE mode request) is in progress, a transition request to STOP0 mode also generates an S_MRIG (Mode request ignored) interrupt. In case of a transition to DRUN (on reset), no interrupt is generated. Before attempting to enter STOP0 mode, properly disable all interrupts not intended to be used as wakeup events in software.

If a STOP0 mode transition request is generated at the same time that an interrupt request occurs there is a possibility that the system may hang requiring a power-on reset to recover. The application software should avoid the conditions where this system hang is possible. Before entering STOP0 mode the application software should disable all interrupts. If this is not easily manageable by software then the software should ensure that any transaction which can potentially generate an interrupt should be finished and all interrupts serviced before requesting STOP0 transition. As a result the wake up source from STOP0 mode should always be executed by an external wake-up/interrupt and not from internal interrupts from the peripheral modules.

This mode is intended as an advanced low-power mode with:

- the core clock frozen
- the additional core clocks frozen
- XBAR masters cannot operate in system STOP0 mode as they are clock gated. Also, NPC should be enabled if mode transition is initiated while debugger is connected
- almost all peripherals stopped

and to be used by software

- to wait until it is required to do something with no need to react quickly (e.g., allow for system clock source to be re-started)

This mode can be used to stop all clock sources and thus preserve the chip status. When exiting the STOP0 mode, the 16 MHz internal RC oscillator clock is selected as the system clock until the target clock is available.

Note

> It is good practice for software to ensure that the S_MTRANS bit in the ME_GS register has been cleared on STOP0 mode exit to ensure that the previous RUN0…3 mode configuration has been fully restored before executing critical code.

59.4.3 Mode Transition Process

The process of mode transition follows the following steps in a pre-defined manner depending on the current chip mode and the requested target mode. In many cases of mode transition, not all steps need to be executed based on the mode control information, and some steps may not be applicable according to the mode definition itself.

59.4.3.1 Target Mode Request

The target mode is requested by accessing the ME_MCTL register with the required keys. This mode transition request by software must be a valid request satisfying a set of pre-defined rules to initiate the process. If the request fails to satisfy these rules, it is ignored, and the TARGET_MODE bit field is not updated. An optional interrupt can be generated for invalid mode requests. Refer to Mode Transition Interrupts for details.

In the case of mode transitions occurring because of hardware events such as a reset, a SAFE mode request, or interrupt requests and wakeup events to exit from low-power modes, the TARGET_MODE bit field of the ME_MCTL register is automatically updated with the appropriate target mode. The mode change process start is indicated by the setting of the mode transition status bit S_MTRANS of the ME_GS register.

A RESET mode requested via the ME_MCTL register is passed to the MC_RGM, which generates a global system reset and initiates the reset sequence. The RESET mode request has the highest priority, and the MC_ME is kept in the RESET mode during the entire reset sequence.

The SAFE mode request has the next highest priority after reset. It can be generated either by software via the ME_MCTL register from all software running modes or by the MC_RGM after the detection of system hardware failures, which may occur in any mode.

59.4.3.2 Target Mode Configuration Loading

On completion of the Target Mode Request step, the target mode configuration from the ME_<target mode>_MC register is loaded to start the resources (voltage sources, clock sources, flash, pads, etc.) control process.

An overview of resource control possibilities for each mode is shown in the following table. A '√' indicates that a given resource is configurable for a given mode.

Table 59-2. MC_ME Resource Control Overview

Resource	Mode						
	RESET	TEST	SAFE	DRUN	RUN0…3	HALT0	STOP0
IRC	on	√ on	on	on	on	on	on
XOSC	off	√ off	off	√ off	√ off	√ off	√ off
PLL0	off	√ off	off	√ off	√ off	√ off	off
PLL1	off	√ off	off	√ off	√ off	√ off	√ off
FLASH	normal	√ normal	normal	√ normal	√ normal	√ low-power	√ power-down
MVREG	on	on	on	on	on	on	on
PDO	off	√ off	√ on	off	off	off	√ off

59.4.3.3 Peripheral Clocks Disable

On completion of the Target Mode Request step and the system clock frequency ramp-down of the System Clock Switching step, the MC_ME requests each peripheral to enter its stop mode when:

- the peripheral is configured to be disabled via the target mode, the peripheral configuration registers ME_RUN_PC0…7 and ME_LP_PC0…7, and the peripheral control registers ME_PCTL***n***

Note

> The MC_ME automatically requests peripherals to enter their stop modes if the power domains in which they are residing are to be turned off due to a mode change. However, it is good practice for software to ensure that those peripherals that are to be powered down are configured in the MC_ME to be frozen.

Each peripheral acknowledges its stop mode request after closing its internal activity. The MC_ME then disables the corresponding clock(s) to this peripheral.

In the case of a SAFE mode transition request, the MC_ME does not wait for the peripherals to acknowledge the stop requests. The SAFE mode clock gating configuration is applied immediately regardless of the status of the peripherals' stop acknowledges.

Please refer to Peripheral Clock Gating for more details.

Each peripheral that may block or disrupt a communication bus to which it is connected ensures that these outputs are forced to a safe or recessive state when the chip enters the SAFE mode.

59.4.3.4 Processor Low-Power Mode Entry

If, on completion of the Peripheral Clocks Disable step, the mode transition is to the HALT0,STOP0 mode, the MC_ME requests each processor to enter its stopped state. Each processor acknowledges its stop state request bit after completing all outstanding bus transactions.

If, on completion of the Peripheral Clocks Disable step, the mode transition is from a non-low-power mode to another non-low-power mode, the MC_ME requests each processor which is configured in the ME_CCTL***n*** registers to be disabled to enter its stopped state. The processor acknowledges its stop state request bit after completing all outstanding bus transactions.

59.4.3.5 Processor Clocks Disable

If, on completion of the Processor Low-Power Mode Entry step, and all processors which are configured in the ME_CCTL***n*** registers to be disabled are in their appropriate stopped state, the MC_ME disables the applicable processor clocks bits to achieve further power saving.

The clocks to processors which are configured to be running in both the current and target modes or disabled in both the current and target modes are unaffected while transitioning between non-low-power modes.

Warning

> Clocks to the whole chip including the processor and system memory can be disabled in TEST mode.

59.4.3.6 System Clock Disable

If, on completion of the Processor Clocks Disable step, all processor clocks have been disabled, the system clock used for non-processor system functions and memory is disabled.

59.4.3.7 Clock Sources Switch-On

On completion of the Processor Low-Power Mode Entry step, the MC_ME switches on all clock sources based on the <clock source>ON bits of the ME_<current mode>_MC and ME_<target mode>_MC registers. The following clock sources are switched on at this step:

- the 16 MHz internal RC oscillator
- the 4-40 MHz crystal oscillator
- the primary PLL
- the secondary PLL

The clock sources that are required by the target mode are switched on. The duration required for the output clocks to be stable depends on the type of source, and all further steps of mode transition depending on one or more of these clocks waits for the stable status of the respective clocks. The availability status of these clocks is updated in the S_<clock source> bits of ME_GS register.

The clock sources which need to be switched off are unaffected during this process in order to not disturb the system clock which might require one of these clocks before switching to a different target clock.

59.4.3.8 Flash Module Switch-On

On completion of the step, if the flash needs to be switched to normal mode from its low-power or power-down mode based on the FLAON bit field of the ME_<current mode>_MC and ME_<target mode>_MC registers, the MC_ME requests the flash to exit from its low-power/power-down mode. When the flash is available for access, the S_FLA bit field of the ME_GS register is updated to "11" by hardware.

Warning

> It is illegal to switch the FLASH from low-power mode to power-down mode and from power-down mode to low-power mode. The MC_ME, however, does not prevent this nor does it flag it.

59.4.3.9 Pad Outputs-On

On completion of the step, if the PDO bit of the ME_<target mode>_MC register is cleared, then

- all pad outputs are enabled to return to their previous state
- the I/O pads power sequence driver is switched on

59.4.3.10 Peripheral Clocks Enable

Based on the current and target chip modes, the peripheral configuration registers ME_RUN_PC0…7, ME_LP_PC0…7, and the peripheral control registers ME_PCTLn, the MC_ME enables the clocks for selected modules as required. This step is executed only after the process is completed, and if the value of the PWRLVL field of the ME_<target mode>_MC register is process is completed.

59.4.3.11 System and Processor Clocks Enable

On completion of the Flash Module Switch-On step, the MC_ME enables the non-processor system clock and the clocks of all processors that are configured in the ME_CCTL***n*** registers to be disabled in the current mode and to be running in the target mode.

If the value of the PWRLVL field of the ME_<target mode>_MC register is different from that of the ME_<current mode>_MC register, the mode change handshake will not be initiated until after the system clock frequency ramp-down step of the System Clock Switching process is completed.

59.4.3.12 Processor Low-Power Mode Exit

On completion of the System and Processor Clocks Enable step, the MC_ME requests all processors which are configured in the ME_CCTL*n* registers to be disabled in the current mode and to be running in the target mode.

59.4.3.13 System Clock Switching

Based on the SYSCLK bit field of the ME_<current mode>_MC and ME_<target mode>_MC registers, if the target and current system clock configurations differ, the following method is implemented for clock switching.

- The target clock configuration for the 16 MHz int. RC osc. takes effect only after the S_IRC bit of the ME_GS register is set by hardware (i.e., the 16 MHz internal RC oscillator has stabilized).
- The target clock configuration for the 4-40 MHz crystal osc. takes effect only after the S_IRC bit of the ME_GS register is set by hardware (i.e., the 16 MHz internal RC oscillator has stabilized).
- The target clock configuration for the primary PLL (PHI) takes effect only after the S_XOSC bit of the ME_GS register is set by hardware (i.e., the 4-40 MHz crystal oscillator has stabilized).
- The target clock configuration for the secondary PLL takes effect only after the S_PLL0 bit of the ME_GS register is set by hardware (i.e., the primary PLL has stabilized).
- If the clock is to be disabled, the SYSCLK bit field should be programmed with "1111". This is possible only in theTEST mode.

If the value of the PWRLVL field of the ME_<target mode>_MC register not equal to that of the ME_<current mode>_MC register's, a progressive clock switching is performed in the MC_CGM to reduce the impact of a sudden increase or drop in the power consumption of the device. The MC_ME requests progressive clock switching and indicates the direction of the switching (ramp-up vs. ramp-down) via the clk_sys_sw_req and clk_sys_sw_ctl[2:0] outputs. If progressive clock switching has been requested, the system clock switching process is not completed until the MC_CGM has indicated that the progressive clock switching has finished by deasserting the clk_sys_sw_busy input ME_CLK_SYS_PCS.

The current system clock configuration can be observed by reading the S_SYSCLK bit field of the ME_GS register, which is updated after every system clock switching. Until the target clock is available, the system uses the previous clock configuration.

System clock switching starts only after

- the Clock Sources Switch-On process has completed if the target system clock source is one of the following:
  - the 16 MHz internal RC oscillator
  - the 4-40 MHz crystal oscillator
  - the primary PLL
  - the Secondary system clock source 1
- the Peripheral Clocks Disable process has completed in order not to change the system clock frequency before peripherals close their internal activitiesthe Peripheral Clocks Enable processe has completed

An overview of system clock source selection possibilities for each mode is shown in the following table. A '√' indicates that a given clock source is selectable for a given mode.

Table 59-3. MC_ME System Clock Selection Overview

System Clock Source	Mode						
	RESET	TEST	SAFE	DRUN	RUN0…3	HALT0	STOP0
16 MHz int. RC osc.	√ (default)	√ (default)	√ (default)	√ (default)	√ (default)	√ (default)	√ (default)
4-40 MHz crystal osc.		√		√	√	√	√
primary PLL (PHI)		√		√	√	√	√
secondary PLL		√		√	√		
system clock is disabled		√[1]					

[1] disabling the system clock during TEST mode will require a reset in order to exit TEST mode

59.4.3.14 Pad Switch-Off

If the PDO bit of the ME_<target mode>_MC register is '1' then

- the outputs of the pads are forced to the high impedance state if the target mode is SAFE or TEST

This step is executed only after the Peripheral Clocks Disable process has completed.

59.4.3.15 Clock Sources (with no Dependencies) Switch-Off

Based on the chip mode and the <clock source>ON bits of the ME_<mode>_MC registers, if a given clock source is to be switched off, the MC_ME requests the clock source to power down and updates its availability status bit S_<clock source> of the ME_GS register to '0'. The following clock sources are switched off at this step:

- the 16 MHz internal RC oscillator, if it is not currently being used as the reference clock for PLL0 (the IRCOSC can be turned off only during TEST mode)
- the 4 MHz to 40 MHz crystal oscillator, if it is not currently being used as the reference clock for either PLL0 or PLL1
- the primary PLL, if it is not currently being used as the reference clock for PLL1
- the secondary PLL

For the clock sources related to the system clock, this step is executed only after the System Clock Switching process has completed.

59.4.3.16 Clock Sources (with Dependencies) Switch-Off

Based on the chip mode and the <clock source>ON bits of the ME_<mode>_MC registers, if a given clock source is to be switched off and all clock sources that need this clock source to be on have been switched off, the MC_ME requests the clock source to power down and updates its availability status bit S_<clock source> of the ME_GS register to '0'. The following clock sources are switched off at this step:

- the 16 MHz internal RC oscillator, if it is currently being used as the reference clock for PLL0 (the IRCOSC can be turned off only during TEST mode)
- the 4 MHz to 40 MHz crystal oscillator, if it is currently being used as the reference clock for either PLL0 or PLL1
- the primary PLL, if it is currently being used as the reference clock for PLL1

This step is executed only after

- the System Clock Switching process has completed in order not to lose the current system clock during mode transition
- the Clock Sources (with no Dependencies) Switch-Off process has completed in order to, for example, prevent unwanted clock transitions

59.4.3.17 Flash Switch-Off

Based on the FLAON bit field of the ME_<current mode>_MC and ME_<target mode>_MC registers, if the flash is to be put in its low-power or power-down mode, the MC_ME requests the flash to enter the corresponding power mode and waits for the flash to acknowledge. The exact power mode status of the flash is updated in the S_FLA bit field of the ME_GS register. This step is executed only when the Processor Clocks Disable and System Clock Disable processes have completed.

59.4.3.18 Current Mode Update

The current mode status bit field S_CURRENT_MODE of the ME_GS register is updated with the target mode bit field TARGET_MODE of the ME_MCTL register when :

- all the updated status bits in the ME_GS register match the configuration specified in the ME_<target mode>_MC register
- power sequences are done
- clock disable/enable process is finished
- processor low-power mode (stop) entry and exit processes are finished

Note

SAFE mode entry does not wait for the clock disable/enable process to finish. It only waits for the ME_GS.S_RC bit to be set. This is to ensure that the SAFE mode is entered as quickly as possible.

Software can monitor the mode transition status by reading the S_MTRANS bit of the ME_GS register. The mode transition latency can differ from one mode to another depending on the resources' availability before the new mode request and the target mode's requirements.

If a mode transition is taking longer to complete than is expected, the ME_DMTS register can indicate which process is still in progress.

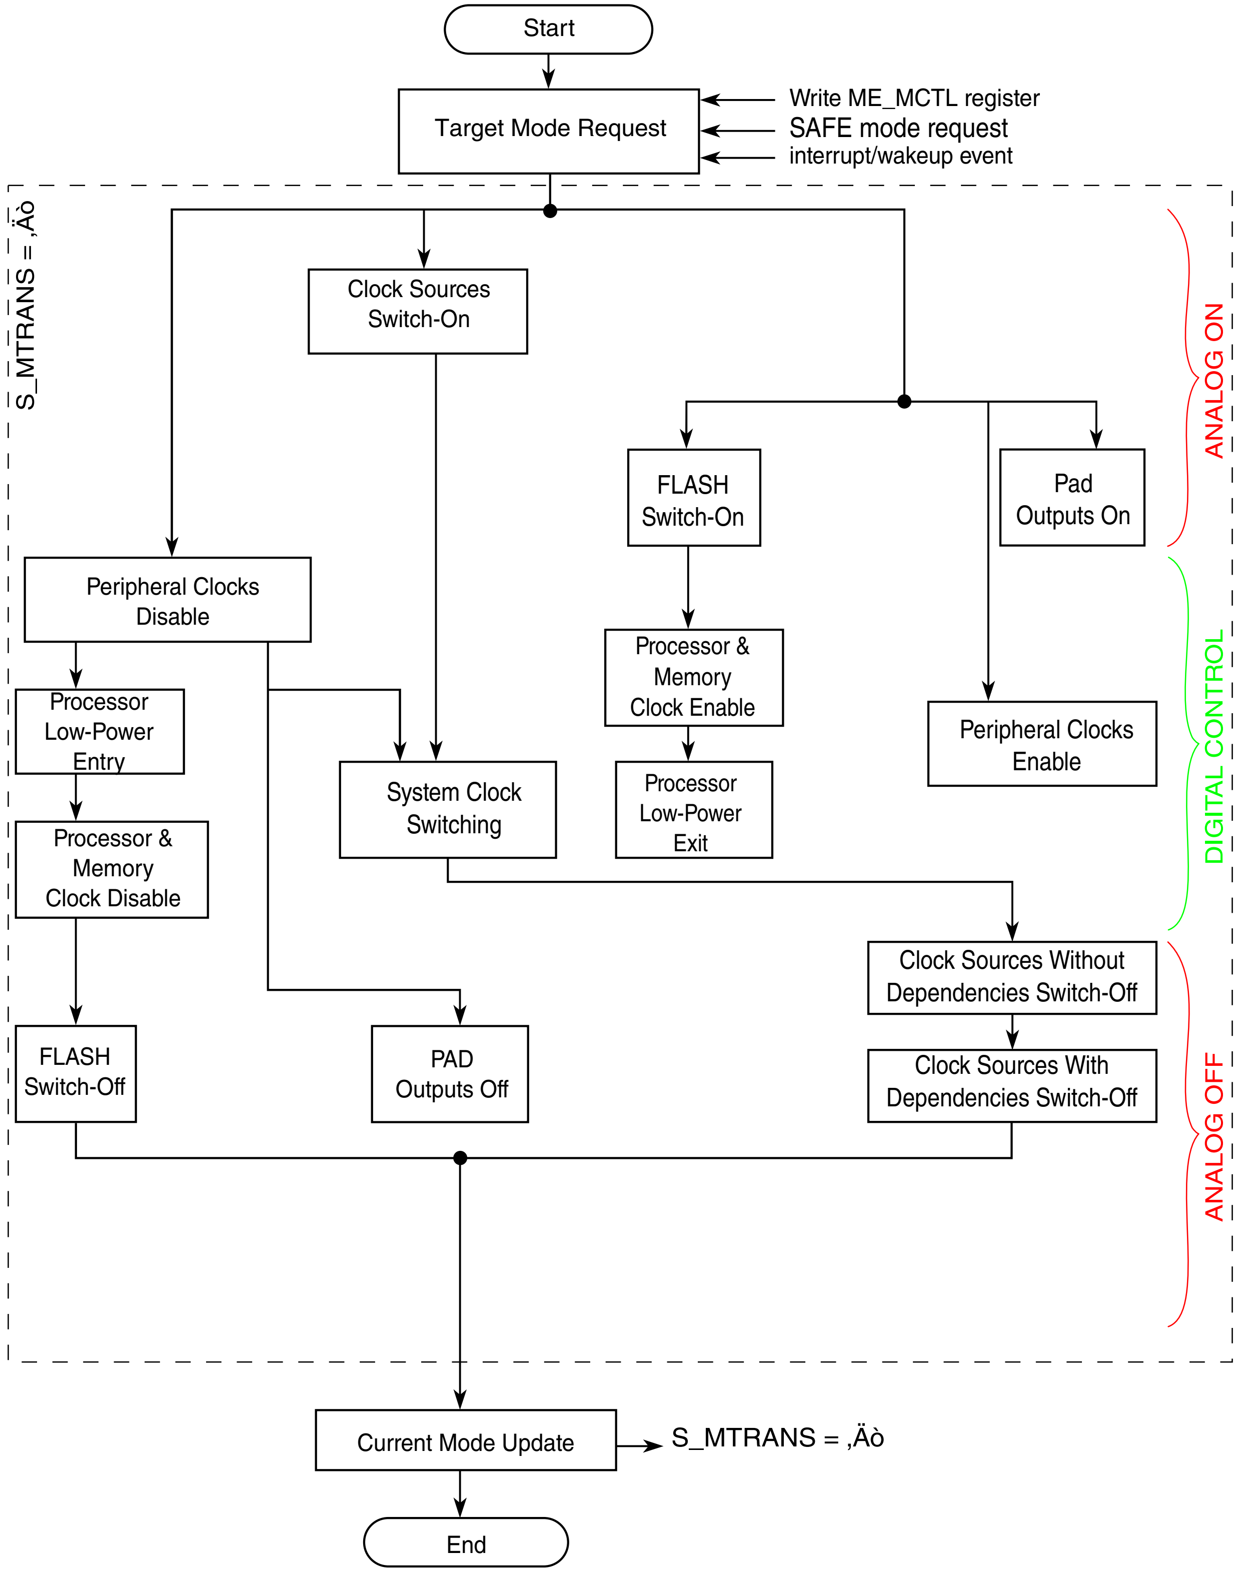

Figure 59-3. MC_ME Transition Diagram

59.4.4 Protection of Mode Configuration Registers

While programming the mode configuration registers ME_<mode>_MC, the following rules must be respected. Otherwise, the write operation is ignored and an invalid mode configuration interrupt may be generated.

- If the 16 MHz internal RC oscillator is selected as the system clock, IRC must be on.
- If the 4 MHz to 40 MHz crystal oscillator clock is selected as the system clock, XOSC must be on.
- If the primary PLL (PHI) clock is selected as the system clock, PLL0 must be on.
- If the secondary PLL clock is selected as the system clock, PLL1 must be on.
- If the 16 MHz internal RC oscillator is selected as the reference for PLL0 (via the MC_CGM_AC3_SC register in the MC_CGM) and PLL0 is on, IRCOSC must be on.
- If the 4 MHz to 40 MHz crystal oscillator is selected as the reference for PLL0 (via the MC_CGM_AC3_SC register in the MC_CGM) and PLL0 is on, XOSC must be on.
- If the 4 MHz to 40 MHz crystal oscillator is selected as the reference for PLL1 (via the MC_CGM_AC4_SC register in the MC_CGM) and PLL1 is on, XOSC must be on.
- If the primary PLL is selected as the reference for PLL1 (via the MC_CGM_AC4_SC register in the MC_CGM) and PLL1 is on, PLL0 must be on.

Note

Software must ensure that clock sources with dependencies other than those mentioned above are switched on as needed. There is no automatic protection mechanism to check this in the MC_ME.

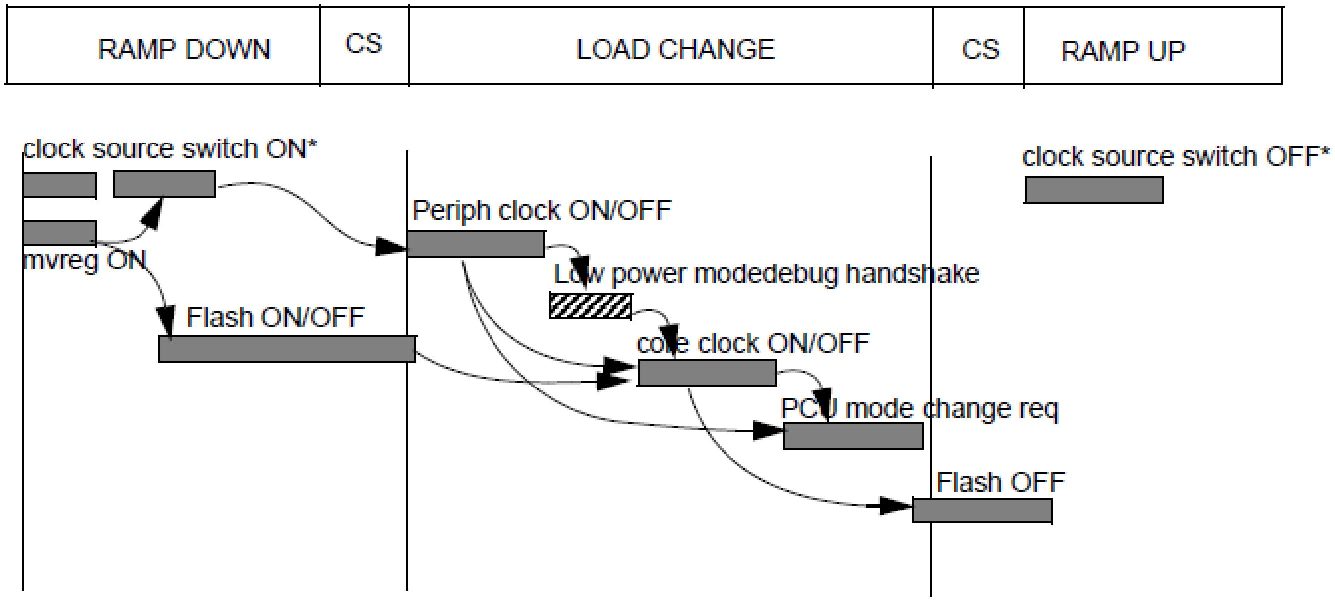
- Configuration "00" for the FLAON bit field is reserved.
- System clock configurations marked as 'reserved' may not be selected.
- Configuration "1111" for the SYSCLK bit field is allowed only for theTEST mode, and only in this case may all system clock sources be turned off.

Warning

> If the system clock is stopped during TEST mode, the chip can exit only via a system reset.

59.4.5 Mode transition and progressive clock switching

The MC_ME initiates a progressive clock switching via MC_CGM whenever the **ME_<current mode>_MC.PWRLVL** field is different from **ME_<target mode>_MC.PWRLVL** bit field. Broadly, the mode transition process can be divided into three steps with respect to progressive cclock switching - RAMP DOWN, LOAD CHANGE and RAMP UP. One or more of these steps may not be needed based on the current and target mode configirations. The clock switching (from current system clock source to target system clock source) can happen before or after the LOAD CHANGE step.



* - The clock source switching ON process is shown in two steps - the main vreg independent clock source switching ON and the main vreg dependent clock sources swicthing ON.

CS - Clock swtching. Only one clock switching step is needed.It can be before the load change process or after it.

▨ Optional step

Figure 59-4. MC_ME mode transition process with PCS

The table below shows the different ways the mode transition process can complete.

Table 59-4. Mode transition steps

Pwrlvl	Source clock	Target clock	Mode transition steps
Same	IRC	Non-IRC	LoadChange -> ClockSwitch
	IRC	IRC	LoadChange
	Non-IRC	IRC	LoadChange -> ClockSwitch
	Non-IRC	Non-IRC	LoadChange -> ClockSwitch
Different	IRC	Non-IRC	LoadChange -> ClockSwitch -> RampUp
	IRC	IRC	LoadChange
	Non-IRC	IRC	RampDown -> ClockSwitch -> LoadChange
	Non-IRC	Non-IRC	RampDown -> ClockSwitch -> LoadChange -> RampUp

59.4.6 Mode Transition Interrupts

The MC_ME provides interrupts for incorrectly configuring a mode, requesting an invalid mode transition, indicating a SAFE mode transition not due to a software request, and indicating when a mode transition has completed.

59.4.6.1 Invalid Mode Configuration Interrupt

Whenever a write operation is attempted to the ME_<mode>_MC registers violating the protection rules mentioned in the Protection of Mode Configuration Registers, the interrupt pending bit I_ICONF of the ME_IS register is set and an interrupt request is generated if the mask bit M_ICONF of the ME_IM register is '1'.

In addition, during a mode transition, if a clock source has been configured in the ME_<target mode>_MC register to be off and a peripheral requiring this clock source to be on has been enabled via the ME_RUN_PC0…7/ME_LP_PC0…7 and ME_PCTLn registers, the interrupt pending bit I_ICONF_CU of the ME_IS register is set and an iterrupt request is generated if the mask bit M_ICONF_CU of the ME_IM register is '1'.

If an attempt to write to one of the ME_CADDRn registers is made after a mode change request has been made via the second write to the ME_CTL register and before the completion of that mode transition as indicated by the S_MTRANS bit in the ME_GS register deasserting, the interrupt pending bit I_ICONF_CC of the ME_IS register is set and an iterrupt request is generated if the mask bit M_ICONF_CC of the ME_IM register is '1'.

59.4.6.2 Invalid Mode Transition Interrupt

The mode transition request is considered invalid under the following conditions:

- If the system is in the SAFE mode and the SAFE mode request from MC_RGM is active, and if the target mode requested is other than RESET or SAFE, then this new mode request is considered to be invalid, and the S_SEA bit of the ME_IMTS register is set.
- If the TARGET_MODE bit field of the ME_MCTL register is written with a value different from the specified mode values (i.e., a non-existing mode), an invalid mode transition event is generated. When such a non existing mode is requested, the S_NMA bit of the ME_IMTS register is set. This condition is detected regardless of whether the proper key mechanism is followed while writing the ME_MCTL register.
- If some of the chip modes are disabled as programmed in the ME_ME register, their respective configurations are considered reserved, and any access to the ME_MCTL register with those values results in an invalid mode transition request. When such a disabled mode is requested, the S_DMA bit of the ME_IMTS register is set. This condition is detected regardless of whether the proper key mechanism is followed while writing the ME_MCTL register.
- If the target mode is not a valid mode with respect to the current mode, the mode request illegal status bit S_MRI of the ME_IMTS register is set. This condition is detected only when the proper key mechanism is followed while writing the ME_MCTL register. Otherwise, the write operation is ignored.
- If further new mode requests occur while a mode transition to a mode other than SAFE mode is in progress (the S_MTRANS bit of the ME_GS register is '1'), the mode transition illegal status bit S_MTI of the ME_IMTS register is set. This condition is detected only when the proper key mechanism is followed while writing the ME_MCTL register. Otherwise, the write operation is ignored.
- If a new mode request occur while a mode transition to the SAFE mode is in progress (the S_MTRANS bit of the ME_GS register is ‘1’), the mode request ignored status bit S_MRIG of the ME_IMTS register is set. This condition is detected only when the proper key mechanism is followed while writing the ME_MCTL register. Otherwise, the write operation is ignored.

Note

As the causes of invalid mode transitions may overlap at the same time, the priority implemented for invalid mode transition status bits of the ME_IMTS register in the order from highest to lowest is S_SEA, S_NMA, S_DMA, S_MRI, S_MRIG, and S_MTI.

As an exception, the mode transition request is not considered as invalid under the following conditions:

- A new request is allowed to enter the RESET or SAFE mode irrespective of the mode transition status.
- As the exit of HALT0 and STOP0 modes depends on the interrupts of the system which can occur at any instant, these requests to return to RUN0…3 modes are always valid.
- In order to avoid any unwanted lockup of the chip modes, software can abort a mode transition by requesting the parent mode if, for example, the mode transition has not completed after a software-determined 'reasonable' amount of time for whatever reason. The parent mode is the chip mode before a valid mode request was made.

CAUTION

Depending on the cause of an incomplete mode transition, aborting by requesting the parent mode might not succeed. In this case, software must request a change to either SAFE or RESET mode, because the cause of the lockup is most likely a hardware fault.

- Self-transition requests (e.g., RUN0 → RUN0) are not considered as invalid even when the mode transition process is active (i.e., S_MTRANS is '1'). During the low-power mode exit process, if the system is not able to enter the respective RUN0…3 mode properly (i.e., all status bits of the ME_GS register match with configuration bits in the ME_<mode>_MC register), then software can only request the SAFE or RESET mode. It is not possible to request any other mode or to go back to the low-power mode again.

Whenever an invalid mode request is detected, the interrupt pending bit I_IMODE of the ME_IS register is set, and an interrupt request is generated if the mask bit M_IMODE of the ME_IM register is '1'.

59.4.6.3 SAFE Mode Transition Interrupt

Whenever the system enters the SAFE mode as a result of a SAFE mode request from the MC_RGM due to a hardware failure, the interrupt pending bit I_SAFE of the ME_IS register is set, and an interrupt is generated if the mask bit M_SAFE of ME_IM register is '1'.

The SAFE mode interrupt pending bit can be cleared only when the SAFE mode request is deasserted by the MC_RGM (see the MC_RGM chapter for details on how to clear a SAFE mode request). If the system is already in SAFE mode, any new SAFE mode request by the MC_RGM also sets the interrupt pending bit I_SAFE. However, the SAFE mode interrupt pending bit is not set when the SAFE mode is entered by a software request (i.e., programming of ME_MCTL register).

59.4.6.4 Mode Transition Complete interrupt

Whenever the system fully completes a mode transition (i.e., the S_MTRANS bit of ME_GS register transits from '1' to '0'), the interrupt pending bit I_MTC of the ME_IS register is set, and an interrupt request is generated if the mask bit M_MTC of the ME_IM register is '1'. The interrupt bit I_MTC is not set when entering low-power modes HALT0 and STOP0 in order to avoid the same event requesting the immediate exit of these low-power modes.

59.4.7 Peripheral Clock Gating

During all chip modes, each peripheral can be associated with a particular clock gating policy determined by two groups of peripheral configuration registers.

The run peripheral configuration registers ME_RUN_PC0…7 are chosen only during the software running modes DRUN, TEST, SAFE, and RUN0…3. All configurations are programmable by software according to the needs of the application. Each configuration register contains a mode bit which determines whether or not a peripheral clock is to be gated. Run configuration selection for each peripheral is done by the RUN_CFG bit field of the ME_PCTL***n*** registers.

The low-power peripheral configuration registers ME_LP_PC0…7 are chosen only during the low-power modes HALT0 and STOP0. All configurations are programmable by software according to the needs of the application. Each configuration register contains a mode bit which determines whether or not a peripheral clock is to be gated. Low-power configuration selection for each peripheral is done by the LP_CFG bit field of the ME_PCTL***n*** registers.

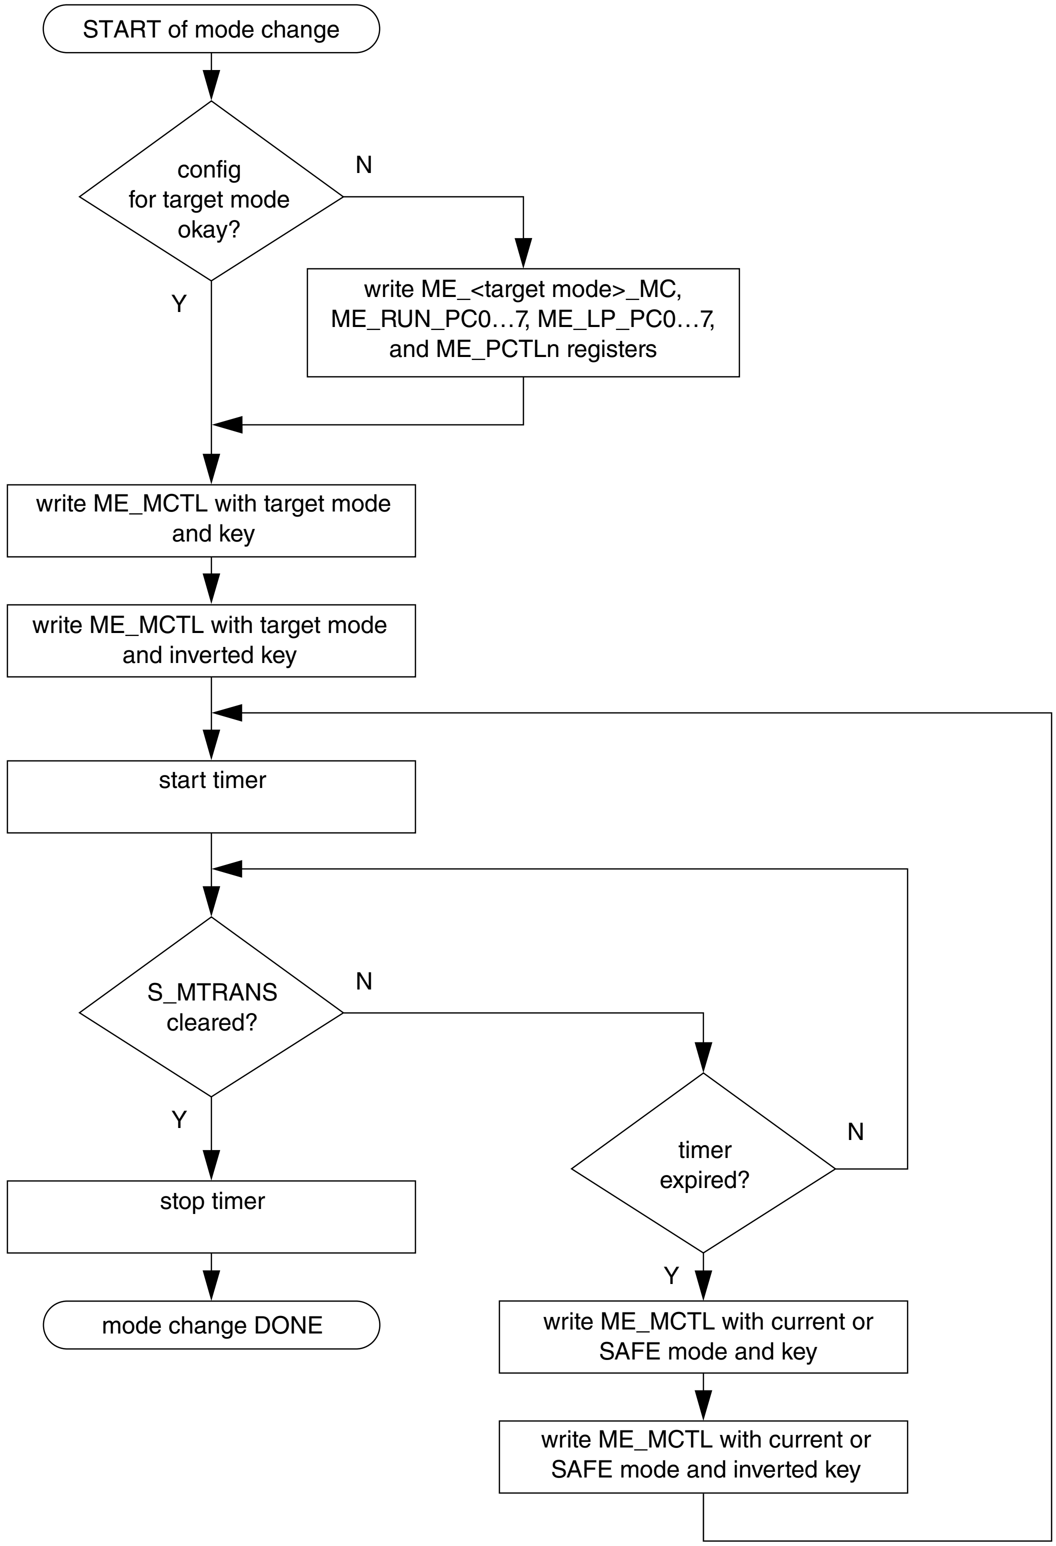
Any modifications to the ME_RUN_PC0…7, ME_LP_PC0…7, and ME_PCTL***n*** registers do not affect the clock gating behavior until a new mode transition request is generated.

Whenever the chip enters a debug session during any mode, the following occurs for each peripheral:

- The clock is gated if the DBG_F bit of the associated ME_PCTL***n*** register is set. Otherwise, the peripheral clock gating status depends on the RUN_CFG and LP_CFG bits.

59.4.8 Application Example

The following figure shows an example application flow for requesting a mode change and then waiting until the mode transition has completed.



START of mode change

Chapter 60
Core Debug Support

60.1 Overview

Internal debug support in the e200z4251n3 core allows for software and hardware debug by providing debug functions, such as instruction and data breakpoints and program trace modes. For software based debugging, debug facilities consisting of a set of software accessible debug registers and interrupt mechanisms are provided. These facilities are also available to a hardware based debugger which communicates using a modified IEEE 1149.1 Test Access Port (TAP) controller and pin interface. When hardware debug is enabled, the debug facilities controlled by hardware are protected from software modification.

Software debug facilities are defined as part of *Power ISA 2.06*. e200z4251n3 supports a subset of these defined facilities. In addition to the facilities defined in *Power ISA 2.06*, e200z4251n3 provides additional flexibility and functionality in the form of additional instruction breakpoints, linked instruction and data breakpoints, and extended range and value masking. These features are also available to a hardware-based debugger.

When not being used for debugging purposes, a portion of the debug facilities may be configured to provide a stack limit checking mechanism.

60.1.1 Software Debug Facilities

e200z4251n3 provides debug facilities to enable hardware and software debug functions, such as instruction and data breakpoints and program single stepping. The debug facilities consist of a set of debug control registers (DBCR0–2,4–8, EDBRAC0), a set of address compare registers (IAC1–8, DAC1–4), a set of 64-bit data value compare registers (DVC1, DVC2), a Debug Status Register (DBSR) for enabling and recording various kinds of debug events, a Debug Data Effective Address Register (DDEAR), and a special Debug interrupt type built into the interrupt mechanism.

The debug facilities also provide a mechanism for software-controlled processor reset, and debug mode entry. In addition, the Performance Monitor may be configured to utilize the debug interrupt type. Also, the Memory Protection Unit (MPU) may be configured to generate debug events using region descriptors which are not utilized for performing a protection function.

Software debug facilities are enabled by setting the internal debug mode bit in Debug Control register 0 ($\mathrm{DBCR0}_{\mathrm{IDM}}$). When internal debug mode is enabled, debug events can occur, and can be enabled to record exceptions in the Debug Status register (DBSR). If enabled by $\mathrm{MSR}_{\mathrm{DE}}$, these recorded exceptions cause Debug interrupts to occur. When $\mathrm{DBCR0}_{\mathrm{IDM}}$ is cleared (and $\mathrm{EDBCR0}_{\mathrm{EDM}}$ is cleared as well), no debug events occur, and no status flags are set in DBSR unless already set. In addition, when $\mathrm{DBCR0}_{\mathrm{IDM}}$ is cleared (or is overridden by $\mathrm{EDBCR0}_{\mathrm{EDM}}$ being set and EDBRAC0 indicating no resource is "owned" by software) no Debug interrupts will occur, regardless of the contents of DBSR. A software Debug interrupt handler may access all system resources and perform necessary functions appropriate for system debug.

60.1.1.1 *Power ISA 2.06* Compatibility

The e200z4251n3 core implements a subset of the *Power ISA 2.06* internal debug features. The following restrictions on functionality are present:

- Instruction address compares do not support compare on physical (real) addresses.
- Data address compares do not support compare on physical (real) addresses.

60.1.2 Additional Debug Facilities

In addition to the debug functionality defined in *Power ISA 2.06*, e200z4251n3 provides capability to link instruction and data breakpoints, provides additional instruction and data breakpoints, extended range and value masking, multiple watchpoint outputs, provides capability for the Performance Monitor to generate debug events, and allows for sharing of debug resources between software and a hardware debugger. (See Sharing Debug Resources by Software/Hardware.) A data trace port is also provided.

60.1.2.1 Data Trace Port

The data trace port interface is provided to assist in implementing extended debug watchpoint/breakpoint/trace capture capability with logic external to the e200z4251n3 core. This port provides information corresponding to each read or write access completed without error by the CPU. In order to report data accesses, the Nexus 3 DTC register DI control bit must be set to trace data accesses, not instruction accesses (i.e. the normal setting. See the "Data Trace Control Register (DTC)" section in the Core (e200z4251n3) Nexus 3 Module chapter. The data trace port will report aligned accesses, and most misaligned accesses as one access, unless the two portions of a misaligned access are non-contiguous, such as when the second portion of the misaligned access is to address 0. Also, for accesses generated by a LSP load/store instruction using circular addressing mode which crosses a buffer boundary, the two portions of the misaligned access will be reported separately, since otherwise it is not possible to correctly correlate the data with the initial access address.

60.1.3 Hardware Debug Facilities

The e200z4251n3 core contains facilities that allow for external test and debugging. A modified IEEE 1149.1 control interface is used to communicate with the core resources. This interface is implemented through a standard IEEE 1149.1 TAP (test access port) controller.

By using public instructions, the external debugger can freeze or halt the e200z4251n3 core, read and write internal state and debug facilities, single-step instructions, and resume normal execution.

Hardware Debug is enabled by setting the External Debug Mode enable bit in External Debug Control register 0 ($EDBCR0_{EDM}$), which is also aliased to $DBCR0_{EDM}$. Setting $EDBCR0_{EDM}$ overrides the Internal Debug Mode enable bit $DBCR0_{IDM}$ unless resources are provided back to software via the settings in EDBRAC0. When the Hardware Debug facility is enabled, software is blocked from modifying the "hardware-owned" debug facilities. In addition, since resources are "owned" by the hardware debugger, inconsistent values may be present if software attempts to read "hardware-owned" debug-related resources.

When hardware debug is enabled by setting $EDBCR0_{EDM}$=1, the control registers and resources described in Debug registers are reserved for use by the external debugger. The same events described in Software Debug Events and Exceptions are also used for external debugging, but exceptions are not generated to running software. Hardware-owned debug events enabled in the respective DBCR0–8 registers are recorded in the EDBSR0 register (not the DBSR) regardless of MSR_{DE}, and no debug interrupts are generated unless a) the resource is granted back to software via EDBRAC0 settings, and b) debug mode entry is not masked by the corresponding event bit in EDBSRMSK0. Instead, the CPU will enter debug mode when an enabled event causes a EDBSR0 bit to become set. $EDBCR0_{EDM}$, EDBSR0, EDBSRMSK0, EDDEAR, and EDBRAC0 may only be written through the OnCE port.

Access to most debug resources (registers) requires that the CPU clock (**m_clk**) be running in order to perform write accesses from the external hardware debugger.

60.1.4 Sharing Debug Resources by Software/Hardware

Debug resources may be shared by a hardware debugger and software debug based on the settings of debug control register EDBRAC0. When EDBCR0$_{EDM}$ is set, EDBRAC0 settings determine which debug resources are allocated to software and which resources remain under exclusive hardware control. Software-owned resources which set DBSR bits when DBCR0$_{IDM}$=1 will cause a debug interrupt to occur when enabled with MSR$_{DE}$. Hardware-owned resources which set EDBSR0 bits when EDBCR0$_{EDM}$=1 will cause an entry into debug mode if the event is not masked in EDBSRMSK0. EDBRAC0 is read-only by software. When resource sharing is enabled, (EDBCR0$_{EDM}$=1 and EDBRAC0$_{IDM}$=1), only software-owned resources may be modified by software. Hardware always has full access to all registers and all register fields through the OnCE register access mechanism, and it is up to the debug firmware to properly implement modifications to these registers with read-modify-write operations to implement any control sharing with software. Hardware-owned resources will set status bits in the EDBSR0 register instead of in DBSR, and will report the effective address of data breakpoints in EDDEAR instead of DDEAR. Settings in EDBRAC0 should be considered by the debug firmware in order to preserve software settings of control and status registers as appropriate when hardware modifications to the debug registers are performed.

60.1.4.1 Simultaneous Hardware and Software Debug Event Handing

Since it is possible that a "hardware-owned" resource can produce a debug event in conjunction with a software-owned resource producing a different debug event simultaneously, a priority ordering mechanism is implemented which guarantees that the hardware event is handled as soon as possible, while preserving the recognition of the software event. The CPU will give highest priority to the software event initially in order to reach a recoverable boundary, and then will give highest priority to the hardware event in order to enter debug mode as near the point of event occurrence as possible. This is implemented by allowing software exception handing to begin internal to the CPU and to reach the point where the current program counter and MSR values have been saved into DSRR0/1, and the new PC pointing to the debug interrupt handler, along with the new MSR updates. At this point, hardware priority takes over, and the CPU enters debug mode.

The following figure shows the e200z4251n3 debug resources.

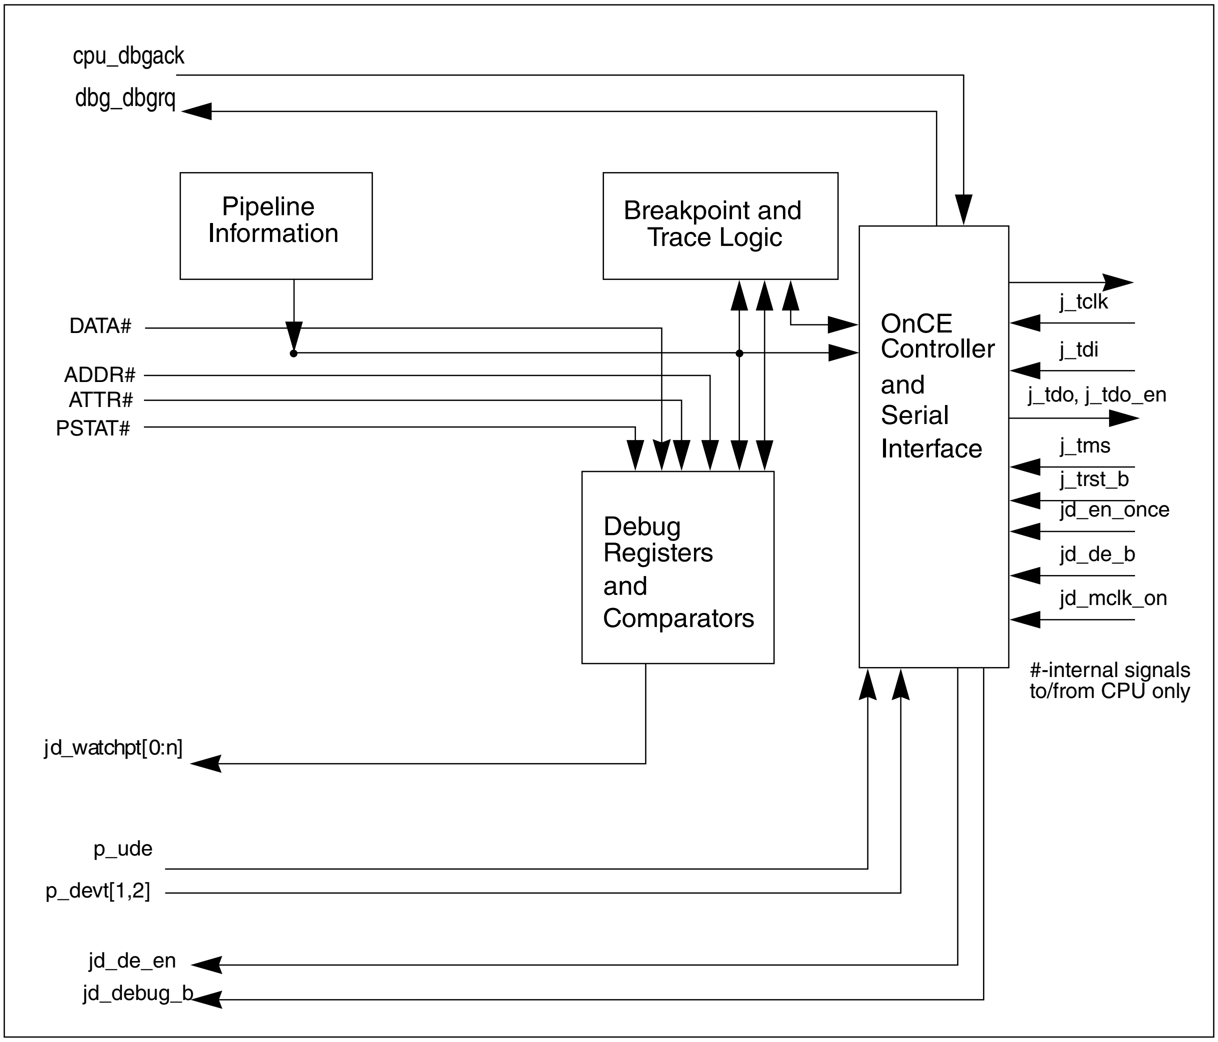

Figure 60-1. e200z4251n3 Debug Resources

60.2 Software Debug Events and Exceptions

Software debug events and exceptions are available when internal debug mode is enabled (DBCR0$_{\text{IDM}}$=1) and not overridden by external debug mode (EDBCR0$_{\text{EDM}}$ must either be cleared or corresponding resources must be allocated to software debug by the settings in EDBRAC0). When enabled, debug events cause debug exceptions to be recorded in the Debug Status Register. Specific event types are enabled by the Debug Control Registers (DBCR0–8). The Unconditional Debug Event (UDE) is an exception to this rule; it is always enabled. Once a Debug Status Register (DBSR) bit is set by a debug resource which is "owned" by software (other than MRR, DAC_OFST, or VLES), if Debug interrupts are enabled by MSR$_{\text{DE}}$, a Debug interrupt will be generated. The debug interrupt handler is responsible for ensuring that multiple repeated debug interrupts do not occur by clearing the DBSR as appropriate.

Certain debug events are not allowed to occur when MSR_{DE}=0 and $DBCR0_{IDM}$=1. In such situations, no debug exception occurs and thus no DBSR bit is set. Other debug events may cause debug exceptions and set DBSR bits regardless of the state of MSR_{DE}. A Debug interrupt will be delayed until MSR_{DE} is later set to '1'.

When a Debug Status Register bit is set while MSR_{DE}=0, an Imprecise Debug Event flag ($DBSR_{IDE}$) will also be set to indicate that an exception bit in the Debug Status Register was set while Debug interrupts were disabled. Debug interrupt handler software can use this bit to determine whether the address recorded in Debug Save/Restore Register 0 is an address associated with the instruction causing the debug exception, or the address of the instruction which enabled a delayed Debug interrupt by setting the MSR_{DE} bit. A **mtmsr** or **mtdbcr0** which causes both MSR_{DE} and $DBCR0_{IDM}$ to become set, enabling precise debug mode, may cause an Imprecise (Delayed) Debug exception to be generated due to an earlier recorded event in the Debug Status register.

There are eight types of debug events defined by *Power ISA 2.06*:

1. Instruction Address Compare debug events
2. Data Address Compare debug events
3. Trap debug events
4. Branch Taken debug events
5. Instruction Complete debug events
6. Interrupt/Critical Interrupt Taken debug events
7. Return/Critical Return debug events
8. Unconditional debug events

In addition, e200z4251n3 defines additional debug events:

- The External debug events DEVT1 and DEVT2 which are described in External debug event.
- The Performance Monitor Interrupt event PMI which is described in Performance Monitor Interrupt debug event.

The e200z4251n3 debug configuration supports most of these event types. Unsupported *Power ISA 2.06* defined functionality is as follows:

- Instruction Address Compare and Data Address Compare *Real address* mode is not supported

A brief description of each of the event types follows.

60.2.1 Instruction Address Compare Event

Instruction Address Compare debug events occur when enabled and execution is attempted of an instruction at an address that meets the criteria specified in the DBCR0, DBCR1, DBCR5, DBCR6, and IAC1–8 Registers. Instruction Address compares may specify user/supervisor mode, along with an effective address, masked effective address, or range of effective addresses for comparison. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. IAC events will not occur when an instruction would not have normally begun execution due to a higher priority exception at an instruction boundary.

IAC compares perform a 31-bit compare for VLE instruction storage accesses. Each halfword fetched by the instruction fetch unit will be marked with a set of bits indicating whether an Instruction Address Compare occurred on that halfword. Debug exceptions will occur if enabled and a 16-bit instruction, or the first halfword of a 32-bit instruction, is tagged with an IAC hit.

60.2.2 Data Address Compare Event

Data Address Compare debug events occur when enabled and execution of a load or store class instruction or a cache maintenance instruction results in a data access that meets the criteria specified in the DBCR0, DBCR2, DBCR4, DBCR7–8, DAC1–4, DVC1, and DVC2 Registers. Data address compares may specify user/supervisor mode, along with an effective address, masked effective address, or range of effective addresses for comparison. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. Four address compare values (DAC1–4) are provided.

The effective address of the load, store, or cache control operation is recorded in the DDEAR register when a data address compare event is recorded in DBSR if the previous values of the $DBSR_{DAC\{R,W\}}$ bits are zero. Once a DDEAR update is performed, these bits must be cleared by software prior to another DDEAR hardware update occurring. A subsequent DAC event will not update the DDEAR register if either of the $DBSR_{DAC\{R,W\}}$ bits are set.

Note

> In contrast to the *Power ISA 2.06* definition, Data Address Compare events on e200z4251n3 do not prevent the load or store class instruction from completing. If a load or store class

instruction completes successfully without a Data Storage interrupt, Data Address Compare exceptions are reported at the completion of the instruction. If the exception results in a precise Debug interrupt, the address value saved in DSRR0 is the address of the instruction following the load or store class instruction. For DVC DAC events, the exception can be imprecisely reported even further past the load or store class instruction generating the event (without necessarily affecting DBSR_{IDE}) and the saved address value can point to a subsequent instruction past the next instruction. This occurrence is indicated in the $\text{DBSR}_{\text{DAC\_OFST}}$ field.

If a load or store class instruction does not complete successfully due to a Data Storage exception or a machine check condition for the load or store, and a Data Address Compare debug exception also occurs, the result is an imprecise Debug interrupt, the address value saved in DSRR0 is the address of the load or store class instruction, and the DBSR_{IDE} bit will be set. In addition to occurring when $\text{DBCR0}_{\text{IDM}}$=1, this circumstance can also occur when $\text{EDBCR0}_{\text{EDM}}$=1 and the event is hardware-owned, in which case $\text{EDBSR0}_{\text{IDE}}$ will be set.

Note

DAC events will not be recorded if a load multiple word or store multiple word instruction is interrupted prior to completion by a critical input or external input interrupt.

Note

DAC events will occur for cache control instructions without performing data compares, regardless of the settings of the DBCRx registers and DVC registers for data value comparison qualifications, i.e. no data comparisons are performed since these instructions do not have associated data values.

Note

DAC events are not signaled on the second portion of a misaligned load or store that is broken up into two separate accesses.

Note

DAC events are not signaled on the **mpure** or **mpuwe** MPU instructions.

Note

DAC[1,2] events are not signaled if DVC[1,2]M is non-zero and a DSI exception occurs on the load or store, since the load or store access is not performed. For a **lmw** or **stmw** transfer however, if a DVC successfully occurs on a transfer and a later transfer encounters a DSI exception, the DAC event will be reported, since a successful data value compare took place.

Note

Due to internal pipeline status, for a reported DAC event on a **lmw** or **stmw** transfer, the value stored in the DDEAR/ EDDEAR will be the effective address of the first transfer of the sequence, and not necessarily the precise transfer that caused the DAC event.

60.2.2.1 Data Address Compare Event Status Updates

Data Address Compare debug events with Data Value compares can be reported ambiguously in several circumstances involving issuing a sequence of load or store class instructions. Due to the CPU pipeline and the delay in performing the data value compare following completion of the access, if the first load or store class instruction generates a DVC DAC, a second and possibly third load or store class instruction may also generate a DAC or DVC DAC event, or may generate a DSI exception with or without a simultaneous DAC event.

Also, since non-load/store instructions may be dual-issued in combination with a load/ store instruction, the actual number of additional instructions that are completed following a recognized DVC DAC on a load/store instruction may vary from 0 to 5. This value will be reported in the $\text{DBSR}_{\text{DAC\_OFST}}$ field when the DVC DAC status is recorded.

Table 60-1 outlines the settings of the DBSR, DSRR0 saved value, and potential updating of the ESR register for various exception cases on sequences of load/store class instructions. Not all exception combinations are covered in the table, such as IAC, ISI, or Alignment exceptions on subsequent instructions. In general these exceptions will cause further instruction issue to be halted, execution of the excepting instruction to be aborted, and reporting of these exceptions will be masked. The saved DSRR0 value will point to this excepting instruction, and the exception(s) may be regenerated after returning from the debug interrupt handler and attempting to re-execute the instruction pointed to by DSRR0. In addition, in the examples in Table 60-1, the DAC_OFST and DSRR0 values assume no dual issue occurs. If dual-issue occurs with the first, second, or third column, then the DAC_OFST and DSRR0 values will point beyond the values shown.

Table 60-1. DAC events and Resultant Updates

1st load/store class instruction	2nd instruction (load/store class unless otherwise specified)	3rd instruction (load/store class unless otherwise specified)	Result
DSI, no DAC	—	—	Take DSI exception, no DBSR update. Update ESR.
DSI, with DACx	—	—	Take Debug exception, DBSR update setting DACx and IDE, DAC_OFST not set. DSRR0 points to 1st load/store class instruction. No ESR update.
DACx	—	—	Take Debug exception, DBSR update setting DACx, DAC_OFST not set. DSRR0 points to 2nd load/store class instruction. No ESR update.
DVC DACx	No exceptions, any instruction	No exceptions, Non-ldst instruction	Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b001. DSRR0 points to 3rd instruction. No ESR update.
DVC DACx	No exceptions	No exceptions, Ldst instruction	Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b010. DSRR0 points to instruction after 3rd instruction. No ESR update.
DVC DACx	DSI, no DAC	—	Take Debug exception, DBSR update setting DACx, DAC_OFST not set. DSRR0 points to 2nd load/store class instruction. No ESR update. **Note:** in this case the 2nd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.
DVC DACx	DSI, with DACy	—	Take Debug exception, DBSR update setting DACx. DAC_OFST not set. DSRR0 points to 2nd load/store class instruction. No ESR update. **Note:** in this case the 2nd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.
DVC DACx	DACy	—	Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b001. DSRR0 points to 3rd instruction. **Note:** in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.
DVC DACx	DVC DACy,Normal Ldst	Non-Ldst instruction	Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b001. DSRR0 points to the 3rd instruction. **Note:** in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.
DVC DACx	DVC DACy,Normal Ldst	Ldst instruction,no exception	Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b010. DSRR0 points to instruction after the 3rd load/store class instruction. **Note:** in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

Table continues on the next page...

Table 60-1. DAC events and Resultant Updates (continued)

1st load/store class instruction	2nd instruction (load/store class unless otherwise specified)	3rd instruction (load/store class unless otherwise specified)	Result
DVC DACx	DVC DACy,Normal Ldst	DSI Error, with or without DAC	Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b001. No ESR update. DSRR0 points to 3rd instruction. **Note:** in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case. **Note:** in this case the 3rd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.
DVC DACx	DVC DACy,Normal Ldst	DACy, or DVC DAC_y Normal Ldst or multiple word Ldst	Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b010. DSRR0 points to instruction after the 3rd load/store class instruction. **Note:** in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.
DVC DACx	DVC DACy,Ldst multiple (lmw, stmw)	Any instruction including ld/st	Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b001. DSRR0 points to the 3rd instruction. **Note:** in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.
DVC DACx	Any instruction(no exception)	DSI, with or without DAC,Normal Ldst or multiple word Ldst	Take Debug exception, DBSR update setting DACx. DAC_OFST set to 3'b001. DSRR0 points to the 3rd instruction. No ESR update. **Note:** in this case the 3rd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.
DVC DACx	Any instruction(no exception)	DACy, or DVC DAC_y Normal Ldst or multiple word Ldst	Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b010. DSRR0 points to instruction after the 3rd class instruction. **Note:** in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

Table 60-2 through Table 60-5 show some example updates for specific code sequences of dual issuing of load/store class instructions with non-load/store class instructions and the results of DAC and DVC events on selected ones of the load/store instructions.

Table 60-2. DAC events and Resultant Updates, Dual-issue case 1

Instruction Sequence:	Event(s)	Result
The following pairs dual-issue: (1) load/store (2) alu (3) load/store (4) alu (5) load/store (6) alu		
	Instruction (1): DSI, no DAC	Take DSI exception, no DBSR update, Update ESR.
	Instruction (1): DSI, with DACx	Take Debug exception, DBSR update setting DACx and IDE, DAC_OFST set to 3'b000. DSRR0 points to instruction (1). No ESR update.
	Instruction (1): DACx	Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b000. DSRR0 points to instruction (2). No ESR update.
	Instruction (1): DVC DACx No other exceptions	Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b100. DSRR0 points to instruction (6). No ESR update. No debug event updates for instruction (6)

	Instruction (1):
	DVC DACx
	Instruction (3):
	DSI, with or without DAC
		Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b001. DSRR0 points to instruction (3). No ESR update. No debug event updates for instructions (3)–(6).
		Note: in this case the 2nd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.

	Instruction (1):
	DVC DACx
	Instruction (3):
	DACy
		Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b010. DSRR0 points to instruction (4). No debug event updates for instructions (4)–(6).
		Note: in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

	Instruction (1):
	DVC DACx
	Instruction (3):
	DVC DACy
		Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b100. DSRR0 points to instruction (6). No ESR update. No debug event updates for instruction (6).
		Note: in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

	Instruction (1):
	DVC DACx
	Instruction (3):
	DVC DACy
	Instruction (5):
	DSI, with or without DAC
		Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b010. No ESR update. DSRR0 points to instruction (4). No debug event updates for instructions (4)–(6).
		Note: in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.
		Note: in this case the 3rd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.

	Instruction (1): DVC DACx No other exceptions	Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b100. DSRR0 points to instruction (6). No ESR update. No debug event updates for instruction (6).

	Instruction (1):
	DVC DACx
	Instruction (5):
	DSI, with or without DAC
		Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b011. DSRR0 points to instruction (5). No ESR update. No debug event updates for instructions (5)–(6).
		Note: in this case the 2nd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.

	Instruction (1):
	DVC DACx
	Instruction (5):
	DACy
		Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b100. DSRR0 points to instruction (6). No debug event updates for instruction (6).
		Note: in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

	Instruction (1):
	DVC DACx
	Instruction (5):
	DVC DACy
		Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b100. DSRR0 points to instruction (6). No ESR update. No debug event updates for instruction (6)
		Note: in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

Table 60-5. DAC events and Resultant Updates, Dual-issue case 4

Instruction Sequence: **The following pairs dual-issue:** **(1) load/store** **(2) alu** **(3) load/store** **(4) alu** **(5) alu** **(6) alu**	**Event(s)**	**Result**
	Instruction (1): DSI, no DAC	Take DSI exception, no DBSR update, Update ESR.
	Instruction (1): DSI, with DACx	Take Debug exception, DBSR update setting DACx and IDE, DAC_OFST set to 3'b000. DSRR0 points to instruction (1). No ESR update.
	Instruction (1): DACx	Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b000. DSRR0 points to instruction (2). No ESR update.
	Instruction (1): DVC DACx No other exceptions	Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b011. DSRR0 points to instruction (5). No ESR update. No debug event updates for instructions (5)–(6)

	Instruction (1):
	DVC DACx
	Instruction (3):
	DSI, with or without DAC
		Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b001. DSRR0 points to instruction (3). No ESR update. No debug event updates for instructions (3)–(6).
		Note: in this case the 2nd ld/st exception is masked. This behavior is implementation dependent and may differ on other CPUs.

	Instruction (1):
	DVC DACx
	Instruction (3):
	DACy
		Take Debug exception, DBSR update setting DACx, DACy. DAC_OFST set to 3'b010. DSRR0 points to instruction (4). No debug event updates for instructions (4)–(6).
		Note: in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

	Instruction (1):
	DVC DACx
	Instruction (3):
	DVC DACy
		Take Debug exception, DBSR update setting DACx, DAC_OFST set to 3'b011. DSRR0 points to instruction (5). No ESR update. No debug event updates for instructions (5)–(6).
		Note: in this case if x==y, then the resultant state of DBSR and DSRR0 may be indistinguishable from the "no DACy" case.

60.2.3 Linked Instruction Address Compare and Data Address Compare Events

Data Address Compare 1, 2, 3, and 4 debug events may be 'linked' with an Instruction Address Compare event by setting the DAC[1–4]LNK control bits in DBCR2 and DBCR8 to further refine when a Data Address Compare debug event is generated. DAC1 may be linked with IAC1, DAC2 (when not used as a mask or range bounds register) may be linked with IAC3. DAC3 may be linked with IAC5, DAC4 (when not used as a mask or range bounds register) may be linked with IAC7. When linked, a DAC debug event occurs when the same instruction that generates the DAC 'hit' also generates a corresponding linked IAC 'hit'. When linked, the IAC event is not recorded in the Debug Status register, regardless of whether a corresponding linked DAC event occurs, or whether the IAC event enable is set.

When enabled and execution of a load or store class instruction results in a data access with an address that meets the criteria specified in the DBCRx, DACx, and DVCx Registers, and the instruction also meets the criteria for generating an Instruction Address Compare event, a Linked Data Address Compare debug event occurs. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. The normal DAC1 status bit in the DBSR is used for recording these events. The IAC status bit is not set if the corresponding Instruction Address Compare register is linked.

Linking is enabled using control bits in DBCR2 and DBCR8. Note that linking is only available in EDM or IDM. Attempts to use linking otherwise are ignored.

Note

> Linked DAC events will not be recorded if a load multiple word or store multiple word type instruction is interrupted prior to completion by a critical input or external input interrupt.

60.2.4 Trap Debug Event

A Trap debug event (TRAP) occurs if Trap debug events are enabled ($DBCR0_{TRAP}$=1), a Trap instruction (**tw**) is executed, and the conditions specified by the instruction for the trap are met. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When a Trap debug event occurs, the $DBSR_{TRAP}$ bit is set to 1 to record the debug exception.

60.2.5 Branch Taken Debug Event

A Branch Taken debug event (BRT) occurs if Branch Taken debug events are enabled ($DBCR0_{BRT}$=1) and execution is attempted of a branch instruction that will be taken (either an unconditional branch, or a conditional branch whose branch condition is true), and MSR_{DE}=1. Branch Taken debug events are not recognized if MSR_{DE}=0 at the time of execution of the branch instruction and thus $DBSR_{IDE}$ can not be set by a Branch Taken debug event. When a Branch Taken debug event is recognized, the DBSR_{BRT} bit is set to 1 to record the debug exception, and the address of the branch instruction will be recorded in DSRR0.

60.2.6 Instruction Complete Debug Event

An Instruction Complete debug event (ICMP) occurs if Instruction Complete debug events are enabled ($\text{DBCR0}_{\text{ICMP}}$=1), execution of any instruction is completed, and MSR_{DE}=1. If execution of an instruction is suppressed due to the instruction causing some other exception that is enabled to generate an interrupt, then the attempted execution of that instruction does not cause an Instruction Complete debug event. The ***se_sc*** instruction does not fall into the category of an instruction whose execution is suppressed, since the instruction actually executes and then generates a System Call interrupt. In this case, the Instruction Complete debug exception will also be set. When an Instruction Complete debug event is recognized, $\text{DBSR}_{\text{ICMP}}$ is set to 1 to record the debug exception and the address of the next instruction to be executed will be recorded in DSRR0.

Instruction Complete debug events are not recognized if MSR_{DE}=0 at the time of execution of the instruction, thus DBSR_{IDE} is not generally set by an ICMP debug event.

One circumstance may cause the $\text{DBSR}_{\text{ICMP}}$ and DBSR_{IDE} bits to be set. This occurs when a EFPU Round exception occurs. Since the instruction is by definition completed (SRR0 points to the following instruction), this interrupt takes higher priority than the Debug interrupt so as not to be lost, and DBSR_{IDE} is set to indicate the imprecise recognition of a Debug interrupt. In this case, the Debug interrupt will be taken with SRR0 pointing to the instruction following the instruction that generated the EFPU Round exception, and DSRR0 will point to the Round exception handler. In addition to occurring when $\text{DBCR0}_{\text{IDM}}$=1, this circumstance can also occur when $\text{EDBCR0}_{\text{EDM}}$=1 and the event is hardware-owned, in which case $\text{EDBSR0}_{\text{IDE}}$ will be set.

Note

> Instruction complete debug events are not generated by the execution of an instruction that sets MSR_{DE} to '1' while $\text{DBCR0}_{\text{ICMP}}$=1, nor by the execution of an instruction that sets $\text{DBCR0}_{\text{ICMP}}$ to '1' while MSR_{DE}=1.

60.2.7 Interrupt Taken Debug Event

An Interrupt Taken debug event (IRPT) occurs if Interrupt Taken debug events are enabled ($DBCR0_{IRPT}$=1) and a base-class interrupt occurs. Only base-class interrupts (an interrupt using SRR0/1) cause an Interrupt Taken debug event. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When an Interrupt Taken debug event occurs, the $DBSR_{IRPT}$ bit is set to 1 to record the debug exception. The value saved in DSRR0 will be the address of the non-critical interrupt handler.

60.2.8 Critical Interrupt Taken Debug Event

A Critical Interrupt Taken debug event (CIRPT) occurs if Critical Interrupt Taken debug events are enabled ($DBCR0_{CIRPT}$=1) and a critical interrupt occurs. Only critical class interrupts (an interrupt using CSRR0/1) cause a Critical Interrupt Taken debug event. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When a Critical Interrupt Taken debug event occurs, the $DBSR_{CIRPT}$ bit is set to 1 to record the debug exception. The value saved in DSRR0 will be the address of the critical interrupt handler.

60.2.9 Return Debug Event

A Return debug event (RET) occurs if Return debug events are enabled ($DBCR0_{RET}$=1) and an attempt is made to execute an **se_rfi** instruction. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When a Return debug event occurs, the $DBSR_{RET}$ bit is set to 1 to record the debug exception.

If MSR_{DE}=0 at the time of the execution of the **se_rfi** (i.e. before the MSR is updated by the **se_rfi**), then $DBSR_{IDE}$ is also set to 1 to record the imprecise debug event.

If MSR_{DE}=1 at the time of the execution of the **se_rfi**, a Debug interrupt will occur provided there exists no higher priority exception that is enabled to cause an interrupt. Debug Save/Restore Register 0 will be set to the address of the **se_rfi** instruction.

60.2.10 Critical Return Debug Event

A Critical Return debug event (CRET) occurs if Critical Return debug events are enabled ($DBCR0_{CRET}$=1) and an attempt is made to execute an **se_rfci** instruction. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When a Critical Return debug event occurs, the $DBSR_{CRET}$ bit is set to 1 to record the debug exception.

If MSR_{DE}=0 at the time of the execution of the **se_rfci** (i.e. before the MSR is updated by the **se_rfci**), then $DBSR_{IDE}$ is also set to 1 to record the imprecise debug event.

If MSR_{DE}=1 at the time of the execution of the **se_rfci**, a Debug interrupt will occur provided there exists no higher priority exception that is enabled to cause an interrupt. Debug Save/Restore Register 0 will be set to the address of the **se_rfci** instruction.

60.2.11 External debug event

An External debug event (DEVT1, DEVT2) occurs if External debug events are enabled ($DBCR0_{DEVT1}$=1 or $DBCR0_{DEVT2}$=1), and the respective **p_devt1** or **p_devt2** input signal transitions to the asserted state while the CPU is not in the Stopped state. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When an External debug event occurs, $DBSR_{DEVT\{1,2\}}$ is set to '1' to record the debug exception. This debug event is an asynchronous event, but is only sampled when the CPU **m_clk** is active.

60.2.12 Unconditional debug event

An Unconditional debug event (UDE) occurs when the Unconditional Debug Event (**p_ude**) input transitions to the asserted state. The Unconditional debug event is the only debug event that does not have a corresponding enable bit for the event in DBCR0. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When an Unconditional debug event occurs, the $DBSR_{UDE}$ bit is set to '1' to record the debug exception. This debug event is an asynchronous event.

60.2.13 Performance Monitor Interrupt debug event

A Performance Monitor Interrupt debug event (PMI) occurs if Performance Monitor Interrupt debug events are enabled ($PMGC0_{UDI}$=1), and a performance monitor interrupt event occurs. This event can occur and be recorded in DBSR regardless of the setting of MSR_{DE}. When a Performance Monitor Interrupt debug event occurs, $DBSR_{PMI}$ is set to '1' to record the debug exception. This debug event is an asynchronous event.

60.3 Debug registers

This section describes debug-related registers that are software accessible. These registers are intended for use by special debug tools and debug software, not by general application code.

Access to these registers (other than DBSR) by software is conditioned by the External Debug mode control bit ($EDBCR0_{EDM}$) and the settings of debug control register EDBRAC0, which can be set by the hardware debug port. If $EDBCR0_{EDM}$ is set and if the bit in EDBRAC0 corresponding to the resource is cleared, software is prevented from modifying debug register values other than in DBSR, since the resource is not "owned" by software. Software always has ownership of DBSR. Execution of a **mtspr** instruction targeting a debug register or register field not "owned" by software will not cause modifications to occur, and no exception will be signaled. In addition, since the external debugger hardware may be manipulating debug register values, the state of these registers or register fields not "owned" by software is not guaranteed to be consistent if accessed (read) by software with a **mfspr** instruction, other than the $DBCR0_{EDM}$ bit itself and the EDBRAC0 register. Hardware always has full access to all registers and all register fields through the OnCE register access mechanism, and it is up to the debug firmware to properly implement modifications to these registers with read-modify-write operations to implement any control sharing with software. Settings in EDBRAC0 should be considered by the debug firmware in order to preserve software settings of control registers as appropriate when hardware modifications to the debug registers is performed.

60.3.1 Debug Address and Value Registers

Instruction Address Compare registers IAC1–8 are used to hold instruction addresses for address comparison purposes. In addition, IAC2 and IAC4 may hold mask information for IAC1 and IAC3 respectively and IAC6 and IAC8 may hold mask information for IAC5 and IAC7 respectively, when *Address Bit Match* compare modes are selected. Note that when performing instruction address compares, the low order bit of the instruction address and the corresponding IAC register is ignored for VLE instructions.

Data Address Compare registers DAC1–4 are used to hold data access addresses for address comparison purposes. In addition, DAC2 and DAC4 may hold mask information for DAC1 and DAC3 respectively when *Address Bit Match* compare modes are selected.

Data Value Compare registers DVC1 and DVC2 are used to hold data values for data comparison purposes. DVC1 and DVC2 are 64-bit registers. Data value comparisons are used to qualify Data Address compare 1 and 2 debug events. Data value comparisons are not available for Data address compare 3–4 events. DVC1 is associated with DAC1, and DVC2 is associated with DAC2. The most significant byte of the DVC1(2) register (labeled B0 in the following figure) corresponds to the byte data value transferred to/from memory byte offset 0, 8, …, and the least significant byte of the register (labeled B7 in the following figure) corresponds to byte offset 7, F, … . When enabled for performing data value comparisons, each enabled byte in DVC1(2) is compared with the memory value transferred on the corresponding active byte lane of the data memory interface to determine if a match occurs. Inactive byte lanes do not participate in the comparison, they are implicitly masked. The Byte Strobe Assertion for Transfers table in the Core (e200z4251n3) Core Complex Overview chapter shows active byte lanes for data transfers. Software must also program the DVC1(2) register byte positions based on the alignment of the access. Misaligned accesses are not fully supported, since the data address and data value comparisons are only performed on the initial access in the case of a misaligned access; thus, accesses that cross a 64-bit boundary cannot be fully matched. For address and size combinations that involve two transfers, only the initial transfer is used for data address and value matching.

DVC1 and DVC2 may be read or written using **mtspr** and **mfspr** instructions. The DVC1U and DVC2U SPR numbers (601,602) are used for accessing the upper 32-bit portion of the DVC register. The DVC1 and DVC2 SPR numbers (318,319) are used for accessing the lower 32-bit portion of the DVC register.

60.3.2 Debug Control and Status registers

Debug Control Registers (DBCR0–8 and EDBRAC0) are used to enable debug events, reset the processor, and set the debug mode of the processor. The Debug Status register (DBSR) records debug exceptions while Internal Debug mode is enabled. The Debug Data Effective Address register (DDEAR) records the effective address of a Data Address Compare event while Internal Debug mode is enabled.

e200z4251n3 requires that a context synchronizing instruction follow a **mtspr** DBCR0–8 or DBSR to ensure that any alterations enabling/disabling debug events are effective. The context synchronizing instruction may or may not be affected by the alteration. Typically, an **se_isync** instruction is used to create a synchronization boundary beyond which it can be guaranteed that the newly written control values are in effect.

For watchpoint generation, configuration settings contained in DBCR1–8 are used, even though the corresponding event(s) may be disabled (via DBCR0) from setting DBSR flags.

60.3.2.1 Debug Control Register 0 (DBCR0)

Debug Control Register 0 is used to enable debug modes and controls which debug events are allowed to set DBSR or EDBSR0 flags. e200z4251n3 adds some implementation specific bits to this register, as seen in the following figure.

EDM	IDM	RST		ICMP	BRT	IRPT	TRAP	IAC1	IAC2	IAC3	IAC4	DAC1		DAC2		RET	IAC5	IAC6	IAC7	IAC8	DEVT1	DEVT2	0		CIRPT	CRET	0				
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPR - 308; Read/Write; Reset[1] - 0x0

Figure 60-3. Debug Control Register 0 (DBCR0) register

Note

[1] DBCR0$_{EDM}$ is affected by **j_trst_b** or **m_por** assertion, and remains reset while in the Test_Logic_Reset state, but is not affected by **p_reset_b**. All other bits are reset by processor reset **p_reset_b** if DBCR0$_{EDM}$=0, as well as unconditionally by **m_por**. If DBCR0$_{EDM}$=1, EDBRAC0 masks off hardware-owned resources (other than RST) from reset by **p_reset_b**, and only software-owned resources indicated by EDBRAC0 and the DBCR0$_{RST}$ field will be reset by **p_reset_b**. The DBCR0$_{RST}$ field will always be reset by **p_reset_b** regardless of the value of DBCR0$_{EDM}$.

The following provides bit definitions for Debug Control Register 0.

Table 60-6. DBCR0 field descriptions

Bit	Name	Description
0	EDM	External Debug mode. This bit is read-only by software. When external debug mode is enabled, hardware-owned resources in debug registers are not affected by processor reset p_reset_b. This allows the debugger to set up hardware debug events that remain active across a processor reset. 0 External debug mode disabled. Internal debug events not mapped into external debug events. 1 External debug mode enabled. Hardware-owned debug events will not cause the CPU to vector to interrupt code. Software is not permitted to write to debug registers {DBCR0–8, IAC1–8, DAC1–4, DVC1–2[U]} unless permitted by settings in EDBRAC0. Hardware-owned events will set status bits in EDBSR0. Programming Notes: It is recommended that debug status bits in the Debug Status Registers be cleared before disabling external debug mode to avoid any internal imprecise debug interrupts. Software may use this bit to determine if external debug has control over the debug registers. The hardware debugger must set the EDM bit to '1' before other bits in this register (and other debug registers) may be altered. On the initial setting of this bit to '1', all other bits are unchanged. This bit is only writable through the OnCE port.
1	IDM	Internal Debug mode 0 Debug exceptions are disabled. Debug events do not affect DBSR. 1 Debug exceptions are enabled. Enabled debug events owned by software will update the DBSR. If MSR_{DE}=1, the occurrence of a debug event, or the recording of an earlier debug event in the Debug Status Register when MSR_{DE} was cleared, will cause a Debug interrupt.
2:3	RST	Reset Control 00 No function 01 **p_dbrstc[1]** pin asserted by Debug Reset Control. Allows external device to initiate processor or system reset 10 **p_dbrstc[0]** pin asserted by Debug Reset Control. Allows external device to initiate processor or system reset. 11 Reserved
4	ICMP	Instruction Complete Debug Event Enable 0 ICMP debug events are disabled 1 ICMP debug events are enabled
5	BRT	Branch Taken Debug Event Enable 0 BRT debug events are disabled 1 BRT debug events are enabled
6	IRPT	Interrupt Taken Debug Event Enable 0 IRPT debug events are disabled 1 IRPT debug events are enabled
7	TRAP	Trap Taken Debug Event Enable 0 TRAP debug events are disabled 1 TRAP debug events are enabled
8	IAC1	Instruction Address Compare 1 Debug Event Enable 0 IAC1 debug events are disabled

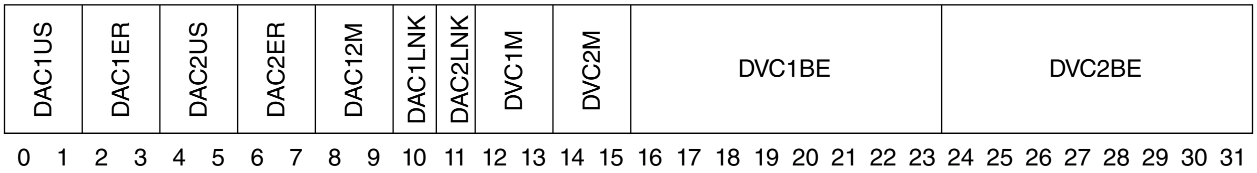
60.3.2.3 Debug Control Register 2 (DBCR2)

Debug Control Register 2 is used to configure Data Address Compare and Data Value Compare operation.The DBCR2 register is shown in the following figure.



SPR - 310; Read/Write; Reset[1] - 0x0

Figure 60-5. DBCR2 Register

Note

[1] Reset by processor reset **p_reset_b** if $\text{EDBCR0}_{\text{EDM}}$=0, as well as unconditionally by **m_por**. If $\text{EDBCR0}_{\text{EDM}}$=1, EDBRAC0 masks off hardware-owned resources from reset by **p_reset_b** and only software-owned resources indicated by EDBRAC0 will be reset by **p_reset_b**.

The following table provides bit definitions for Debug Control Register 2.

Table 60-8. DBCR2 Bit Definitions

Bit	Name	Description
0:1	DAC1US	Data Address Compare 1 User/Supervisor Mode 00 DAC1 debug events not affected by MSR_{PR} 01 Reserved 10 DAC1 debug events can only occur if MSR_{PR}=0 (Supervisor mode) 11 DAC1 debug events can only occur if MSR_{PR}=1 (User mode)
2:3	DAC1ER	Data Address Compare 1 Effective/Real Mode 00 DAC1 debug events are based on effective address 01 Unimplemented (Book E real address compare), no match can occur 10 DAC1 debug events are based on effective address and can only occur if MSR_{DS}=0 11 DAC1 debug events are based on effective address and can only occur if MSR_{DS}=1
4:5	DAC2US	Data Address Compare 2 User/Supervisor Mode 00 DAC2 debug events not affected by MSR_{PR} 01 Reserved 10 DAC2 debug events can only occur if MSR_{PR}=0 (Supervisor mode) 11 DAC2 debug events can only occur if MSR_{PR}=1. (User mode)
6:7	DAC2ER	Data Address Compare 2 Effective/Real Mode 00 DAC2 debug events are based on effective address 01 Unimplemented (Book E real address compare), no match can occur 10 DAC2 debug events are based on effective address and can only occur if MSR_{DS}=0 11 DAC2 debug events are based on effective address and can only occur if MSR_{DS}=1
8:9	DAC12M	Data Address Compare 1/2 Mode 00 Exact address compare. DAC1 debug events can only occur if the address of the data access is equal to the value specified in DAC1. DAC2 debug events can only occur if the address of the data access is equal to the value specified in DAC2. 01 Address bit match. DAC1 debug events can occur only if the address of the data access ANDed with the contents of DAC2, are equal to the contents of DAC1 also ANDed with the contents of DAC2. DAC2 debug events do not occur. DAC1US and DAC1ER settings are used. 10 Inclusive address range compare. DAC1 debug events can occur only if the address of the data access is greater than or equal to the value specified in DAC1 and less than the value specified in DAC2. DAC2 debug events do not occur. DAC1US and DAC1ER settings are used.

Table continues on the next page...

Table 60-8. DBCR2 Bit Definitions (continued)

Bit	Name	Description
		11 Exclusive address range compare. DAC1 debug events can occur only if the address of the data access is less than the value specified in DAC1 or is greater than or equal to the value specified in DAC2. DAC2 debug events do not occur. DAC1US and DAC1ER settings are used.
10	DAC1LNK	Data Address Compare 1 Linked. When linked to IAC1, DAC1 debug events are conditioned based on whether the instruction also generated an IAC1 debug event. Note that linking is only available in EDM or IDM. 0 No effect 1 DAC1 debug events are linked to IAC1 debug events. IAC1 debug events do not affect DBSR When linked to IAC1, DAC1 debug events are conditioned based on whether the instruction also generated an IAC1 debug event. Note that linking is only available in EDM or IDM.
11	DAC2LNK	Data Address Compare 2 Linked. When linked to IAC3, DAC2 debug events are conditioned based on whether the instruction also generated an IAC3 debug event. DAC2 can only be linked if DAC12M specifies Exact Address Compare since DAC2 debug events are not generated in the other compare modes. Note that linking is only available in EDM or IDM. 0 No effect 1 DAC 2 debug events are linked to IAC3 debug events. IAC3 debug events do not affect DBSR
12:13	DVC1M	Data Value Compare 1 Mode When DBCR4$_{DVC1C}$=0: 00 DAC1 debug events not affected by data value compares. 01 DAC1 debug events can only occur when all bytes specified in the DVC1BE field match the corresponding data byte values for active byte lanes of the memory access. 10 DAC1 debug events can only occur when any byte specified in the DVC1BE field matches the corresponding data byte value for active byte lanes of the memory access. 11 DAC1 debug events can only occur when all bytes specified in the DVC1BE field within at least one of the halfwords of the data value of the memory access matches the corresponding DVC1 value. **NOTE:** Inactive byte lanes of the memory access are automatically masked. When DBCR4$_{DVC1C}$=1: 00 Reserved 01 DAC1 debug events can only occur when any byte specified in the DVC1BE field does not match the corresponding data byte value for active byte lanes of the memory access. If all active bytes match, then no event will be generated. 10 DAC1 debug events can only occur when all bytes specified in the DVC1BE field do not match the corresponding data byte values for active byte lanes of the memory access. If any active byte match occurs, no event will be generated. 11 Reserved **NOTE:** Note: Inactive byte lanes of the memory access are automatically masked.
14:15	DVC2M	Data Value Compare 2 Mode When DBCR4$_{DVC2C}$=0: 00 DAC2 debug events not affected by data value compares. 01 DAC2 debug events can only occur when all bytes specified in the DVC2BE field match the corresponding data byte values for active byte lanes of the memory access.

Table continues on the next page...

Table 60-8. DBCR2 Bit Definitions (continued)

Bit	Name	Description
		10 DAC2 debug events can only occur when any byte specified in the DVC2BE field matches the corresponding data byte value for active byte lanes of the memory access. 11 DAC2 debug events can only occur when all bytes specified in the DVC2BE field within at least one of the halfwords of the data value of the memory access matches the corresponding DVC2 value. **NOTE:** Inactive byte lanes of the memory access are automatically masked. When DBCR4$_{DVC2C}$=1: 00 Reserved 01 DAC2 debug events can only occur when any byte specified in the DVC2BE field does not match the corresponding data byte value for active byte lanes of the memory access. If all active bytes match, then no event will be generated. 10 DAC2 debug events can only occur when all bytes specified in the DVC2BE field do not match the corresponding data byte values for active byte lanes of the memory access. If any active byte match occurs, no event will be generated. 11 Reserved **NOTE:** Inactive byte lanes of the memory access are automatically masked.
16:23	DVC1BE	Data Value Compare 1 Byte Enables Specifies which bytes in the aligned doubleword value associated with the memory access are compared to the corresponding bytes in DVC1. Inactive byte lanes of a memory access smaller than 64 bits are automatically masked by hardware. If all bits in the DVC1BE field are clear, then a match will occur regardless of the data. Misaligned accesses that cross a doubleword boundary are not fully supported. 1xxxxxxx Byte lane 0 is enabled for comparison with the value in bits 0:7 of DVC1. x1xxxxxx Byte lane 1 is enabled for comparison with the value in bits 8:15 of DVC1. xx1xxxxx Byte lane 2 is enabled for comparison with the value in bits 16:23 of DVC1. xxx1xxxx Byte lane 3 is enabled for comparison with the value in bits 24:31 of DVC1. xxxx1xxx Byte lane 4 is enabled for comparison with the value in bits 32:39 of DVC1. xxxxx1xx Byte lane 5 is enabled for comparison with the value in bits 40:47 of DVC1. xxxxxx1x Byte lane 6 is enabled for comparison with the value in bits 48:55 of DVC1. xxxxxxx1 Byte lane 7 is enabled for comparison with the value in bits 56:63 of DVC1.
24:31	DVC2BE	Data Value Compare2 Byte Enables Specifies which bytes in the aligned doubleword value associated with the memory access are compared to the corresponding bytes in DVC2. Inactive byte lanes of a memory access smaller than 64 bits are automatically masked by hardware. If all bits in the DVC1BE field are clear, then a match will occur regardless of the data. Misaligned accesses that cross a doubleword boundary are not fully supported. 1xxxxxxx Byte lane 0 is enabled for comparison with the value in bits 0:7 of DVC2. x1xxxxxx Byte lane 1 is enabled for comparison with the value in bits 8:15 of DVC2. xx1xxxxx Byte lane 2 is enabled for comparison with the value in bits 16:23 of DVC2. xxx1xxxx Byte lane 3 is enabled for comparison with the value in bits 24:31 of DVC2. xxxx1xxx Byte lane 4 is enabled for comparison with the value in bits 32:39 of DVC2. xxxxx1xx Byte lane 5 is enabled for comparison with the value in bits 40:47 of DVC2.

Table 60-8. DBCR2 Bit Definitions

Bit	Name	Description
		xxxxxx1x Byte lane 6 is enabled for comparison with the value in bits 48:55 of DVC2. xxxxxxx1 Byte lane 7 is enabled for comparison with the value in bits 56:63 of DVC2.

60.3.2.4 Debug Control Register 4 (DBCR4)

Debug Control Register 4 is used to extend data address and value compare matching functionality. DBCR4 is shown in the following figure.

0	1	2	3	4 5 6 7 8 9 10 11	12	13	14	15	16 17 18 19	20 21 22 23	24 25 26 27	28 29 30 31
0	DVC1C	0	DVC2C	0	0	DAC1XMH	0	DAC2XMH	DAC1XM	DAC2XM	DAC1CFG	DAC2CFG

SPR - 563; Read/Write; Reset[1] - 0x0

Figure 60-6. DBCR4 Register

Note

[1] DBCR4 is reset by processor reset **p_reset_b** if $EDBCR0_{EDM}$=0, as well as unconditionally by **m_por**. If $EDBCR0_{EDM}$=1, EDBRAC0 masks off hardware-owned resources from reset by **p_reset_b** and only software-owned resources indicated by EDBRAC0 will be reset by **p_reset_b**.

The following table provides bit definitions for Debug Control Register 4.

Table 60-9. DBCR4 field description

Bit	Name	Description
0	—	Reserved
1	DVC1C	Data Value Compare 1 Control. DVC1C controls whether DVC1 data value comparisons utilize the normal compare operation, or an alternate “inverted compare” operation. In inverted polarity mode, data value compares perform a not-equal comparison. See details in the DBCR2 register definition. 0 Normal DVC1 operation. 1 Inverted polarity DVC1 operation
2	—	Reserved
3	DVC2C	Data Value Compare 2 Control. DVC2C controls whether DVC2 data value comparisons utilize the normal compare operation, or an alternate “inverted compare” operation. In inverted polarity mode, data value compares perform a not-equal comparison. See details in the DBCR2 register definition 0 Normal DVC2 operation.

Table continues on the next page...

Table 60-9. DBCR4 field description (continued)

Bit	Name	Description
		1 Inverted polarity DVC2 operation
4:12	—	Reserved
13	DAC1XMH	Data Address Compare 1 Extended Mask Control High. DAC1XMH extends the range of the DAC1XM field. 0 DAC1XM masks 0–15 low-order address bits 1 DAC1XM masks 16–31 low-order address bits
14	—	Reserved
15	DAC2XMH	Data Address Compare 2 Extended Mask Control High. . DAC2XMH extends the range of the DAC2XM field. 0 DAC2XM masks 0–15 low-order address bits 1 DAC2XM masks 16–31 low-order address bits
16:19	DAC1XM	Data Address Compare 1 Extended Mask Control. DAC1XM allows for binary power of 2 address range compares for DAC1 without requiring the use of DAC2. Value of DAC1XMH || DAC1XM: 00000 No additional masking when DBCR2[DAC12M] = 00 00001 - 11111 Exact Match Bit Mask. One to 31 low-order bits are masked in DAC1 when comparing the storage address with the value in DAC1 for exact address compare (DBCR2[DAC12M] = 00). Address ranges of 2 bytes to 2GB are supported.
20:23	DAC2XM	Data Address Compare 2 Extended Mask Control Value of DAC2XMH || DAC2XM: 00000 No additional masking when DBCR2[DAC12M] = 00 00001 - 11111 Exact Match Bit Mask. One to 31 low-order bits are masked in DAC2 when comparing the storage address with the value in DAC2 for exact address compare (DBCR2[DAC12M] = 00). Address ranges of 2 bytes to 2GB are supported. DAC2XM allows for binary power of 2 address range compares for DAC2.
24:27	DAC1CFG	Data Address Compare 1 Configuration 0000 DAC1 debug watchpoints are enabled for load-type or store-type data storage accesses when $\text{DBCR0}_{\text{DAC1}}$=00 0001 DAC1 debug watchpoints are enabled only for store-type data storage accesses when $\text{DBCR0}_{\text{DAC1}}$=00 0010 DAC1 debug watchpoints are enabled only for load-type data storage accesses when $\text{DBCR0}_{\text{DAC1}}$=00 0011 Reserved 01xx Reserved 1000 DAC1 address comparisons are used for stack limit checking. DAC1 address comparisons are qualified with use of GPR R1 in <EA> calculation for most load or store instructions. No debug events occur for DAC1. When a qualified DAC1 match occurs, a machine check exception is generated for supervisor-mode accesses or a DSI is generated for user-mode accesses, and a DAC1 watchpoint is generated. $\text{DBCR0}_{\text{DAC1}}$ and $\text{DBCR2}_{\text{DVC1M}}$ settings are ignored. 1001 – 1111 Reserved DAC1CFG controls whether DAC1 data address comparisons utilize the normal PowerISA operation for generating both debug events and watchpoints, a watchpoint-only function, or a stack limit checking function (with watchpoint).

Table continues on the next page...

Table 60-9. DBCR4 field description (continued)

Bit	Name	Description
		NOTE: unlike the DAC3–4CFG fields, debug event enabling for DAC1 is controlled by the DAC1 field in DBCR0. The DAC1CFG encodings 0000–0010 are used to control watchpoint generation when $DBCR0_{DAC1}$=0; when $DBCR0_{DAC1}$!=00, DAC1 watchpoints will fire whenever a DAC1 debug event occurs.
28:31	DAC2CFG	Data Address Compare 2 Configuration 0000 DAC2 debug watchpoints are enabled for load-type or store-type data storage accesses when $DBCR0_{DAC2}$=00 0001 DAC2 debug watchpoints are enabled only for store-type data storage accesses when $DBCR0_{DAC2}$=00 0010 DAC2 debug watchpoints are enabled only for load-type data storage accesses when $DBCR0_{DAC2}$=00 0011 Reserved 01xx Reserved 1xxx Reserved DAC2CFG controls whether DAC2 data address comparisons utilize the normal compare operation for generating both debug events and watchpoints, or a watchpoint-only function. **NOTE:** Unlike the DAC3–4CFG fields, debug event enabling for DAC2 is controlled by the DAC2 field in DBCR0. The DAC2CFG encodings 0000–0010 are used to control watchpoint generation when $DBCR0_{DAC2}$=00. When $DBCR0_{DAC2}$!=00, DAC2 watchpoints will fire whenever a DAC2 debug event occurs.

60.3.2.5 Debug Control Register 5 (DBCR5)

Debug Control Register 5 is used to configure Instruction Address Compare operation for IAC5–8. The DBCR5 register is shown in the following figure.

.

Figure 60-9. DBCR7 Register

Note

[1] DBCR7 is reset by processor reset **p_reset_b** if EDBCR0$_{EDM}$=0, as well as unconditionally by **m_por**. If EDBCR0$_{EDM}$=1, EDBRAC0 masks off hardware-owned resources from reset by **p_reset_b** and only software-owned resources indicated by EDBRAC0 will be reset by **p_reset_b**.

The following table provides bit definitions for Debug Control Register 7.

Table 60-12. DBCR7 Field Descriptions

Bit	Name	Description
0:12	—	Reserved
13	DAC3XMH	Data Address Compare 3 Extended Mask Control High .DAC3XMH extends the range of the DAC3XM field 0 DAC3XM masks 0–15 low-order address bits 1 DAC3XM masks 16–31 low-order address bits
14	—	Reserved
15	DAC4XMH	Data Address Compare 4 Extended Mask Control High. . DAC4XMH extends the range of the DAC4XM field. 0 DAC4XM masks 0–15 low-order address bits 1 DAC4XM masks 16–31 low-order address bits
16:19	DAC3XM	Data Address Compare 3 Extended Mask Control. DAC3XM allows for binary power of 2 address range compares for DAC3 without requiring the use of DAC4. Value of DAC3XMH || DAC3XM: 00000 No additional masking when DBCR8[DAC34M] = 00 00001 - 11111 Exact Match Bit Mask. One to 31 low-order bits are masked in DAC3 when comparing the storage address with the value in DAC3 for exact address compare (DBCR8[DAC34M] = 00). Address ranges of 2 bytes to 2GB are supported.
20:23	DAC4XM	Data Address Compare 4 Extended Mask Control. DAC4XM allows for binary power of 2 address range compares for DAC4 without requiring the use of DAC3. Value of DAC4XMH || DAC4XM: 00000 No additional masking when DBCR8[DAC34M] = 00 00001 - 11111 Exact Match Bit Mask. One to 31 low-order bits are masked in DAC4 when comparing the storage address with the value in DAC4 for exact address compare (DBCR8[DAC34M] = 00). Address ranges of 2 bytes to 2GB are supported.
24:27	DAC3CFG	Data Address Compare 3 Configuration. DAC3CFG controls whether DAC3 data address comparisons utilize the normal compare operation for generating both debug events and watchpoints, a watchpoint-only function, or a stack limit checking function (with watchpoint). 0000 DAC3 debug watchpoints are enabled for load-type or store-type data storage accesses 0001 DAC3 debug watchpoints are enabled only for store-type data storage accesses

Table continues on the next page...

Table 60-12. DBCR7 Field Descriptions (continued)

Bit	Name	Description
		0010 DAC3 debug watchpoints are enabled only for load-type data storage accesses 0011 Reserved 0100Reserved 0101 DAC3 debug events and watchpoints are enabled only for store-type data storage accesses 0110 DAC3 debug events and watchpoints are enabled only for load-type data storage accesses 0111 DAC3 debug events and watchpoints are enabled for load-type or store-type data storage accesses 1000 DAC3 address comparisons are used for stack limit checking. DAC3 address comparisons are qualified with use of GPR R1 in <EA> calculation for most load or store instructions. No debug events occur for DAC3. When a qualified match occurs, a machine check exception is generated for supervisor-mode accesses or a DSI is generated for user-mode accesses, and a DAC3 watchpoints is generated. 1001 - 1111 Reserved
28:31	DAC4CFG	Data Address Compare 4 Configuration. DAC4CFG controls whether DAC4 data address comparisons utilize the normal compare operation for generating both debug events and watchpoints, or a watchpoint-only function. 0000 DAC4 debug watchpoints are enabled for load-type or store-type data storage accesses 0001 DAC4 debug watchpoints are enabled only for store-type data storage accesses 0010 DAC4 debug watchpoints are enabled only for load-type data storage accesses 0011 Reserved 0100 Reserved 0101 DAC4 debug events and watchpoints are enabled only for store-type data storage accesses 0110 DAC4 debug events and watchpoints are enabled only for load-type data storage accesses 0111 DAC4 debug events and watchpoints are enabled for load-type or store-type data storage accesses 1xxx Reserved

60.3.2.8 Debug Control Register 8 (DBCR8)

Debug Control Register 8 is used to configure Data Address Compare 3 and 4 operation. The DBCR8 register is shown in the following figure.

DAC3US	DAC3ER	DAC4US	DAC4ER	DAC34M	DAC3LNK	DAC4LNK	0
0 1	2 3	4 5	6 7	8 9	10	11	12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31

SPR - 597; Read/Write; Reset[1] - 0x0

Figure 60-10. DBCR8 Register

Note

[1] Reset by processor reset **p_reset_b** if EDBCR0$_{EDM}$=0, as well as unconditionally by **m_por**. If EDBCR0$_{EDM}$=1, EDBRAC0 masks off hardware-owned resources from reset by **p_reset_b** and only software-owned resources indicated by EDBRAC0 will be reset by **p_reset_b**.

The following table provides bit definitions for Debug Control Register 8.

Table 60-13. DBCR8 Bit Definitions

Bit(s)	Name	Description
0:1	DAC3US	Data Address Compare 3 User/Supervisor Mode 00 - DAC3 debug events not affected by MSR$_{PR}$ 01 - Reserved 10 - DAC3 debug events can only occur if MSR$_{PR}$=0 (Supervisor mode) 11 - DAC3 debug events can only occur if MSR$_{PR}$=1. (User mode)
2:3	DAC3ER	Data Address Compare 3 Effective/Real Mode 00 - DAC3 debug events are based on effective address 01 - Unimplemented (Book E real address compare), no match can occur 10 - DAC3 debug events are based on effective address and can only occur if MSR$_{DS}$=0 11 - DAC3 debug events are based on effective address and can only occur if MSR$_{DS}$=1
4:5	DAC4US	Data Address Compare 4 User/Supervisor Mode. 00 - DAC4 debug events not affected by MSR$_{PR}$ 01 - Reserved 10 - DAC4 debug events can only occur if MSR$_{PR}$=0 (Supervisor mode) 11 - DAC4 debug events can only occur if MSR$_{PR}$=1. (User mode)
6:7	DAC4ER	Data Address Compare 4 Effective/Real Mode 00 - DAC4 debug events are based on effective address 01 - Unimplemented (Book E real address compare), no match can occur 10 - DAC4 debug events are based on effective address and can only occur if MSR$_{DS}$=0

Table continues on the next page...

Table 60-13. DBCR8 Bit Definitions (continued)

Bit(s)	Name	Description
		11 - DAC4 debug events are based on effective address and can only occur if MSR_{DS}=1
8:9	DAC34M	Data Address Compare 3/4 Mode 00 - Exact address compare. DAC3 debug events can only occur if the address of the data access is equal to the value specified in DAC3. DAC4 debug events can only occur if the address of the data access is equal to the value specified in DAC4. 01 - Address bit match. DAC3 debug events can occur only if the address of the data access ANDed with the contents of DAC4, are equal to the contents of DAC3 also ANDed with the contents of DAC4. DAC4 debug events do not occur. DAC3US and DAC3ER settings are used. 10 - Inclusive address range compare. DAC3 debug events can occur only if the address of the data access is greater than or equal to the value specified in DAC3 and less than the value specified in DAC4. DAC4 debug events do not occur. DAC3US and DAC3ER settings are used. 11 - Exclusive address range compare. DAC3 debug events can occur only if the address of the data access is less than the value specified in DAC3 or is greater than or equal to the value specified in DAC4. DAC4 debug events do not occur. DAC3US and DAC3ER settings are used.
10	DAC3LNK	Data Address Compare 3 Linked 0 - No effect 1 - DAC3 debug events are linked to IAC5 debug events. IAC5 debug events do not affect DBSR When linked to IAC5, DAC3 debug events are conditioned based on whether the instruction also generated an IAC5 debug event. Note that linking is only available in EDM or IDM.
11	DAC4LNK	Data Address Compare 4 Linked 0 - No effect 1 - DAC4 debug events are linked to IAC7 debug events. IAC7 debug events do not affect DBSR When linked to IAC7, DAC4 debug events are conditioned based on whether the instruction also generated an IAC7 debug event. Note that linking is only available in EDM or IDM.
12:31	—	Reserved

60.3.2.9 Debug Status Register (DBSR)

The Debug Status Register (DBSR) contains status on debug events and the most recent processor reset. The Debug Status Register is set via hardware, and read and cleared via software. Bits in the Debug Status Register can be cleared using **mtspr***DBSR,RS*. Clearing is done by writing to the Debug Status Register with a 1 in any bit position that is to be cleared and 0 in all other bit positions. The write data to the Debug Status Register is not direct data, but a mask. A '1' causes the bit to be cleared, and a '0' has no effect. Debug Status bits are set by Debug events only while Internal Debug Mode is enabled (DBCR0$_{IDM}$=1). When debug interrupts are enabled (MSR$_{DE}$=1 DBCR0$_{IDM}$=1 and EDBCR0$_{EDM}$=0, or MSR$_{DE}$=1, DBCR0$_{IDM}$=1, EDBCR0$_{EDM}$=1 and software is allocated resource(s) via EDBRAC0), a set bit in DBSR other than MRR, DAC_OFST, or VLES will cause a debug interrupt to be generated. The debug interrupt handler is responsible for clearing DBSR bits prior to returning to normal execution. When resource sharing is enabled, (EDBCR0$_{EDM}$=1 and EDBRAC0$_{IDM}$=1), only software-owned resources may be modified by software, and status bits associated with hardware-owned resources will not be set by hardware in DBSR. The DBSR register is shown in the following figure.

IDE	UDE	MRR		ICMP	BRT	IRPT	TRAP	IAC	0			DACR	DACW	0	DNI	RET	0				DEVT1	DEVT2	PMI	MPU	CIRPT	CRET	VLES	DAC_OFST			0
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPR - 304; Read/Clear; Reset - 0x1000_0000

Figure 60-11. DBSR Register

The following table provides bit definitions for the Debug Status Register.

Table 60-14. DBSR Bit Definitions

Bit(s)	Name	Description
0	IDE	Imprecise Debug Event Set to 1 if MSR$_{DE}$=0 and DBCR0$_{IDM}$=1 and a debug event causes its respective Debug Status Register bit to be set to 1. It may also be set to '1' if an imprecise debug event occurs due to a DAC event on a load or store which is terminated with error, or if an ICMP event occurs in conjunction with a EFPU FP round exception.
1	UDE	Unconditional Debug Event Set to 1 if an Unconditional debug event occurred.
2:3	MRR	Most Recent Reset. 00 - No reset occurred since these bits were last cleared by software 01 - A hard reset occurred since these bits were last cleared by software 10 - Reserved 11 - Reserved
4	ICMP	Instruction Complete Debug Event Set to 1 if an Instruction Complete debug event occurred.
5	BRT	Branch Taken Debug Event Set to 1 if an Branch Taken debug event occurred.
6	IRPT	Interrupt Taken Debug Event Set to 1 if an Interrupt Taken debug event occurred.
7	TRAP	Trap Taken Debug Event

Table continues on the next page...

Table 60-14. DBSR Bit Definitions (continued)

Bit(s)	Name	Description
		Set to 1 if a Trap Taken debug event occurred.
8	IAC	Instruction Address Compare Debug Event Set to 1 if an IAC debug event occurred.
9:11	—	Reserved
12	DACR	Data Address Compare Read Debug Event Set to 1 if a read-type DAC debug event occurred
13	DACW	Data Address Compare Write Debug Event Set to 1 if a write-type DAC debug event occurred
14	—	Reserved
15	DNI	DNI Debug Event Set to 1 if a DNI debug event occurred
16	RET	Return Debug Event Set to 1 if a Return debug event occurred
17:20	—	Reserved
21	DEVT1	External Debug Event 1 Debug Event Set to 1 if a DEVT1 debug event occurred
22	DEVT2	External Debug Event 2 Debug Event Set to 1 if a DEVT2 debug event occurred
23	PMI	Performance Monitor Interrupt Debug Event Set to 1 if a Performance Monitor Interrupt event occurred with $PMGC0_{UDI}$=1
24	MPU	Memory Protection Unit Debug Event Set to 1 if a MPU debug event occurred. For MPU debug events, the IAC, DACR, or DACW status bit will also be set, depending on the type of access which matched a region descriptor enabled to generate debug events, in order to further define the type of MPU debug event. Note that software MPU debug events on data accesses normally occur after the data access is performed and the instruction completes, thus act like a normal DAC debug event. The instruction may not complete if a DSI occurs. In this case, IDE will be set to indicate this occurrence.
25	CIRPT	Critical Interrupt Taken Debug Event Set to 1 if a Critical Interrupt Taken debug event occurred.
26	CRET	Critical Return Debug Event Set to 1 if a Critical Return debug event occurred
27	VLES	VLE Status Set to 1 if an ICMP, BRT, TRAP, RET, CRET, IAC, or DAC debug event occurred on a Power ISA VLE Instruction. Undefined for IRPT, CIRPT, DEVT[1,2], and UDE events
28:30	DAC_OFST	Data Address Compare Offset Indicates offset-1 of saved DSRR0 value from the address of the load or store instruction which took a DAC Debug exception, unless a simultaneous DSI error occurs, in which case this field is set to 3'b000 and $DBSR_{IDE}$ is set to 1. Normally set to 3'b000 by a non-DVC DAC. A DVC DAC may set this field to any value.
31	—	Reserved

60.3.2.10 Debug Data Effective Address Register (DDEAR)

The Debug Data Effective Address Register (DDEAR) contains address information for data address compare debug events (DAC or MPU DAC). DDEAR is update by hardware with the effective address of the load, store, or cache control operation when a data address compare event is recorded in DBSR if the previous values of the $\mathrm{DBSR}_{\mathrm{DAC\{R,W\}}}$ bits are zero. Once a DDEAR update is performed, these bits must be cleared by software prior to another DDEAR hardware update occurring. A subsequent DAC or MPU DAC event will not update the DDEAR register if either of the $\mathrm{DBSR}_{\mathrm{DAC\{R,W\}}}$ bits are set, in order to capture the first event address.

The DDEAR register is shown in the following table.

Data Effective Address
0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31

SPR - 600; Read/Write; Reset - unaffected

Figure 60-12. DDEAR Register

60.3.3 External Debug Resource Allocation Control Register (EDBRAC0)

The External Debug Resource Allocation Control Register (EDBRAC0) controls resource allocation when $\mathrm{EDBCR0}_{\mathrm{EDM}}$ is set to '1'. EDBRAC0 provides a mechanism for the hardware debugger to share certain debug resources with software. Individual resources are allocated based on the settings of EDBRAC0 when $\mathrm{EDBCR0}_{\mathrm{EDM}}$=1. EDBRAC0 settings are ignored when $\mathrm{EDBCR0}_{\mathrm{EDM}}$=0.

Hardware-owned resources which generate debug events update EDBSR0 instead of DBSR and cause entry into debug mode if the event is not masked in EDBSRMSK0, while software-owned resources which generate debug events if $\mathrm{DBCR0}_{\mathrm{IDM}}$=1 update DBSR, causing debug interrupts to occur if $\mathrm{MSR}_{\mathrm{DE}}$=1. EDBRAC0 is controlled via the OnCE port hardware, and is read-only to software.

The DBSR status register is always owned by software. Debug status bits in DBSR are set by software-owned debug events only while Internal Debug Mode is enabled. When debug interrupts are enabled ($\mathrm{MSR}_{\mathrm{DE}}$=1 $\mathrm{DBCR0}_{\mathrm{IDM}}$=1 and $\mathrm{EDBCR0}_{\mathrm{EDM}}$=0, or $\mathrm{MSR}_{\mathrm{DE}}$=1, $\mathrm{DBCR0}_{\mathrm{IDM}}$=1 and $\mathrm{EDBCR0}_{\mathrm{EDM}}$=1 and software is allocated resource(s) via EDBRAC0), a set bit in DBSR by an event which is software-owned (other than MRR, DAC_OFST, or VLES) will cause a debug interrupt to be generated.

Debug status bits in EDBSR0 are set by hardware-owned debug events only while External Debug Mode is enabled (EDBCR0$_{EDM}$=1). When EDBCR0$_{EDM}$=1, a set bit in EDBSR0 by an event which is hardware-owned (other than IDE, DAC_OFST, or VLES) will cause entry into debug mode unless entry is masked via EDBSRMSK0.

If EDBCR0$_{EDM}$=1, DBSR status bits corresponding to hardware-owned debug events are masked from being set by hardware.

Software-owned resources may be modified by software, but only the corresponding control bits in DBCR0–8 or MPU0CSR0 are affected by execution of a **mtspr**, thus only a portion of these registers may be affected, depending on the allocation settings in EDBRAC0. The debug interrupt handler is still responsible for clearing DBSR bits for software-owned resources prior to returning to normal execution. Hardware always has full access to all registers and register fields through the OnCE register access mechanism, and it is up to the debug firmware to properly implement modifications to these registers with read-modify-write operations to implement any control sharing with software. Settings in EDBRAC0 should be considered by the debug firmware in order to preserve software settings of control and status registers as appropriate when hardware modifications to the debug registers is performed.

The EDBRAC0 register is shown in the following figure.

0	IDM	RST	UDE	ICMP	BRT	IRPT	TRAP	IAC1	IAC2	IAC3	IAC4	DAC1	DAC34	DAC2	0	RET	IAC5	IAC6	IAC7	IAC8	DEVT1	DEVT2	PMI	MPU	CIRPT	CRET	DNI	DQM	0		
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPR - 638; Read-only by Software; Reset - Unaffected by **p_reset_b,** reset to 0x00000180 by **m_por** or while in the test-logic-reset OnCE controller state

Figure 60-13. EDBRAC0 Register

Table 60-14 provides bit definitions for the Debug External Resource Control Register. Note that EDBRAC0 controls are disabled when EDBCR0EDM=0.

Table 60-15. EDBRAC0 Bit Definitions

Bit(s)	Name	Description
0	—	Reserved
1	IDM	Internal Debug Mode control 0 - Internal Debug mode may not be enabled by software. DBCR0$_{IDM}$ is owned exclusively by hardware. **mtspr** DBCR0–8 and other debug registers is always ignored. No resource sharing occurs, regardless of the settings of other fields in EDBRAC0. Hardware exclusively owns all resources. 1 - Internal Debug mode may be enabled by software. DBCR0$_{IDM}$ is owned by software. DBCR0$_{IDM}$ is software readable/writable. When EDBRAC0$_{IDM}$=1, software writes to hardware-owned bits in DBCR0–8 via **mtspr** are ignored.

Table continues on the next page...

Table 60-15. EDBRAC0 Bit Definitions (continued)

Bit(s)	Name	Description
2	RST	Reset Field Control 0 - $DBCR0_{RST}$ owned exclusively by hardware debug. No **mtspr** access by software to $DBCR0_{RST}$ field. 1 - $DBCR0_{RST}$ accessible by software debug. $DBCR0_{RST}$ is software readable/writable.
3	UDE	Unconditional Debug Event 0 - Event owned by hardware debug. 1 - Event owned by software debug.
4	ICMP	Instruction Complete Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to $DBCR0_{ICMP}$ field. 1 - Event owned by software debug. $DBCR0_{ICMP}$ is software readable/writable.
5	BRT	Branch Taken Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to $DBCR0_{BRT}$ field. 1 - Event owned by software debug. $DBCR0_{BRT}$ is software readable/writable.
6	IRPT	Interrupt Taken Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to $DBCR0_{IRPT}$ field. 1 - Event owned by software debug. $DBCR0_{IRPT}$ is software readable/writable.
7	TRAP	Trap Taken Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to $DBCR0_{TRAP}$ field. 1 - Event owned by software debug. $DBCR0_{TRA}$P is software readable/writable.
8	IAC1	Instruction Address Compare 1 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC1 control and status fields. 1 - Event owned by software debug. IAC1 control fields are software readable/writable.
9	IAC2	Instruction Address Compare 2 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC2 control and status fields. 1 - Event owned by software debug. IAC2 control fields are software readable/writable.
10	IAC3	Instruction Address Compare 3 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC3 control and status fields. 1 - Event owned by software debug. IAC3 control fields are software readable/writable.
11	IAC4	Instruction Address Compare 4 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC4 control and status fields. 1 - Event owned by software debug. IAC4 control fields are software readable/writable.
12	DAC1	Data Address Compare 1 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to DAC1 control and status fields.

Table continues on the next page...

Table 60-15. EDBRAC0 Bit Definitions (continued)

Bit(s)	Name	Description
		1 - Event owned by software debug. DAC1 control fields are software readable/writable.
13	DAC34	Data Address Compare 3 and 4 Debug Events 0 - Events owned by hardware debug. No **mtspr** access by software to DAC3 and DAC4 control and status fields. 1 - Event owned by software debug. DAC3 and DAC4 control fields are software readable/writable.
14	DAC2	Data Address Compare 2 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to DAC2 control and status fields. 1 - Event owned by software debug. DAC2 control fields are software readable/writable.
15	—	Reserved
16	RET	Return Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to $\text{DBCR0}_{\text{RET}}$ field. 1 - Event owned by software debug. $\text{DBCR0}_{\text{RET}}$ is software readable/writable.
17	IAC5	Instruction Address Compare 5 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC5 control and status fields. 1 - Event owned by software debug. IAC5 control fields are software readable/writable.
18	IAC6	Instruction Address Compare 6 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC6 control and status fields. 1 - Event owned by software debug. IAC6 control fields are software readable/writable.
19	IAC7	Instruction Address Compare 7 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC7 control and status fields. 1 - Event owned by software debug. IAC7 control fields are software readable/writable.
20	IAC8	Instruction Address Compare 8 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to IAC8 control and status fields. 1 - Event owned by software debug. IAC8 control are software readable/writable.
21	DEVT1	External Debug Event Input 1 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to $\text{DBCR0}_{\text{DEVT1}}$ field. 1 - Event owned by software debug. $\text{DBCR0}_{\text{DEVT1}}$ is software readable/writable.
22	DEVT2	External Debug Event Input 2 Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to $\text{DBCR0}_{\text{DEVT2}}$ field. 1 - Event owned by software debug. $\text{DBCR0}_{\text{DEVT2}}$ is software readable/writable.
23	PMI	Performance Monitor Interrupt Debug Event

Table continues on the next page...

Table 60-15. EDBRAC0 Bit Definitions (continued)

Bit(s)	Name	Description
		0 - Event owned by hardware debug. No **mtspr** access by software to the PMRs. Performance monitor interrupts set EDBSR0$_{PMI}$ regardless of the setting of PMGC0$_{UDI}$ 1 - Event owned by software debug. PMRs are software readable/writable. **Note:** this bit is reset to '1'.
24	MPU	Memory Protection Unit Debug Event 0 - Event owned by hardware debug. No **mpuwe** access by software to region descriptors which have the DEBUG control bit set to '1' or to the MPU0CSR0$_{DRDEN,DWDEN,IDEN}$ control bits, unless the CPU is in a debug session (**jd_debug_b** is asserted). MPU debug events set EDBSR0$_{MPU}$, and if not masked by EDBSRMSK0$_{MPU}$, one of EDBSR0$_{IAC}$, EDBSR0$_{DACR}$, or EDBSR0$_{DACW}$. MPU flash invalidates do not affect DEBUG=1 entries unless the CPU is in a debug session (**jd_debug_b** is asserted). 1 - Event owned by software debug. All region descriptors and the MPU0CSR0$_{DRDEN,DWDEN,IDEN}$ control bits are software readable/writable. **Note:** this bit is reset to '1'.
25	CIRPT	Critical Interrupt Taken Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to DBCR0$_{CIRPT}$ field. 1 - Event owned by software debug. DBCR0$_{CIRPT}$ is software readable/writable.
26	CRET	Critical Return Debug Event 0 - Event owned by hardware debug. No **mtspr** access by software to DBCR0$_{CRET}$ field. 1 - Event owned by software debug. DBCR0$_{CRET}$ is software readable/writable.
27	DNI	DNI Instruction Debug Control 0 - DNI resource owned by hardware debug. Execution of an **e_dni** or **se_dni** instruction results in entry into debug mode. 1 - DNI resource owned by software debug. Execution of an **e_dni** or **se_dni** instruction results in either a debug interrupt (DBCR0$_{IDM}$=1 and MSR$_{DE}$=1) or a nop (DBCR0$_{IDM}$=0 or MSR$_{DE}$=0). **Note:** DNI events are not blocked during a debug session
28	DQM	Data Acquisition Messaging Registers 0 - DEVENT$_{DQTAG}$ and DDAM register are exclusively owned by hardware debug. No **mtspr** access by software to DEVENTD$_{QTAG}$ field or DDAM register. Attempted access by software is ignored. 1 - DEVENT$_{DQTAG}$ and DDAM register are owned by software. Software has read/write access to DEVENT$_{DQTAG}$ field and DDAM register.
29:31	—	Reserved

[1] Note: IDM not required to be set to enable software access.

EDBRAC0 also controls which bits or fields in DBCR0–8, MPU0CSR0, and the PMRs are reset by assertion of **p_reset_b** when EDBCR0$_{EDM}$=1. Only software-owned bits or fields as shown in Table 60-16 are affected in this case, except that DBCR0$_{RST}$ and DBSR$_{MRR}$ are updated by assertion of **p_reset_b** regardless of the value of EDBCR0$_{EDM}$ or EDBRAC0.

60.3.4 Debug Event Select Register (DEVENT)

The Debug Event Select Register allows instrumented software to internally generate signals when a **mtspr** instruction is executed and this register is accessed. The values written to this register determine which of the **p_devnt_out[0:7]** processor output signals are asserted upon access. Writing a '1' to any of these bit positions will cause a one clock pulse to be generated on the corresponding output. For **p_devnt_out[0:3]**, a corresponding **jd_watchpt[x]** output is asserted as well to indicate a watchpoint has occurred. These signals may be used for internal core debug resources as well as for SoC level cross-triggering. See the SoC User's Manual for more information on SoC use cases.

The DEVENT$_{\text{DEVNT}}$ register field value is undefined on a read; it may or may not remain set to the last value written. Since it is unconditionally shared by hardware debug and software, software should not rely on any value remaining.

The upper 8 bits of the DEVENT register also provide the DQTAG used to identify channels within Data Acquisition Messages. See the "Data Acquisition ID Tag Field" section in the Core (e200z4251n3) Nexus 3 Module chapter for more detail on the DQTAG.

The DEVENT register is shown in the following figure.

DQTAG	0	DEVNT
0 1 2 3 4 5 6 7	8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	24 25 26 27 28 29 30 31

SPR - 975; Reset[1] - 0x0

Figure 60-14. DEVENT Register

Note

[1] Reset by processor reset **p_reset_b** if EDBCR0$_{\text{EDM}}$=0, as well as unconditionally by **m_por**. If EDBCR0$_{\text{EDM}}$=1, EDBRAC0 masks off hardware-owned resources from reset by **p_reset_b** and only software-owned resources indicated by EDBRAC0 will be reset by **p_reset_b**. Note that DEVNT field is shared by hardware and software but is always reset by **p_reset_b**.

The following table provides bit definitions for the Debug Event Register.

Table 60-17. DEVENT Bit Definitions

Bit(s)	Name	Description
0:7	DQTAG	Data Acquisition Message IDTAG channel identifier (supplied to Nexus 3)
8:23	—	Reserved, should be cleared.
24:31	DEVNT	Debug Event Signals 00000000 - No signal is asserted xxxxxxx1 - **p_devnt_out[0]** and **jd_watchpt[12]** are asserted for one clock xxxxxx1x - **p_devnt_out[1]** and **jd_watchpt[13]** are asserted for one clock xxxxx1xx - **p_devnt_out[2]** and **jd_watchpt[20]** are asserted for one clock xxxx1xxx - **p_devnt_out[3]** and **jd_watchpt[21]** are asserted for one clock xxx1xxxx - **p_devnt_out[4]** is asserted for one clock xx1xxxxx - **p_devnt_out[5]** is asserted for one clock

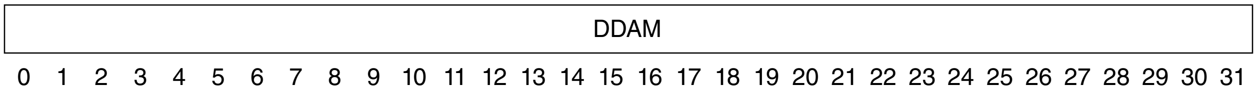
Table 60-17. DEVENT Bit Definitions

Bit(s)	Name	Description
		x1xxxxxx - **p_devnt_out[6]** is asserted for one clock 1xxxxxxx - **p_devnt_out[7]** is asserted for one clock

60.3.5 Debug Data Acquisition Message Register (DDAM)

The Debug Data Acquisition Message Register allows instrumented software to generate real-time Data Acquisition Messages (as defined by Nexus 3) via a **mtspr** instruction to this register. See the "Data Acquisition Messaging" section in the Core (e200z4251n3) Nexus 3 Module chapter for details.

The DDAM register is shown in the following figure.



SPR - 576; Reset[1] - 0x0

Figure 60-15. DDAM Register

Note

[1] Reset by processor reset **p_reset_b** if EDBCR0$_{EDM}$=0, as well as unconditionally by **m_por**. If EDBCR0$_{EDM}$=1, EDBRAC0 masks off hardware-owned resources from reset by **p_reset_b** and only software-owned resources indicated by EDBRAC0 will be reset by **p_reset_b**.

The following table provides bit definitions for the Debug Data Acquisition Message Register.

Table 60-18. DDAM Bit Definitions

Bit(s)	Name	Description
0:31	DDAM	Value to be transmitted in a Data Acquisition Message (DQM) (supplied to Nexus 3 with strobe)

60.4 Using Debug Resources for Stack Limit Checking

The DAC1,2 and DAC3,4 resources can be used for stack overflow/underflow detection when not being used as a hardware or software debug resource. Stack limit checking is available regardless of EDM or IDM mode, and when resources used for stack limit checking are owned by software, will utilize a DSI or machine check exception. Software-owned stack limit checking does not require IDM to be set. Hardware owned stack limit checking requires EDM to be set.

When stack limit checking is enabled, and DAC resources used for stack limit checking are owned by software, DAC events are not generated for resources configured to perform stack limit checking, and no DBSR DAC status flag will be set due to a detected stack limit violation. Instead, depending on the processor mode, a data storage interrupt or a machine check exception is signaled. When stack limit checking is enabled, and DAC resources used for stack limit checking are owned by hardware, DAC events will be generated for resources configured to perform stack limit checking, and the EDBSR0 DAC status flag will be set due to a detected stack limit violation, causing entry into debug halted mode in the same way as a DAC exception normally does. The only difference is that qualification of the access address is performed as discussed in the next paragraph.

Stack limit checking is implemented in the same way as range compares using DAC1,2 or 3,4, or extended masking using DAC1 or DAC3, but qualify a load or store access address with the use of GPR R1 as the base or index register used to compute an effective address when a load or store instruction is executed. No stack limit checking is performed for other instructions which may calculate an EA using GPR R1 such as cache, MMU/MPU management instructions, or instructions which indicate GPR R1 is used to hold a decoration value (for decorated load/store type instructions) or a modify specifier (for LSP load/store instructions w/modify). When DAC resources configured to perform stack limit checking are not owned by hardware, if a stack limit violation occurs when performing the load or store, the access is aborted, and an error report machine check is generated, with MCSRR0 pointing to the address of the load or store access which generated the stack overflow/underflow. If DAC resources configured to perform stack limit checking are owned by hardware, then a normal DAC event is generated (but qualified with use of GPR R1), and debug mode entry will occur in the same manner as for a non-stack limit DAC event.

Enabling of this functionality is described in more detail in Table 60-9. Note that IDM is not required to be set for software-owned stack limit checking.

In contrast to the normal case of DAC address matching resulting in a debug event, the stack limit check address compare logic operates differently for stack limit checking. When using resources for stack limit checking, a DACn hit to a resource enabled for performing stack limit checking on a stack access indicates a stack limit violation.

When stack limit checking is enabled by the setting of the $\mathrm{DBCR4}_{\mathrm{DAC1CFG}}$ field to '1000' or the $\mathrm{DBCR8}_{\mathrm{DAC3CFG}}$ field to '1000' (or both), and the corresponding DACn resources are owned by software, DACn events are not generated and the DBSR DAC status flag will not be set due to a detected stack limit hit. Instead, if stack limit checking is enabled for supervisor mode stack accesses in DAC1 or DAC3, and a compare hit occurs for a supervisor mode stack access (A load or store using GPR R1 in the <EA> calculation), a machine check exception is signaled. If stack limit checking is enabled for user mode accesses, a DSI exception is signaled when a stack limit checking enabled DAC1 or DAC3 compare hit occurs for a user mode access. A watchpoint for DAC1 or DAC3 will be generated when the stack limit violation is detected, even though the instruction does not complete. Stack limit checking for supervisor mode stack accesses is considered enabled when either the $\mathrm{DBCR4}_{\mathrm{DAC1CFG}}$ field is set to '1000' with $\mathrm{DBCR2}_{\mathrm{DAC1US}}$ set to '00' or '10', or the $\mathrm{DBCR7}_{\mathrm{DAC3CFG}}$ field is set to '1000' with $\mathrm{DBCR8}_{\mathrm{DAC3US}}$ set to '00' or '10', or both. Stack limit checking for user mode stack accesses is considered enabled when either the $\mathrm{DBCR4}_{\mathrm{DAC1CFG}}$ field is set to '1000' with $\mathrm{DBCR2}_{\mathrm{DAC1US}}$ set to '00' or '01', or the $\mathrm{DBCR7}_{\mathrm{DAC3CFG}}$ field is set to '1000' with $\mathrm{DBCR8}_{\mathrm{DAC3US}}$ set to '00' or '01', or both. Note that unlike regular debug DAC events, both halves of a misaligned access are checked for limit violations.

When stack limit checking is enabled for a stack access, and DACn resources are owned by hardware, the EDBSR0 DAC status flag will be set due to a detected stack limit violation, to cause entry into debug halted mode or to generate a watchpoint, or both, in the same way as a DAC event normally does, i.e. after the access has completed. The only difference is that qualification of the access address is performed as discussed in the next paragraph. If the access is aborted due to a DSI or other exception such as machine check condition, the $\mathrm{EDBSR0}_{\mathrm{IDE}}$ status bit will also be set to indicate that the data access instruction was not completed.

Stack limit checking is implemented in the same way as address compares using DACn, but qualify a load or store access address with the use of GPR R1 as the base or index register used to compute an effective address when a load or store instruction is executed. No stack limit checking is performed for other instructions which may calculate an EA using GPR R1 such as cache, MMU/MPU management instructions, or instructions which indicate GPR R1 is used to hold a decoration value (for decorated load/store type instructions) or a modify specifier (for LSP load/store instructions w/modify). When DACn resources are not owned by hardware, if a stack limit violation occurs (a hit to a stack limit enabled DAC is detected) when performing the load or store, the access request is aborted and the access is not performed. Instead, for supervisor mode accesses, an error report machine check exception is generated, with MCSRR0 pointing to the address of the load or store instruction which generated the stack overflow/underflow, and for user mode accesses, a DSI exception is generated, with SRR0 pointing to the address of the load or store instruction which generated the stack overflow/underflow. If all stack limit check enabled DACn resources are owned by hardware, then a DAC event is generated (but qualified with use of GPR R1), and debug mode entry will occur in the same manner as for a non-stack limit DAC event. In this case, the instruction and access will normally have completed, in the same manner as a normal DAC event.

Independent limit checks for supervisor and user accesses may be implemented by allocating independent DACn resources to each, or a single limit may be applied using a single DACn resource. Typically, a DAC1,2 pair operating in exclusive address range mode is utilized for stack limit checking for a single shared limit. For separate limits, DAC3,4 may also be utilized. If more than one DACn resource is utilized, a DAC hit on any resource utilized for stack limit checking will cause the corresponding stack limit exception action to occur. If both a hardware-owned and a software-owned resource generate a stack limit exception for a given load or store, the software resource will have priority, since it is detected prior to completion of the access, and the access is aborted, thus the hardware event will not occur.

Enabling of this functionality is described in more detail in the description of the DACnCFG fields in Table 60-9 and Table 60-12 in Debug Control and Status registers. Note that for DAC1 and DAC2, access type (read, write) control is part of DBCR0.

60.5 External Debug Support

External debug support is supplied through the OnCE controller serial interface which allows access to internal CPU registers and other system state while the CPU is halted in debug mode. All debug resources including DBCR0–8, DBSR, IAC1–8, DAC1–4, and DVC1–2 are accessible through the serial OnCE interface in external debug mode. Setting the $EDBCR0_{EDM}$/$DBCR0_{EDM}$ bit to '1' through the OnCE interface enables external debug mode, and unless otherwise permitted by the settings in EDBRAC0, disables software updates to the debug control registers. When $EDBCR0_{EDM}$ is set, debug events enabled to set respective status bits will also cause the CPU to enter Debug Mode if the event is not masked in EDBSRMSK0, as opposed to generating Debug Interrupts, unless the specific events are allocated to software via the settings in EDBRAC0. In Debug Mode, the CPU is halted at a recoverable boundary, and an external Debug Control Module may control CPU operation through the On-Chip Emulation logic (OnCE).

Note that the descriptions of events in the subsections of Software Debug Events and Exceptions refer to setting DBSR status bits, however, when resources are owned by hardware, the events for those resources set the respective status bits in EDBSR0 instead of DBSR.

Note

On the initial setting of EDBCR0$_{EDM}$ to '1', other bits in DBCR0 will remain unchanged. After EDBCR0$_{EDM}$ has been set, all debug register resources may be subsequently controlled through the OnCE interface. The CPU should be placed into debug mode via the OCR$_{DR}$ control bit prior to writing EDM to '1'. This gives the debugger the opportunity to cleanly write to the DBCRx registers and the DBSR to clear out any residual state / control information which could cause unintended operation.

Note

It is intended for the CPU to remain in external debug mode (EDBCR0$_{EDM}$=1) in order to single step or perform other debug mode entry/ reentry via the OCR$_{DR}$, by performing go+noexit commands, or by assertion of the **jd_de_b** signal.

Note

EDBCR0$_{EDM}$ operation will be blocked if OnCE operation is disabled (**jd_en_once** negated) regardless of whether it is set or cleared. This means that if EDBCR0$_{EDM}$ was previously set, and then **jd_en_once** is negated (this should not occur), entry into debug mode will be blocked, and all *hardware* debug events are blocked. Watchpoints are not blocked.

Due to clock domain design, the CPU clock (**m_clk**) must be active in order to perform writes to debug registers other than the OnCE Command register (OCMD), the OnCE Control register (OCR), External Debug Control Register 0 (EDBCR0), External Debug Status register 0 (EDBSR0), External Debug Status Register Mask 0 (EDBSRMSK0), or the EDBCR0$_{EDM}$ bit. Register read data is synchronized back to the **j_tclk** clock domain. The OnCE Control register provides the capability of signaling the system level clock controller that the CPU clock should be activated if not already active.

Updates to the DBCRx, DBSR, and most other debug registers via the OnCE interface should be performed with the CPU in debug mode to guarantee proper operation. Due to the various points in the CPU pipeline where control is sampled and event handshaking is performed, it is possible that modifications to these registers while the CPU is running may result in early or late entry into debug mode, and may have incorrect status posted in the DBSR register.

If resource sharing is enabled via EDBRAC0, updates to the EDBRAC0, DBCRx, and DBSR registers must be performed with the CPU in debug mode, since simultaneous updates of register portions could otherwise be attempted, and such updates are not guaranteed to properly occur. The results of such an attempt are undefined.

60.5.1 External Debug Registers

The external debug registers are used for controlling several debug aspects of the core and reporting status while in External Debug Mode.

60.5.1.1 External Debug Control Register 0 (EDBCR0)

EDBCR0 is a control register accessible to an external debugger through the OnCE/Jtag port. An external development tool can write to this register in order to enable external debug mode or to enable Debugger Notify Halt instructions (**e_dnh**, **se_dnh**), as well as to control aspects of Debugger Notify Interrupt instructions (**e_dni**, **se_dni**).

EDBCR0 is not accessible by software, However, the state of $\text{EDBCR0}_{\text{EDM}}$ is reflected as a read-only bit in $\text{DBCR0}_{\text{EDM}}$ to software. There is only one physical EDM bit implemented; it is reflected in both the DBCR0 and EDBCR0 registers, and may be written and read using either register by the hardware debugger. For future compatibility, EDBCR0 updates are preferred.

EDBCR0 is shown in the following figure.

EDM	DNH_EN	0	DNI_CTL	0
0	1	2 3 4 5 6	7	8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31

Reset[1] - 0x0

Figure 60-16. EDBCR0 Register

Note

[1] EDBCRO is affected (reset) by **j_trst_b** or **m_por** assertion, and remains reset while in the Test_Logic_Reset state, but is not affected by **p_reset_b.**

The following table provides bit definitions for External Debug Control Register 0.

Table 60-19. EDBCR0 Bit Definitions

Bit(s)	Name	Description
0	EDM	External Debug Mode. This bit is also reflected in DBCR0 0 - External debug mode disabled. Internal debug events not mapped into external debug events. 1 - External debug mode enabled. Hardware-owned events will not cause the CPU to vector to interrupt code. Software is not permitted to write to debug registers {DBCRx, IAC1-8, DAC1-4, DVC1-2[U]} unless permitted by settings in EDBRAC0. When external debug mode is enabled, hardware-owned resources in debug registers are not affected by processor reset **p_reset_b**. This allows the debugger to set up hardware debug events which remain active across a processor reset.
1	DNH_EN	**dnh** Instruction Enable 0 - execution of **e_dnh** and **se_dnh** instructions cause illegal instruction exceptions to occur. 1 - execution of **e_dnh** and **se_dnh** instructions cause entry into debug mode and a debug halt occurs, regardless of the value of EDM.
2:6	---	Reserved
7	DNI_CTL	**dni** Instruction Control 0 - When the **dni** resource is owned by hardware, the MSR_{DE} bit is cared, and when MSRDE=0, execution of **e_dni** and **se_dni** instructions are nop'ed and no entry into debug mode occurs. 1 - When the **dni** resource is owned by hardware, the MSR_{DE} bit is don't-cared, and execution of **e_dni** and **se_dni** instructions cause entry into debug mode and a debug halt occurs, regardless of the value of MSR_{DE}. Note that this control bit is only used when the dni resource is owned by hardware via control in $EDBRAC0_{DNI}$, and thus also only when EDM=1
8:31	---	Reserved

60.5.1.2 External Debug Status Register 0 (EDBSR0)

The External Debug Status Register 0 (EDBSR0) contains status on debug events owned by hardware. The External Debug Status Register 0 is set via hardware, and read and cleared via OnCE access by the debugger. Clearing is done by writing to the External Debug Status Register via the OnCE port, with a '1' in any bit position that is to be cleared and '0' in all other bit positions. The write data to EDBSR0 is not direct data, but a mask. A '1' causes the bit to be cleared, and a '0' has no effect. The EDBSR0 register is shown in the following figure.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
IDE	UDE	DNH	0	ICMP	BRT	IRPT	TRAP	IAC	0			DACR	DACW	0	DNI	RET	0				DEVT1	DEVT2	PMI	MPU	CIRPT	CRET	VLES	DAC_OFST			0

Read/Write; Reset[1] - 0x0000_0000

Figure 60-17. EDBSR0 Register

Note

[1] Reset by **j_trst_b** or **m_por** assertion, and remains reset while in the Test_Logic_Reset state or while EDBCRO$_{EDM}$=O.

The following table provides bit definitions for External Debug Status Register 0.

Table 60-20. EDBSR0 Bit Definitions

Bit(s)	Name	Description
0	IDE	Imprecise Debug Event Set to 1 if EDBCR0$_{EDM}$=1 and an imprecise debug event occurs for a hardware-owned DAC event due to a load or store which is terminated with error, or if a hardware-owned ICMP event occurs in conjunction with a EFPU round exception. This bit will not be set for imprecise debug events which are masked via settings in EDBSRMSK0.
1	UDE	Unconditional Debug Event Set to 1 if a hardware-owned Unconditional debug event occurred.
2	DNH	Debugger Notify Halt Event Set to 1 if a debugger notify halt instruction was executed and caused a debug halt.
3	—	Reserved
4	ICMP	Instruction Complete Debug Event Set to 1 if a hardware-owned Instruction Complete debug event occurred.
5	BRT	Branch Taken Debug Event Set to 1 if a hardware-owned Branch Taken debug event occurred.
6	IRPT	Interrupt Taken Debug Event Set to 1 if a hardware-owned Interrupt Taken debug event occurred.
7	TRAP	Trap Taken Debug Event Set to 1 if a hardware-owned Trap Taken debug event occurred.
8	IAC	Instruction Address Compare 1 Debug Event Set to 1 if a hardware-owned IAC debug event occurred.
9:11	—	Reserved
12	DACR	Data Address Compare Read Debug Event Set to 1 if a hardware-owned read-type DAC debug event occurred
13	DACW	Data Address Compare Write Debug Event Set to 1 if a hardware-owned write-type DAC1 debug event occurred
14	—	Reserved

Table continues on the next page...

Table 60-20. EDBSR0 Bit Definitions (continued)

Bit(s)	Name	Description
15	DNI	DNI Debug Event Set to 1 if a hardware-owned DNI debug event occurred
16	RET	Return Debug Event Set to 1 if a hardware-owned Return debug event occurred
17:20	—	Reserved
21	DEVT1	External Debug Event 1 Debug Event Set to 1 if a hardware-owned DEVT1 debug event occurred
22	DEVT2	External Debug Event 2 Debug Event Set to 1 if a hardware-owned DEVT2 debug event occurred
23	PMI	Performance Monitor Interrupt Debug Event Set to 1 if a Performance Monitor Interrupt event occurred with $EDBRAC0_{PMI}$=0 regardless of the setting of $PMGC0_{UDI}$
24	MPU	Memory Protection Unit Debug Event Set to 1 if a hardware-owned MPU debug event occurred. For MPU debug events, if $EDBSRMSK0_{MPU}$ is cleared, the IAC, DACR, or DACW status bit will also be set, depending on the type of access which matched a region descriptor enabled to generate debug events, in order to further define the type of MPU debug event. If $EDBSRMSK0_{MPU}$ is set at the time a MPU debug event occurs, the IAC, DACR, and DACW status bits will not be set by MPU debug events, in order to properly mask the MPU debug event. Note that hardware MPU debug events on data accesses normally occur after the data access is performed and the instruction completes, thus act like a normal DAC debug event. The instruction may not complete if a DSI occurs. In this case, IDE will be set to indicate this occurrence.
25	CIRPT	Critical Interrupt Taken Debug Event Set to 1 if a hardware-owned Critical Interrupt Taken debug event occurred.
26	CRET	Critical Return Debug Event Set to 1 if a hardware-owned Critical Return debug event occurred
27	VLES	VLE Status Set to 1 if a hardware-owned ICMP, BRT, TRAP, RET, CRET, IAC, or DAC debug event occurred on a Power ISA VLE Instruction. Also set for execution of an e_dnh or se_dnh instruction when enabled by $EDBCR0_{DNH\_EN}$. Undefined for IRPT, CIRPT, DEVT[1,2], and UDE events
28:30	DAC_OFST	Data Address Compare Offset Indicates offset-1 of saved DSRR0 value from the address of the load or store instruction which took a hardware-owned DAC Debug exception, unless a simultaneous DSI error occurs, in which case this field is set to 3'b000 and $EDBSR0_{IDE}$ is set to 1. Normally set to 3'b000 by a non-DVC DAC. A DVC DAC may set this field to any value.
31	—	Reserved

60.5.1.3 External Debug Status Register Mask 0 (EDBSRMSK0)

The External Debug Status Register Mask 0 (EDBSRMSK0) is used to mask debug events set in EDBSR0 from causing entry into debug halted mode. A '1' stored in any mask bit prevents debug mode entry caused by the corresponding bit being set in EDBSR0. The mask has no effect on DBSR actions or on the setting of EDBSR0 status bits by hardware-owned events, except that the IDE bit will not be set by imprecise hardware-owned debug events which are masked. EDBSRMSK0 may be used to allow debug events owned by hardware to be configured for watchpoint generation purposes without causing debug mode entry when the watchpoint occurs. EDBSRMSK0 is read and written via OnCE access by the debugger. No software access is provided. The EDBSRMSK0 register is shown in the following figure.

0	UDE	DNH	0	ICMP	BRT	IRPT	TRAP	IAC	0			DACR	DACW	0	DNI	RET	0				DEVT1	DEVT2	PMI	MPU	CIRPT	CRET	0				
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

Read/Write; Reset[1] - 0x0000_0000

Figure 60-18. EDBSRMSK0 Register

Note

[1] Reset by **j_trst_b** or **m_por** assertion, and remains reset while in the Test_Logic_Reset state or while $EDBCRO_{EDM}$=O.

The following table provides bit definitions for External Debug Status Register Mask 0.

Table 60-21. EDBSRMSK0 Bit Definitions

Bit(s)	Name	Description
0	—	Reserved
1	UDE	Unconditional Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{UDE}$
2	DNH	Debugger Notify Halt Event Set to 1 to mask debug mode entry by $EDBSR0_{DNH}$
3	—	Reserved
4	ICMP	Instruction Complete Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{ICMP}$
5	BRT	Branch Taken Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{BRT}$
6	IRPT	Interrupt Taken Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{IRPT}$

23	PMI	Performance Monitor Interrupt Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{PMI}$
24	MPU	Memory Protection Unit Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{MPU}$
25	CIRPT	Critical Interrupt Taken Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{CIRPT}$
26	CRET	Critical Return Debug Event Set to 1 to mask debug mode entry by $EDBSR0_{CRET}$
22:31	—	Reserved

60.5.1.4 External Debug Data Effective Address Register (EDDEAR)

The External Debug Data Effective Address Register (EDDEAR) contains address information for hardware-owned data address compare debug events, including MPU DAC events. EDDEAR is update by hardware with the effective address of the load, store, or cache control operation when an unmasked data address compare event is recorded in EDBSR0 if the previous values of $EDBSR0_{DAC\{R,W\}}$ bits which are unmasked in EDBSRMSK0 are zero. Once an EDDEAR update is performed, these unmasked bits must be cleared by the hardware debugger prior to another EDDEAR hardware update occurring. A subsequent hardware-owned unmasked DAC event will not update the EDDEAR register if either of the EDBSR0$_{DAC\{R,W\}}$ bits are set and are not masked by EDBSRMSK0, in order to capture the first unmasked event address. EDDEAR is read and written via OnCE access by the debugger. No software access is provided.

The EDDEAR register is shown in the following figure.

Data Effective Address

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31

Read/Write; Reset - unaffected

Figure 60-19. EDDEAR Register

60.5.2 OnCE Introduction

The e200z4251n3 on-chip emulation circuitry (OnCE™/Nexus Class 1 interface) provides a means of interacting with the e200z4251n3 core and integrated system so that a user may examine registers, memory, or on-chip peripherals facilitating hardware/ software development. OnCE operation is controlled via an industry standard IEEE 1149.1 TAP controller. By using public instructions, the external hardware debugger can freeze or halt the CPU, read and write internal state, and resume normal execution. The core does not contain IEEE 1149.1 standard boundary cells on its interface, as it is a building block for further integration. It does not support the JTAG related boundary scan instruction functionality, although JTAG public instructions may be decoded and signaled to external logic.

The OnCE logic provides for Nexus Class 1 static debug capability (utilizing the same set of resources available to software while in internal debug mode).

In order to enable full OnCE operation, the **jd_enable_once** input signal must be asserted. In some system integrations, this is automatic, since the input will be tied asserted. Other integrations may require the execution of the Enable OnCE command via the TAP and appropriate entry of serial data. Exact requirements will be documented by the integrated product specification. The **jd_enable_once** input signal should not change state during a debug session, or undefined activity may occur.

The following figures show the TAP controller state model and the TAP registers implemented by the OnCE logic.

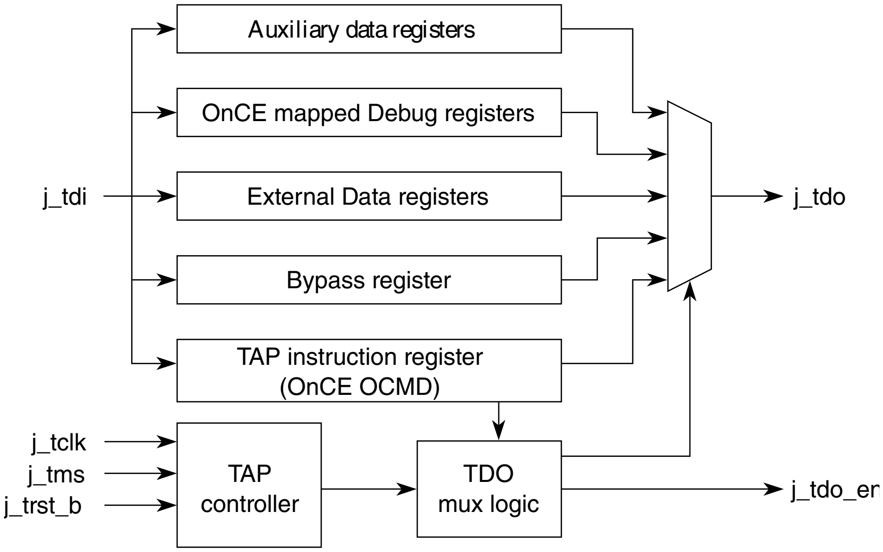

Figure 60-20. OnCE TAP Controller and Registers

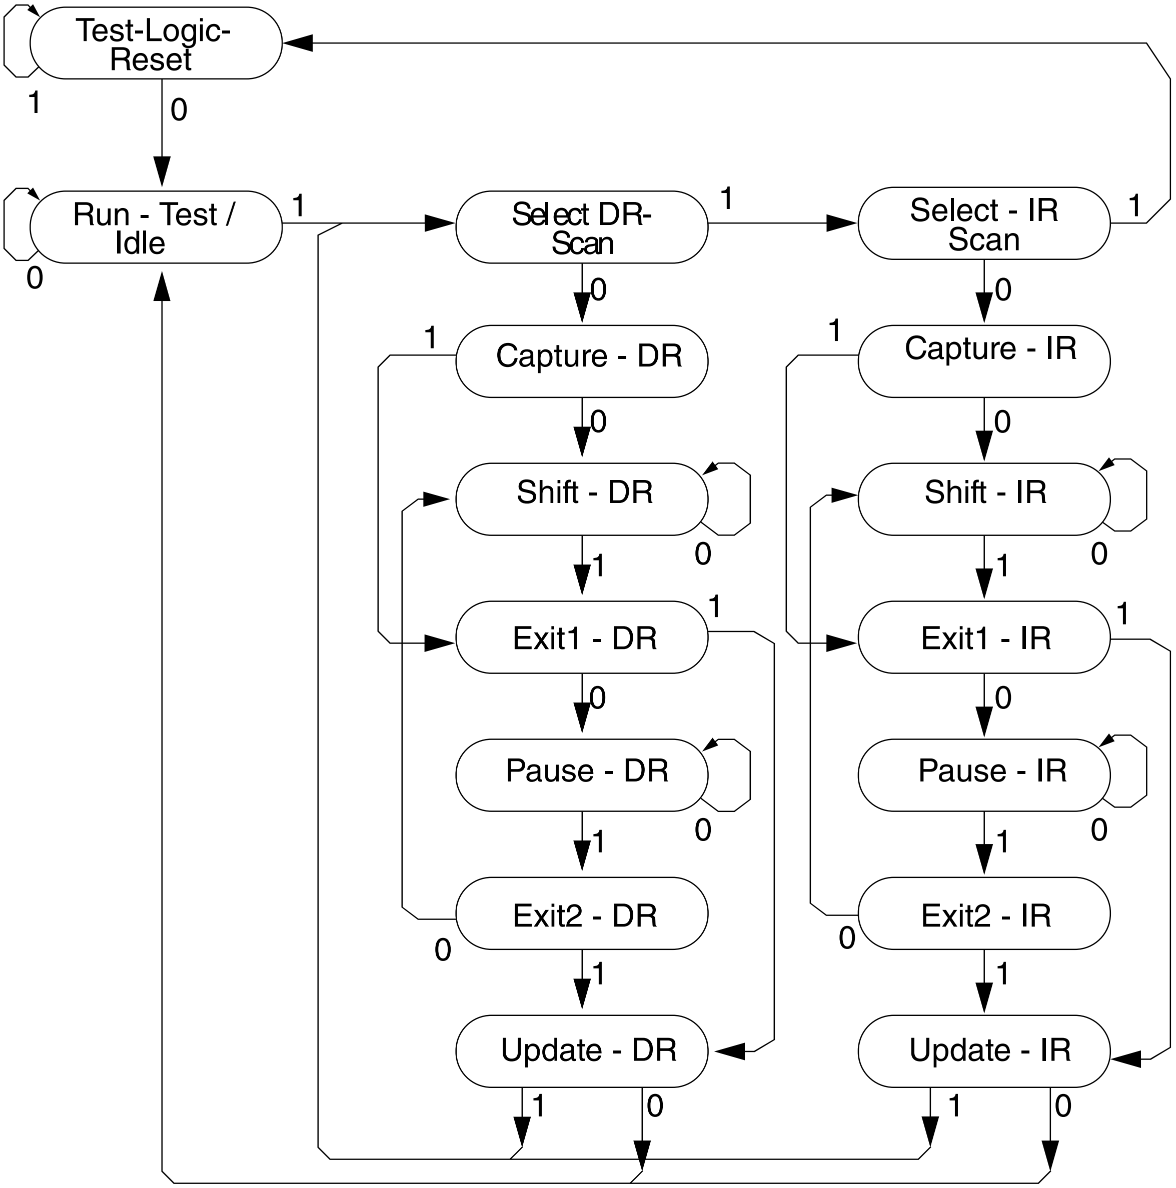
The OnCE controller is implemented as a 16-state FSM, with a one-to-one correspondence to the states defined for the JTAG TAP controller.



Access to processor registers and the contents of memory locations are performed by enabling external debug mode (setting EDBCR0$_{EDM}$ to '1'), placing the processor into debug mode, followed by scanning instructions and data into and out of the CPU Scan Chain (CPUSCR); execution of scanned instructions by the CPU is used as the method to access required data. Memory locations may be read by scanning a load instruction into the CPU core which will reference the desired memory location, executing the load instruction, and then scanning out the result of the load. Other resources are accessed in a similar manner.

The initial entry by the CPU into the debug state (or mode) from normal, Waiting, Stopped, or Halted states (all indicated via the OnCE Status Register (OSR), OnCE Status Register) by assertion of one or more debug requests, begins a *debug session*. The **jd_debug_b** output signal indicates that a debug session is in progress, and the OSR will indicate the CPU is in the debug state. Instructions may the be single-stepped by scanning new values into the CPUSCR, and performing a OnCE go+noexit command (See OnCE Command Register (OCMD)). The CPU will then temporarily exit the debug state (but not the debug session) to execute the instruction, and will then return to the debug state (again indicated via the OnCE Status Register (OSR)). The debug session remains in force until the final OnCE go+exit command is executed, at which time the CPU will return to the previous state it was in (unless a new debug request is pending). A scan into the CPUSCR is required prior to executing each go+exit or go+noexit OnCE command.

60.5.3 JTAG/OnCE Pins

The JTAG/OnCE pin interface is used to transfer OnCE instructions and data to the OnCE control block. Depending on the particular resource being accessed, the CPU may need to be placed in the Debug mode. For resources outside of the CPU block and contained in the OnCE block, the processor is not disturbed, and may continue execution. If a processor resource is required, an internal debug request (**dbg_dbgrq**) may be asserted to the CPU by the OnCE controller, and causes the CPU to finish the current instruction being executed, save the instruction pipeline information, enter Debug Mode, and wait for further commands. Asserting **dbg_dbgrq** will cause the chip to temporarily exit the Waiting, Stopped or Halted power management states.

The following table details the primary JTAG/OnCE interface signals.

Table 60-22. JTAG/OnCE Primary Interface Signals

Signal name	Type	Description
j_trst_b	I	JTAG test reset
j_tclk	I	JTAG test clock
j_tms	I	JTAG test mode select
j_tdi	I	JTAG test data input
j_tdo	O	Test data out to master controller or pad
j_tdo_en[1]	O	Enables TDO output buffer

[1] j_tdo_en is asserted when the TAP controller is in the shift_DR or shift_IR state.

A full description of JTAG pins is provided in the JTAG Support Signals section of the Core (e200z4251n3) Core Complex Overview.

60.5.4 OnCE Internal Interface Signals

The following paragraphs describe the OnCE interface signals to other internal blocks associated with the OnCE controller.

60.5.4.1 CPU Debug Request (dbg_dbgrq)

The **dbg_dbgrq** signal is asserted by the OnCE control logic to request the CPU to enter the debug state. It may be asserted for a number of different conditions, and causes the CPU to finish the current instruction being executed, save the instruction pipeline information, enter the debug mode, and wait for further commands.

60.5.4.2 CPU Debug Acknowledge (cpu_dbgack)

The **cpu_dbgack** signal is asserted by the CPU upon entering the debug state. This signal is used as part of the handshake mechanism between the OnCE control logic and the rest of the CPU. The CPU core may enter debug mode either through a software or hardware event.

60.5.4.3 CPU Address, Attributes

The CPU address and attribute information are used by the Nexus3 unit with information for real-time address trace information.

60.5.4.4 CPU Data

The CPU data buses are used to supply the Nexus3 debug unit with information for real-time data trace capability.

60.5.5 OnCE Interface Signals

The following paragraphs describe additional OnCE interface signals to other external blocks such as a Nexus controller and external blocks which may need information pertaining to debug operation.

60.5.5.1 OnCE Enable (jd_en_once)

The OnCE enable signal **jd_en_once** is used to enable the OnCE controller to allow certain instructions and operations to be executed. Assertion of this signal will enable the full OnCE command set, as well as operation of control signals and OnCE Control register functions. When this signal is disabled, only the Bypass, ID and Enable_OnCE commands are executed by the OnCE unit, and all other commands default to a "Bypass" command. The OnCE Status register (OSR) is not visible when OnCE operation is disabled. In addition, OnCE Control register (OCR) functions are disabled, as is the operation of the **jd_de_b** input. Secure systems may choose to leave the **jd_en_once** signal negated until a security check has been performed. Other systems should tie this signal asserted to enable full OnCE operation. The **j_en_once_regsel** output signal is provided to assist external logic performing security checks.

The **jd_en_once** input must only change state during the Test-Logic-Reset, Run-Test/ Idle, or Update_DR TAP states. A new value will take affect after one additional **j_tclk** cycle of synchronization. In addition, **jd_enable_once** input signal must not change state during a debug session, or undefined activity may occur.

60.5.5.2 OnCE Debug Request/Event (jd_de_b, jd_de_en)

If implemented at the SoC level, a system level bidirectional open drain debug event pin **DE_b** (not part of the e200z4251n3 interface) provides a fast means of entering the Debug Mode of operation from an external command controller (when input) as well as a fast means of acknowledging the entering of the Debug Mode of operation to an external command controller (when output). The assertion of this pin by a command controller causes the CPU core to finish the current instruction being executed, save the instruction pipeline information, enter Debug Mode, and wait for commands to be entered. If **DE_b** was used to enter the Debug Mode then **DE_b** must be negated after the OnCE controller responds with an acknowledge and before sending the first OnCE command. The assertion of this pin by the CPU Core acknowledges that it has entered the Debug Mode and is waiting for commands to be entered.

To support operation of this system pin, the OnCE logic supplies the **jd_de_en** output and samples the **jd_de_b** input when OnCE is enabled (**jd_en_once** asserted). Assertion of **jd_de_b** will cause the OnCE logic to place the CPU into Debug Mode. Once Debug Mode has been entered, the **jd_de_en** output will be asserted for three **j_tclk** periods to signal an acknowledge. **jd_de_en** can be used to enable the open-drain pulldown of the system level **DE_b** pin.

For systems which do not implement a system level bidirectional open drain debug event pin **DE_b**, the **jd_de_en** and **jd_de_b** signals may still be used to handshake debug entry.

60.5.5.3 OnCE Debug Output (jd_debug_b)

The OnCE Debug output **jd_debug_b** is used to indicate to on-chip resources that a debug session is in progress. Peripherals and other units may use this signal to modify normal operation for the duration of a debug session, which may involve the CPU executing a sequence of instructions solely for the purpose of visibility/system control which are not part of the normal instruction stream the CPU would have executed had it not been placed in debug mode. This signal is asserted the first time the CPU enters the debug state, and remains asserted until the CPU is released by a write to the OnCE Command Register with the GO and EX bits set, and a register specified as either "No Register Selected" or the CPUSCR. This signal will remain asserted even though the CPU may enter and exit the debug state for each instruction executed under control of the OnCE controller. See OnCE Command Register (OCMD) for more information on the function of the GO and EX bits. This signal is not normally used by the CPU.

60.5.5.4 CPU Clock On Input (jd_mclk_on)

The CPU Clock On input **jd_mclk_on** is used to indicate that the CPU's **m_clk** input is active. This input signal is expected to be driven by system logic external to the e200z4251n3 core, is synchronized to the **j_tclk** (scan clock) clock domain, and is presented as a status flag on the **j_tdo** output during the Shift_IR state. External firmware may use this signal to ensure proper scan sequences will occur to access debug resources in the **m_clk** clock domain.

60.5.5.5 Watchpoint Events (jd_watchpt[0:31])

The **jd_watchpt[0:31]** signals may be asserted by the OnCE control logic to signal that a watchpoint condition has occurred. Watchpoints do not directly cause the CPU to be affected. They are provided to allow external visibility only or for triggering purposes. Watchpoint events are conditioned by the settings in the DBCRxx registers, as well as by the DEVENT register, the DTC/DTSA/DTEA registers, the Performance Monitor control register settings, and generation of MPU debug events. Refer to Table 60-28 for details of the signal assignments. Note that assertion of most watchpoint outputs is conditioned on being in EDM or IDM. The Performance monitor, DEVENT, and DTC watchpoints are not conditioned however, and may assert regardless of the state of EDM or IDM. In addition, DAC1 or DAC3 watchpoints may be generated for stack limit violation occurrences when those resources are configured to perform stack limit checking, regardless of the state of EDM or IDM.

60.5.5.6 Update DR w/go+exit (j_ocmd_go_exit)

This signal indicates the TAP controller is in the Update_DR state and that the go and exit bits in the OnCE Command register are high, and RS indicates "no register selected". This signal will assert regardless of whether the CPU is currently in debug mode. It may be monitored by external logic to cause a synchronous exit from debug mode of other modules (but not other CPUs) in the system. A debugger can place all of the CPU tap controllers in parallel, scan in a go+exit command with "no register selected", and sequence through the Update_DR state to cause any CPU currently in debug mode to exit. CPUs which are not it debug mode will ignore the command.

60.5.6 OnCE Controller and serial interface

The OnCE Controller contains the OnCE command register, the OnCE decoder, and the status/control register. The following figure is a block diagram of the OnCE controller. In operation, the OnCE Command register acts as the IR for the TAP controller, and all other OnCE resources are treated as data registers (DR) by the TAP controller. The Command register is loaded by serially shifting in commands during the TAP controller Shift-IR state, and is loaded during the Update-IR state. The Command register selects a resource to be accessed as a data register (DR) during the TAP controller Capture-DR, Shift-DR and Update-DR states.

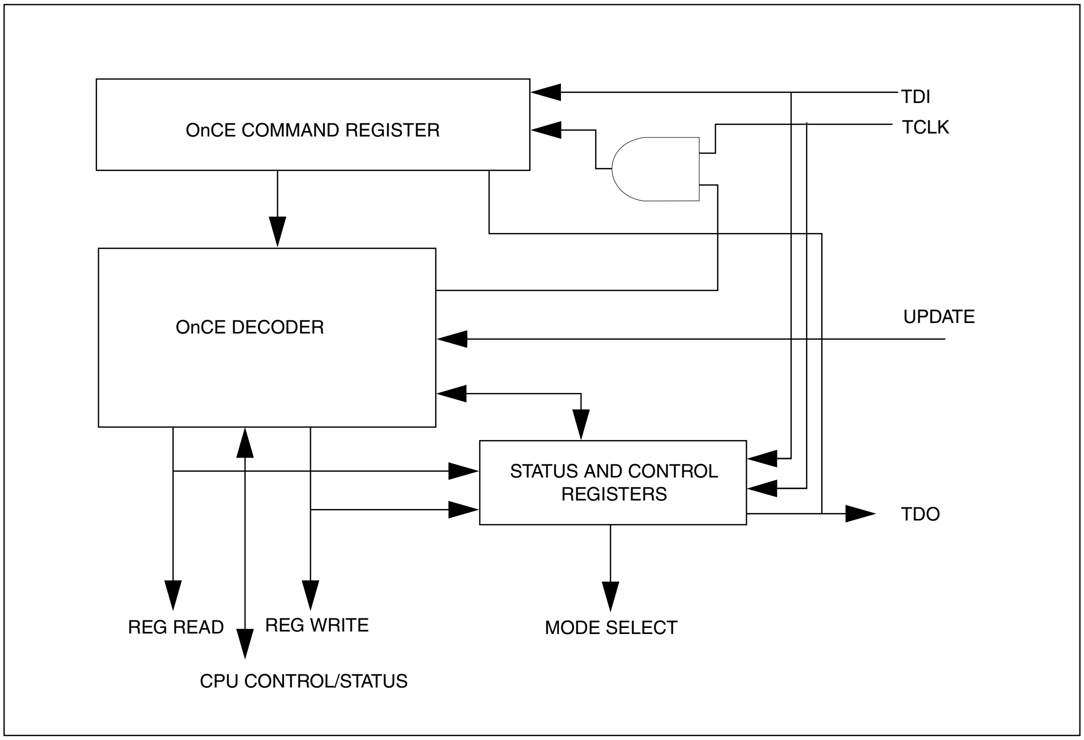


Figure 60-21. OnCE Controller and Serial Interface

60.5.6.1 OnCE Status Register

Status information regarding the state of the CPU is latched into the OnCE Status register when the OnCE controller state machine enters the Capture-IR state. When OnCE operation is enabled, this information is provided on the **j_tdo** output in serial fashion when the Shift_IR state is entered following a Capture-IR. Information is shifted out least significant bit first.

MCLK	ERR	0	RESET	HALT	STOP	DEBUG	WAIT	0	1
0	1	2	3	4	5	6	7	8	9

Figure 60-22. OnCE Status Register

The following table provides bit definitions for the Once Status Register.

Table 60-23. OnCE Status Register Bit Definitions

Bit(s)	Name	Description
0	MCLK	MCLK **m_clk** Status Bit 0 - Inactive state 1 - Active state This status bit reflects the logic level on the **jd_mclk_on** input signal after capture by **j_tclk**.
1	ERR	ERROR This bit is used to indicate that an error condition occurred during attempted execution of the last single-stepped instruction (GO+NoExit with CPUSCR or No Register Selected in OCMD), and that the instruction may not have been properly executed. This could occur if an Interrupt (all classes including External, Critical, machine check, Storage, Alignment, Program, etc.) occurred while attempting to perform the instruction single step. In this case, the CPUSCR will contain information related to the first instruction of the Interrupt handler, and no portion of the handler will have been executed.
3	RESET	RESET Mode This bit reflects the inverted logic level on the CPU **p_reset_b** input after capture by **j_tclk**.
4	HALT	HALT Mode This bit reflects the logic level on the CPU **p_halted** output after capture by **j_tclk**.
5	STOP	STOP Mode This bit reflects the logic level on the CPU **p_stopped** output after capture by **j_tclk**.
6	DEBUG	Debug Mode This bit is asserted once the CPU is in debug mode. It is negated once the CPU exits debug mode (even during a debug session)
7	WAIT	Waiting Mode This bit reflects the logic level on the CPU **p_waiting** output after capture by **j_tclk**.

Table continues on the next page...

Table 60-23. OnCE Status Register Bit Definitions (continued)

Bit(s)	Name	Description
8	0	Reserved, set to 0 for 1149.1 compliance
9	1	Reserved, set to 1 for 1149.1 compliance

60.5.6.2 OnCE Command Register (OCMD)

The OnCE Command Register (OCMD) is a 10-bit shift register that receives its serial data from the TDI pin and serves as the instruction register (IR). It holds the 10-bit commands to be used as input for the OnCE Decoder. The Command Register is shown in Figure 60-23. The OCMD is updated when the TAP controller enters the Update-IR state. It contains fields for controlling access to a resource, as well as controlling single-step operation and exit from OnCE mode.

Although the OCMD is updated during the Update-IR TAP controller state, the corresponding resource is accessed in the DR scan sequence of the TAP controller, and as such, the Update-DR state must be transitioned through in order for an access to occur. In addition, the Update-DR state must also be transitioned through in order for the single-step and/or exit functionality to be performed, even though the command appears to have no data resource requirement associated with it.

R/W	GO	EX	RS[0:6]						
0	1	2	3	4	5	6	7	8	9

Reset - 10’b1000000010 on assertion of **j_trst_b** or **m_por** , or while in the Test_Logic_Reset state

Figure 60-23. OnCE Command Register

Table 60-24 provides bit definitions for the Once Command Register.

Table 60-24. OnCE Command Register Bit Definitions

Bit(s)	Name	Description
0	R/W	Read/Write Command Bit The R/W bit specifies the direction of data transfer. The table below describes the options defined by the R/W bit. **Note:** The R/W bit generally ignored for read-only or write-only registers, although the PC FIFO pointer is only guaranteed to be update when R/W=1. In addition, it is ignored for all bypass operations. When performing writes, most registers are sampled in the Capture-DR state into a 32-bit shift register, and subsequently shifted out on **j_tdo** during the first 32 clocks of Shift-DR. 0 - Write the data associated with the command into the register specified by RS[0:6]

Table continues on the next page...

Table 60-24. OnCE Command Register Bit Definitions (continued)

Bit(s)	Name	Description
		1 - Read the data contained in the register specified by RS[0:6]
1	GO	Go Go Command Bit If the GO bit is set, and the CPU is currently in debug mode, the CPU will execute the instruction which resides in the IR register in the CPUSCR. To execute the instruction, the processor leaves the debug mode, executes the instruction, and if the EX bit is cleared, returns to the debug mode immediately after executing the instruction. The processor goes on to normal operation if the EX bit is set, and no other debug request source is asserted. The GO command is executed only if the operation is a read/write to CPUSCR or a read/write to "No Register Selected". Otherwise the GO bit is ignored.The processor will leave the debug mode after the TAP controller Update-DR state is entered. On a GO+NoExit operation, returning to debug mode is treated as a debug event, thus exceptions such as machine checks and interrupts may take priority and prevent execution of the intended instruction. Debug firmware should mask these exceptions as appropriate. The $\mathrm{OSR}_{\mathrm{ERR}}$ bit indicates such an occurrence. If the CPU is not currently in debug mode, then the GO command will be ignored. Note that asynchronous interrupts are blocked on a GO+Exit operation until the first instruction to be executed begins execution. See Exiting Debug Mode and Interrupt Blocking. 0 - Inactive (no action taken) 1 - Execute instruction in IR
2	EX	Exit Command Bit 0 - Remain in debug mode 1 - Leave debug mode If the EX bit is set, the processor will leave the debug mode and resume normal operation until another debug request is generated. The Exit command is executed only if the Go command is issued, and the operation is a read/write to CPUSCR or a read/write to "No Register Selected". Otherwise the EX bit is ignored. The processor will leave the debug mode after the TAP controller Update-DR state is entered. Note that if the DR bit in the OnCE control register is set or remains set, or if a bit in EDBSR0 is set and $\mathrm{EDBCR0}_{\mathrm{EDM}}$=1 (external debug mode is enabled), or if another debug request source is asserted, then the processor may return to the debug mode *without* execution of an instruction, even though the EX bit was set. Note that asynchronous interrupts are blocked on a GO+Exit operation until the first instruction to be executed begins execution. See Exiting Debug Mode and Interrupt Blocking.
3:9	RS	Register Select The Register Select bits define which register is source (destination) for the read (write) operation. Table 60-25 indicates the OnCE register addresses. Attempted writes to read-only registers are ignored.

Table 60-25 indicates the OnCE register addresses.

[1] Causes assertion of the j_en_once_regsel output.

The Once Decoder receives as input the 10-bit command from the OCMD, and status signals from the processor, and generates all the strobes required for reading and writing the selected OnCE registers.

Single stepping of instructions is performed by placing the CPU in debug mode, scanning in appropriate information into the CPUSCR, and setting the Go bit (with the EX bit cleared) with the RS field indicating either the CPUSCR or No Register Selected. After executing a single instruction, the CPU will re-enter debug mode and await further commands. During single-stepping, exception conditions may occur if not properly masked by debug firmware (interrupts, machine checks, bus error conditions, etc.) and may prevent the desired instruction from being successfully executed. The $\mathrm{OSR}_{\mathrm{ERR}}$ bit is set to indicate this condition. In these cases, values in the CPUSCR will correspond to the first instruction of the exception handler.

Additionally, the $\mathrm{EDBCR0}_{\mathrm{EDM}}$ bit is forced to '1' internally while single-stepping to prevent Debug events from generating Debug interrupts. Also, during a debug session, the DBSR register is frozen from updates due to debug events other than execution of a DNI-type instruction, regardless of EDBCR0EDM. DBSR may still be modified during a debug session via a single-stepped **mtspr** instruction, or via OnCE access.

If the CPU is not currently in debug mode, go+exit and go+noexit commands are ignored, although for a go+exit command with "No Register Selected", the j_ocmd_go_exit output will be asserted.

60.5.6.3 OnCE Control Register (OCR)

The OnCE Control Register is a 32-bit register used to force the e200z4251n3 core into debug mode and to enable / disable sections of the OnCE control logic. It also provides control over the MPU during a debug session (see MPU Operation During Debug). The control bits are read/write. These bits are only effective while OnCE is enabled (**jd_en_once** asserted). The OCR is shown in the following figure.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
0								I_DMDIS	0		I_DVLE	I_DI	0			D_DMDIS	0			D_DI	0	D_DG	0						WKUP	FDB	DR

Reset - 0xo000_0000 on **m_por, j_trst_b,** or entering Test_logic_Reset state

Figure 60-24. OnCE Control Register

The following table provides bit definitions for the OnCE Control Register.

Table 60-26. OnCE Control Register Bit Definitions

Bit(s)	Name	Description
0:7	—	Reserved
8	I_DMDIS	Instruction Side Debug MPU Disable Control Bit (I_DMDIS) 0 - MPU not disabled for debug sessions 1 - MPU disabled for debug sessions This bit may be used to control whether the MPU is enabled normally, or whether the MPU is disabled during a debug session for Instruction Accesses. When enabled, the MPU functions normally. When disabled, for Instruction Accesses, the I bit is taken from the OCR bit I_DI. The SX and UX access permission control bits are set to'1' to allow full access. When disabled, no MPU exceptions are generated for Instruction accesses. External access errors can still occur. MPU entries with DEBUG=1 are not affected by this control bit.
9:10	—	Reserved
11	I_DVLE	Instruction Side Debug 'VLE' Attribute Bit (I_DVLE) This bit is used to provide the 'VLE' attribute bit to be used during a debug session. Note: this bit is ignored, since VLE is always enabled.
12	I_DI	Instruction Side Debug 'I' Attribute Bit (I_DI) This bit is used to provide the 'I' attribute bit to be used for Instruction accesses for Instruction accesses during a debug session.
13:15	—	Reserved
16	D_DMDIS	Data Side Debug MPU Disable Control Bit (D_DMDIS) 0 - MPU not disabled for debug sessions 1 - MPU disabled for debug sessions

Table continues on the next page...

Table 60-26. OnCE Control Register Bit Definitions (continued)

Bit(s)	Name	Description
		This bit may be used to control whether the MPU is enabled normally, or whether the MPU is disabled during a debug session for Data Accesses. When enabled, the MPU functions normally. When disabled, for Data Accesses, the MPU I and G bits are taken from the OCR bits D_DI and D_DG. The SR, SW, UR, and UW access permission control bits are set to'1' to allow full access. When disabled, no MPU exceptions are generated for Data accesses. External access errors can still occur. MPU entries with DEBUG=1 are not affected by this control bit.
17:19	—	Reserved
20	D_DI	Data Side Debug 'I' Attribute Bit (D_DI) This bit is used to provide the 'I' attribute bit to be used for Data accesses during a debug session.
21	—	Reserved
22	D_DG	Data Side Debug 'G' Attribute Bit (D_DG) This bit is used to provide the 'G' attribute bit to be used for Data accesses during a debug session.
23:28	—	Reserved
29	WKUP	Wakeup Request Bit (WKUP) This control bit may be used to force the **p_wakeup** output signal to be asserted. This control function may be used by debug firmware to request that the chip-level clock controller restore the **m_clk** input to normal operation regardless of whether the CPU is in a low power state to ensure that debug resources may be properly accessed by external hardware through scan sequences.
30	FDB	Force Breakpoint Debug Mode Bit (FDB) This control bit is used to determine whether the processor is operating in breakpoint debug enable mode or not. The processor may be placed in breakpoint debug enable mode by setting this bit. In breakpoint debug enable mode, execution of the '**bkpt**' pseudo- instruction will cause the processor to enter debug mode, as if the **jd_de_b** input had been asserted. This bit is qualified with EDBCR0$_{EDM}$, which must be set for FDB to take effect. Note that this bit has no effect on **e_dnh** or **se_dnh** instruction operation.
31	DR	CPU Debug Request Control Bit This control bit is used to unconditionally request the CPU to enter the Debug Mode. The CPU will indicate that Debug Mode has been entered via the data scanned out in the shift-IR state. 0 - No Debug Mode request 1 - Unconditional Debug Mode request When the DR bit is set the processor will enter Debug mode at the next instruction boundary.

60.5.7 Access to Debug Resources

Resources contained in the OnCE Module which do not require the processor core to be halted for access may be accessed while the e200z4251n3 core is running, and will not interfere with processor execution. Accesses to other resources such as the CPUSCR require the e200z4251n3 core to be placed in debug mode to avoid synchronization hazards. Debug firmware may ensure that it is safe to access these resources by determining the state of the e200z4251n3 core prior to access. Note that a scan operation to update the CPUSCR is required prior to exiting debug mode if debug mode has been entered.

Some cases of write accesses other than accesses to the OnCE Command and Control registers, or the EDM bit of DBCR0 require **m_clk** to be running for proper operation. The OnCE control register provides a means of signaling this need to a system level clock control module via the OCR_{WKUP} control bit.

In addition, since the CPU may cause multiple bits of certain registers to change state, reads of certain registers while the CPU is running (DBSR, etc.) may not have consistent bit settings unless read twice with the same value indicated. In order to guarantee that the contents are consistent, the CPU should be placed into debug mode, or multiple reads should be performed until consistent values have been obtained on consecutive reads.

The following table provides a list of access requirements for OnCE registers.

Table 60-27. OnCE Register Access Requirements

Register name	Access requirements					Notes
	Requires jd_en_once to be asserted	Requires $\text{EDBCR0}_{\text{EDM}}$ = 1 for write access	Requires m_clk active for Write Access	Requires CPU to be halted for Read Access	Requires CPU to be halted for Write Access	
Enable_OnCE	N	N	N	N	—	
Bypass	N	N	N	N	N	
CPUSCR	Y	Y	Y	Y	Y	
DAC1–4	Y	Y	Y	N	*	
DBCR0	Y	Y	Y	N	*[1]	*$\text{EDBCR0}_{\text{EDM}}$ access only requires **jd_en_once** asserted
DBCR1–8	Y	Y	Y	N	*[1]	
DEVENT	Y	Y	Y	N	*[1]	
EDBRAC0 (DBERC0)	Y	N	Y	N	*[1]	
DBSR	Y	Y	Y	N	*[1]	
EDBCR0	Y	N	N	N	N	
EDBSR0	Y	N	Y	N	N	

Table continues on the next page...

Table 60-27. OnCE Register Access Requirements (continued)

Register name	Access requirements					Notes
	Requires jd_en_once to be asserted	Requires EDBCR0 EDM = 1 for write access	Requires m_clk active for Write Access	Requires CPU to be halted for Read Access	Requires CPU to be halted for Write Access	
EDBSRMSK0	Y	N	N	N	N	
IAC1–8	Y	Y	Y	N	*[1]	
JTAG ID	N	N	—	N	—	Read-only
MPU0CSR0	Y	N	Y	N	N	
OCR	Y	N	N	N	N	
OSR	Y	N	—	N	—	Read-only, accessed by scanning out IR while **jd_en_once** is asserted
Cache Debug Access Control (CDACNTL)	Y	N	Y	N	N	CPU gives lowest priority to a Cache access request when it is not debug halted
Cache Debug Access Data (CDADATA)	Y	N	Y	N	N	CPU gives lowest priority to a Cache access request when it is not debug halted
Nexus3-Access	Y	N	N	N	N	
PMR-Access	Y	N	N	N	N	
PMR Registers	Y	Y	Y	N	N	
External GPRs	Y	N	N	N	N	
LSRL Select	Y	N	?	?	?	System Test logic implementation determines LSRL functionality

1. Writes to these registers while the CPU is running may have unpredictable results due to the pipelined nature of operation, and the fact that updates are not synchronized to a particular clock, instruction, or bus cycle boundary, therefore it is strongly recommended to ensure the processor is first placed into debug mode before updates to these registers are performed.

60.5.8 Methods of Entering Debug Mode

The OnCE Status Register indicates that the CPU has entered the debug mode via the DEBUG status bit. The following sections describe how Debug Mode is entered assuming the OnCE circuitry has been enabled. OnCE operation is enabled by the assertion of the **jd_en_once** input See OnCE Enable (jd_en_once).

60.5.8.1 External Debug Request During RESET

Holding the **jd_de_b** signal asserted during the assertion of **p_reset_b,** and continuing to hold it asserted following the negation of **p_reset_b** causes the e200z4251n3 core to enter Debug Mode. After receiving an acknowledge via the OnCE Status Register DEBUG bit, the external command controller should negate the **jd_de_b** signal before sending the first command. Note that in this case the e200z4251n3 core does not execute an instruction before entering Debug Mode, although the first instruction to be executed will be fetched prior to entering Debug Mode in order to properly initialize the CPUSCR.

60.5.8.2 Debug Request During RESET

Asserting a debug request by setting the DR bit in the OCR during the assertion of **p_reset_b** and then negating **p_reset_b** causes the chip to enter debug mode. In this case the CPU will fetch the first instruction of the reset exception handler in order to properly initialize the CPUSCR, but does not execute an instruction before entering debug mode.

60.5.8.3 Debug Request During Normal Activity

Asserting a debug request by setting the DR bit in the OCR during normal chip activity causes the chip to finish the execution of the current instruction and then enter the debug mode. Note that in this case the chip completes the execution of the current instruction and stops after the newly fetched instruction enters the CPU instruction register. This process is the same for any newly fetched instruction including instructions fetched by the interrupt processing, or those that will be aborted by the interrupt processing.

60.5.8.4 Debug Request During Waiting, Halted or Stopped State

Asserting a debug request by setting the DR bit in the OCR when the chip is in the Waiting state (**p_waiting** asserted), Halted state (**p_halted** asserted) or Stopped state (**p_stopped** asserted) causes the CPU to exit the state and enter the debug mode once the CPU clock **m_clk** has been restored. Note that in this case, the CPU will negate the **p_waiting, p_halted** and **p_stopped** outputs. Once the debug session has ended, the CPU will return to the state it was in prior to entering debug mode.

To signal the chip-level clock generator to re-enable **m_clk**, the **p_wakeup** output will be asserted whenever the debug block is asserting a debug request to the CPU due to $\mathrm{OCR}_{\mathrm{DR}}$ being set, or **jd_de_b** assertion, and will remain set from then until the debug session ends (**jd_debug_b** goes from asserted to negated). In addition, the status of the **jd_mclk_on** input (after synchronization to the **j_tclk** clock domain) may be sampled along with other status bits from the **j_tdo** outputs during the Shift_IR TAP controller state. This status may be used if necessary by external debug firmware to ensure proper scan sequences occur to registers in the **m_clk** clock domain.

60.5.8.5 Software Request During Normal Activity

Upon executing a '**bkpt**' pseudo-instruction (for e200z4251n3, defined to be an all 0's instruction opcode) when the OCR register's (FDB) bit is set (debug mode enable control bit is true), and EDBCR0$_{EDM}$=1, the CPU enters the debug mode after the instruction following the '**bkpt**' pseudo-instruction has entered the instruction register.

60.5.8.6 Debug Notify Halt Instructions

The **e_dnh** and **se_dnh** instructions allow software to transition the core from a running state to a debug halted state if enabled by EDBCR0$_{DNH\_EN}$, and provide the external debugger with bits reserved in the instruction itself to pass additional information. Entry into debug mode is ***not*** conditioned on EDBCR0$_{EDM}$, allowing for debug of software debug handlers as well as other software. For e200z4251n3, when the CPU enters a debug halted state due to a **e_dnh** or **se_dnh** instruction, the instruction will be stored in the CPUSCR[IR] portion, and the CPUSCR[PC] value will point to the instruction. The external debugger should update the CPUSCR prior to exiting the debug halted state to point past the **e_dnh** or **se_dnh** instruction.

60.5.9 CPU Status and Control Scan Chain Register (CPUSCR)

A number of on-chip registers store the CPU pipeline status and are configured in a single scan chain for access by the OnCE controller. The CPUSCR register contains these processor resources, which are used to restore the pipeline and resume normal chip activity upon return from the debug mode, as well as a mechanism for the emulator software to access processor and memory contents. The following figure shows the block diagram of the pipeline information registers contained in the CPUSCR. Once debug mode has been entered, it is required to scan in and update this register prior to exiting debug mode.

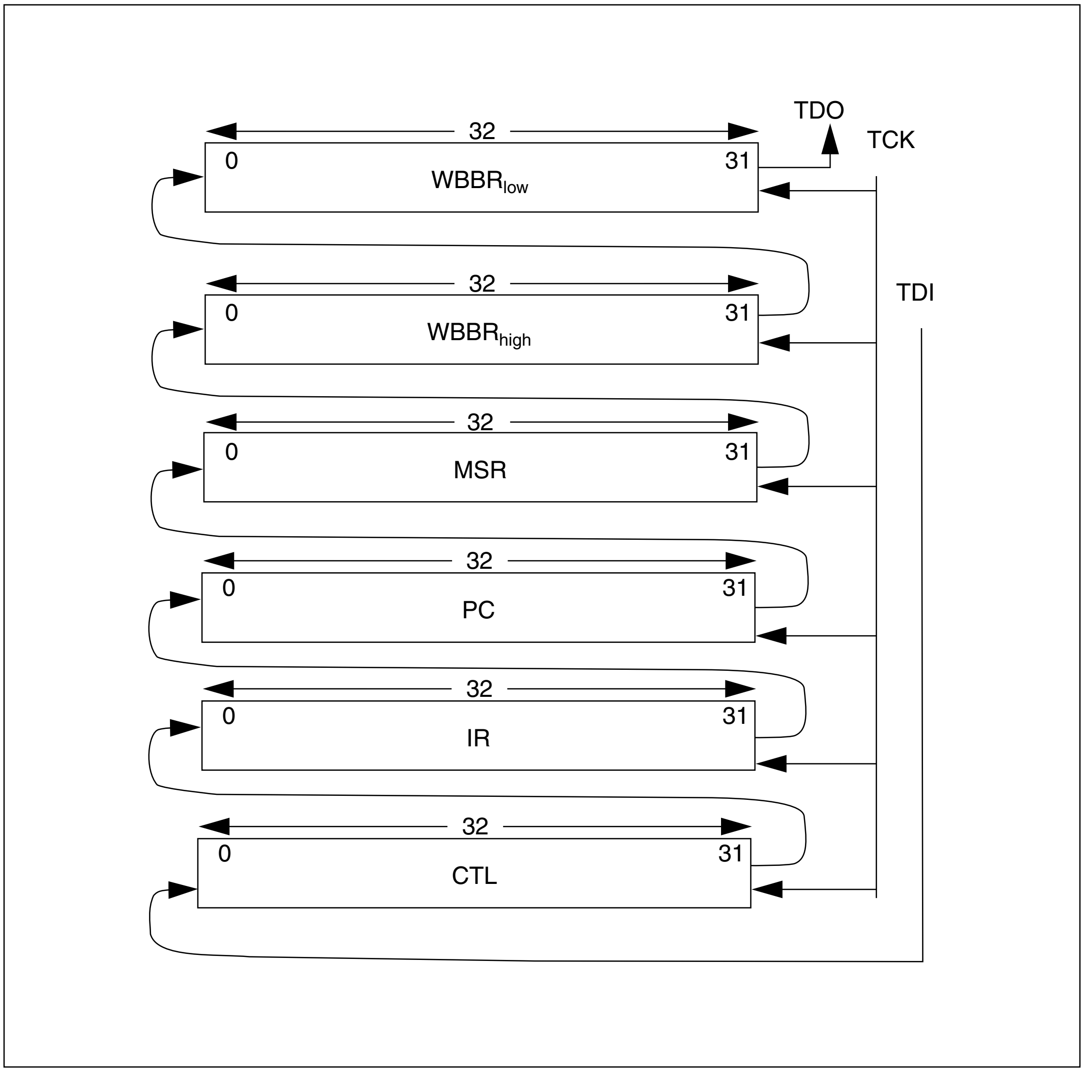

Figure 60-25. CPU Scan Chain Register (CPUSCR)

60.5.9.1 Instruction Register (IR)

The Instruction Register (IR) provides a mechanism for controlling the debug session by serving as a means for forcing in selected instructions, and then causing them to be executed in a controlled manner by the debug control block. The opcode of the next instruction to be executed when entering debug mode is contained in this register when the scan-out of this chain begins. This value should be saved for later restoration if continuation of the normal instruction stream is desired.

On scan-in, in preparation for exiting debug mode, this register is filled with an instruction opcode selected by debug control software. By selecting appropriate instructions and controlling the execution of those instructions, the results of execution may be used to examine or change memory locations and processor registers. The debug control module external to the processor core will control execution by providing a single-step capability. Once the debug session is complete and normal processing is to be resumed, this register may be loaded with the value originally scanned out.

60.5.9.2 Control State Register (CTL)

The Control State Register (CTL) is a 32-bit register that stores the value of certain internal CPU state variables before the debug mode is entered. This register is affected by the operations performed during the debug session and should normally be restored by the external command controller when returning to normal mode. In addition to saved internal state variables, two of the bits are used by emulation firmware to control the debug process. In certain circumstances, emulation firmware must modify the content of this register as well as the PC and IR values in the CPUSCR before exiting debug mode. These cases are described below.

*										IRSTAT14	IRSTAT13	IRSTAT12	IRSTAT11	IRSTAT10	WAITING	PCOFST				PCINV	FFRA	IRSTAT0	IRSTAT1	IRSTAT2	IRSTAT3	IRSTAT4	IRSTAT5	IRSTAT6	IRSTAT7	IRSTAT8	IRSTAT9
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

Figure 60-26. Control State Register (CTL)

WAITING — WAITING State Status

This bit indicates whether the CPU was in the waiting state prior to entering debug mode. If set, the CPU was in the waiting state. Upon exiting a debug session, the value of this bit in the restored CPUSCR will determine whether the CPU re-enters the waiting state on a go+exit.

0- CPU was not in the waiting state when debug mode was entered

1- CPU was in the waiting state when debug mode was entered

PCOFST — PC Offset Field

This field indicates whether the value in the PC portion of the CPUSCR must be adjusted prior to exiting debug mode. Due to the pipelined nature of the CPU, the PC value must be backed-up by emulation software in certain circumstances. The PCOFST field specifies the value to be subtracted from the original value of the PC. This adjusted PC value should be restored into the PC portion of the CPUSCR just prior to exiting debug mode with a go+exit. In the event the PCOFST is non-zero, the IR should be loaded with a nop instruction instead of the original IR value, other wise the original value of IR should be restored. (But see PCINV which overrides this field)

0000 - No correction required.

0001 - Subtract 0x04 from PC.

0010 - Subtract 0x08 from PC.

0011 - Subtract 0x0C from PC.

0100 - Subtract 0x10 from PC.

0101 - Subtract 0x14 from PC.

all other encodings are reserved

* — Internal State Bits

Table continues on the next page...

These control bits represent internal processor state and should be restored to their original value after a debug session is completed, i.e when a OnCE command is issued with the GO and EX bits set and not ignored. When performing instruction execution during a debug session. See OnCE Debug Output (jd_debug_b), which is not part of the normal program execution flow, these bits should be set to a 0.

PCINV — PC and IR Invalid Status Bit

This status bit indicates that the values in the IR and PC portions of the CPUSCR are invalid. Exiting debug mode with the saved values in the PC and IR will have unpredictable results. Debug firmware should initialize the PC and IR values in the CPUSCR with desired values prior to exiting debug mode if this bit was set when debug mode was initially entered.

0= No error condition exists.

1= Error condition exists. PC and IR are corrupted.

FFRA— Feed Forward RA Operand Bit

This control bit causes the content of the WBBR$_{lo}$ to be used as the RA operand value (RS for logical, mtspr, mtdcr, cntlzw, and shift operations, RX for VLE se_ instructions, RT for e_{logical_op}2i type instructions, RB for evaddiw, evsubifw, and the value to use as the PC for calculating the LR update value for branch with link type instructions) of the first instruction to be executed following an update of the CPUSCR.For most LSP instructions using rA||rB as a 64-bit source operand, WBBR$_{hi, lo}$ is used to supply the 64-bit source value.

This allows the debug firmware to update processor registers — initialize the WBBR$_{lo}$ with the desired value, set the FFRA bit, and execute a ori Rx,Rx,0 instruction to the desired register.

Note: not all instructions support using the FFRA control. FFRA is mainly intended for use with the ori instruction to allow the debugger to write to a GPR. Support for other instructions is implementation-dependent.

0= No action.

1= Content of WBBR$_{lo}$or WBBR$_{hi,lo}$used as operand value

IRStat0 — IR Status Bit 0

This control bit indicates a TEA status for the IR.

0= No TEA occurred on the fetch of this instruction.

1= TEA occurred on the fetch of this instruction.

IRStat1 — IR Status Bit 1

This control bit is reserved.

IRStat2 — IR Status Bit 2

This control bit indicates an Instruction Address Compare 1 event status for the IR.

0= No Instruction Address Compare event 1 occurred on the fetch of this instruction.

1= An Instruction Address Compare event 1 occurred on the fetch of this instruction.

IRStat3 — IR Status Bit 3

This control bit indicates an Instruction Address Compare 2 event status for the IR.

0= No Instruction Address Compare 2 event occurred on the fetch of this instruction.

1= An Instruction Address Compare 2 event occurred on the fetch of this instruction.

IRStat4 — IR Status Bit 4

This control bit indicates an Instruction Address Compare 3 event status for the IR.

0= No Instruction Address Compare event 3 occurred on the fetch of this instruction.

1= An Instruction Address Compare event 3 occurred on the fetch of this instruction.

IRStat5 — IR Status Bit 5

This control bit indicates an Instruction Address Compare 4 event status for the IR.

Table continues on the next page...

0= No Instruction Address Compare 4 event occurred on the fetch of this instruction.

1= An Instruction Address Compare 4 event occurred on the fetch of this instruction.

IRStat6 — IR Status Bit 6

This control bit indicates a Parity Error status for the IR.

0= No Parity Error occurred on the fetch of this instruction.

1= Parity Error occurred on the fetch of this instruction from the I-Cache .

IRStat7 — IR Status Bit 7

This control bit indicates a Precise External Termination Error status for the IR.

0= No Precise External Termination Error occurred on the fetch of this instruction.

1= A Precise External Termination Error occurred on the fetch of this instruction.

IRStat8 — IR Status Bit 8

This control bit indicates the Power ISA VLE status for the IR.

0= IR contains a BookE instruction. (unused encoding)

1= IR contains a Power ISA VLE instruction, aligned in the Most Significant Portion of IR if 16-bit.

- this bit should not be modified by the debugger, otherwise the resulting operation is boundedly undefined. It should always indicate VLE (=1).

IRStat9 — IR Status Bit 9

This control bit is reserved.

IRStat10 — IR Status Bit 10

This control bit indicates an Instruction Address Compare 5 event status for the IR.

0= No Instruction Address Compare 5 event occurred on the fetch of this instruction.

1= An Instruction Address Compare 5 event occurred on the fetch of this instruction.

IRStat11 — IR Status Bit 11

This control bit indicates an Instruction Address Compare 6 event status for the IR.

0= No Instruction Address Compare 6 event occurred on the fetch of this instruction.

1= An Instruction Address Compare 6 event occurred on the fetch of this instruction.

IRStat12 — IR Status Bit 12

This control bit indicates an Instruction Address Compare 7 event status for the IR.

0= No Instruction Address Compare 7 event occurred on the fetch of this instruction.

1= An Instruction Address Compare 7 event occurred on the fetch of this instruction.

IRStat13 — IR Status Bit 13

This control bit indicates an Instruction Address Compare 8 event status for the IR.

0= No Instruction Address Compare 8 event occurred on the fetch of this instruction.

1= An Instruction Address Compare 8 event occurred on the fetch of this instruction.

IRStat14 — IR Status Bit 14

This control bit indicates an MPU Instruction Address Compare event status for the IR.

0= No MPU Instruction Address Compare event occurred on the fetch of this instruction.

1= An MPU Instruction Address Compare event occurred on the fetch of this instruction.

Emulation firmware should modify the content of the CTL, PC, and IR values in the CPUSCR during execution of debug related instructions as well as just prior to exiting debug with a go+exit command. During the debug session, the CTL register should be written with the FFRA bit set as appropriate, and all other bit set to '0', and the IR set to the value of the desired instruction to be executed. IRStat8 will be used to determine the type of instruction present in the IR.

Just prior to exiting debug mode with a go+exit, the PCINV status bit which was originally present when debug mode was first entered should be tested, and if set, the PC and IR initialized for performing whatever recovery sequence is appropriate for a faulted exception vector fetch. If the PCINV bit is cleared, then the PCOFST bits should be examined to determine whether the PC value must be adjusted. Due to the pipelined nature of the CPU, the PC value must be backed-up by emulation software in certain circumstances. The PCOFST field specifies the value to be subtracted from the original value of the PC. This adjusted PC value should be restored in to the PC portion of the CPUSCR just prior to exiting debug mode with a go+exit. In the event the PCOFST is non-zero, the IR should be loaded with a nop instruction (such as **ori r0,r0,0**) instead of the original IR value, otherwise the original value of IR should be restored. Note that when a correction is made to the PC value, it will generally point to the last completed instruction, although that instruction will not be re-executed. The nop instruction is executed instead, and instruction fetch and execution will resume at location PC+4. IRStat8 will be used to determine the type of instruction present in the IR, thus should be cleared in this case. Note that debug events which may occur on the nop (ICMP) will be generated if enabled.

For the CTL register, the internal state bits should be restored to their original value. The IRStatus bits should be set to '0's if the PC was adjusted. If no PC adjustment was performed, emulation firmware should determine whether other IRStat flags should be set to '0' to avoid re-entry into debug mode for an instruction breakpoint request. Upon exiting debug mode with go+exit, if one of these bits is set, debug mode will be re-entered prior to any further instruction execution.

60.5.9.3 Program Counter Register (PC)

The PC is a 32-bit register that stores the value of the program counter which was present when the chip entered the debug mode. It is affected by the operations performed during the debug mode and must be restored by the external command controller when the CPU returns to normal mode. PC normally points to the instruction contained in the IR portion of CPUSCR. If debug firmware wishes to redirect program flow to an arbitrary location, the PC and IR should be initialized to correspond to the first instruction to be executed upon resumption of normal processing. Alternatively, the IR may be set to a nop and the PC set to point to the location prior to the location at which it is desired to redirect flow to. On exiting debug mode, the nop will be executed, and instruction fetch and execution will resume at PC+4.

60.5.9.4 Write-Back Bus Register (WBBR$_{low}$, WBBR$_{high}$)

WBBR is used as a means of passing operand information between the CPU and the external command controller. Whenever the external command controller needs to read the contents of a register or memory location, it will force the chip to execute an instruction that brings that information to WBBR. WBBR$_{low}$ holds the 32-bit result of most instructions including load data returned for a load or load with update instruction. For LSP instructions which generate 64-bit results, WBBR$_{low}$ holds the low-order 32 bits of the result. WBBR$_{high}$ holds the updated effective address calculated by a load with update instruction. For LSP instructions which generate 64-bit results, WBBR$_{high}$ holds the high-order 32 bits of the result. It is undefined for other instructions.

As an example, to read the 32 bits of processor register **r1**, an **ori r1,r1,0** instruction is executed, and the result value of the instruction will be latched into WBBR$_{low}$. The contents of WBBR$_{low}$ can then be delivered serially to the external command controller. To update a processor resource, this register is initialized with a data value to be written, and an **ori** instruction is executed which uses this value as a substitute data value. The Control State register FFRA bit forces the value of the WBBR$_{low}$ to be substituted for the normal RS source value of the **ori** instruction, thus allowing updates to processor registers to be performed. (Refer to Control State Register (CTL) for more detail on the CTL$_{FFRA}$ bit.)

WBBR$_{low}$ and WBBR$_{high}$ are generally undefined on instructions which do not writeback a result, and due to control issues are not defined on **lmw** or branch instructions as well.

60.5.9.5 Machine State Register (MSR)

The MSR is a 32-bit register used to read/write the Machine State Register. Whenever the external command controller needs to save or modify the contents of the Machine State Register, this register is used.This register is affected by the operations performed during the debug mode and must be restored by the external command controller when returning to normal mode.

60.5.9.6 Exiting Debug Mode and Interrupt Blocking

When exiting debug mode with a Go+Exit, "asynchronous" interrupts are blocked until the first instruction to be executed begins execution. This includes External and Critical input, NMI, and machine check interrupts. Asynchronous debug interrupts are not blocked however, and the CPU will re-enter debug mode without executing an instruction following Go+Exit, although it may fetch an instruction and discard it. Exceptions due to an illegal instruction or error flags set within the CPUSCR CTL register are not blocked, since they apply to the instruction in the CPUSCR IR.

60.5.10 Reserved Registers (Reserved)

The Reserved Registers are used to control various test control logic. These registers are not intended for customer use. To preclude device and/or system damage, these registers should not be accessed.

60.6 Watchpoint Support

e200z4251n3 supports the generation and signalling of watchpoints when operating in internal debug mode ($\mathrm{DBCR0}_{\mathrm{IDM}}$=1) or in external debug mode ($\mathrm{EDBCR0}_{\mathrm{EDM}}$=1). Watchpoints are indicated with a dedicated set of interface signals. The **jd_watchpt[0:31]** output signals are used to indicate that a watchpoint has occurred. Certain watchpoints however (DEVENT-based, DTC-based, and Performance Monitor watchpoints) are not qualified with $\mathrm{EDBCR0}_{\mathrm{EDM}}$ or $\mathrm{DBCR0}_{\mathrm{IDM}}$.

Each debug address compare function (IAC1–8, DAC1–4), as well as other event types are capable of triggering a watchpoint output. The DBCRx control fields are used to configure watchpoints, regardless of whether events are enabled in DBCR0. Watchpoints may occur whenever an associated event would have been posted in the Debug Status Register if enabled. No explicit enable bits are provided for watchpoints; they are always enabled by definition, although the data address compare watchpoints may be controlled for read and write accesses via configuration fields in DBCR4, 7, and 9. During a debug session, debug events (other than PMI, DEVT1 and DEVT2) with a corresponding DBSR bit are blocked from asserting a watchpoint. The Performance Monitor, DEVNT-based and DTC-based watchpoints are not blocked during a debug session. If not desired, for address-based events the base address values for these events may be programmed to an unused system address. $\mathrm{MSR}_{\mathrm{DE}}$ has no effect on watchpoint generation.

External logic may monitor the assertion of these signals for debugging or triggering purposes. Watchpoints are signaled in the clock cycle following the occurrence of the actual event. The Nexus3 module also monitors assertion of a portion of these output signals (**jd_watchpt[0:31]**) for various development control purposes. (See the "Watchpoint Trace Messaging" section in the Core (e200z4251n3) Nexus 3 Module chapter.)

Note that these signals are **m_clk** domain signals, not **j_tclk** domain signals.

The following table shows the **jd_watchpt[0:31]** output signal assignments to various debug events.

Table 60-28. Watchpoint Output Signal Assignments

Signal Name	Type	Description
jd_watchpt[0]	IAC1	Instruction Address Compare 1 watchpoint Asserted whenever an IAC1 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[1]	IAC2	Instruction Address Compare 2 watchpoint Asserted whenever an IAC2 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[2]	IAC3	Instruction Address Compare 3 watchpoint Asserted whenever an IAC3 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[3]	IAC4	Instruction Address Compare 4 watchpoint Asserted whenever an IAC4 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[4]	DAC1	Data Address Compare 1 watchpoint Asserted whenever a DAC1 compare occurs regardless of being enabled to set DBSR status, based on DBCR4$_{\text{DAC1CFG}}$ settings
jd_watchpt[5]	DAC2	Data Address Compare 2 watchpoint Asserted whenever a DAC2 compare occurs regardless of being enabled to set DBSR status, based on DBCR4$_{\text{DAC2CFG}}$ settings
jd_watchpt[6]	DAC3	Data Address Compare 3 watchpoint Asserted whenever a DAC3 compare occurs regardless of being enabled to set DBSR status, based on DBCR7$_{\text{DAC3CFG}}$ settings
jd_watchpt[7]	DAC4	Data Address Compare 4 watchpoint Asserted whenever a DAC4 compare occurs regardless of being enabled to set DBSR status, based on DBCR7$_{\text{DAC4CFG}}$ settings
jd_watchpt[8]	IAC5	Instruction Address Compare 5 watchpoint Asserted whenever an IAC5 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[9]	IAC6	Instruction Address Compare 6 watchpoint Asserted whenever an IAC6 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[10]	DEVT1	Debug Event Input 1 watchpoint Asserted whenever a DEVT1 debug event occurs regardless of being enabled to set DBSR status
jd_watchpt[11]	DEVT2	Debug Event Input 2 watchpoint Asserted whenever a DEVT2 debug event occurs regardless of being enabled to set DBSR status
jd_watchpt[12]	DEVNT0	Debug Event Output 0 watchpoint Asserted whenever a '1' is written to the bit of the DEVNT field of the DEVENT debug register corresponding to jd_watchpt[12]
jd_watchpt[13]	DEVNT1	Debug Event Output 1 watchpoint

Table continues on the next page...

Table 60-28. Watchpoint Output Signal Assignments (continued)

Signal Name	Type	Description
		Asserted whenever a '1' is written to the bit of the DEVNT field of the DEVENT debug register corresponding to jd_watchpt[13]
jd_watchpt[14]	IAC7	Instruction Address Compare 7 watchpoint Asserted whenever an IAC7 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[15]	IAC8	Instruction Address Compare 8 watchpoint Asserted whenever an IAC8 compare occurs regardless of being enabled to set DBSR status
jd_watchpt[16]	IRPT	Interrupt watchpoint Asserted whenever an IRPT debug event occurs regardless of being enabled to set DBSR status
jd_watchpt[17]	RET	Return watchpoint Asserted whenever a RET debug event occurs regardless of being enabled to set DBSR status
jd_watchpt[18]	CIRPT	Critical Interrupt watchpoint Asserted whenever a CIRPT debug event occurs regardless of being enabled to set DBSR status
jd_watchpt[19]	CRET	Critical Return watchpoint Asserted whenever a CRET debug event occurs regardless of being enabled to set DBSR status
jd_watchpt[20]	DEVNT2	Debug Event Output 2 watchpoint Asserted whenever a '1' is written to the bit of the DEVNT field of the DEVENT debug register corresponding to jd_watchpt[20]
jd_watchpt[21]	DEVNT3	Debug Event Output 3 watchpoint Asserted whenever a '1' is written to the bit of the DEVNT field of the DEVENT debug register corresponding to jd_watchpt[21]
jd_watchpt[22]	PMEVENT	Performance Monitor Event input watchpoint Asserted whenever **p_pm_event** transitions from a '0' to a '1' while **m_clk** is running
jd_watchpt[23]	PMC0	Performance Monitor Counter 0 watchpoint Asserted whenever PMC0 triggers an event based on $\text{PMLCa0}_{\text{PMP}}$
jd_watchpt[24]	PMC1	Performance Monitor Counter 1 watchpoint Asserted whenever PMC1 triggers an event based on $\text{PMLCa1}_{\text{PMP}}$
jd_watchpt[25]	PMC2	Performance Monitor Counter 2 watchpoint Asserted whenever PMC2 triggers an event based on $\text{PMLCa2}_{\text{PMP}}$
jd_watchpt[26]	PMC3	Performance Monitor Counter 3 watchpoint Asserted whenever PMC3 triggers an event based on $\text{PMLCa3}_{\text{PMP}}$
jd_watchpt[27]	MPU	Memory Protection Unit watchpoint Asserted whenever a the MPU generates a debug event based on region descriptor matches with DEBUG control enabled.
jd_watchpt[28]	TRAP	TRAP watchpoint

Table continues on the next page...

Table 60-28. Watchpoint Output Signal Assignments (continued)

Signal Name	Type	Description
		Asserted whenever an TRAP debug event occurs regardless of being enabled to set DBSR status
jd_watchpt[29]	DTC1	Data Trace Control Range 1 watchpoint Asserted whenever an access meets the conditions for DTC Range 1
jd_watchpt[30]	DTC2	Data Trace Control Range 2 watchpoint Asserted whenever an access meets the conditions for DTC Range 2
jd_watchpt[31]	DTC3	Data Trace Control Range 3 watchpoint Asserted whenever an access meets the conditions for DTC Range 3

60.7 MPU Operation During Debug

A debug session begins when the CPU initially enters debug mode, and ends when a OnCE command with GO+EXIT is executed, releasing the CPU for normal operation. If desired during a debug session, the debug firmware may substitute default values obtained from the OnCE Control Register for Access Attribute (I, G) bits. Refer to the bit definitions in the OCR (OnCE Control Register (OCR) for more detail.

Normal operation of the MPU may be modified during a 'debug session' via the OnCE Control Register (OCR). A debug session begins when the CPU initially enters debug mode, and ends when a OnCE command with GO+EXIT is executed, releasing the CPU for normal operation. If desired during a debug session, the debug firmware may disable the MPU protection mechanism and may substitute default values for the Access Protection (UX, UR, UW, SX, SR, SW) bits, and values obtained from the OnCE Control Register for Memory Attributes (I, G) bits normally provided by a matching MPU entry.

When disabled during a debug session, no MPU-related storage interrupt conditions will occur. If the debugger desires to use the normal protection mechanism, the MPU may be left enabled in the OnCE OCR, and normal protections provided by the MPU (including the possibility of a storage interrupt) will remain in effect.

The OCR control bits are used when debug mode is entered. Refer to the bit definitions in the OCR (OnCE Control Register (OCR) for more detail. When the MPU is disabled for instruction accesses (OCR_{I_DMDIS}) or for data accesses (OCR_{D_DMDIS}), substituted access attribute bits will control operation on respective accesses initiated during debug.

60.8 Cache Array Access During Debug

The cache arrays may be read and written during debug mode via the CDACNTL and CDADATA debug registers.

60.9 Basic Steps for Enabling, Using, and Exiting External Debug Mode

The following steps show one possible scenario for a debugger wishing to use the external debug facilities. *This simplified flow is intended to illustrate basic operations, but does not cover all potential methods in depth.*

Enabling External Debug Mode and initializing Debug registers

- The debugger should ensure that the **jd_en_once** control signal is asserted in order to enable OnCE operation.
- Select the OCR and write a value to it in which $\mathrm{OCR}_{\mathrm{DR}}$, $\mathrm{OCR}_{\mathrm{WKUP}}$, are set to '1'. The tap controller must step through the proper states as outlined earlier. This step will place the CPU in a debug state in which it is halted and awaiting single-step commands or a release to normal mode.
- Scan out the value of the OSR to determine that the CPU clock is running and the CPU has entered the Debug state. This can be done in conjunction with a Read of the CPUSCR. The OSR is shifted out during the Shift_IR state. The CPUSCR will be shifted out during the Shift_DR state. The debugger should save the scanned-out value of CPUSCR for later restoration.
- Select the DBCR0 register and update it with the $\mathrm{EDBCR0}_{\mathrm{EDM}}$ bit set.
- Clear the DBSR status bits.
- Write appropriate values to the DBCR0–8, IAC, and DAC registers. Note that the initial write to DBCR0 will only affect the EDM bit, so the remaining portion of the register must now be initialized, keeping the EDM bit set

At this point the system is ready to commence debug operations. Depending on the desired operation, different steps must occur.

- Optionally, ensure that the values entered into the MSR portion of the CPUSCR during the following steps cause interrupt to be disabled (clearing MSR_{EE} and MSR_{CE}). This will ensure that external interrupt sources do not cause single-step errors.

To single-step the CPU:

- debugger scans in either a new or a previously saved value of the CPUSCR (with appropriate modification of the PC and IR as described in Control State Register (CTL)), with a Go+Noexit OnCE Command value.
- The debugger scans out the OSR with "no-register selected", Go cleared, and determines that the PCU has re-entered the Debug state and that no ERR condition occurred.

To return the CPU to normal operation (without disabling external debug mode)

- The OCR_{DR} control bit should be cleared, leaving the OCR_{WKUP} bit set.
- The debugger restores the CPUSCR with a previously saved value of the CPUSCR (with appropriate modification of the PC and IR as described in Control State Register (CTL)), with a Go+Exit OnCE Command value.
- The OCR_{WKUP} bit may then be cleared.

To exit External Debug Mode

- The debugger should place the CPU in the debug state via the OCR_{DR} with OCR_{WKUP} asserted, scanning out and saving the CPUSCR.
- The debugger should write the DBCR0–8 registers as needed, likely clearing every enable except the $EDBCR0_{EDM}$ bit.
- The debugger should write the DBSR to a cleared state.
- The debugger should re-write the DBCR0 with all bits including EDM cleared.
- The debugger should clear the OCR_{DR} bit.
- The debugger restores the CPUSCR with the previously saved value of the CPUSCR (with appropriate modification of the PC and IR as described in Control State Register (CTL)), with a Go+Exit OnCE Command value.
- The OCR_{WKUP} bit may then be cleared.

Note

These steps are meant by way of examples, and are not meant to be an exact template for debugger operation.

Chapter 61
JTAG Controller (JTAGC)

61.1 Introduction

NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The JTAGC block provides the means to test chip functionality and connectivity while remaining transparent to system logic when not in test mode. Testing is performed via a boundary scan technique, as defined in the IEEE 1149.1-2001 standard. All data input to and output from the JTAGC block is communicated in serial format.

61.1.1 Block diagram

The following is a simplified block diagram of the JTAG Controller (JTAGC) block. Refer to the chip-specific configuration information as well as Register description for more information about the JTAGC registers.

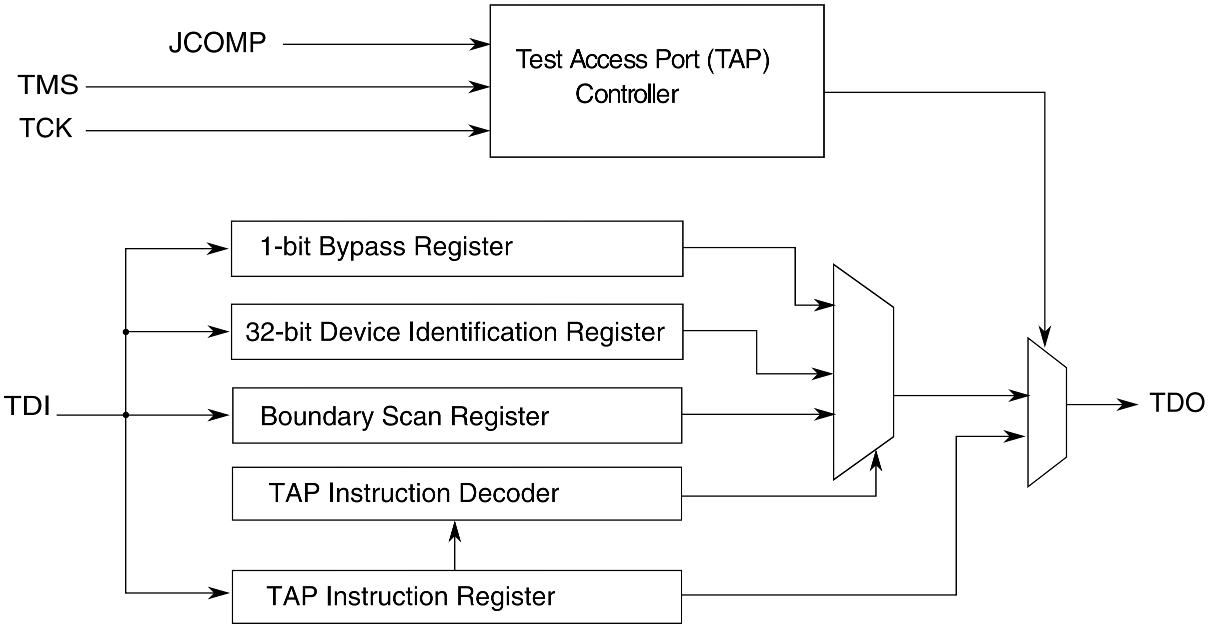

Figure 61-1. JTAG (IEEE 1149.1) block diagram

61.1.2 Features

The JTAGC block is compliant with the IEEE 1149.1-2001 standard, and supports the following features:

- IEEE 1149.1-2001 Test Access Port (TAP) interface
  - 4 pins (TDI, TMS, TCK, and TDO)
- JCOMP input that provides reset control
- Instruction register that supports several IEEE 1149.1-2001 defined instructions as well as several public and private device-specific instructions. Refer to Table 61-5 for a list of supported instructions.
- Sharing of the TAP with other TAP controllers via ACCESS_AUX_x instructions
- TEST_CTRL register
- JTAG_PASSWORD register
- Bypass register, boundary scan register, and device identification register.
- TAP controller state machine that controls the operation of the data registers, instruction register and associated circuitry.

61.1.3 Modes of operation

The JTAGC block uses JCOMP and a power-on reset indication as its primary reset signals. Several IEEE 1149.1-2001 defined test modes are supported, as well as a bypass mode.

61.1.3.1 Reset

The JTAGC block is placed in reset when either power-on reset is asserted, JCOMP is negated, or the TMS input is held high for enough consecutive rising edges of TCK to sequence the TAP controller state machine into the Test-Logic-Reset state. Holding TMS high for five consecutive rising edges of TCK guarantees entry into the Test-Logic-Reset state regardless of the current TAP controller state. Asserting power-on reset or setting JCOMP to a value other than the value required to enable the JTAGC block results in asynchronous entry into the reset state. While in reset, the following actions occur:

- The TAP controller is forced into the Test-Logic-Reset state, thereby disabling the test logic and allowing normal operation of the on-chip system logic to continue unhindered
- The instruction register is loaded with the IDCODE instruction

61.1.3.2 IEEE 1149.1-2001 defined test modes

The JTAGC block supports several IEEE 1149.1-2001 defined test modes. A test mode is selected by loading the appropriate instruction into the instruction register while the JTAGC is enabled. Supported test instructions include EXTEST, HIGHZ, CLAMP, SAMPLE and SAMPLE/PRELOAD. Each instruction defines the set of data register(s) that may operate and interact with the on-chip system logic while the instruction is current. Only one test data register path is enabled to shift data between TDI and TDO for each instruction.

The boundary scan register is enabled for serial access between TDI and TDO when the EXTEST, SAMPLE or SAMPLE/PRELOAD instructions are active. The single-bit bypass register shift stage is enabled for serial access between TDI and TDO when the BYPASS, HIGHZ, CLAMP or reserved instructions are active. The functionality of each test mode is explained in more detail in JTAGC block instructions.

61.1.3.3 Bypass mode

When no test operation is required, the BYPASS instruction can be loaded to place the JTAGC block into bypass mode. While in bypass mode, the single-bit bypass shift register is used to provide a minimum-length serial path to shift data between TDI and TDO.

61.2 External signal description

The JTAGC consists of a set of signals that connect to off chip development tools and allow access to test support functions. The JTAGC signals are outlined in the following table and described in the following sections.

Table 61-1. JTAG signal properties

Name	I/O	Function	Reset State	Pull
TCK	Input	Test Clock	—	Up
TDI	Input	Test Data In	—	Up
TDO	Output	Test Data Out	High Z	—
TMS	Input	Test Mode Select	—	Up
JCOMP	Input	JTAG Compliancy	—	Down

61.2.1 TCK—Test clock input

Test Clock Input (TCK) is an input pin used to synchronize the test logic and control register access through the TAP.

61.2.2 TDI—Test data input

Test Data Input (TDI) is an input pin that receives serial test instructions and data. TDI is sampled on the rising edge of TCK.

61.2.3 TDO—Test data output

Test Data Output (TDO) is an output pin that transmits serial output for test instructions and data. TDO is three-stateable and is actively driven only in the Shift-IR and Shift-DR states of the TAP controller state machine, which is described in TAP controller state machine.

61.2.4 TMS—Test mode select

Test Mode Select (TMS) is an input pin used to sequence the IEEE 1149.1-2001 test control state machine. TMS is sampled on the rising edge of TCK.

61.2.5 JCOMP—JTAG compliancy

The JCOMP signal provides IEEE 1149.1-2001 compatibility and provides the ability to share the TAP. The JTAGC TAP controller is enabled when JCOMP is set to the JTAGC enable encoding, otherwise the JTAGC TAP controller remains in reset.

61.3 Register description

This section provides a detailed description of the JTAGC block registers accessible through the TAP interface, including data registers and the instruction register. Individual bit-level descriptions and reset states of each register are included. These registers are not memory-mapped and can only be accessed through the TAP.

61.3.1 Instruction register

The JTAGC block uses a 5-bit instruction register as shown in the following figure. The instruction register allows instructions to be loaded into the block to select the test to be performed or the test data register to be accessed or both. Instructions are shifted in through TDI while the TAP controller is in the Shift-IR state, and latched on the falling edge of TCK in the Update-IR state. The latched instruction value can only be changed in the Update-IR and Test-Logic-Reset TAP controller states. Synchronous entry into the Test-Logic-Reset state results in the IDCODE instruction being loaded on the falling edge of TCK. Asynchronous entry into the Test-Logic-Reset state results in asynchronous loading of the IDCODE instruction. During the Capture-IR TAP controller state, the instruction shift register is loaded with the value 00001b , making this value the register's read value when the TAP controller is sequenced into the Shift-IR state.

	4	3	2	1	0
R	0	0	0	0	1
W	Instruction Code				
Reset:	0	0	0	0	1

Figure 61-2. Instruction register

61.3.2 Bypass register

The bypass register is a single-bit shift register path selected for serial data transfer between TDI and TDO when the BYPASS, CLAMP, HIGHZ or reserve instructions are active. After entry into the Capture-DR state, the single-bit shift register is set to a logic 0. Therefore, the first bit shifted out after selecting the bypass register is always a logic 0.

61.3.3 Device identification register

The device identification (JTAG ID) register, shown in the following figure, allows the revision number, part number, manufacturer, and design center responsible for the design of the part to be determined through the TAP. The device identification register is selected for serial data transfer between TDI and TDO when the IDCODE instruction is active. Entry into the Capture-DR state while the device identification register is selected loads the IDCODE into the shift register to be shifted out on TDO in the Shift-DR state. No action occurs in the Update-DR state.

<table>
<tr><td></td><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td></tr>

</table>

The following table describes the device identification register functions.

Table 61-2. Device identification register field descriptions

Field	Description
PRN	Part Revision Number. Contains the revision number of the part. Value is as mentioned in Table - "PRN for existing Masksets" given in Debug section of "Chip configuration" chapter..
DC	Design Center. Indicates the design center. Value is 0x26.
PIN	Part Identification Number. Contains the part number of the device. 0x345.
MIC	Manufacturer Identity Code. Contains the reduced Joint Electron Device Engineering Council (JEDEC) ID. Value is 0x00E.
IDCODE ID	IDCODE Register ID. Identifies this register as the device identification register and not the bypass register. Always set to 1.

61.3.4 TEST_CTRL Register

The TEST_CTRL register is a 17-bit shift register path from TDI to TDO selected when the ENABLE_TEST_CTRL instruction is active. The TEST_CTRL register transfers its value to a parallel hold register on the rising edge of TCK when the TAP controller state machine is in the Update-DR state.

Reset:	*[1]	*	*	*	*

[1] The reset value of TEST_CTRL is 0x5D

The following table describes the TEST_CTRL register functions.

Table 61-3. TEST_CTRL register field descriptions

Field	Description
TEST_CTRL	Test Control. Used to control chiptop test functions.

61.3.5 JTAG_PASSWORD register

The JTAG_PASSWORD register is a 65-bit shift register path from TDI to TDO selected when the ENABLE_JTAG_PASSWORD instruction is active. The default reset value of the JTAG_PASSWORD register is 65'b0. The JTAG_PASSWORD register transfers its value to a parallel hold register on the rising edge of TCK when the TAP controller state machine is in the Update-DR state. Once the ENABLE_JTAG_PASSWORD instruction is executed, the register value remains valid until a JTAG reset occurs. The operation of this register is described in the security documentation.

The following table describes the JTAG_PASSWORD register functions.

Table 61-4. JTAG_PASSWORD register field descriptions

Field	Description
JTAG_PASSWORD	JTAG Password. The JTAG_PASSWORD bits are used to provide the JTAG password for security.

61.3.6 Boundary scan register

The boundary scan register is connected between TDI and TDO when the EXTEST, SAMPLE or SAMPLE/PRELOAD instructions are active. It is used to capture input pin data, force fixed values on output pins, and select a logic value and direction for bidirectional pins. Each bit of the boundary scan register represents a separate boundary scan register cell, as described in the IEEE 1149.1-2001 standard and discussed in Boundary scan. The size of the boundary scan register and bit ordering is device-dependent and can be found in the device BSDL file.

61.4 Functional description

This section explains the JTAGC functional description.

61.4.1 JTAGC reset configuration

While in reset, the TAP controller is forced into the Test-Logic-Reset state, thus disabling the test logic and allowing normal operation of the on-chip system logic. In addition, the instruction register is loaded with the IDCODE instruction.

61.4.2 IEEE 1149.1-2001 (JTAG) Test Access Port

The JTAGC block uses the IEEE 1149.1-2001 TAP for accessing registers. This port can be shared with other TAP controllers on the MCU. Ownership of the port is determined by the value of the currently loaded instruction. For more detail on TAP sharing via JTAGC instructions refer to ACCESS_AUX_x instructions.

Data is shifted between TDI and TDO though the selected register starting with the least significant bit, as illustrated in the following figure. This applies for the instruction register, test data registers, and the bypass register.

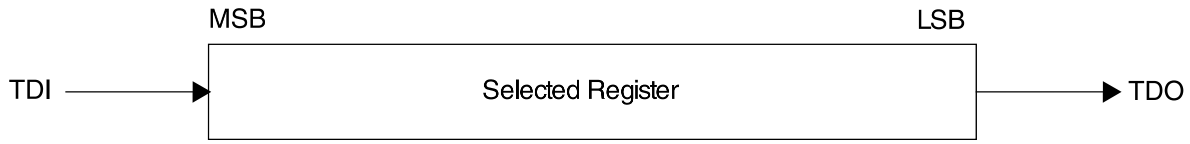

Figure 61-3. Shifting data through a register

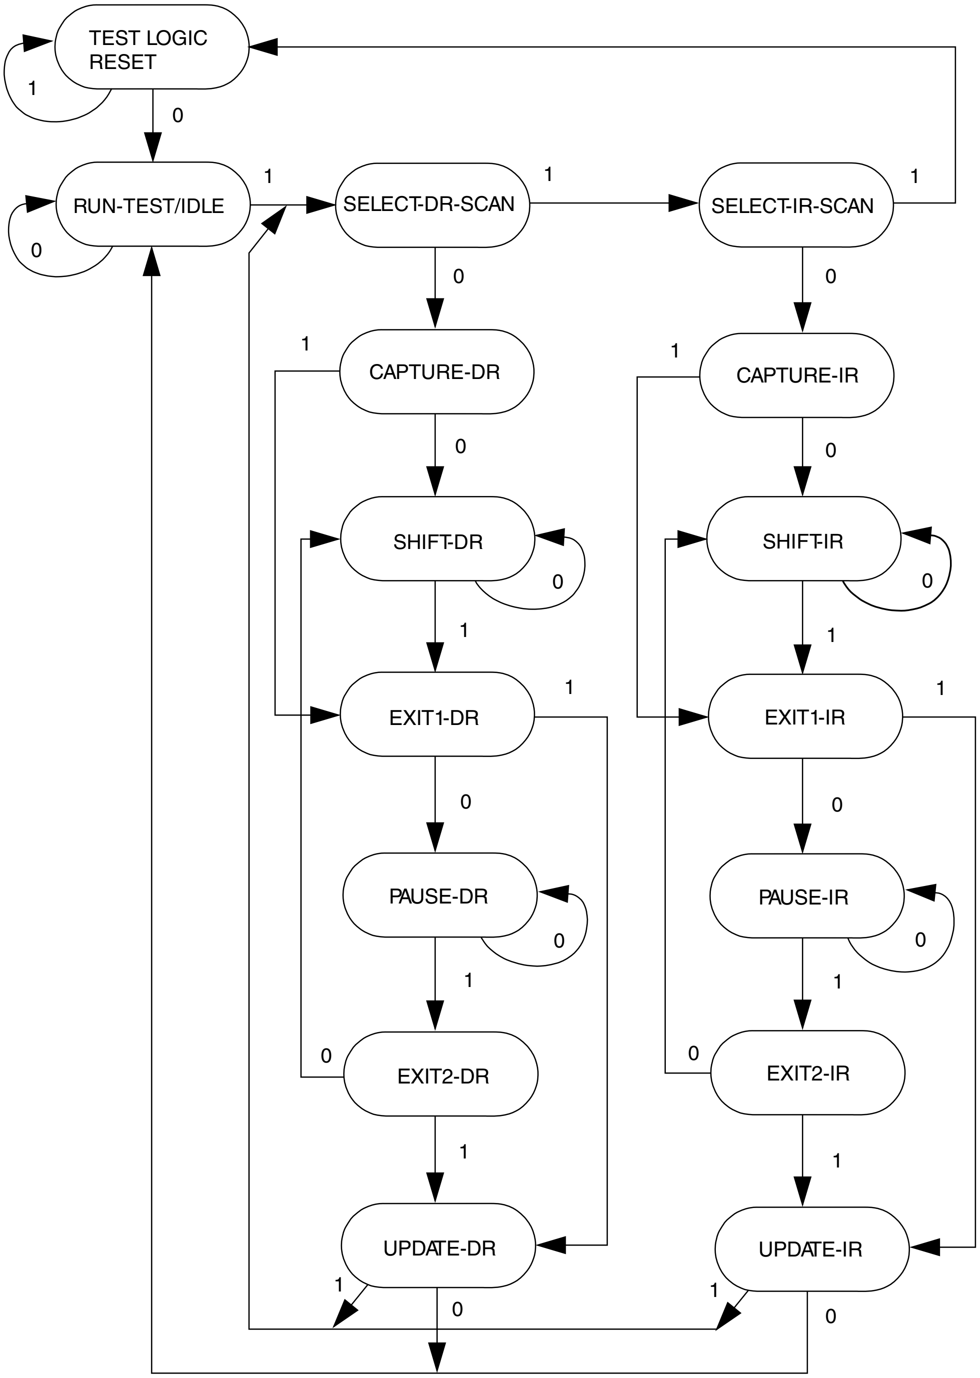
61.4.3 TAP controller state machine

The TAP controller is a synchronous state machine that interprets the sequence of logical values on the TMS pin. The following figure shows the machine's states. The value shown next to each state is the value of the TMS signal sampled on the rising edge of the TCK signal. As the following figure shows, holding TMS at logic 1 while clocking TCK through a sufficient number of rising edges also causes the state machine to enter the Test-Logic-Reset state.



The value shown adjacent to each state transition in this figure represents the value of TMS at the time of a rising edge of TCK.

Figure 61-4. IEEE 1149.1-2001 TAP controller finite state machine

61.4.3.1 Enabling the TAP controller

The JTAGC TAP controller is enabled by setting JCOMP to a logic 1 value.

61.4.3.2 Selecting an IEEE 1149.1-2001 register

Access to the JTAGC data registers is achieved by loading the instruction register with any of the JTAGC block instructions while the JTAGC is enabled. Instructions are shifted in via the Select-IR-Scan path and loaded in the Update-IR state. At this point, all data register access is performed via the Select-DR-Scan path.

The Select-DR-Scan path is used to read or write the register data by shifting in the data (LSB first) during the Shift-DR state. When reading a register, the register value is loaded into the IEEE 1149.1-2001 shifter during the Capture-DR state. When writing a register, the value is loaded from the IEEE 1149.1-2001 shifter to the register during the Update-DR state. When reading a register, there is no requirement to shift out the entire register contents. Shifting may be terminated once the required number of bits have been acquired.

61.4.4 JTAGC block instructions

The JTAGC block implements the IEEE 1149.1-2001 defined instructions listed in the following table. This section gives an overview of each instruction; refer to the IEEE 1149.1-2001 standard for more details. All undefined opcodes are reserved.

Table 61-5. General 5-bit JTAG instructions

Instruction	Code[4:0]	Instruction Summary
IDCODE	00001	Selects device identification register for shift
SAMPLE/PRELOAD	00010	Selects boundary scan register for shifting, sampling, and preloading without disturbing functional operation
SAMPLE	00011	Selects boundary scan register for shifting and sampling without disturbing functional operation
EXTEST	00100	Selects boundary scan register and applies preloaded values to output pins. **NOTE:** Execution of this instruction asserts functional reset.
Factory debug reserved	00101	Intended for factory debug only
ENABLE_TEST_CTRL	00110	Selects TEST_CTRL register
ENABLE_JTAG_PASSWORD	00111	Selects JTAG_PASSWORD register
HIGHZ	01001	Selects bypass register and three-states all output pins. **NOTE:** Execution of this instruction asserts functional reset.
Factory debug reserved	01010	Intended for factory debug only
CLAMP	01100	Selects bypass register and applies preloaded values to output pins. **NOTE:** Execution of this instruction asserts functional reset.

Table continues on the next page...

Table 61-5. General 5-bit JTAG instructions (continued)

Instruction	Code[4:0]	Instruction Summary
Factory debug reserved	01110	Intended for factory debug only
Factory debug reserved	01111	Intended for factory debug only
BYPASS	11111	Selects bypass register for data operations
Reserved[1]	All other opcodes	Decoded to select bypass register

[1] The manufacturer reserves the right to change the decoding of reserved instruction codes in the future

The ACCESS_AUX instructions are described in the chip configuration debug information.

61.4.4.1 IDCODE instruction

IDCODE selects the 32-bit device identification register as the shift path between TDI and TDO. This instruction allows interrogation of the MCU to determine its version number and other part identification data. IDCODE is the instruction placed into the instruction register when the JTAGC block is reset.

61.4.4.2 SAMPLE/PRELOAD instruction

The SAMPLE/PRELOAD instruction has two functions:

- The SAMPLE portion of the instruction obtains a sample of the system data and control signals present at the MCU input pins and just before the boundary scan register cells at the output pins. This sampling occurs on the rising edge of TCK in the Capture-DR state when the SAMPLE/PRELOAD instruction is active. The sampled data is viewed by shifting it through the boundary scan register to the TDO output during the Shift-DR state. Both the data capture and the shift operation are transparent to system operation.
- The PRELOAD portion of the instruction initializes the boundary scan register cells before selecting the EXTEST or CLAMP instructions to perform boundary scan tests. This is achieved by shifting in initialization data to the boundary scan register during the Shift-DR state. The initialization data is transferred to the parallel outputs of the boundary scan register cells on the falling edge of TCK in the Update-DR state. The data is applied to the external output pins by the EXTEST or CLAMP instruction. System operation is not affected.

61.4.4.3 SAMPLE instruction

The SAMPLE instruction obtains a sample of the system data and control signals present at the MCU input pins and just before the boundary scan register cells at the output pins. This sampling occurs on the rising edge of TCK in the Capture-DR state when the SAMPLE instruction is active. The sampled data is viewed by shifting it through the boundary scan register to the TDO output during the Shift-DR state. There is no defined action in the Update-DR state. Both the data capture and the shift operation are transparent to system operation.

61.4.4.4 EXTEST External test instruction

EXTEST selects the boundary scan register as the shift path between TDI and TDO. It allows testing of off-chip circuitry and board-level interconnections by driving preloaded data contained in the boundary scan register onto the system output pins. Typically, the preloaded data is loaded into the boundary scan register using the SAMPLE/PRELOAD instruction before the selection of EXTEST. EXTEST asserts the internal system reset for the MCU to force a predictable internal state while performing external boundary scan operations.

61.4.4.5 ENABLE_TEST_CTRL instruction

The ENABLE_TEST_CTRL instruction selects the TEST_CTRL register for connection as the shift path between TDI and TDO.

61.4.4.6 ENABLE_JTAG_PASSWORD instruction

The ENABLE_JTAG_PASSWORD instruction selects the JTAG_PASSWORD register for connection as the shift path between TDI and TDO.

61.4.4.7 HIGHZ instruction

HIGHZ selects the bypass register as the shift path between TDI and TDO. While HIGHZ is active all output drivers are placed in an inactive drive state (e.g., high impedance). HIGHZ also asserts the internal system reset for the MCU to force a predictable internal state.

61.4.4.8 CLAMP instruction

CLAMP allows the state of signals driven from MCU pins to be determined from the boundary scan register while the bypass register is selected as the serial path between TDI and TDO. CLAMP enhances test efficiency by reducing the overall shift path to a single bit (the bypass register) while conducting an EXTEST type of instruction through the boundary scan register. CLAMP also asserts the internal system reset for the MCU to force a predictable internal state.

61.4.4.9 ACCESS_AUX_x instructions

The JTAGC is configurable to allow other TAP controllers on the device to share the port with it. This is done by providing ACCESS_AUX_x instructions for each of these TAP controllers. When this instruction is loaded, control of the JTAG pins are transferred to the selected TAP controller. Any data input via TDI and TMS is passed to the selected TAP controller, and any TDO output from the selected TAP controller is sent back to the JTAGC to be output on the pins. The JTAGC regains control of the JTAG port during the UPDATE-DR state if the PAUSE-DR state was entered. Auxiliary TAP controllers are held in RUN-TEST/IDLE while they are inactive. Instructions not used to access an auxiliary TAP controller on a device are treated like the BYPASS instruction.

61.4.4.10 BYPASS instruction

BYPASS selects the bypass register, creating a single-bit shift register path between TDI and TDO. BYPASS enhances test efficiency by reducing the overall shift path when no test operation of the MCU is required. This allows more rapid movement of test data to and from other components on a board that are required to perform test functions. While the BYPASS instruction is active the system logic operates normally.

61.4.5 Boundary scan

The boundary scan technique allows signals at component boundaries to be controlled and observed through the shift-register stage associated with each pad. Each stage is part of a larger boundary scan register cell, and cells for each pad are interconnected serially to form a shift-register chain around the border of the design. The boundary scan register consists of this shift-register chain, and is connected between TDI and TDO when the EXTEST, SAMPLE, or SAMPLE/PRELOAD instructions are loaded. The shift-register chain contains a serial input and serial output, as well as clock and control signals.

61.5 Initialization/Application information

The test logic is a static logic design, and TCK can be stopped in either a high or low state without loss of data. However, the system clock is not synchronized to TCK internally. Any mixed operation using both the test logic and the system functional logic requires external synchronization.

To initialize the JTAGC block and enable access to registers, the following sequence is required:

1. Set the JCOMP signal to the JTAGC enable value, thereby enabling the JTAGC TAP controller.
2. Load the appropriate instruction for the test or action to be performed.

Chapter 62
Nexus Module

62.1 Introduction

The e200z4251n3Nexus 3 module provides real-time development capabilities for corresponding core processors in compliance with the IEEE-ISTO 5001 standard. This module provides development support capabilities without requiring the use of address and data pins for internal visibility.

A portion of the pin interface (the JTAG port) is also shared with the OnCE / Nexus 1 unit. The IEEE-ISTO 5001 standard defines an extensible auxiliary port which is used in conjunction with the JTAG port in these processors.

62.1.1 General description

This chapter defines the auxiliary pin functions, transfer protocols and standard development features of a Class 3 device in compliance with the IEEE-ISTO 5001 standard. The development features supported are Program Trace, Data Trace, Watchpoint Messaging, Ownership Trace, Data Acquisition Messaging, and Read/Write Access via the JTAG interface. The Nexus 3 module also supports two Class 4 features: Watchpoint Triggering, and Processor Overrun Control.

62.1.2 Terms and definitions

The following table contains a set of terms and definitions associated with the Nexus 3 module.

Table 62-1. Terms and definitions

Term	Description
IEEE-ISTO 5001	Consortium & standard for real-time embedded system design. World wide Web documentation at http://www.ieee-isto.org/Nexus5001
Auxiliary Port	Refers to Nexus auxiliary port. Used as auxiliary port to the IEEE 1149.1 JTAG interface.
Branch Trace Messaging (BTM)	Visibility of addresses for taken branches and exceptions, and the number of sequential instructions executed between each taken branch.
Data Read Message (DRM)	External visibility of data reads to memory-mapped resources.
Data Write Message (DWM)	External visibility of data writes to memory-mapped resources.
Data Trace Messaging (DTM)	External visibility of how data flows through the embedded system. This may include DRM and/or DWM.
Data Acquisition Messaging (DQM)	Data Acquisition Messaging (DQM) allows code to be instrumented to export customized information to the Nexus Auxiliary Output Port.
JTAG Compliant	Device complying to IEEE 1149.1 JTAG standard
JTAG IR & DR Sequence	JTAG Instruction Register (IR) scan to load an opcode value for selecting a development register. The JTAG IR corresponds to the OnCE command register (OCMD). The selected development register is then accessed via a JTAG Data Register (DR) scan.
Nexus1	The (OnCE) debug module. This module integrated with each processor provides all static (core halted) debug functionality. This module is compliant with Class1 of the IEEE-ISTO 5001 standard.
Ownership Trace Message (OTM)	Visibility of process/function that is currently executing.
Public Messages	Messages on the auxiliary pins for accomplishing common visibility and controllability requirements
SoC	"System-on-a-Chip". SoC signifies all of the modules on a single die. This generally includes one or more processors with associated peripherals, interfaces & memory modules.
Standard	The phrase "according to the standard" is used to indicate according to the IEEE-ISTO 5001 standard.
Transfer Code (TCODE)	Message header that identifies the number and/or size of packets to be transferred, and how to interpret each of the packets.
Watchpoint	A Data or Instruction Breakpoint or other debug event that does not cause the processor to halt. Instead, a pin is used to signal that the condition occurred. A Watchpoint Message may also be generated.

62.1.3 Feature list

The Nexus 3 module is compliant with Class 3 of the IEEE-ISTO 5001 standard, with additional Class 4 features available. The following features are implemented:

- Program Trace via Branch Trace Messaging (BTM). Branch trace messaging displays program flow discontinuities (direct and indirect branches, exceptions, etc.), allowing the development tool to interpolate what transpires between the discontinuities. Thus static code may be traced.
- Data Trace via Data Write Messaging (DWM) and Data Read Messaging (DRM). This provides the capability for the development tool to trace reads and/or writes to selected internal memory resources.
- Ownership Trace via Ownership Trace Messaging (OTM). OTM facilitates ownership trace by providing visibility of which process ID or operating system task is activated. An Ownership Trace Message is transmitted when a new process/task is activated, allowing the development tool to trace ownership flow.
- Run-time access to embedded processor memory map via the JTAG port. This allows for enhanced download/upload capabilities.
- Watchpoint Messaging via the auxiliary pins
- Watchpoint Trigger enable of Program and/or Data Trace Messaging
- Auxiliary interface for higher data input
    - Configurable (min/max) Message Data Out pins (**nex_mdo[n:0]**)
    - One (1) or two (2) Message Start/End Out pins (**nex_mseo_b[1:0]**)
    - One (1) Read/Write Ready pin (**nex_rdy_b**) pin
    - One (1) Watchpoint Event output pin (**evto_b**)
    - One (1) Event In pin (**nex_evti_b**)
    - One (1) MCKO (Message Clock Out) pin
- Registers for Program Trace, Data Trace, Ownership Trace and Watchpoint Trigger
- All features controllable and configurable via the JTAG port
- Conditional software control of the module via SoC signaling input (**nex_sfwcntl_en**)
- Indicates to the FCCU whether it becomes active during functional mode.

Note

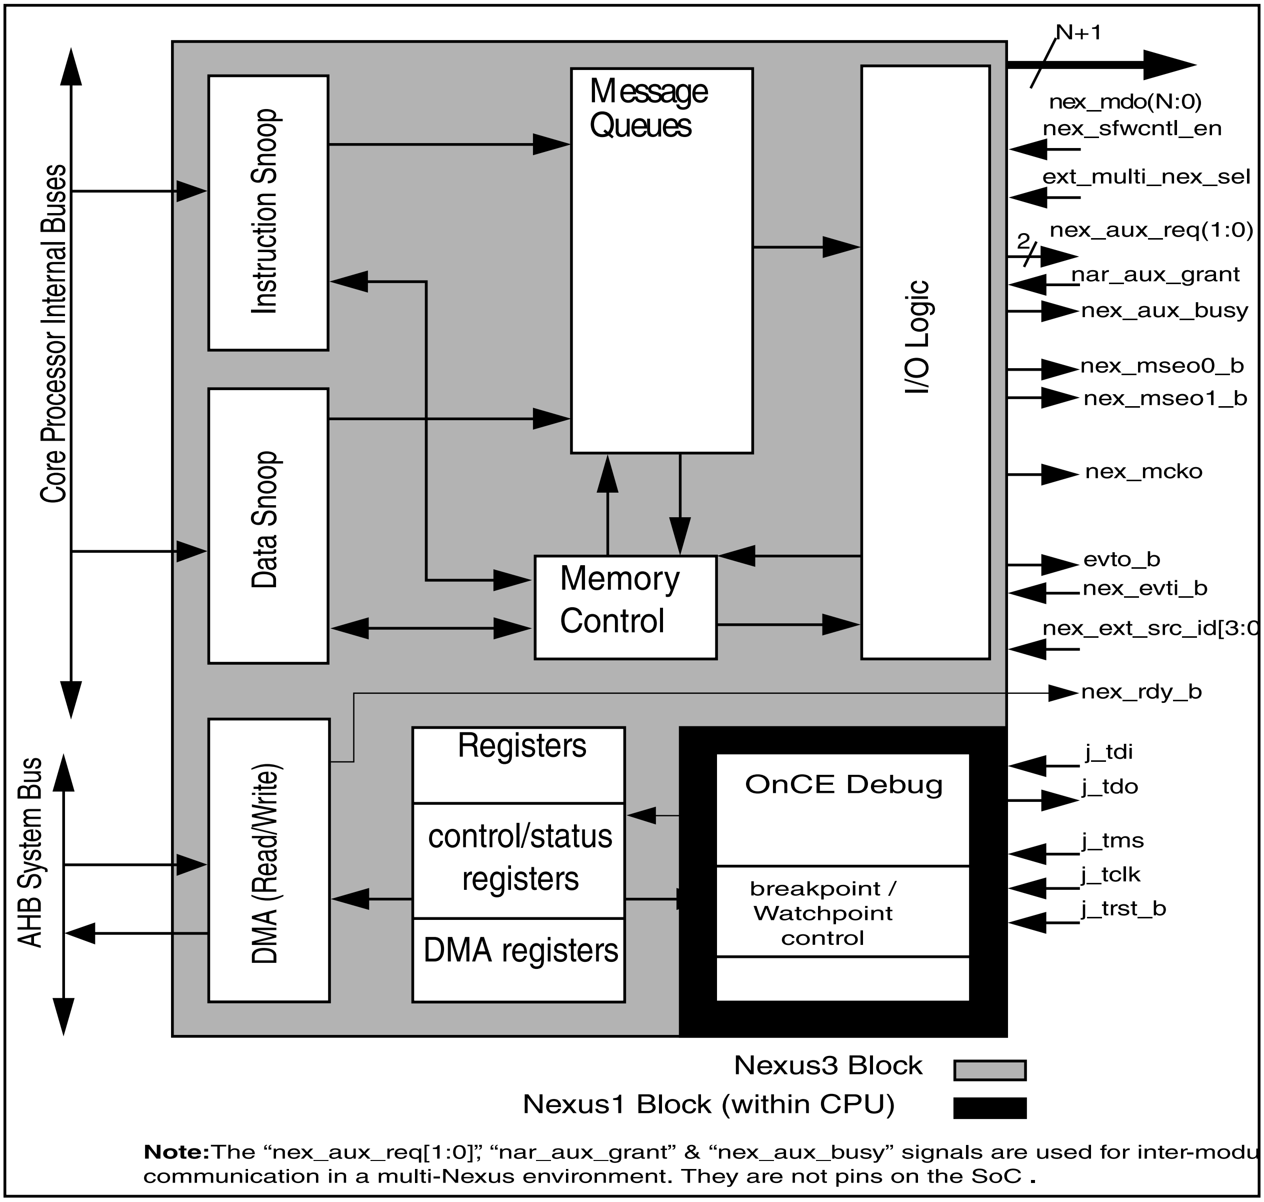
For multi-Nexus implementations, the configuration of the Message Data Out pins is controlled by the Port Control Register (at the SoC level). For single Nexus implementations (not normally implemented on an SoC), this configuration is controlled by Development Control Register 1 (DC1) within the Nexus 3 module.

In either implementation, Full Port Mode (FPM - maximum number of MDO pins) or Reduced Port Mode (RPM - minimum number of MDO pins) are supported. This setting should not be changed while the system is running.

Note

The configuration of the Message Start/End Out pins (1 or 2) is determined at the SOC integration level. This option will be hard-wired based on SOC bandwidth requirements.

62.1.4 Functional block diagram



Note: The “nex_aux_req[1:0]”, “nar_aux_grant” & “nex_aux_busy” signals are used for inter-modu communication in a multi-Nexus environment. They are not pins on the SoC .

Figure 62-1. Nexus 3 functional block diagram

62.2 Enabling Nexus 3 operation

The Nexus module is enabled by loading a single instruction (*NEXUS3-ACCESS*) into the JTAG Instruction Register (IR) (OnCE OCMD register). For the Nexus3 module, the OCMD value is 0b0001111100. The Nexus 3 module may alternately be enabled if the nex_evti_b input signal is asserted at the time that j_trst_b is initially negated, or is asserted during the Test-Logic-Reset TAP state. Once enabled, the module will be ready to accept control input via the JTAG/OnCE pins.

Enabling the Nexus 3 module automatically enables the generation of Debug Status Messages.

The Nexus 3 module is disabled when the JTAG state machine initially reaches the Test-Logic-Reset state from any other state. This state can be reached by the assertion of the **j_trst_b** pin or by cycling through the state machine using the **j_tms** pin. The Nexus module will also be disabled if a Power-on-Reset (POR) event occurs. If the Nexus 3 module is disabled, no trace output will be provided, and the module will disable (drive inactive) auxiliary port output pins (**nex_mdo[n:0]**, **nex_mseo[1:0]**, **nex_mcko**). Nexus registers will not be available for reads or writes.

In order to support software control of the Nexus 3 module when no external development tool is present, the Nexus 3 module is not forced to be disabled when the JTAG state remains in the Test-Logic-Reset state. Software is allowed to control the Nexus 3 module when the input signal **nex_sfwcntl_en** is asserted by the SoC. This signal is intended to provide a mechanism for allowing software to use the Nexus 3 module to fill on-chip trace buffers or other visibility mechanisms. It is up to the SoC to determine whether a top-level Nexus 3 controller has been enabled by a hardware debugger, or whether appropriate security mechanisms have granted the capability for software to use these resources, and to drive the appropriate value to the **nex_sfwcntl_en** input. Software can enable the module by a write to any of the module's DCRs when **nex_sfwcntl_en** is asserted.

Reset of the Nexus 3 module is accomplished by a transition on **j_trst_b**, on initial entry into the Test_Logic_Reset state from another state, or if a Power-on-Reset (POR) event occurs. The module is not reset by the CPU's **p_reset_b** signal, even when software has control of the module.

62.2.1 Interaction with Low Power Modes

The Nexus 3 module will continue to operate in the Waiting and Halted states, as long as **nex_clk** remains active. In the Stopped state, **nex_clk** is gated off internally to the Nexus 3 logic, therefore watchpoint or hardware triggering recognition, message generation, and Nexus 3 read-write access to memory is suspended. The Nexus 3 logic will wait to enter the Stopped state until the message FIFOs are empty and any in-progress Nexus R/W transfer has completed. If a block transfer has been requested, the remainder of the block transfer is not completed, and the RWCS AC bit is cleared, and the ERR bit is set. Once the Stopped state has been entered, no further messages are queued and no triggering conditions are monitored. Also, Nexus R/W accesses are no longer available. Upon exiting the Stopped state, normal functions will resume assuming **nex_clk** is active.

62.3 TCODEs supported

The Nexus 3 pins allow for flexible transfer operations via Public Messages. A TCODE defines the transfer format, the number and/or size of the packets to be transferred, and the purpose of each packet. The IEEE-ISTO 5001-2003 standard defines a set of public messages and allocates additional TCODEs for vendor-specific features outside the scope of the public messages. The Nexus 3 block supports the TCODEs shown in Table 62-2.

Table 62-2. Supported TCODEs

Message Name	Min Field Size (bits)	Max Field Size (bits)	Field Name	Field Type	Field Description
Debug Status	6	6	TCODE	fixed	TCODE number = 0
	4	4	SRC	fixed	source processor identifier
	8	8	STATUS	fixed	Development Status Register (DS[31:24])
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Ownership Trace Message	6	6	TCODE	fixed	TCODE number = 2
	4	4	SRC	fixed	source processor identifier
	1	32	PROCESS	variable	Task/Process ID tag
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Direct Branch Message	6	6	TCODE	fixed	TCODE number = 3
	4	4	SRC	fixed	source processor identifier
	1	8	ICNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Indirect Branch Message	6	6	TCODE	fixed	TCODE number = 4
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	1	8	ICNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow
	1	32	U-ADDR	variable	unique part of target address for taken branches/ exceptions
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Data Trace - Data Write Message	6	6	TCODE	fixed	TCODE number = 5
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	4	4	DSZ	fixed	data size (Refer to Table 62-7)
	1	32	U-ADDR	variable	unique portion of the data write address
	1	64	DATA	variable	data write value(s) (see Data Trace section for details)

Table continues on the next page...

Table 62-2. Supported TCODEs (continued)

Message Name	Min Field Size (bits)	Max Field Size (bits)	Field Name	Field Type	Field Description
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Data Trace - Data Read Message	6	6	TCODE	fixed	TCODE number = 6
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	4	4	DSZ	fixed	data size (Refer to Table 62-7)
	1	32	U-ADDR	variable	unique portion of the data read address
	1	64	DATA	variable	data read value(s) (see Data Trace section for details)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Data Acquisition Message	6	6	TCODE	fixed	TCODE number = 7
	4	4	SRC	fixed	source processor identifier
	8	8	DQTAG	fixed	identification tag taken from DEVENT$_{DQTAG}$ register field
	1	32	DQDATA	variable	exported data taken from DDAM register
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Error Message	6	6	TCODE	fixed	TCODE number = 8
	4	4	SRC	fixed	source processor identifier
	4	4	ETYPE	fixed	error type
	8	8	ECODE	fixed	error code
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Synchronization Message	6	6	TCODE	fixed	TCODE number = 9
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	1	8	I-CNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow. Cleared for most sync conditions.
	1	32	F-ADDR	variable	full target address (leading zero (0) truncated)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Direct Branch Message w/ Sync	6	6	TCODE	fixed	TCODE number = 11
	4	4	SRC	fixed	source processor identifier
	1	8	ICNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow
	1	32	F-ADDR	variable	full target address (leading zeros truncated)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Indirect Branch Message w/Sync	6	6	TCODE	fixed	TCODE number = 12
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)

Table continues on the next page...

Table 62-2. Supported TCODEs (continued)

Message Name	Min Field Size (bits)	Max Field Size (bits)	Field Name	Field Type	Field Description
	1	8	ICNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow
	1	32	F-ADDR	variable	full target address (leading zeros truncated)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Data Trace - Data Write Message w/ Sync	6	6	TCODE	fixed	TCODE number = 13
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	4	4	DSZ	fixed	data size (Refer to Table 62-7)
	1	32	F-ADDR	variable	full access address (leading zeros truncated)
	1	64	DATA	variable	data write value(s) (see Data Trace section for details)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Data Trace - Data Read Message w/ Sync	6	6	TCODE	fixed	TCODE number = 14
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	4	4	DSZ	fixed	data size (Refer to Table 62-7)
	1	32	F-ADDR	variable	full access address (leading zeros truncated)
	1	64	DATA	variable	data read value(s) (see Data Trace section for details)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Watchpoint Message	6	6	TCODE	fixed	TCODE number = 15
	4	4	SRC	fixed	source processor identifier
	1	32	WPHIT	variable	Field indicating watchpoint source(s) (leading zeros truncated)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Resource Full Message	6	6	TCODE	fixed	TCODE number = 27
	4	4	SRC	fixed	source processor identifier
	4	4	RCODE	fixed	resource code (Refer to Table 62-5) - indicates which resource is the cause of this message
	1	32	RDATA	variable	branch / predicate instruction history (See Section Resource Full Messages.)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Indirect Branch History Message	6	6	TCODE	fixed	TCODE number = 28 (see Note below)
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	1	8	I-CNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow
	1	32	U-ADDR	variable	unique part of target address for taken branches/ exceptions

Table continues on the next page...

Table 62-2. Supported TCODEs (continued)

Message Name	Min Field Size (bits)	Max Field Size (bits)	Field Name	Field Type	Field Description
	1	32	HIST	variable	branch / predicate instruction history (see Branch Trace Messaging types)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Indirect Branch History Message w/ Sync	6	6	TCODE	fixed	TCODE number = 29 (see Note below)
	4	4	SRC	fixed	source processor identifier
	1	1	MAP	fixed	(always set to 0)
	1	8	I-CNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow
	1	32	F-ADDR	variable	full target address (leading zero (0) truncated)
	1	32	HIST	variable	branch / predicate instruction history (See Branch Trace Messaging types.)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)
Program Trace - Program Correlation Message	6	6	TCODE	fixed	TCODE number = 33
	4	4	SRC	fixed	source processor identifier
	4	4	EVCODE	fixed	event correlated w/ program flow (Refer to Table 62-6)
	2	2	CDF	fixed	# fields of information in CDATA. 00 - reserved, 01 - one field (CDATA1) (reserved), 10 - two fields (CDATA1 + CDATA2), 11 - three fields (reserved)
	1	8	I-CNT	variable	# sequential instructions completed since last predicate instruction, transmitted instruction count, or taken change of flow
	1	32	CDATA1	variable	correlation data field 1 - [branch / predicate instruction history] (See Program Correlation Messages.)
	0	32	CDATA2	variable	correlation data field 2- PID info (See Program Correlation Messages.)
	0	30	TSTAMP	variable	Timestamp value (optionally generated field)

Note

Program Trace can be implemented using either Branch History/Predicate Instruction Messages, or traditional Direct/ Indirect Branch Messages. The user can select between the two types of Program Trace. The advantages for each are discussed in Branch Trace Messaging types. If the Branch History method is selected, the shaded TCODES above will not be messaged out.

Table 62-3 shows the error code encodings used when reporting an error via the Nexus 3 Error Message.

Table 62-3. Error Code (ECODE) Encoding (TCODE = 8)

Error Code	Description
xxxxxxx1	Watchpoint Trace Message(s) Lost
xxxxxx1x	Data Trace Message(s) Lost
xxxxx1xx	Program Trace Message(s) Lost
xxxx1xxx	Ownership Trace Message(s) Lost
xxx1xxxx	Status Message(s) Lost (Debug Status messages, etc.)
xx1xxxxx	Data Acquisition Message(s) Lost
x1xxxxxx	Reserved
1xxxxxxx	Reserved

Table 62-4 shows the error type encodings used when reporting an error via the Nexus 3 Error Message.

Table 62-4. Error Type (ETYPE) Encoding (TCODE = 8)

Error Type	Description
0000	Message Queue Overrun caused one or more messages to be lost
0001	Contention with higher priority messages caused one or more messages to be lost
0010	Reserved
0011	Reserved
0100	Reserved
0101	Invalid access opcode (Nexus Register unimplemented)
0110 - 1111	Reserved

Table 62-5 shows the encodings used for resource codes for certain messages.

Table 62-5. Resource Code (RCODE) values (TCODE = 27)

Resource Code	Description
0000	Program Trace Instruction counter reached 255 and was reset.
0001	Program Trace, Branch / Predicate Instruction History full. This type of packet is terminated by a stop bit set to 1 after the last history bit.

Table 62-6 shows the event code encodings used for certain messages.

Table 62-6. Event Code (EVCODE) Encoding (TCODE = 33)

Event Code	Description
0000	Entry into Debug Mode
0001	Entry into Low Power Mode (CPU only)
0010-0011	Reserved for future functionality
0100	Disabling Program Trace

Table continues on the next page...

Table 62-6. Event Code (EVCODE) Encoding (TCODE = 33) (continued)

Event Code	Description
0101	Process ID value is established in PID0/NPIDR via **mtspr PID0/NPIDR**
0110-1000	Reserved for future functionality
1001	Begin masking of program trace messages due to MSR_{PMM}=0 and $DC4_{PTMARK}$=1
1010	Branch and link occurrence (direct branch function call)
1011-1111	Reserved for future functionality

Table 62-7 shows the data trace size encodings used for certain messages.

Table 62-7. Data Trace Size (DSZ) Encodings (TCODE = 5,6,13,14)

DTM Size Encoding	Transfer Size
0000	0 - no data
0001	Byte
0010	Halfword (2 bytes)
0011	Three bytes
0100	Word (4 bytes)
0101	Five bytes
0110	Six bytes
0111	Seven bytes
1000	Doubleword (8 bytes)
1001-1111	Reserved

62.4 Nexus 3 Programmer's model

This section describes the Nexus 3 programmer's model. Nexus 3 registers are accessed using the JTAG/OnCE port in compliance with IEEE 1149.1, or by software via DCRs. See Nexus 3 Register Access via JTAG/OnCE and Nexus 3 Register Access via Software for details on Nexus 3 register access.

Note

Nexus 3 registers and output signals are numbered using bit 0 as the least significant bit. This bit ordering is consistent with the ordering defined by the IEEE-ISTO 5001 standard.

The following table details the register map for the Nexus 3 module.

Table 62-8. Nexus 3 register map

Nexus Register	Nexus Access Opcode	Read/ Write	Read Address	Write Address	DCR #[1]

1. Software access via the **mfdcr** and **mtdcr** instructions use these values for the DCR number. Software writes to these registers via **mtdcr** when **nex_sfwcntl_en** is negated are ignored.
2. The CSC and PCR registers are shown in this table as part of the Nexus programmer's model. They are only present at the top level SoC Nexus controller in a multi-Nexus implementation, not in the Nexus 3 module. The SoC's CSC Register is readable through Nexus, but the PCR is shown for reference only here.

3. The "PCR_INDEX" is a parameter determined by the SoC.

62.4.1 Client Select Control (CSC) register

The CSC Register determines which Nexus client is under development. This register is present at the top-level SOC Nexus 3 controller to select one of multiple on-chip Nexus 3 units.

7	6	5	4	3	2	1	0

25:0	—	Reserved for future functionality

Note

The CSC and PCR Registers exist in a separate module at the SoC level in a multi-Nexus environment. If the core Nexus 3 module is the only Nexus module, these registers are not implemented and the Nexus 3 defined Development Control Register 1 (DC1) is used to control the SoC-level Nexus port functionality.

62.4.3 Nexus Development Control Register 1 (DC1)

Nexus Development Control Register 1 is used to control the basic development features of the Nexus 3 module. Development Control Register 1 is shown in Figure 62-4 and its fields are described in Table 62-11.

Direct writes to this field to enable one or more trace types take precedence over hardware updates. Refer to Watchpoint Trigger (WT, PTSTC, PTETC, DTSTC, DTETC) registers for more information on watchpoint triggering.

Note

> The Output Port Mode Control bit (OPC) and MCKO Clock Divide Ratio bits (MCK_DIV) MUST ONLY be modified during system reset or debug mode to insure correct output port and output clock functionality. It is also recommended that all other bits of the DC1 also only be modified in one of these two modes.

62.4.4 Nexus Development Control Registers 2 & 3 (DC2, DC3)

Nexus Development Control Registers 2 and 3 are used to control output signaling on the Nexus 3 module. A table of watchpoints can be found in the Core (e200z4251n3) Core Debug Support chapter.

Development Control Register 2 is shown in Figure 62-5 and its fields are described in Table 62-12.

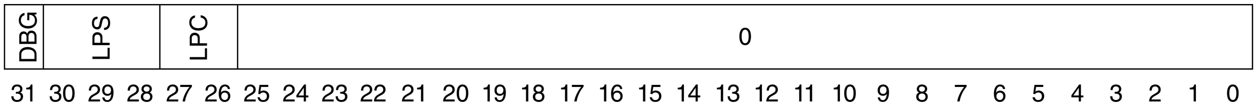
62.4.6 Development Status Register (DS)

The Development Status Register is used to report system debug status. When Debug Mode is entered or exited, or an SoC- or core-defined Low Power Mode is entered (see note below), a Debug Status Message is transmitted with DS[31:24]. The external tool can read this register at any time.



Nexus Reg# - 0x4; DCR - 409; Read-only; Reset - 0x0

62.4.7 Watchpoint Trigger (WT, PTSTC, PTETC, DTSTC, DTETC) registers

The Watchpoint Trigger Registers allows the watchpoints defined within the Nexus1 logic to trigger actions. These watchpoints can control Program and/or Data Trace enable and disable. The control bits can be used to produce a related "window" for triggering Trace Messages. Watchpoint trigger register WT is used to control triggering by a single selected watchpoint. The Program Trace Start Trigger Control (PTSTC), Program Trace End Trigger Control (PTETC), Data Trace Start Trigger Control (DTSTC), and Data Trace End Trigger Control (DTETC) are used for extended trigger controls for the respective function. If multiple watchpoints are desired for triggering, or a watchpoint beyond watchpoint #13 is required, then one or more of the extended watchpoint trigger registers may be used. A field encoding of 4'b1111 in one of the WT register fields enables the corresponding extended trigger register. For all other WT field encodings, the corresponding extended trigger register is disabled and the contents are ignored. Note that direct writes to enable program trace and/or data trace in DC1 will override these controls, and trace will remain enabled until another direct write to DC1 to disable program and/or data trace occurs.

When a start trigger is detected, the designated trace features become enabled, and the corresponding enable bits of the DC1 register are set. Whenever a stop trigger is detected, the designated trace features become disabled, and the corresponding enable bits of the DC1 register are cleared. If the same trigger condition is used for both start and stop triggering, then the designated trace features will toggle between being enabled and disabled at each occurrence of the trigger condition. Similarly, if start and stop triggers for a trace feature occur simultaneously, then the designated trace feature will toggle between enabled and disabled depending on the enable state at the time of the trigger events. For example, if tracing is enabled, and a start and stop trigger occur simultaneously, then tracing will be disabled. Direct writes of the DC1 register take precedence over any trace feature enable state that is derived from watchpoint triggering. A table of watchpoints can be found in the Core (e200z4251n3) Core Debug Support chapter.

Figure 62-16. Nexus Overrun Control Register Fields

62.4.10 Data Trace Control Register (DTC) register

The Data Trace Control Register controls whether DTM Messages are restricted to reads, writes, or both for a user programmable address range. In addition, control is provided to restrict data trace message generation to only those load or store accesses that are not stack-related, in order to minimize required data trace message bandwidth.

There are four Data Trace channels controlled by the DTC for the Nexus 3 module. Channels can be programmed to trace data accesses or instruction accesses, but not independently.

RWT1		RWT2		RWT3		RWT4		0								STDC1	STDC2	STDC3	STDC4	0				RC1	RC2	RC3	RC4	DI	0

Nexus Reg# - 0x15; DCR - 408; Read/Write; Reset - 0x0

Figure 62-25. Data Trace End Address 4 (DTEA4) register

Table 62-23 illustrates the range that will be selected for Data Trace for various cases of DTSA being less than, greater than, or equal to DTEA.

Table 62-23. Data trace - address range options

Programmed values	Range Control Bit Value	Range Selected
DTSA < DTEA	0	DTSA -> <- DTEA
DTSA < DTEA	1	<- DTSA DTEA ->
DTSA > DTEA	N/A	Invalid Range - no trace
DTSA = DTEA	N/A	Invalid Range - no trace

Note

> DTSA must be less than DTEA in order to guarantee correct Data Write/Read Traces. Data Trace ranges are *inclusive* of the DTSA and DTEA addresses for Range Control settings indicating "within range," and are *exclusive* of the DTSA and DTEA addresses for Range Control settings indicating "outside of range."

Accesses that meet the range and access type qualifiers will cause assertion of a watchpoint output for Ranges 1, 2, and 3. There are three dedicated watchpoint outputs, one for each DTSA/DTEA sets 1, 2, and 3. Range 4 does not provide a watchpoint output. Note that when DTC_{DI}=1, all instruction fetches and prefetches (including discarded prefetches) are monitored, and thus these range watchpoints differ from the IACx watchpoint outputs, which are not asserted for instructions that are not executed (i.e. when the instruction prefetch is discarded).

62.4.13 Read/Write Access Control/Status (RWCS) register

The Read Write Access Control/Status Register provides control for Read/Write Access. Read/Write access provides DMA-like access to memory-mapped resources on the AHB System bus either while the processor is halted, or during runtime. Control is provided over access type, size, count, and certain bus attributes.

Note that the internal CPU interfaces to the caches and local memory are not accessible or utilized by this mechanism. Since the external interface is used, base address port settings are used to access local memory, and not the settings of local memory control register base address values.

The RWCS Register also provides Read/Write Access Status information per Table 62-25.

AC	RW	SZ	MAP	PR	ATTR	0	CNT	ERR	DV
31	30	29 28 27	26 25 24	23 22	21 20 19 18	17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2	1	0

Nexus Reg# - 0x7; Read/Write[1] ; Reset - 0x0

Figure 62-26. Read/Write Access Control/Status (RWCS) register

NOTES:

[1] ERR and DV are read-only

Table 62-24. RWCS field description

RWCS[1]	ERR	Read/Write Access Error (see Table 62-25)
RWCS[0]	DV[2]	Read/Write Access Data Valid (see Table 62-25)

[1] The priority functionality is not currently implemented.

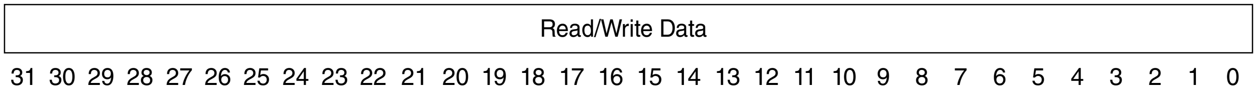
[2] ERR and DV are read-only.

Table 62-25. Read/Write Access Status Bit Encoding

Read Action	Write Action	ERR	DV
Read Access has not completed	Write Access completed without error	0	0
Read Access error has occurred	Write Access error has occurred	1	0
Read Access completed without error	Write Access has not completed	0	1
Not Allowed	Not allowed	1	1

62.4.14 Read/Write Access Data (RWD) register

The Read/Write Access Data (RWD) register provides the data to/from system bus memory-mapped locations when initiating a read or a write access.



Nexus Reg# - 0xA; Read/Write; Reset - 0x0

Figure 62-27. Read/Write Access Data (RWD) register

Read/Write accesses to the AHB require that the debug firmware properly retrieve/place the data in the RWD. Table 62-26 shows the proper placement of data into the RWD. Note that doubleword transfers require two passes through RWD.

Table 62-26. RWD data placement for ransfers

Transfer Size and byte offset	RWA(2:0)	RWCS[SZ]	RWD			
			31:24	23:16	15:8	7:0
Byte	x x x	0 0 0	-	-	-	X
Half	x x 0	0 0 1	-	-	X	X
Word	x 0 0	0 1 0	X	X	X	X
Doubleword first RWD pass (low order data) second RWD pass (high order data)	0 0 0	0 1 1	 X X	 X X	 X X	 X X

Table Notes:

"X" indicates byte lanes with valid data

"-" indicates byte lanes that will contain unused data.

Table 62-27 shows the mapping of RWD bytes to byte lanes of the AHB read and write data buses.

Table 62-27. RWD byte lane mapping

Transfer Size and byte offset	RWA(2:0)	RWD			
		31:24	23:16	15:8	7:0

second RWD pass		AHB[63:56]	AHB[55:48]	AHB[47:40]	AHB[39:32]

Table Notes:

"-" indicates byte lanes that will contain unused data.

62.4.15 Read/Write Access Address (RWA)

The Read/Write Access Address Register provides the system bus address to be accessed when initiating a read or a write access.

Read/Write Address

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Nexus Reg# - 0x9; Read/Write; Reset - 0x0

Figure 62-28. Read/Write Access Address (RWA) register

62.5 Nexus 3 Register Access via JTAG/OnCE

Access to Nexus 3 register resources is enabled by loading a single instruction ("*NEXUS3-ACCESS*") into the JTAG Instruction Register (IR) (OnCE OCMD register). For the Nexus 3 block, the OCMD value is 0b0001111100.

Once the NEXUS3-ACCESS instruction has been loaded, the JTAG/OnCE port allows tool/target communications with all Nexus 3 registers according to the register map in Table 62-8.

Reading/writing of a Nexus 3 register then requires two (2) passes through the Data-Scan (DR) path of the JTAG state machine. (See IEEE 1149.1 (JTAG) RD/WR sequences.)

1. The first pass through the DR selects the Nexus 3 register to be accessed by providing an index (see Table 62-8), and the direction (read/write). This is achieved by loading an 8-bit value into the JTAG Data Register (DR). This register has the following format:

(7bits)	(1 bit)
Nexus Register Index	R/W

RESET Value: 0x0

Nexus Register Index	Selected from values in Table 62-8
Read/Write (R/W):	0 - Read 1 - Write

2. The second pass through the DR then shifts the data in or out of the JTAG port, LSB first.

   a. During a read access, data is latched from the selected Nexus register when the JTAG state machine passes through the "Capture-DR" state.

   b. During a write access, data is latched into the selected Nexus register when the JTAG state machine passes through the "Update-DR" state.

62.6 Nexus 3 Register Access via Software

Access to most Nexus 3 register resources by software is supported by mapping the Nexus 3 registers to privileged DCRs (device control registers) that are accessible via the **mfdcr** and **mtdcr** instructions. It is intended that these access only occur when no possible conflicts with hardware-based accesses are possible. A conflict between hardware and software accesses will produce undefined results. Table 62-8 shows the mappings of Nexus 3 registers to DCR numbers. Software writes to Nexus 3 register resources are blocked when the **nex_sfwcntl_en** input signal is negated, without signaling an exception. Note that the Nexus 3 Read/Write Access functionality is not available to software, since software can use load and store instructions to access memory.

62.7 Nexus message fields

Nexus messages are composed of fields. Each field contains a distinct piece of information within a message, and each message contains multiple fields. Messages are transferred in packets over the Auxiliary Output protocol. A packet is a collection of fields. A packet may contain any number of fixed length fields, but may contain at most one variable length field. The variable length field must be the last field in a packet. The following sub-sections describe a subset of the message field types.

62.7.1 TCODE Field

The TCODE field is a 6-bit fixed length field that identifies the type of message and its format. The field encodings are assigned by IEEE-ISTO 5001.

62.7.2 Source ID Field (SRC)

Each Nexus module in a device is identified by a unique Client Source Identification Number. The number assigned to each Nexus module is determined by the SoC integrator, and is provided on the **nex3_ext_src_id[0:3]** input signals. Multi-threaded processors may assign additional source ID information to indicate which thread a message is associated with. The Nexus 3 module implements a 4-bit fixed length Source ID field consisting of a Client Source ID.

62.7.3 Relative Address Field (U-ADDR)

The non-sync forms of the Program and Data Trace messages include addresses that are relative to the address that was transmitted in the previous Program or Data Trace message, respectively. The relative address format is compliant with IEEE-ISTO 5001 and is designed to reduce the number of bits transmitted for address fields.

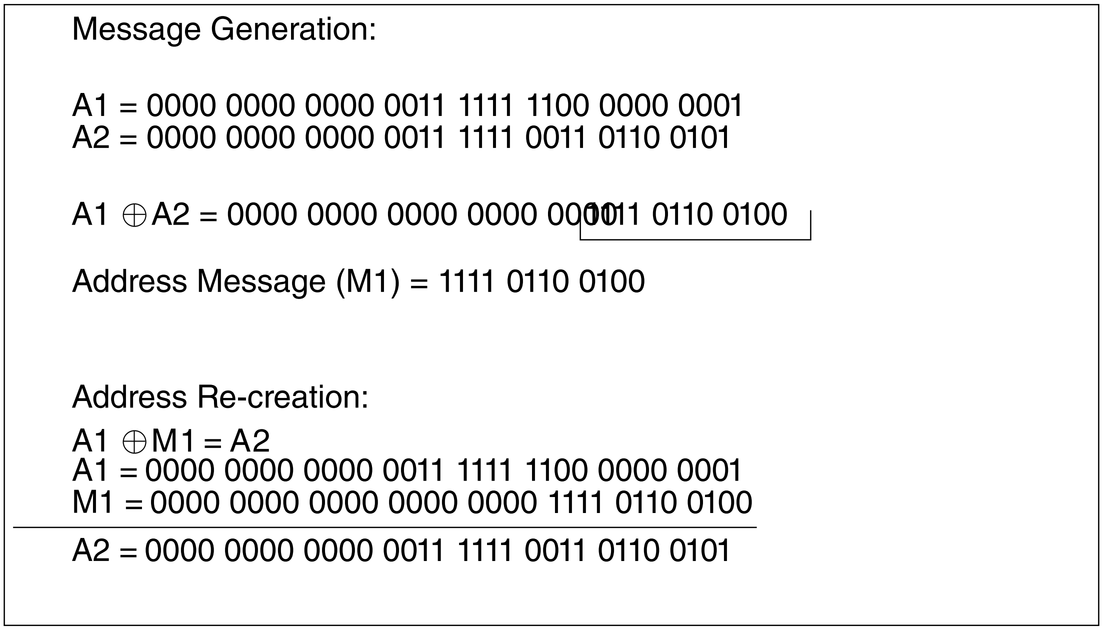
The relative address is generated by XORing the new address with the previous, and then using only the results up to the most significant '1'. To recreate the original address, the relative address is XORed with the previously decoded address.

The relative address of a Program Trace message is calculated with respect to the previous Program Trace message, regardless of any address information that may have been sent in any other trace messages in the interim between the two Program Trace messages.

The relative address of a Data Trace message is calculated with respect to the previous Data Trace message, regardless of any address information that may have been sent in any other trace messages in the interim between the two Data Trace messages.

Program trace messages also provide the execution mode status in the least significant bit of the **reconstructed** address field. A value of '0' indicates that preceding instruction count and history information should be interpreted in a non-VLE context. A value of '1' indicates that the preceding instruction count and history information should be interpreted in a VLE context.

Previous Address (A1) =0x0003FC01, New Address (A2) = 0x0003F365



Message Generation:

A1 = 0000 0000 0000 0011 1111 1100 0000 0001
A2 = 0000 0000 0000 0011 1111 0011 0110 0101

A1 ⊕ A2 = 0000 0000 0000 0000 0000 1111 0110 0100

Address Message (M1) = 1111 0110 0100

Address Re-creation:

A1 ⊕ M1 = A2
A1 = 0000 0000 0000 0011 1111 1100 0000 0001
M1 = 0000 0000 0000 0000 0000 1111 0110 0100

A2 = 0000 0000 0000 0011 1111 0011 0110 0101

Figure 62-29. Relative address generation and recreation

62.7.4 Full Address Field (F-ADDR)

Program Trace synchronization messages provide the full address associated with the trace event (leading zeroes may be truncated) with the intent of providing a reference point for development tools to operate from when reconstructing relative addresses. Synchronization messages are generated at significant mode switches and are also generated periodically to ensure that development tools are guaranteed to have a reference address given a sufficiently large sample of trace messages. Program trace messages also provide the execution mode status in the least significant bit of the **reconstructed** address field. A value of '0' indicates that preceding instruction count and history information should be interpreted in a non-VLE context. A value of '1' indicates that the preceding instruction count and history information should be interpreted in a VLE context.

62.7.5 Timestamp field (TSTAMP)

Timestamps may be optionally applied to messages. Enabling of timestamping is controlled by the nex_tsen input signal. The timestamping mode (timestamp frequency of occurrence) is controlled by the value of nex_tsmode[0:1] and the timestamp value is based on the nex_timebase[0:29] inputs. These signals are first synchronized to the nex_clk clock domain, and for nex_timebase[0:29], a gray-code to binary value conversion is performed. The timestamp value is applied to messages as they exit the message queues. Leading zeros in the timestamp value are removed. The table shows the nex_tsmode[0:1] encodings used for the timestamp mode.

Table 62-28. nex_tsmode[0:1] timestamp mode encoding

nex_tsmode[0:1]	Timestamp Mode
00	Timestamp applied to every message
01	Timestamp applied to every 4th message
10	Timestamp applied to every 16th message
11	Timestamp applied to every 64th message

62.8 Nexus Message Queues

The Nexus 3 module implements internal message queues capable of storing up to three messages per cycle into a small initial queue, which then fills a larger queue at up to two messages per cycle. Messages that enter the queues are transmitted in the order in which they are received.

If more than three messages attempt to enter the queue in the same cycle, the highest priority messages are stored and the remaining message(s) will be dropped due to a collision. Collision events are expected to be rare.

The Overrun Control register (OVCR) controls the Nexus behavior as the message queue fills. The Nexus block may be programmed to:

- Allow the queue to overflow, drain the contents, queue an overrun error message and resume tracing.
- Stall the processor when the queue utilization reaches the selected threshold.
- Suppress selected message types when the queue utilization reaches the selected threshold.

62.8.1 Message Queue Overrun

In this mode, the message queue will stop accepting messages when an overrun condition is detected. The contents of the queues will be allowed to drain until empty. Incoming messages are discarded until the queue is emptied. Once empty, an overrun error message is enqueued that contains information about the types of messages that were discarded due to the overrun condition.

62.8.2 CPU Stall

In this mode, processor instruction issue is stalled when the queue utilization reaches the selected threshold. The processor is stalled long enough to drop one threshold level below the level that triggered the stall. For example, if stalling the processor is triggered at 1/4 full, the stall will stay in effect until the queue utilization drops to empty. There may be significant skid from the time that the stall request is made until the processor is able to stop completing instructions. This skid should be taken into consideration when programming the threshold. Refer to Nexus Overrun Control Register (OVCR) for complete programming options.

62.8.3 Message Suppression

In this mode, the message queue will disable selected message types when the queue utilization reaches the selected threshold. This allows lower bandwidth tracing to continue and possibly avoid an overrun condition. If an overrun condition occurs despite this message suppression, the queue will respond according to the behavior described in

Message Queue Overrun. Suppressed message types are reported in the error message if they occur after overrun in addition to other discarded message types. Once triggered, message suppression will remain in effect until queue utilization drops to the threshold below the level selected to trigger suppression.

62.8.4 Nexus Message Priority

Nexus messages may be lost due to contention with other message types under the following circumstances:

- More than three messages are generated in the same cycle

Table 62-29 lists the various message types and their relative priority from highest to lowest.

Up to three message requests can be queued into the message buffer in a given cycle. If more than three message requests exist in a given cycle, the three highest priority message classes are queued into the message buffer. The remaining messages that did not successfully queue into the message buffer in that cycle will generate subsequent responses, as detailed in Table 62-29.

The CPU is capable of completing two instructions per cycle. If multiple trace messages need to be queued at the same time, they will be queued with the following priority: Instruction 0 (oldest instruction) (WPM ->DQM -> $\mathrm{PCM}_{\mathrm{PIDMSG}}$ -> OTM -> BTM -> DTM)-> Instruction1 (newer instruction) (WPM -> DQM -> OTM -> BTM -> DTM). As many as three messages may be simultaneously queued. Note that for the cycle following a dropped PTM, non-periodic OTM, or DQM message, only two other messages may be queued in addition to the dropped Error Message.

Watchpoint Messages from instructions that complete at the same time or events that occur during the same cycle will be combined.

Table 62-29. Message Type Priority and Message Dropped Responses

Message Type	Message	Priority	Message Dropped Response
Error	Error	0 (highest)	N/A
WP (Watchpoint Trace)	WPM (Watchpoint Message)	1	N/A[1]
DQ (Data Acquisition)	DQM (Data Acquisition Message)	2	DQM Error Message
Program Trace (PID MSG)	PCM - PID/NPIDR update (Program Correlation Message)	2	OTM Error Message

Table continues on the next page...

Table 62-29. Message Type Priority and Message Dropped Responses (continued)

Message Type	Message	Priority	Message Dropped Response
OT (Ownership)	OTM - PID/NPIDR update (Ownership Trace Message)	2	OTM Error Message[2]
Program Trace	BTM (Branch Trace Message)	2	BTM Error Message, Sync upgrade next BTM
	Sync (Program Sync Message)	3	Sync upgrade next BTM
	RFM (Resource Full for Instruction counter or history buffer)	4	BTM Error Message Sync upgrade next BTM
	DS (Debug Status Message)	5	Sync upgrade next BTM
	PCM (Program Correlation Message)	6	BTM Error Message Sync upgrade next BTM
DT (Data Trace)	DTM (Data Trace Message)	7	Sync upgrade next DTM
OT (Ownership)	OTM - Periodic update (Ownership Trace Message)	8 (lowest)	none

1. Error and Watchpoint messages are not dropped due to collisions, due to their priority.
2. Message will always be dropped if program trace is enabled, and program correlation messages for PID messages are not masked (Event Code = 0101). No error message is sent for this case since the PID value is contained in the higher priority message.

62.8.5 Data Acquisition Message Priority Loss Response

If a Data Acquisition Message (DQM) loses arbitration due to contention with higher priority messages, an error message will be generated to indicate that a DQM has been lost due to contention.

62.8.6 Ownership Trace Message Priority Loss Response

If an Ownership Trace message (OTM) due to software updates to the Process ID state loses arbitration due to contention with higher priority messages other than a program correlation message with EVCODE = 0101 (PID update), an error message will be generated to indicate that a OTM has been lost due to contention. If the pending OTM is a periodic update, the event is dropped without generating an error message.

62.8.7 Program Trace Message Priority Loss Response

If a Program Trace message (PTM) loses arbitration due to contention with higher priority messages, and the discarded PTM is a Program Correlation message, a Resource Full message for instruction count or history buffer, or a Branch Trace message, then an Error message is generated to indicate that branch trace information has been lost, and the next Branch Trace message will be upgraded to a sync-type message.

If the discarded PTM is a Program Correlation message with PID information (EVCODE=0101), the Error message will indicate a dropped OTM and a dropped Program Trace (Error code = xxxx11xx).

62.8.8 Program Trace Sync Message Priority Loss Response

If a Program Trace Sync message (SYNC) loses arbitration due to contention with higher priority messages, the Sync event is discarded, and the next Branch Trace message will be upgraded to a sync-type message.

62.8.9 Data Trace Message Priority Loss Response

If a Data Trace message (DTM) loses arbitration due to contention with higher priority messages, the DTM event is discarded, and the next DTM will be upgraded to a sync-type message.

62.9 Debug Status messages

Debug Status Messages report low power mode and debug status. Debug Status messages are enabled when Nexus 3 is enabled. Entering/exiting Debug Mode as well as entering, exiting, or changing Low Power Mode(s) will trigger a Debug Status message, indicating the value of the most significant byte in the Development Status register. Debug status information is sent out in the following format:

(8 bits)	(4 bits)	(6 bits)
DS[31:24]	Src. Proc.	TCODE (000000)

Fixed length = 18 bits

Figure 62-30. Debug Status message format

62.10 Error messages

Error messages are enabled whenever the debug logic is enabled. There are two conditions that will produce an error message, each receiving a separate error type designation:

- A message is discarded due to contention with other (higher priority) message types. These errors will have an Error Type value of 1.
- The message queue overruns. After the queue is drained, an error message is enqueued with an error code that indicates what types of messages were discarded during the interim. These errors will have an Error Type value of 0.

Note

> The OVCR Register can be used in order to alleviate potential overrun situations.

Error information is messaged out in the following format (also see Table 62-3 and Table 62-4):

(6 bits)	(4 bits)	(4 bits)	(6 bits)
Error Code	Error Type	Src. Proc.	TCODE (001000)

Fixed length = 20 bits

Figure 62-31. Error message format

62.11 Ownership trace

This section details the ownership trace features of the Nexus 3 module.

62.11.1 Overview

Ownership trace provides a macroscopic view, such as task flow reconstruction, when debugging software written in a high level (or object-oriented) language. It offers the highest level of abstraction for tracking operating system software execution. This is especially useful when the developer is not interested in debugging at lower levels.

62.11.2 Ownership Trace Messaging (OTM)

Ownership trace information is messaged via the auxiliary port using an Ownership Trace Message (OTM). Core (e200z4251n3) processors contain a *Power ISA 2.06* defined "Process ID" register within the CPU. It is updated by the operating system software to provide task/process ID information. The contents of this register are replicated on the pins of the processor and connected to Nexus. The Process ID (PID) register value can be accessed using the **mfspr/mtspr** instructions.

Note

> The CPU includes a Process ID register (PID0), thus the Nexus UBA functionality is not implemented.

In addition, to decouple trace information from the PID0 register and to provide a full independent 32-bit process ID for debug use, the Nexus PID Register (NPIDR) may be used instead of PID0 to provide OTM process ID information. It is updated by the operating system software to provide task/process ID information. The Nexus Process ID (NPIDR) register value can be accessed using the **mfspr/mtspr** instructions. This register is accessible in user or supervisor mode.

Nexus 3 Process ID																															
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SPR - 517; Read/Write; Reset: - 0

Figure 62-32. Nexus 3 Process ID Register (NPIDR)

Note

> OS updates to NPIDR should be performed in addition to normal PID0 updates when a process switch occurs, in order to properly generate OTM messages with new process ID information when NPIDR is selected for OTM use.

The process ID source (PID0 or NPIDR) is selected by the setting of the $DC1_{OTS}$ control bit.

There are two conditions that will cause an Ownership Trace Message when Ownership Trace is enabled:

- When the PID0 register is written to by the processor and $DC1_{OTS}$ indicates PID0 should be used, or when the NPIDR register is written to by the processor and $DC1_{OTS}$ indicates NPIDR should be used, the data is latched within Nexus, and is messaged out via the auxiliary port, allowing development tools to trace ownership flow. However, if Program Trace is enabled, and program correlation messages for

PID updates are not masked (Event Code = 0101), then an OTM will not be generated for an update to the selected process ID register, since the program correlation message will provide this process ID update information.

- Periodically, at least once every 256 messages, the most recent state of the selected process ID register is messaged out. The resulting Ownership Trace message will indicate in the PID Index sub-field that PID0/NPIDR status is being reported and the most recent value of the PID0/NPIDR register will be conveyed in the Process ID value sub-field. These periodic Ownership Trace message events can be disabled by setting DC1$_{\text{POTD}}$.

Ownership trace information is messaged out in the following format:

(1-32 bits)	(4 bits)	(4 bits)	(6 bits)
Process ID	PID Index (0000)	Src. Proc.	TCODE (000010)

Variable length = 15-46 bits

Figure 62-33. Ownership Trace Message format

62.12 Program trace

This section details the program trace mechanism supported by Nexus3 for the e200z4251n3 processor. Program trace is implemented via Branch Trace Messaging (BTM) as per the **IEEE-ISTO 5001** standard definition. Branch Trace Messaging for Core (e200z4251n3) processors is accomplished by snooping the internal address bus (between the CPU and Cache), attribute signals, and CPU Status (**p_mode[0:3]**, **p_pstat_pipe{0,1}[0:5]**).

62.12.1 Branch Trace Messaging types

Traditional Branch Trace Messaging facilitates program trace by providing the following types of information:

- Messaging for taken direct branches includes how many sequential instructions were executed since the last taken branch or exception, including the taken direct branch. Branch instructions are included in the count of sequential instructions.
- Messaging for taken indirect branches and exceptions includes how many sequential instructions were executed since the last taken branch or exception and the unique portion of the branch target address or exception vector address. Branch instructions are included in the count of sequential instructions. For taken indirect branches that trigger generation of a message, the branch is also included in the count.

Branch History Messaging facilitates program trace by providing the following information.

- Messaging for taken indirect branches and exceptions includes a) how many sequential instructions (I-CNT) were executed since the last predicate instruction, taken/not taken direct branch, taken/not-taken indirect branch, or exception, b) the unique portion of the branch target address or exception vector address, and c) a branch/predicate instruction history field. Each bit in the history field represents a direct branch or predicated instruction where a value of one (1) indicates taken, and a value of zero (0) indicates not taken. Certain instructions (**zvselh**) generate a pair of predicate bits that are both reported as consecutive bits in the history field. Not-taken indirect branches will generate a history bit with a value of zero (0). Instructions that generate history bits are not included in instruction counts. For taken indirect branches that trigger generation of this message type, the branch is included in the count, but not in the history field.

62.12.1.1 Indirect Branch Message instructions

Table 62-30 shows the types of instructions and events that cause Indirect Branch Messages or Branch History Messages to be encoded.

Table 62-30. Indirect Branch Message sources

Source of Indirect Branch Message	Instructions / Detail
Taken branch relative to a register value	**bcctr, bcctrl, bclr, bclrl, se_bctr, se_bctrl, se_blr, se_blrl**
System Call / Trap exceptions taken	**se_sc, tw**
Return from interrupts / exceptions	**se_rfi, se_rfci, se_rfdi**
Exit from reset with Program Trace Enabled	**Indirect branch with Sync, target address is initial instruction, count = 1**

62.12.1.2 Direct Branch Message Instructions

Table 62-31 shows the types of instructions that will cause Direct Branch Messages or will toggle a bit in the instruction history buffer to be messaged out in a Resource Full Message or Branch History Message.

Table 62-31. Direct Branch Message sources

Source of Direct Branch Message	Instructions
Taken direct branch instructions Instruction Synchronize	**b, ba, bl, bla, bc, bca, bcl, bcla, se_b. se_bc, se_bl, e_b, e_bc, e_bl, e_bcl, se_isync**

62.12.1.3 BTM using Branch History Messages

Traditional BTM Messaging can accurately track the number of sequential instructions between branches, but cannot accurately indicate which instructions were conditionally executed, and which were not.

Branch History Messaging solves this problem by providing a predicated instruction history field in each Indirect Branch Message. Each bit in the history represents a predicated instruction or direct branch, or a not-taken indirect branch. A value of one (1) indicates the conditional instruction was executed or the direct branch was taken. A value of zero (0) indicates the conditional instruction was not executed or the branch was not taken. Certain instructions (**zvselh**) generate a pair of predicate bits that are both reported as consecutive bits in the history field.

Branch History Messages solve predicated instruction tracking and save bandwidth since only indirect branches cause messages to be queued.

62.12.1.4 BTM using Traditional Program Trace Messages

Based on the PTM bit in the DC1 Register, Program Tracing can utilize either Branch History Messages (PTM = 1) or traditional Direct/Indirect Branch Messages (PTM = 0).

Branch History will save bandwidth and keep consistency between methods of Program Trace, yet may lose temporal order between BTM messages and other types of messages. Since direct branches are not messaged, but are instead included in the history field of the Indirect Branch History Message, other types of messages may enter the FIFO between Branch History Messages. The development tool cannot determine the ordering of "events" that occurred with respect to direct branches simply by the order in which messages are sent out.

Traditional BTM messages maintain their temporal ordering because each event that can cause a message to be queued will enter the FIFO in the order it occurred and will be messaged out maintaining that order.

62.12.2 BTM Message For mats

The Nexus 3 block supports three types of traditional BTM Messages - Direct, Indirect, and Synchronization Messages. It supports two types of branch history BTM Messages - Indirect Branch History, and Indirect Branch History with Synchronization Messages.

62.12.2.1 Indirect branch messages (history)

Indirect branches include all taken branches whose destination is determined at run time, interrupts, and exceptions. If $DC1_{PTM}$ is set to '1', indirect branch information is messaged out in the following format:

(1-32 bits)	(1-32 bits)	(1-8 bits)	(1 bit)	(4 bits)	(6 bits)
Branch History	Relative Address	Sequence Count	(0)	Source Proc.	TCODE (011100)

Max length = 83 bits; Min length = 14 bits

Figure 62-34. Indirect branch message (history) format

62.12.2.2 Indirect branch messages (traditional)

If $DC1_{PTM}$ is cleared to '0', indirect branch information is messaged out in the following format:

(1-32 bits)	(1-8 bits)	(1 bit)	(4 bits)	(6 bits)
Relative Address	Sequence Count	(0)	Source Proc.	TCODE (000100)

Max length = 51 bits; Min length = 13 bits

Figure 62-35. Indirect branch message format

62.12.2.3 Direct branch messages (traditional)

Direct branches (conditional or unconditional) are all taken branches whose destination is fixed in the instruction opcode. Direct branch information is messaged out in the following format:

(1-8 bits)	(4 bits)	(6 bits)
Sequence Count	Src. Proc.	TCODE (000011)

Max length = 18 bits; Min length = 11bits

Figure 62-36. Direct Branch message format

Note

When DC1_{PTM} is set, Direct Branch Messages will not be transmitted. Instead, each direct branch, not-taken indirect branch, or predicated instruction will be recorded in the history buffer.

62.12.3 Program Trace Message Fields

The following subsections describe specific fields used for Program Trace messages.

62.12.3.1 Sequential Instruction Count Field (ICNT)

Most of the program trace messages include an instruction count field. For traditional Branch messages, ICNT represents the number of sequential instructions including non-taken branches since the last Direct/Indirect Branch messages. Branch instructions that trigger message generation are included in the ICNT.

For Branch History messages, ICNT represents the number of instructions executed since the last taken/non-taken direct branch, predicate instruction, last taken/not-taken indirect branch, or exception. Branch instructions that trigger message generation are included in the ICNT. Instructions that generate history bits are not included in the ICNT.

The sequential instruction counter overflows after its value reaches 255 and is reset to 0. In addition, the next BTM Message (corresponding to the 256th or later instruction) will be converted to a w/sync type message.

The instruction counter is reset every time the instruction count is transmitted in a message or whenever there is a branch/predicate history event, as well as on exiting from debug mode.

62.12.3.2 Branch/Predicate Instruction History (HIST)

If $DC1_{PTM}$ is set, BTM messaging will use the Branch History format. The branch history (HIST) field in these messages provides a history of branch execution used for reconstructing the program flow. The branch/predicate history buffer stores information about branch and predicate instruction execution. The buffer is implemented as a left-shifting register. The buffer is preloaded with a one (1), which acts as a stop bit (the most significant 1 in the history field is a termination bit for the field). The pre-loaded bit itself is not part of the history, but is transmitted with the packet.

A value of one (1) is shifted into the history buffer for each taken direct branch (program counter relative branch) or predicate instruction whose condition evaluates to true. A value of zero (0) is shifted into the history buffer for each not-taken branch (including indirect branch instructions) or predicate instruction whose condition evaluates to false. For the **zvselh** instruction, two bits are shifted in, corresponding to the low element (shifted in first) and the high element (shifted in second) conditions.

This history buffer information is transmitted as part of an Indirect Branch with History message, as part of a Program Correlation message, or as part of a Resource Full message if the history buffer becomes full. The history buffer is reset every time the history information is transmitted in a message, as well as on exiting from debug mode.

Table 62-32. Branch/Predicate history events

Branch/Predicate History Event	History Bit(s)	Relevant Instructions
Not taken register indirect branches	0	**bcctr, bcctrl, bclr, bclrl**
Not taken direct branches	0	**b, ba, bc, bca, bla, bcla, bl, bcl**
Taken direct branches	1	**b, ba, bc, bca, bla, bcla, bl, bcl**[1]
zvselh instruction	00,01,10, or 11	**zvselh**

[1] If the EVCODE for direct branch function calls is not masked in DC4, taken **bl** and **bcl** instructions will generate Program Correlation Messages and will not be logged in the history buffer.1

62.12.3.3 Execution Mode Indication

In order for a development tool to properly interpret instruction count and history information, it must be aware of the execution mode context of that information. VLE instructions will be interpreted differently from non-VLE instructions.

Program trace messages provide the execution mode status in the least significant bit of the **reconstructed** address field. A value of '0' indicates that preceding instruction count and history information should be interpreted in a non-VLE context. A value of '1' indicates that the preceding instruction count and history information should be interpreted in a VLE context.

62.12.4 Resource Full Messages

The Resource Full Message is used in conjunction with Branch Trace and Branch History Messages. The Resource Full Message is generated when either the internal branch/ predicate history buffer is full, or if the BTM Instruction sequence counter (I-CNT) overflows. If synchronization is needed at the time this message is generated, the synchronization is delayed until the next Branch Trace Message that is not a Resource Full Message.

For history buffer overflow, the Resource Full Message transmits a Resource Code (RCODE) of 0b0001 and the current contents of the history buffer, including the stop bit, are transmitted in the Resource Data (RDATA) field. This history information can be concatenated by the development tool with the branch/predicate history information from subsequent messages to obtain the complete branch/predicate history between indirect changes of flow.

For instruction counter overflow, the Resource Full Message transmits an RCODE of 0b0000 and a value of 0xFF is transmitted in the RDATA field, indicating that 255 sequential instructions have been executed since the last change of flow, or, if program trace is in history mode, since the last instruction that recorded history information.

(1-32 bits)	(4 bits)	(4 bits)	(6 bits)
RDATA	RCODE	Src. Proc.	TCODE (011011)

Max length = 46 bits; Min length = 15 bits

Figure 62-37. Resource Full Message format

The following table shows the RCODE encodings and RDATA information used for Resource Full Messages.

Table 62-33. RCODE encoding

RCODE	Description	RDATA field
0000	Program Trace Instruction counter reached 255 and was reset.	0xFF
0001	Program Trace, Branch / Predicate Instruction History full.	Branch HIstory. This type of packet is terminated by a stop bit set to 1 after the last history bit.

62.12.5 Program Correlation Messages

Program Correlation Messages (PCMs) are used to correlate events to the program flow that may or may not be associated with the instruction stream. The following events will result in a PCM when program trace is enabled:

- When the CPU enters debug mode, a PCM is generated. The instruction count and history information provided by the PCM can be used to determine the last sequence of instructions executed prior to debug mode entry.
- When the CPU first enters a low power mode in which instructions are no longer executed, a PCM is generated. The instruction count and history information provided by the PCM can be used to determine the last sequence of instructions executed prior to low power mode entry.
- Whenever program trace is disabled by any means, a PCM is generated. The instruction count and history information provided by the PCM can be used to determine the last sequence of instructions executed prior to disabling program trace.
- When a "Branch and Link" instruction executes (direct branch function call — **bl/bcl/bla/bcla**-type instructions)
- When program trace becomes masked due to MSR_{PMM}='0' and $\text{DC4}_{\text{PTMARK}}$='1'.
- When a write to the process ID register selected by DC1_{OTS} (PID0 or NPIDR) is made via a **mtspr** PID0 or **mtspr** NPIDR.

Refer to Table 62-6 for the event codes that are supported in this implementation. Event code masking is available via the EVCDM field of the DC4 register to allow for control over generation of Program Correlation messages for each event type.

Program Correlation is messaged out in the following formats:

(1-32 bits)	(1-8 bits)	(2 bits)	(4 bits)	(4 bits)	(6 bits)
Branch History	Sequence Count	CDF*	EVCOD	Src. Proc.	TCODE (100001)

Max length = 56 bits; Min length = 18 bits

* - CDF=01,
EVCODE = Any but 0101, 110

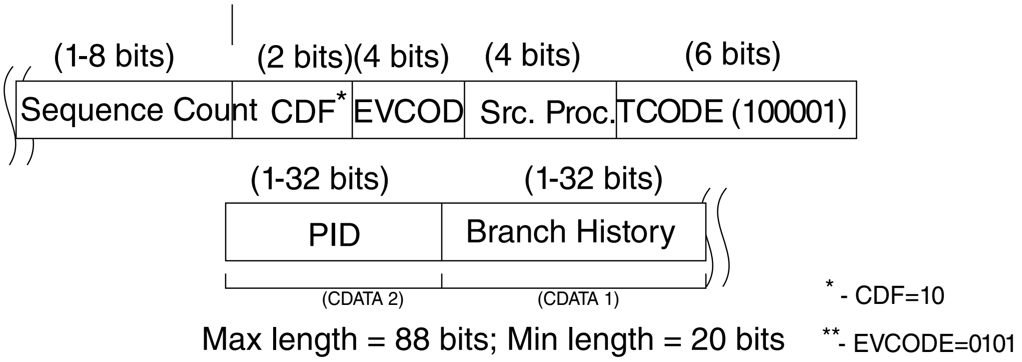


Figure 62-38. Program Correlation message formats

62.12.5.1 Program Correlation message generation for PID updates

When a (potentially) new value is established in the selected process ID register via a **mtspr** PID0/NPIDR, a Program Correlation message is generated containing the information regarding the new process ID value. This PCM also contains the current history and instruction count. The message is provided so that address translation information can be processed by the development tool in the proper program flow. The **mtspr** PID0/NPIDR is included in the instruction count information. Note that Ownership Trace Messages (other than the periodic OTM) are redundant with the information provided, and may be disabled to avoid unnecessary message bandwidth or collisions.

62.12.6 Program Trace Overflow Error messages

An Error Message occurs when a new message cannot be queued due to the message queue being full. The FIFO will discard incoming messages until it has completely emptied the queue. Once emptied, an Error Message will be queued. The error encoding will indicate which type(s) of messages attempted to be queued while the FIFO was being emptied.

62.12.7 Program Trace Synchronization messages

By default, program trace messages will perform XOR compression on the branch target address to produce the address field for the message. This compression is consistent with the specification in IEEE-ISTO 5001.

Under some conditions an uncompressed address is sent to provide development tools with a baseline reference address. A Program Trace Synchronization message is messaged via the auxiliary port (provided Program Trace is enabled) for the following conditions (see Table 62-34):

- Initial Program Trace message after exit from system reset or whenever program trace is enabled.
- Upon exiting from a CPU Low Power state.
- Upon exiting from Debug Mode.
- Upon occurrence of queue overrun (can be caused by any trace message), provided Program Trace is enabled.
- Upon assertion of the Event In (**nex_evti_b**) pin if the EIC bits within the DC1 Register have enabled this feature.
- When program trace becomes unmasked due to MSR_{PMM} → '1' with $\text{DC4}_{\text{PTMARK}}$='1'.

Note that the ICNT information for these messages is driven to zero, thus will not always be meaningful for some of these cases.

The format for Program Trace Synchronization messages is as follows:

(1-32 bits)	(1-8 bits)	(1 bit)	(4 bits)	(6 bits)
Full Target Address	Seq. Count (0)	(0)	Source Proc.	TCODE (001001)

Max length = 51 bits; Min length = 13 bits

Exception conditions that result in Program Trace Synchronization are summarized in Table 62-34.

Table 62-34. Program Trace exception summary

Exception Condition	Exception Handling
System Reset Negation	At the negation of JTAG reset (**j_trst_b**), queue pointers, counters, state machines, and registers within the Nexus 3 module are reset. Upon exiting system reset (**p_reset_b**), if Program Trace is already enabled, a Program Trace Sync Message is sent.
Program Trace Enabled	The first Program Trace Message (after Program Trace has been enabled or re-enabled) is a synchronization message.
Exit from Low Power/Debug	Upon exit from a Low Power mode or Debug mode, a Program Trace Sync Message is sent.
Queue Overrun	An Error Message occurs when a new message cannot be queued due to the message queue being full. The FIFO will discard messages until it has completely emptied the queue. Once emptied, an Error Message will be queued. The error encoding will indicate which type(s) of messages attempted to be queued while the FIFO was being emptied. The next BTM message in the queue will be a Program Trace Sync Message.

Table continues on the next page...

Table 62-34. Program Trace exception summary (continued)

Exception Condition	Exception Handling
Event In	If the Nexus module is enabled, a **nex_evti_b** assertion initiates a Program Trace Sync Message if Program Trace is enabled and the EIC bits of the DC1 Register have enabled this feature.

Note that for cases where program trace sync messages are generated due to program trace being enabled, the address contained in the sync message may either be the address of the instruction that caused program trace to be enabled, or may be the address of the first instruction of an exception handler that is executed in response to unsuccessful completion of that instruction.

62.12.8 Program Trace Direct/Indirect Branch with Sync messages

Under some conditions an uncompressed address is sent to provide development tools with a baseline reference address. A Program Trace Synchronization or a Direct/Indirect Branch with Sync message is messaged via the auxiliary port (provided Program Trace is enabled) for the following conditions (see Table 62-34):

- Upon direct/indirect branch after a Program Sync Message was lost due to a collision while attempting to enter the message queue.
- Upon direct/indirect branch after the sequential instruction counter has expired indicating 255 instructions have occurred since the last change of flow.
- When the periodic program trace counter has expired indicating 255 *without-sync* Program Trace messages have occurred since the last *with-sync* message occurred.

Note that the ICNT and History information for the first message will not always be meaningful, since the temporary masking of program trace may result in ambiguous values. Subsequent w/sync messages will not have this issue.

The format for Program Trace Direct/Indirect Branch with Sync Messages is as follows:

(1-32 bits)	(1-8 bits)	(1 bit)	(4 bits)	(6 bits)
Full Target Address	Sequence Count	(0)	Source Proc.	TCODE (001011 or 001100)

Max length = 51 bits; Min length = 13 bits

Figure 62-39. Direct/Indirect Branch with Sync message format

The format for Program Trace Indirect Branch History with Sync. messages is as follows:

(1-32 bits)	(1-32 bits)	(1-8 bits)	(1 bit)	(4 bits)	(6 bits)
Branch History	Full Target Address	Sequence Count	(0)	Source Proc.	TCODE (011101)

Max length = 83 bits; Min length = 14 bits

Figure 62-40. Indirect Branch History w/ Sync. message format

Exception conditions that result in Program Trace Synchronization using a w/Sync message type are summarized in Table 62-35.

Table 62-35. Program Trace Exception Summary for w/Sync BTM messages

Exception Condition	Exception Handling
Periodic Program Trace Sync.	A forced synchronization occurs periodically after 255 non-sync Program Trace Messages have been queued. A Direct/Indirect Branch w/ Sync. Message is queued. The periodic program trace message counter then resets.
Sequential Instruction Count Overflow	After the sequential instruction counter reaches its maximum count (up to 255 sequential instructions may be executed), a forced synchronization occurs. The sequential counter then resets. A Program Trace Direct/Indirect Branch w/ Sync.Message is queued upon execution of the next branch. A Resource Full Message is Queued on the overflow event. If a branch instruction is the 255th instruction to occur, and causes a Program Trace message to be queued, then no Resource Full Message is queued, and the w/Sync message will be queued for the *next* Program Trace Direct/Indirect Branch Message.
Collision Priority	All Messages have the following priority: Instruction 0 (WPM -> DQM -> $\text{PCM}_{\text{PIDMSG}}$ → OTM → BTM → DTM) → Instruction1 (WPM → DQM → OTM → BTM → DTM), where instruction0 is the oldest instruction. A BTM Message from Instruction1 that attempts to enter the queue at the same time as three higher priority messages from either instruction will be lost. An Error Message will be sent indicating the BTM was lost. The following direct/indirect branch will queue a Direct/Indirect Branch w/ Sync. Message. The count value within this message will reflect the number of sequential instructions executed after the last successful BTM Message was generated. This count will include the branch that did not generate a message due to the collision.

62.12.9 Enabling Program Trace

Program Trace Messaging can be enabled in one of three ways:

- Setting the TM field of the DC1 Register to enable Program Trace
- Using the PTS field of the WT Register to enable Program Trace on Watchpoint hits (watchpoints are configured within the CPU)
- Filtering of Program Trace messages may be performed using the MSR_{PMM} bit and the setting of $\text{DC4}_{\text{PTMARK}}$

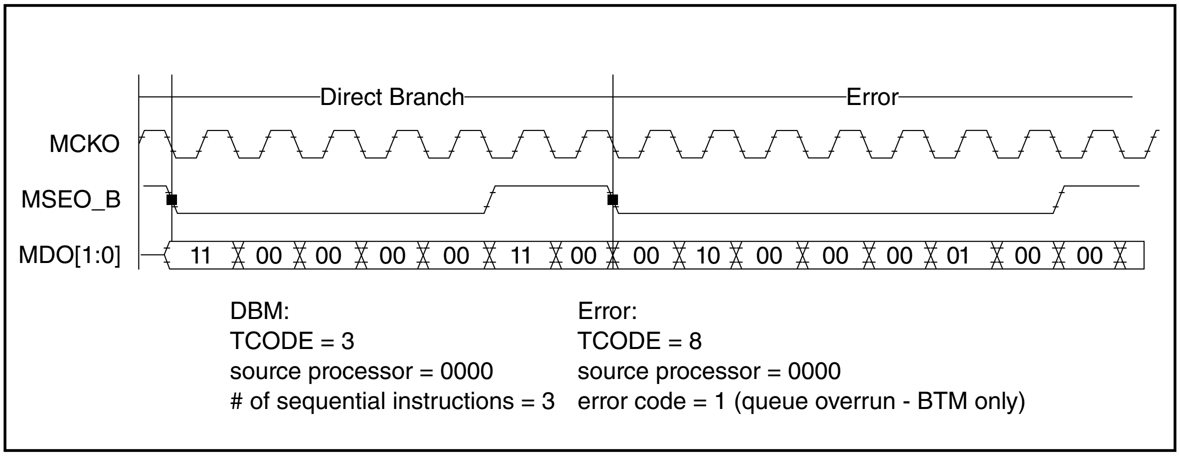

Figure 62-43. Program Trace - Direct Branch (traditional) & Error messages

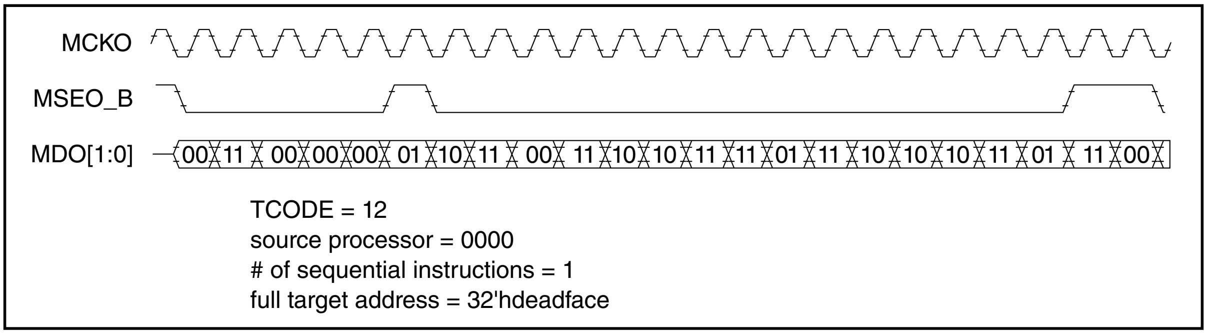

Figure 62-44. Program Trace - Indirect Branch w/ Sync. message

62.13 Data Trace

This section deals with the Data Trace mechanism supported by the Nexus 3 module. Data Trace is implemented via Data Write Messaging (DWM) and Data Read Messaging (DRM), as per the **IEEE-ISTO 5001** standard.

62.13.1 Data Trace Messaging (DTM)

Data Trace Messaging is accomplished by snooping the internal address and data buses, and storing the information for qualifying accesses (based on enabled features and matching target addresses). The Nexus 3 module traces all data access that meet the selected range and attributes.

Note

Data Trace is only performed on the internal data buses. This allows for data visibility for Core (e200z4251n3) processors that incorporate a data cache. Only CPU initiated accesses will be traced. No DMA accesses to the AHB system bus will be traced.

Data Trace Messaging can be enabled in one of the following ways:

- Setting the TM field of the DC1 Register to enable Data Trace.
- Using the DTS field of the WT Register to enable Data Trace on Watchpoint hits (watchpoints are configured within the Nexus1 module).

62.13.2 DTM Message formats

The Nexus 3 block supports five types of DTM Messages — Data Write, Data Read, Data Write Synchronization, Data Read Synchronization and Error Messages.

62.13.2.1 Data Write messages

The Data Write message contains the data write value and the address of the write access, relative to the previous Data Trace Message. Data Write message information is messaged out in the following format:

(1-64 bits)	(1-32 bits)	(4 bits)	(1 bit)	(4 bits)	(6 bits)
Data Value(s)*	Relative Address	Data Size	(0)	Src. Proc	TCODE (000101)

Max length = 111 bits; Min length = 17 bits

Figure 62-45. Data Write message format

62.13.2.2 Data Read messages

The Data Read message contains the data read value and the address of the read access, relative to the previous Data Trace message. Data Read message information is messaged out in the following format:

(1-64 bits)	(1-32 bits)	(4 bits)	(1 bit)	(4 bits)	(6 bits)
Data Value(s)*	Relative Address	Data Size	(0)	Src. Proc	TCODE (000110)

Max length = 111 bits; Min length = 17 bits

Figure 62-46. Data Read fessage format

Note

* Core (e200z4251n3)-based CPUs are capable of generating two (2) reads or writes per clock cycle in cases where multiple registers are accessed with a single instruction (lmw/stmw). These will have a double word pair size encoding (**p_tsiz** = 0b000). In these cases, the Nexus 3 module will send one (1) Data Trace Message with the two 32-bit data values as one combined 64-bit value for each message.

For Core (e200z4251n3)-based CPUs, the doubleword encoding (**p_tsiz** = 0b000) may also indicate a doubleword access and will be sent out as a single Data Trace Message with a single 64-bit data value.

The debug/development tool will need to distinguish the two cases based on the family of processor.

62.13.2.3 Data Trace Synchronization messages

A Data Trace Write/Read with Sync. message is messaged via the auxiliary port (provided Data Trace is enabled) for the following conditions (see Table 62-36):

- Initial Data Trace Message after exit from system reset or whenever Data Trace is enabled.
- Upon returning from a CPU Low Power state.
- Upon returning from Debug Mode.
- After occurrence of queue overrun (can be caused by any trace message), provided Data Trace is enabled.
- After the periodic data trace counter has expired indicating 255 *without-sync* Data Trace messages have occurred since the last *with-sync* message occurred.
- Upon assertion of the Event In (**nex_evti_b**) pin, the first Data Trace Message will be a synchronization message if the EIC bits of the DC1 Register have enabled this feature.
- Upon Data Trace Write/Read after the previous DTM message was lost due to an attempted access to a secure memory location (for SOC's w/ security).
- Upon Data Trace Write/Read after the previous DTM message was lost due to a collision entering the FIFO between the DTM message and any two of the following: Watchpoint message, Ownership Trace message, or Program Trace message.

Data Trace Synchronization Messages provide the full address (without leading zeros) and insure that development tools fully synchronize with Data Trace regularly. Synchronization messages provide a reference address for subsequent DTMs, in which only the unique portion of the Data Trace address is transmitted. The format for Data Trace Write/Read with Sync. Messages is as follows:

(1-64 bits)	(1-32 bits)	(4 bits)	(1 bit)	(4 bits)	(6 bits)
Data Value	Full Address	Data Size	(0)	Source Proc.	TCODE (001101 or 001110)

Max length = 111 bits; Min length = 17 bits

Figure 62-47. Data Write/Read with Sync. message format

Exception conditions that result in Data Trace Synchronization are summarized in Table 62-36.

Table 62-36. Data Trace Exception summary

Exception Condition	Exception Handling
System Reset Negation	At the negation of JTAG reset (**j_trst_b**), queue pointers, counters, state machines, and registers within the Nexus 3 module are reset. If Data Trace is enabled, the first Data Trace Message is a Data Write/Read w/ Sync. Message.
Data Trace Enabled	The first Data Trace Message (after Data Trace has been enabled) is a synchronization message.
Exit from Low Power/Debug	Upon exit from a Low Power mode or Debug mode the next Data Trace Message will be converted to a Data Write/Read with Sync. Message.
Queue Overrun	An Error Message occurs when a new message cannot be queued due to the message queue being full. The FIFO will discard messages until it has completely emptied the queue. Once emptied, an Error Message will be queued. The error encoding will indicate which type(s) of messages attempted to be queued while the FIFO was being emptied. The next DTM message in the queue will be a Data Write/Read w/ Sync. Message.
Periodic Data Trace Sync.	A forced synchronization occurs periodically after 255 Data Trace Messages have been queued. A Data Write/Read w/ Sync. Message is queued. The periodic data trace message counter then resets.
Event In	If the Nexus module is enabled, a **nex_evti_b** assertion initiates a Data Trace Write/Read w/ Sync. Message upon the next data write/read (if Data Trace is enabled and the EIC bits of the DC1 Register have enabled this feature).
Collision Priority	All Messages have the following priority: Instruction 0 (WPM → DQM → $\text{PCM}_{\text{PIDMSG}}$ → OTM → BTM → DTM) → Instruction1 (WPM → DQM → OTM → BTM → DTM), where instruction0 is the oldest instruction. A DTM Message that attempts to enter the queue at the same time as three other higher priority messages will be lost. A subsequent read/write will queue a Data Trace Read/Write w/ Sync. Message.

62.13.3 DTM Operation

62.13.3.1 Data Trace windowing

Data Write/Read Messages are enabled via the RWT field in the Data Trace Control Register (DTC) for each DTM channel. Data Trace windowing is achieved via the address range defined by the DTEA and DTSA Registers and by the RC field in the DTC register. All CPU initiated read/write accesses that fall inside or outside these address ranges, as programmed, are candidates to be traced.

62.13.3.2 Data Access / Instruction Access Data Tracing

The Nexus3 module is capable of tracing either instruction access data or data access data and can be configured for either type of data trace by setting the DI1 field within the Data Trace Control Register. This setting applies to all DTM channels.

62.13.3.3 Data Trace filtering

Data Trace filtering is available base on the settings of MSR_{PMM} and $DC4_{DTMARK}$.

62.13.3.4 Bus Cycle special cases

Table 62-37. Bus Cycle Special Cases

Special Case	Action
Bus cycle aborted	Cycle ignored
Bus cycle with data error ($\overline{TEA}$)	Data Trace Message discarded
Bus cycle completed without error[1]	Cycle captured & transmitted
AHB bus cycle initiated by Nexus 3	Cycle ignored
Bus cycle is an instruction fetch	Cycle selectively ignored based on DTC_{DI} setting
Bus cycle accesses misaligned data (across 64-bit boundary) - both 1st & 2nd transactions within data trace range	1st & 2nd cycle captured & a single or a pair of DTM(s) is (are) transmitted (see Note)
Bus cycle accesses misaligned data (across 64-bit boundary) - 1st transaction within data trace range; 2nd transaction out of data trace range	1st & 2nd cycle captured & a single or a pair of DTM(s) is (are) transmitted (see Note)
Bus cycle accesses misaligned data (across 64-bit boundary) - 1st transaction within data trace range; 2nd transaction (regardless of within range or not) receives a bus error	Data Trace Message discarded
Bus cycle accesses misaligned data (across 64-bit boundary) - 1st transaction out of data trace range; 2nd transaction within data trace range	1st & 2nd cycle captured & a single or a pair of DTM(s) is (are) transmitted (see Note)
Bus cycle accesses misaligned data (across 64-bit boundary) - 1st transaction out of data trace range; 2nd transaction within range, receives a bus error	Data Trace Message discarded

[1] Buffering of stores in the CPU store buffer may generate a DTM prior to the actual memory access, regardless of an error termination condition from memory.

Note

For misaligned accesses (crossing 64-bit boundary), the access is broken into two accesses by the CPU. If either access is within the data trace range, a single DTM will be sent with a size encoding indicating the size of the original access (i.e. word), and the address indicating the original misaligned accesses, unless the misaligned access wraps into the doubleword at address 0, or unless the misaligned access wraps over the end of a circular buffer when using the LSP specialized load or store with circular addressing. In this case, since the two portions of the misaligned access are not contiguous, two DTMs will be sent, one for each portion. The size encodings and the addresses of the DTMs will indicate the accessed bytes of data. The data trace port handles these cases in the same manner. (See the Data Trace Port section in the Core (e200z4251n3) Core Debug Support chapter.)

Note

A store to the cache's store buffer within the data trace range may initiate a DTM message prior to completion of the actual memory access.

write data = 8'h5c

Figure 62-49. Data Trace — Data Read w/ Sync message

62.14 Data Acquisition messaging

This section details the Data Acquisition mechanisms supported by the Nexus 3 module. Data Acquisition Trace is implemented using Data Acquisition Trace Messages in accordance with IEEE-ISTO 5001 definitions. The control mechanism to export the data is different from the recommendations of the standard, however.

Data Acquisition Trace provides a convenient and flexible mechanism for the debugger to observe the architectural state of the machine through software instrumentation.

62.14.1 Data Acquisition ID Tag field

The DQTAG Tag field (DQTAG) is an 8-bit value specifying control or attribute information for the data included in the Data Acquisition message. DQTAG is sampled from $\text{DEVENT}_{\text{DQTAG}}$ when a write to DDAM is performed via **mtspr** operations. The usage of the DQTAG is left to the discretion of the development tool to be used in whatever manner is deemed appropriate for the application.

62.14.2 Data Acquisition Data field

The Data Acquisition Data field (DQDATA) is the data captured from the DDAM write operation via **mtspr** operations. Leading zeros are omitted from the message.

62.14.3 Data Acquisition Trace event

For DQM, a dedicated SPR has been allocated (DDAM). It is expected that the general use case is to instrument the software and use **mtspr** operations to generate Data Acquisition messages.

There is no explicit error response for failed accesses as a result of contention between an internal and external debugger. Software may be blocked or given ownership of DDAM and the DQTAG field of the DEVENT register via control in EDBRAC0 while in External Debug Mode. Hardware always has access to these registers. Refer to the "External Debug Resource Allocation Control Register (EDBRAC0)" section in the Core (e200z4251n3) Core Debug Support chapter for more detail on EDBRAC0.

Reads from the Data Acquisition channel do not generate a Data Acquisition event and will return zeroes for the read data.

(1-32 bits)	(8 bits)	(4 bits)	(6 bits)
DQDATA	DQTAG	Src. Proc.	TCODE (000111)

Max length = 50 bits; Min length = 19 bits

Figure 62-50. Data Acquisition message format

62.15 Watchpoint Trace messaging

Enabling Watchpoint messaging is done by setting the Watchpoint Trace Enable bit in the DC1 Register. Setting the individual Watchpoint sources is supported through the Nexus1 module and the Performance Monitor unit. The Nexus1 module is capable of setting multiple types of watchpoints. Please refer to the Core (e200z4251n3) Core Debug Support chapter for details on watchpoint initialization.

When watchpoints occur due to one or more asserted watchpoint event signals and Watchpoint Trace Messaging is enabled, a Watchpoint Trace message will be sent to the message queue to be messaged out. This message includes the watchpoint number indicating which watchpoint(s) caused the message. If more than one enabled watchpoint occurs in a single cycle, only one Watchpoint Trace message is generated and multiple bits of the watchpoint hit field will be set. The settings of the WMSK_{WEM} field control which watchpoints are enabled to generate watchpoint trace messages.

The occurrence of any of the defined watchpoints can also be programmed to assert the Event Out (**evto_b**) pin for one (1) period of the output clock (**nex_mcko**) based on settings in the DC2 and DC3 registers. See Table 62-40 for details on **evto_b**.

Watchpoint information is messaged out in the following format:

(1-30 bits)	(4 bits)	(6 bits)
Watchpoint Source	Src. Proc.	TCODE (001111)

Variable length = 11-40 bits

Figure 62-51. Watchpoint message format

The Watchpoint Source message field will contain a '1' for each asserted watchpoint. Leading zeros are truncated.

Table 62-38. Watchpoint Source Encoding

Watchpoint Source (1-30 bits)	Watchpoint Description
00000000000000000000000000000 - No Watchpoints enabled for Watchpoint Trace Messaging	
XXXXXXXXXXXXXXXXXXXXXXXXXXXXX1 - Watchpoint #0 enabled for WTM

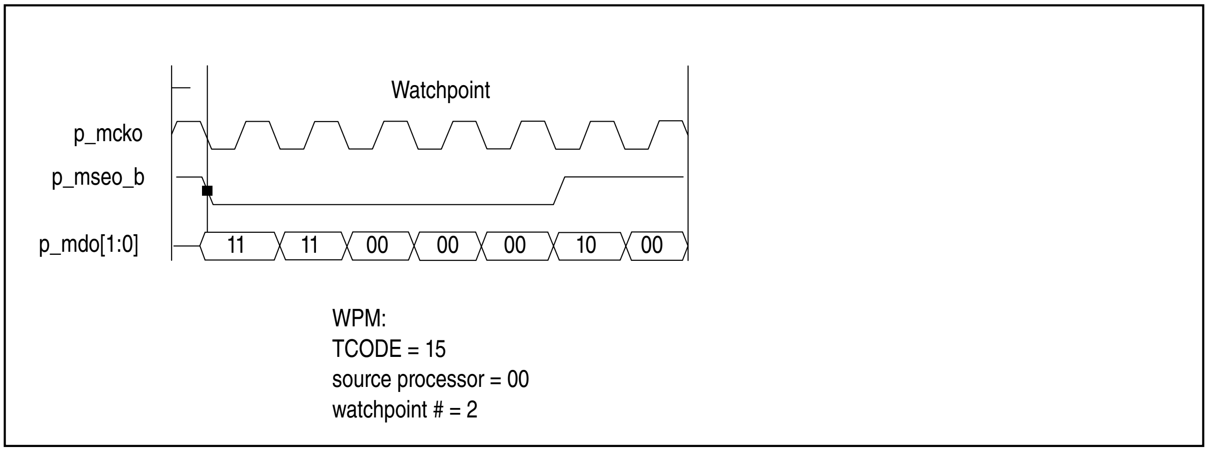

Figure 62-52. Watchpoint Message & Watchpoint Error message

62.16 Nexus 3 Read/Write access to memory-mapped resources

The Read/Write access feature allows access to memory-mapped resources via the JTAG/ OnCE port. The Read/Write mechanism supports single as well as block reads and writes to AHB resources.

The Nexus 3 module is capable of accessing resources on the system bus (AHB). Memory-mapped registers and other non-cached memory can be accessed via the standard memory map settings.

All accesses are setup and initiated by the Read/Write Access Control/Status Register (RWCS), as well as the Read/Write Access Address (RWA) and Read/Write Access Data Registers (RWD). Nexus 3 read/write accesses are run as privileged data non-cacheable accesses by default, and drive the **p_d_hprot[5:0]** bus access attributes to 6'b000011 accordingly. The $\mathrm{RWCS}_{\mathrm{ATTR}}$ field is provided to allow a portion of these default values to be modified when performing read or write accesses using the Nexus 3 Read/Write access mechanism.

Using the Read/Write Access Registers (RWCS/RWA/RWD), memory mapped AHB resources can be accessed through Nexus 3. The following subsections describe the steps required to access memory-mapped resources.

Note

Read/Write Access can only access memory mapped resources when system reset is de-asserted and clocks are running.

Misaligned accesses are NOT supported in the Nexus 3 module.

Uncorrectable ECC errors on Nexus 3 read access will result in the RWD register being updated with the raw data received.

62.16.1 Single write access

1. Initialize the Read/Write Access Address Register (RWA) through the access method outlined in Nexus 3 Register Access via JTAG/OnCE. Configure as follows:
   - Write Address → 32h'xxxxxxxx (write address)
2. Initialize the Read/Write Access Control/Status (RWCS) register through the access method outlined in Nexus 3 Register Access via JTAG/OnCE. Configure the bits as follows:
   - Access Control (AC) → 1b'1 (to indicate start access)
   - Map Select (MAP) → 3b'000 (primary memory map)
   - Access Priority (PR) → 2b'11 (highest priority)
   - Read/Write (RW) → 1b'1 (write access)
   - Word Size (SZ) → 3b'0xx (32-bit, 16-bit, 8-bit)
   - Access Count (CNT) → 14h'0000 or 14h'0001(single access)

   Note

   Access Count (CNT) of 14'h0000 or 14'h0001 will perform a single access.

3. Initialize the Read/Write Access Data (RWD) register through the access method outlined in Nexus 3 Register Access via JTAG/OnCE. Configure as follows:
   - Write Data → 32h'xxxxxxxx (write data)
4. The Nexus block will then arbitrate for the AHB system bus and transfer the data value from the data buffer RWD register to the memory mapped address in the Read/Write Access Address (RWA) register. The nex_ahb_start output will be asserted during the first clock of the address phase of the transfer. When the access has completed, Nexus clears the AC and DV bits in the RWCS register. If the access has completed without error, (ERR=1'b0), Nexus asserts the **nex_rdy_b** pin (see Table 62-40 for details) and clears the ERR bit in the RWCS register. Otherwise, if the access completes with an error, the ERR bit will be set to indicate an error has

occurred, and the **nex_rdy_b** pin will not be asserted. Once the DV bit has been cleared, this indicates that the device is ready for the next access, or that an error has occurred.

Note

Only the **nex_ahb_start**, and **nex_rdy_b** pins, as well as the AC, DV, and ERR bits within the RWCS, provide Read/Write Access status to the external development tool.

62.16.2 Block write access

1. For a block write access, follow Steps 1, 2, and 3 outlined in Single write access to initialize the registers, but using a value greater than one (14'h0001) for the CNT field in the RWCS register.
2. The Nexus block then arbitrates for the AHB system bus and transfers the first data value from the RWD register to the memory-mapped address in the Read/Write Access Address (RWA) register. The nex_ahb_start output is asserted during the first clock of the address phase of the transfer. When the transfer has completed without error, the address from the RWA register is incremented to the next word size (specified in the SZ field) andthe number from the CNT field is decremented. If the access has completed without error, Nexus clears the ERR and DV bits in the RWCS register. Otherwise, the ERR bit is set and the DV bit is cleared to indicate an error has occurred, , the block transfer is aborted, and the AC bit in the RWCS register is cleared. Clearing the DV bit indicates that the device is ready for the next access in the block transfer, or that an error has occurred.
3. If the AC bit has not been cleared due to an error, repeat Step 3 in Single write access until the internal CNT value is zero (0). When this occurs, the AC bit within the RWCS register is cleared to indicate the end of the block write access.

Note

The actual RWA register value as well as the CNT field within the RWCS register are not changed when executing a block write access. The original values can be read by the external development tool at any time.

62.16.3 Single read access

1. Initialize the Read/Write Access Address (RWA)register through the access method outlined in Nexus 3 Register Access via JTAG/OnCE. Configure as follows:
   - Read Address → 32h'xxxxxxxx (read address)
2. Initialize the Read/Write Access Control/Status (RWCS) register through the access method outlined in Nexus 3 Register Access via JTAG/OnCE. Configure the bits as follows:
   - Access Control (AC) → 1b'1 (to indicate start access)
   - Map Select (MAP) → 3b'000 (primary memory map)
   - Access Priority (PR) → 2b'11 (highest priority)
   - Read/Write (RW) → 1b'0 (read access)
   - Word Size (SZ) → 3b'0xx (32-bit, 16-bit, 8-bit)
   - Access Count (CNT) → 14h'0000 or 14h'0001(single access)

   Note

   An Access Count (CNT) of 14'h0000 or 14'h0001 will perform a single access.

3. The Nexus block will then arbitrate for the AHB system bus and the read data will be transferred from the AHB to the RWD register. The nex_ahb_start output will be asserted during the first clock of the address phase of the transfer. When the access has completed without error, Nexus clears the ERR bit and sets the DV bit in the RWCS register and asserts the **nex_rdy_b** pin (see Table 62-40 for detail on **nex_rdy_b**). Otherwise, if the access has completed with an error, the ERR bit will be set and the DV bit will be cleared to indicate an error has occurred. The **nex_rdy_b** pin will not be asserted. Once ERR or DV has been set, this indicates that the device is ready for the next access, or that an error has occurred. The AC bit is cleared in either case.
4. The data can then be read from the Read/Write Access Data register (RWD) through the access method outlined in Nexus 3 Register Access via JTAG/OnCE.

Note

Only the **nex_ahb_start**and **nex_rdy_b** pins as well as the AC, DV, and ERR bits within the RWCS register provide Read/Write Access status to the external development tool.

62.16.4 Block read access

1. For a block read access, follow Steps 1 and 2 outlined in Single read access to initialize the registers, but using a value greater than one (14'h0001) for the CNT field in the RWCS register.
2. The Nexus block will then arbitrate for the AHB system bus and the read data will be transferred from the AHB to the RWD register. The nex_ahb_start output will be asserted during the first clock of the address phase of the transfer. When the access has completed without error, Nexus clears the ERR bit and sets the DV bit in the RWCS register and asserts the **nex_rdy_b** pin (see Table 62-40 for detail on **nex_rdy_b**). Otherwise, if the access has completed with an error, the ERR bit will be set and the DV bit will be cleared to indicate an error has occurred, and the **nex_rdy_b** pin will not be asserted. Once ERR or DV has been set, this indicates that the device is ready for the next access, or that an error has occurred. The AC bit will be cleared in either case.
3. When the transfer has completed without error, the address from the RWA Register is incremented to the next word size (specified in the SZ field), the number from the CNT field is decremented, Nexus clears the ERR bit and sets the DV bit in the RWCS register, and asserts the **nex_rdy_b** pin (see Table 62-40 for detail on **nex_rdy_b**). Otherwise, if the access has completed with an error, the ERR bit will be set and the DV bit will be cleared to indicate an error has occurred, the AC bit is cleared and the block transfer is aborted, and the **nex_rdy_b** pin will not be asserted. Once ERR or DV has been set, this indicates that the device is ready for the next access, or that an error has occurred. Once DV has been set, this indicates that the device is ready for the next access in the block transfer, or if ERR is set (AC will be cleared), the block transfer has been aborted.
4. The data can then be read from the RWD register through the access method outlined in Nexus 3 Register Access via JTAG/OnCE.
5. If AC has not been cleared due to an error, repeat Steps 3 and 4 in Single read access until the CNT value is zero (0). When this occurs, the AC bit within the RWCS register is cleared to indicate the end of the block read access.

Note

The data values must be shifted out 32 bits at a time LSB first (i.e. doubleword read = two word reads from the RWD).

Note

The actual RWA value as well as the CNT field within the RWCS register are not changed when executing a block read access. The original values can be read by the external development tool at any time.

62.16.5 Error handling

The Nexus 3 module handles various error conditions as follows:

62.16.5.1 AHB Read/Write error

All address and data errors that occur on read/write accesses to the AHB system bus will return a transfer error encoding on the **p_hresp[1:0]** signals. If this occurs:

1. The access is terminated without retrying (AC bit is cleared)
2. The ERR bit in the RWCS Register is set
3. The Error Message is sent (TCODE = 8) indicating Read/Write error

62.16.5.2 Access termination

The following cases are defined for sequences of the Read/Write protocol that differ from those described in the above sections.

1. If the AC bit in the RWCS Register is set to start Read/Write accesses and invalid values are loaded into the RWD and/or RWA, then an AHB access error may occur. This is handled as described above.
2. If a block access is in progress (all cycles not completed), and the RWCS Register is written, then the original block access is terminated at the boundary of the nearest completed access.

a. If the RWCS is written with the AC bit set, the next Read/Write access will begin and the RWD can be written to/ read from.

b. If the RWCS is written with the AC bit cleared, the Read/Write access is terminated at the nearest completed access. This method can be used to break (early terminate) block accesses.

62.16.6 Read/Write access error message

The Read/Write Access Error Message is sent out when an AHB system bus access error (read or write) has occurred.

Error information is messaged out in the following format:

(5 bits)	(4 bits)	(6 bits)
Error Code (00011)	Src. Proc.	TCODE (001000)

Fixed length = 15 bits

Figure 62-53. Error message format1

62.17 Nexus 3 pin interface

This section details information regarding the Nexus 3 pins and pin protocol.

The Nexus 3 pin interface provides the function of transmitting messages from the messages queues to the external tools. It is also responsible for handshaking with the message queues.

62.17.1 Pins implemented

The Nexus 3 module implements an auxiliary port consisting of one (1) **nex_evti_b** and one (1) **nex_mseo_b** or two (2) **nex_mseo_b[1:0]**. It also implements a configurable number of **nex_mdo[n:0]** pins, (1) **nex_rdy_b** pin, (1) **evto_b** pin, and one (1) clock output pin (**nex_mcko**), as well as additional configuration pins described in Table 62-40. The output pins are synchronized to the Nexus 3 output clock (**nex_mcko**).

All Nexus 3 input functionality may be controlled through the JTAG/OnCE port in compliance with IEEE 1149.1 (see Nexus 3 Register Access via JTAG/OnCE for details). The JTAG pins are incorporated as I/O to the processor, and are further described in the "JTAG/OnCE Pins" section of the Core (e200z4251n3) Core Debug Support chapter.

Table 62-39. JTAG Pins for Nexus 3

JTAG Pins	Input/ Output	Description of JTAG Pins (included in Nexus 1)
j_tdo	O	The Test Data Output (**j_tdo**) pin is the serial output for test instructions and data. **j_tdo** is three-stateable and is actively driven in the "Shift-IR" and "Shift-DR" controller states. **j_tdo** changes on the falling edge of **j_tclk**.
j_tdi	I	The Test Data Input (**j_tdi**) pin receives serial test instruction and data. TDI is sampled on the rising edge of **j_tclk**.
j_tms	I	The Test Mode Select (**j_tms**) input pin is used to sequence the OnCE controller state machine. **j_tms** is sampled on the rising edge of **j_tclk**.
j_tclk	I	The Test Clock (**j_tclk**) input pin is used to synchronize the test logic, and control register access through the JTAG/OnCE port.
j_trst_b	I	The Test Reset (**j_trst_b**) input pin is used to asynchronously initialize the JTAG/OnCE controller.

The auxiliary pins are used to send and receive messages and are described in Table 62-40.

Table 62-40. Nexus 3 Auxiliary pins

Auxiliary pins	Input/ Output	Description of auxiliary pins
nex_mcko	O	Message Clock Out (**nex_mcko**) is a free running output clock to development tools for timing of **nex_mdo[n:0]** & **nex_mseo_b[1:0]** pin functions. **nex_mcko** is programmable through the DC1 Register.
nex_mdo[n:0]	O	Message Data Out (**nex_mdo[n:0]**) are output pins used for OTM, BTM, and DTM. External latching of **nex_mdo[n:0]** shall occur on the rising edge of the Nexus3 clock (**nex_mcko**).
nex_mseo_b[1:0]	O	Message Start/End Out (**nex_mseo_b[1:0]**) are output pins that indicate when a message on the **nex_mdo[n:0]** pins has started, when a variable length packet has ended, and when the message has ended. External latching of **nex_mseo_b[1:0]** shall occur on the rising edge of the Nexus3 clock (**nex_mcko**). One or two pin MSEO functionality is determined at integration time per SOC implementation.
nex_ahb_start	O	AHB Start (**nex_ahb_start**) is an output pin used to indicate to the external tool or SoC that the Nexus block is requesting the next Read/Write Access on the system bus. If Nexus is enabled, this signal is asserted upon an acknowledged request to start an AHB system bus transfer (Nexus read or write) and is pulsed asserted for one **nex_clk** clock period, corresponding to the first clock of the address phase of the transfer. Upon exit from system reset or if Nexus is disabled, **nex_ahb_start** remains de-asserted.
nex_rdy_b	O	Ready (**nex_rdy_b**) is an output pin used to indicate to the external tool that the Nexus block is ready for the next Read/Write Access. If Nexus is enabled, this signal is asserted upon successful (without error) completion of an AHB system bus transfer (Nexus read or write) & is held asserted until the JTAG/OnCE state machine reaches the "Capture_DR" state. Upon exit from system reset or if Nexus is disabled, **nex_rdy_b** remains deasserted.
evto_b	O	Event Out (**evto_b**) is an output that, when asserted, indicates one of two events has occurred based on the EOC bits in the DC1 Register. **evto_b** is held asserted for one (1) cycle of **nex_mcko**: 1. One (or more) watchpoints has occurred (from Nexus1) & EOC = 2'b00

Table continues on the next page...

Table 62-40. Nexus 3 Auxiliary pins (continued)

Auxiliary pins	Input/ Output	Description of auxiliary pins
		2. Debug mode was entered (jd_debug_b asserted from Nexus1) & EOC = 2'b01
nex_evti_b	I	Event In (**nex_evti_b**) is an input that, when asserted, will initiate one of two events based on the EIC bits in the DC1 Register (if the Nexus module is enabled at reset): 1. Program Trace & Data Trace synchronization messages (provided Program Trace & Data Trace are enabled & EIC = 2'b00). 2. Debug request to Nexus1 module (provided EIC = 2'b01 and this feature is implemented).
nex_ext_src_id[0:3]	I	**nex_ext_src_id[0:3]** is used to provide the SRC field value used in each message. These pins are tied to a predetermined value at SoC integration time.
nex_sfwcntl_en]	I	**nex_sfwcntl_en** is used to allow software to control the module resources via the DCR register mappings. SoC logic should drive this signal appropriately in a semi-static manner based on the presence of an external hardware debugger and appropriate security precautions.

The Nexus auxiliary port arbitration pins are used when the Nexus 3 module is implemented in a multi-Nexus SoC that shares a single auxiliary output port. The arbitration is controlled by an SoC level Nexus Aurora Router (NAR). Refer to Auxiliary port arbitration for detail on Nexus port arbitration.

Table 62-41. Nexus port arbitration signals

Nexus port arbitration pins	Input/ Output	Description of arbitration pins
nex_aux_req[1:0]	O	Nexus Auxiliary Request (**nex_aux_req[1:0]**) output signals indicate to an SoC level Nexus arbiter a request for access to the shared Nexus auxiliary port in a multi-Nexus implementation. The priority encodings are determined by how many messages are currently in the message queues (See Table 62-43.)
nex_aux_busy	O	Nexus Auxiliary Busy (**nex_aux_busy**) is an output signal to an SoC level Nexus arbiter indicating that the Nexus 3 module is currently transmitting its message after being granted the Nexus auxiliary port.
nar_aux_grant	I	Nexus Auxiliary Grant **(nar_aux_grant)** is an input from the SoC level NAR that the auxiliary port has been granted to the Nexus 3 module to transmit its message.
ext_multi_nex_sel	I	Multi-Nexus Select (**ext_multi_nex_sel**) is a static signal indicating that the Nexus 3 module is implemented within a multi-Nexus environment. If set, port control and arbitration is controlled by the SoC level arbitration module (NAR).

62.17.2 Pin protocol

The protocol for the processor transmitting messages via the auxiliary pins is accomplished with the MSEO pin function outlined in Table 62-42. Both single and dual pin cases are shown.

nex_mseo_b[1:0] is used to signal the end of variable-length packets, and not fixed length packets. **nex_mseo_b[1:0]** is sampled on the rising edge of the Nexus 3 clock (**nex_mcko**).

Single pin MSEO is not supported on the MPC5744P.

Table 62-42. MSEO pin(s) protocol

nex_mseo_b function	Single nex_mseo_b data (serial)	Dual nex_mseo_b[1:0] data
Start of message	1-1-0	11-00
End of message	0-1-1-(more 1's)	00 (or 01)-11-(more 1's)
End of variable length packet	0-1-0	00-01
Message transmission	0's	00's
Idle (no message)	1's	11's

Figure 62-54 illustrates the state diagram for single pin MSEO transfers.

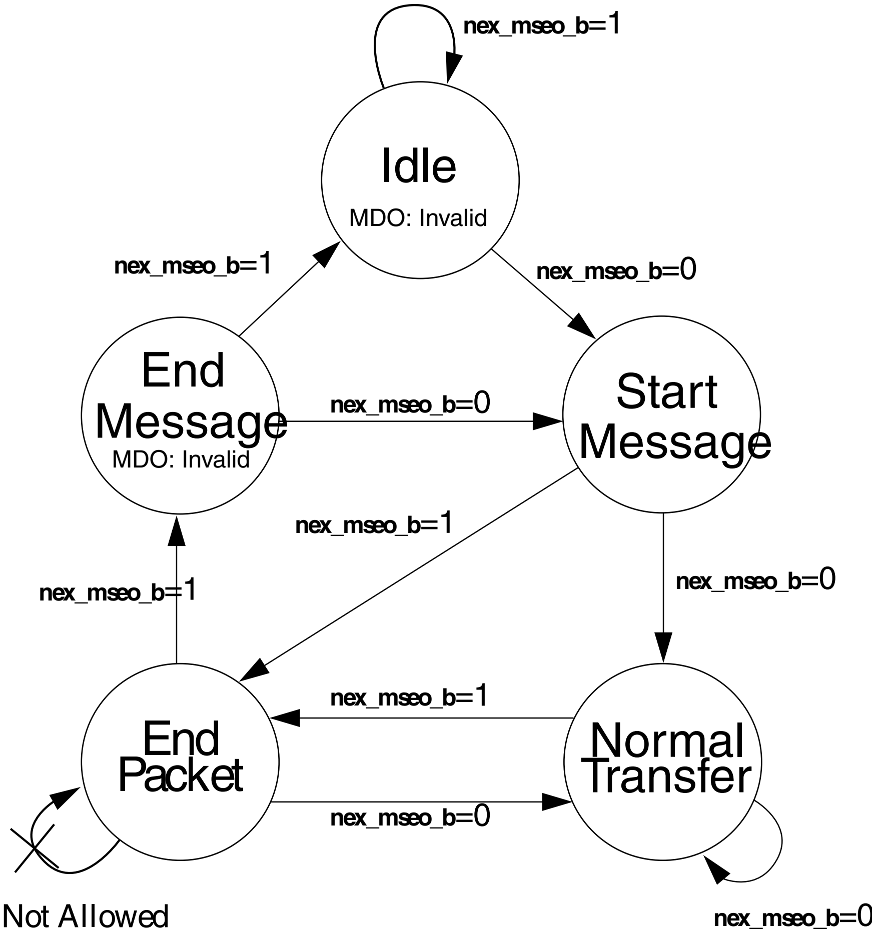

Figure 62-54. Single pin MSEO transfers

Note that the "End Message" state does not contain valid data on the **nex_mdo[n:0]** pins. Also, It is not possible to have two consecutive "End Packet" messages. This implies the minimum packet size for a variable length packet is 2x the number of **nex_mdo[n:0]** pins. This ensures that a false end of message state is not entered by emitting two consecutive '1's on the **nex_mseo_b** pin before the actual end of message.

Figure 62-55 illustrates the state diagram for dual pin MSEO transfers.

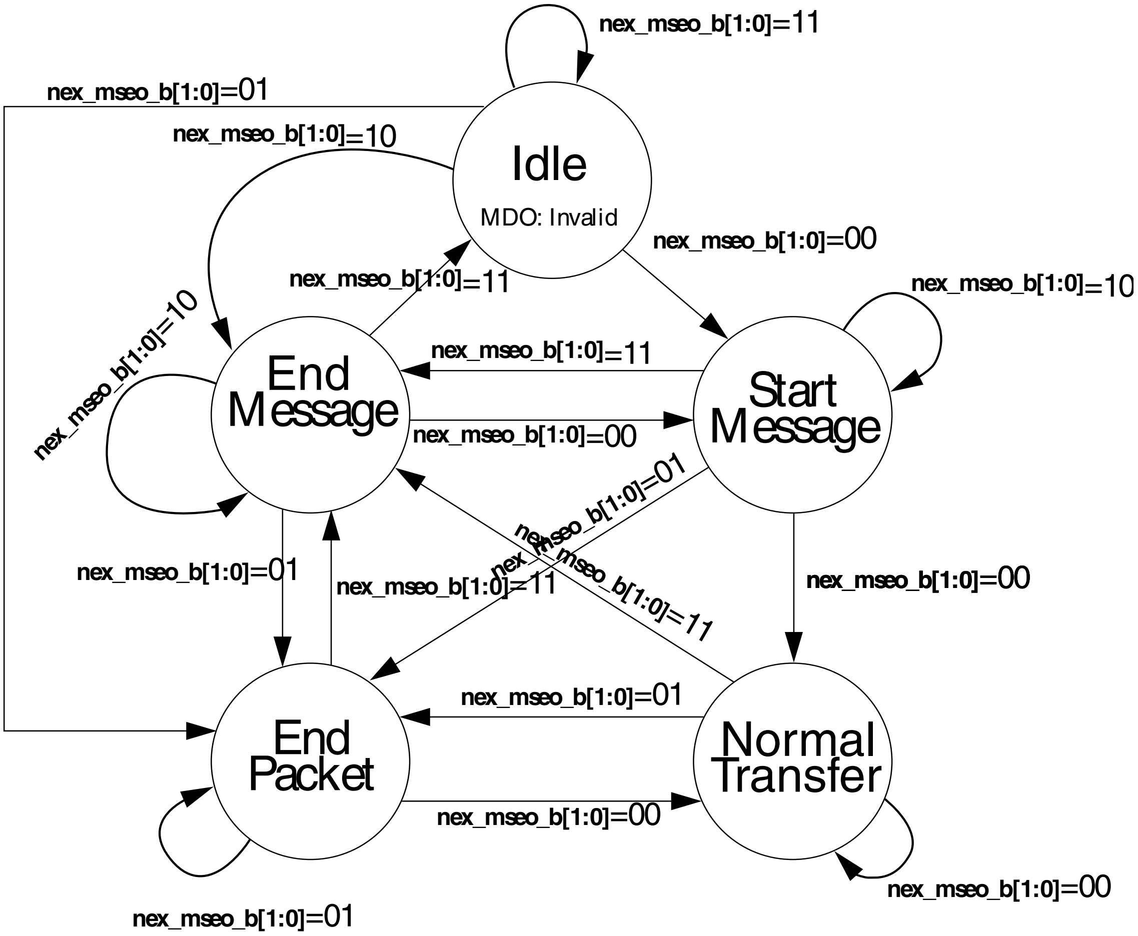

Figure 62-55. Dual pin MSEO transfers

The dual pin MSEO option is more robust that the single pin option. Termination of the current message may immediately be followed by the start of the next message on the consecutive clocks. An extra clock to end the message is not necessary as with the one MSEO pin option. The dual pin option also allows for consecutive "End Packet" states. This can be an advantage when small, variable sized packets are transferred.

Note

> The "End Message" state may also indicate the end of a variable-length packet as well as the end of the message when using the dual pin option.

62.18 Rules for output messages

Class 3 compliant embedded processors must provide messages via the auxiliary port in a consistent manner as described below:

- A variable-sized packet within a message must end on a port boundary.
- A variable-sized packet may start within a port boundary only when following a fixed length packet. (If two variable-sized packets end and start on the same clock, it is impossible to know which bit is from the last packet and which bit is from the next packet.)
- Whenever a variable-length packet is sized such that it does not end on a port boundary, it is necessary to extend and zero fill the remaining bits after the highest-order bit so that it can end on a port boundary.

  For example, if the **nex_mdo[n:0]** port is 2 bits wide, and the unique portion of an indirect address TCODE is 5 bits, then the remaining 1 bit of **nex_mdo[n:0]** must be packed with a 0.

62.19 Auxiliary port arbitration

In a multi-Nexus environment, the Nexus 3 module must arbitrate for the shared Nexus port at the SoC level.The request scheme is implemented as a 2-bit request with various levels of priority. The priority levels are defined in Table 62-43 below. The Nexus 3 module will receive a 1-bit grant signal (**nar_aux_grant**) from the SoC level arbiter. When a grant is received, the Nexus 3 module will begin transmitting its message following the protocol outlined in Pin protocol. The Nexus 3 module will maintain control of the port, by asserting the **nex_aux_busy** signal, until the $\overline{\text{MSEO}}$ state machine reaches the "End Message" state.

Table 62-43. MDO Request Encodings

Request level	MDO request encoding (nex_aux_req[1:0])	Condition of queue
No Request	00	No message to send
Low Priority	01	Message queue less than 1/2 full
—	10	Reserved
High Priority	11	Message queue 1/2 full or more

62.20 Examples

The following are examples of Program Trace and Data Trace Messages.

Table 62-44 illustrates an example Indirect Branch Message with 2 MDO / 1MSEO configuration. Table 62-45 illustrates the same example with an 8 MDO / 2 MSEO configuration.

Note that T0 and S0 are the least significant bits where:

- Tx = TCODE number (fixed)
- Sx = Source processor (fixed)
- MAP = (always set to 0)
- Ix = Number of instructions (variable)
- Ax = Unique portion of the address (variable)

Note that during clock 13, the **nex_mdo[n:0]** pins are ignored in the single MSEO case.

Table 62-44. Indirect Branch Message Example (2 MDO / 1 MSEO)

Clock	nex_mdo[1:0]		nex_mseo_b	State
0	X	X	1	Idle (or end of last message)
1	T1	T0	0	Start Message
2	T3	T2	0	Normal Transfer
3	T5	T4	0	Normal Transfer
4	S1	S0	0	Normal Transfer
5	S3	S2	0	Normal Transfer
6	I0	MAP	0	Normal Transfer
7	I2	I1	0	Normal Transfer
8	I4	I3	1	End Packet
9	A1	A0	0	Normal Transfer
10	A3	A2	0	Normal Transfer
11	A5	A4	0	Normal Transfer
12	A7	A6	1	End Packet
13	0	0	1	End Message
14	T1	T0	0	Start Message

Table 62-45. Indirect branch message example (8 MDO / 2 MSEO)

Clock	nex_mdo[7:0]								nex_mseo_b[1:0]		State
0	X	X	X	X	X	X	X	X	1	1	Idle (or end of last message)
1	S1	S0	T5	T4	T3	T2	T1	T0	0	0	Start Message
2	I4	I3	I2	I1	I0	M A P	S3	S2	0	1	End Packet
3	A7	A6	A5	A4	A3	A2	A1	A0	1	1	End Packet/End Message
4	S1	S0	T5	T4	T3	T2	T1	T0	0	0	Start Message

Table 62-46 and Table 62-47 illustrate examples of Direct Branch Messages: one with 2 MDO / 1 MSEO, and one with 8 MDO / 2 MSEO.

Note that T0 and I0 are the least significant bits where:

- Tx = TCODE number (fixed)
- Sx = Source processor (fixed)
- Ix = Number of Instructions (variable)

Table 62-46. Direct branch message example (2 MDO / 1 MSEO)

Clock	nex_mdo[1:0]		nex_mseo_b	State
0	X	X	1	Idle (or end of last message)
1	T1	T0	0	Start Message
2	T3	T2	0	Normal Transfer
3	T5	T4	0	Normal Transfer
4	S1	S0	0	Normal Transfer
5	S3	S2	0	Normal Transfer
6	I1	I0	1	End Packet
7	0	0	1	End Message

Table 62-47. Direct branch message example (8 MDO / 2 MSEO)

Clock	nex_mdo[7:0]								nex_mseo_b[1:0]		State
0	X	X	X	X	X	X	X	X	1	1	Idle (or end of last message)
1	S1	S0	T5	T4	T3	T2	T1	T0	0	0	Start Message
2	0	0	0	0	I1	I0	S3	S2	1	1	End Packet/End Message
3	S1	S0	T5	T4	T3	T2	T1	T0	0	0	Start Message

Table 62-48 illustrates an example Data Write Message with 8 MDO / 1 MSEO configuration, and Table 62-49 illustrates the same DWM with 8 MDO / 2 MSEO configuration

Note that T0, A0, D0 are the least significant bits where:

- Tx = TCODE number (fixed)
- Sx = Source processor (fixed)
- MAP = (always set to 0)
- Zx = Data size (fixed)
- Ax = Unique portion of the address (variable)
- Dx = Write data (variable 8-, 16- or 32-bit)

Table 62-48. Data write message example (8 MDO / 1 MSEO)

Clock	nex_mdo[7:0]								nex_mseo_b	State
0	X	X	X	X	X	X	X	X	1	Idle (or end of last message)
1	S1	S0	T5	T4	T3	T2	T1	T0	0	Start Message
2	A0	Z3	Z2	Z1	Z0	0	S3	S2	1	End Packet
3	D7	D6	D5	D4	D3	D2	D1	D0	0	Normal Transfer
4	0	0	0	0	0	0	0	0	1	End Packet
5	0	0	0	0	0	0	0	0	1	End Message

Table 62-49. Data write message example (8 MDO / 2 MSEO)

Clock	nex_mdo[7:0]								nex_mseo_b[1:0]		State
0	X	X	X	X	X	X	X	X	1	1	Idle (or end of last message)
1	S1	S0	T5	T4	T3	T2	T1	T0	0	0	Start Message
2	A0	Z3	Z2	Z1	Z0	0	S3	S2	0	1	End Packet
3	D7	D6	D5	D4	D3	D2	D1	D0	1	1	End Packet/ End Message

62.21 Electrical characteristics

For all electrical characteristics related to core processor and Nexus 3 operation, please refer to the MPC5744P Data Sheet.

62.22 IEEE 1149.1 (JTAG) RD/WR sequences

This section contains example JTAG/OnCE sequences used to access resources.

62.22.1 JTAG sequence for accessing internal Nexus registers

Table 62-50. Accessing internal Nexus 3 registers via JTAG/OnCE

Step #	TMS Pin	Description
1	1	IDLE -> SELECT-DR_SCAN
2	0	SELECT-DR_SCAN -> CAPTURE-DR (Nexus Command Register value loaded in shifter)
3	0	CAPTURE-DR -> SHIFT-DR
4	0	(7) TCK clocks issued to shift in direction (rd/wr) bit and first 6 bits of Nexus reg. addr.
5	1	SHIFT-DR -> EXIT1-DR (7th bit of Nexus reg. shifted in)
6	1	EXIT1-DR -> UPDATE-DR (Nexus shifter is transferred to Nexus Command Register)
7	1	UPDATE-DR -> SELECT-DR_SCAN
8	0	SELECT-DR_SCAN -> CAPTURE-DR (Register value is transferred to Nexus shifter)
9	0	CAPTURE-DR -> SHIFT-DR
10	0	(31) TCK clocks issued to transfer register value to TDO pin while shifting in TDI value
11	1	SHIFT-DR -> EXIT1-DR (MSB of value is shifted in/out of shifter)
12	1	EXIT1-DR -> UPDATE -DR (if access is write, shifter is transferred to register)
13	0	UPDATE-DR -> RUN-TEST/IDLE (transfer complete - Nexus controller to Reg. Select state)

62.22.2 JTAG sequence for read access of memory-mapped resources

Table 62-51. Accessing memory-mapped resources (reads)

Step #	TCLK clocks	Description
1	13	Nexus Command = write to Read/Write Access Address Register (RWA)
2	37	Write RWA (initialize starting read address — data input on TDI)
3	13	Nexus Command = write to Read/Write Control/Status Register (RWCS)
4	37	Write RWCS (initialize read access mode and CNT value — data input on TDI)
5	—	Wait for falling edge of **nex_rdy_b** pin
6	13	Nexus Command = read Read/Write Access Data Register (RWD)
7	37	Read RWD (data output on TDO)
8	—	If CNT > 0, go back to Step #5

62.22.3 JTAG sequence for write access of memory-mapped resources

Table 62-52. Accessing memory-mapped resources (writes)

Step #	TCLK clocks	Description
1	13	Nexus Command = write to Read/Write Access Control/Status Register (RWCS)
2	37	Write RWCS (initialize write access mode and CNT value - data input on TDI)
3	13	Nexus Command = write to Read/Write Address Register (RWA)
4	37	Write RWA (initialize starting write address - data input on TDI)
5	13	Nexus Command = read Read/Write Access Data Register (RWD)
6	37	Write RWD (data output on TDO)
7	—	Wait for falling edge of **nex_rdy_b** pin
8	—	If CNT > 0, go back to Step #5

Chapter 63
Nexus Crossbar Multi-Master Client (NXMC)

63.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The Nexus Crossbar Multi-master Client (NXMC) module provides real-time trace capabilities in compliance with the IEEE-ISTO Nexus 5001-2012 standard. This module provides development support capabilities for devices without requiring address and data pins for internal visibility. A portion of the pin interface is also compliant with the IEEE 1149.1 JTAG standard. The IEEE-ISTO 5001 standard defines an extensible auxiliary port which is used in conjunction with the JTAG port.

Many bus masters start accesses to internal address locations via the system bus. The NXMC module monitors the system bus and provides real-time trace information to debug or development tools.

63.1.1 Features

The NXMC module is compliant with the IEEE-ISTO 5001-2012 standard. The following features are implemented:

- Data trace via Data Write Messaging (DWM) and Data Read Messaging (DRM). This provides the capability for the development tool to trace reads and/or writes to (selected) internal memory resources.
- Multi-master tracing capability for multiple master accesses
- Watchpoint messaging based on internal/external triggers, via the auxiliary pins
- Watchpoint trigger events out based on internal/external triggers
- Watchpoint trigger enable of data trace messaging
- Start or stop of Tracing (Data Trace, Watchpoint Trace) based on internal triggers.

- Nexus Auxiliary port for higher data throughput
  - 4 MDO (Message Data Out) pins
  - Two $\overline{\text{MSEO}}$ (Message Start/End Out) pins
  - One $\overline{\text{EVTO}}$ (Watchpoint Event) pin
  - One $\overline{\text{EVTI}}$ (Event In) pin
  - One MCKO (Message Clock Out) pin
- Registers for data trace, watchpoint generation, and watchpoint trigger
- All features controllable and configurable via the JTAG port

63.2 External signal description

This section details information regarding the standard ports and protocol. The NXMC pin interface provides the function of transmitting messages from the messages queues to NPC. It is also responsible for handshaking with the message queues.

The NXMC module implements the following signals:

- One $\overline{\text{EVTI}}$
- One $\overline{\text{EVTO}}$
- Two $\overline{\text{MSEO}}$
- 4 MDOs
- One MCKO

These pins are described in Table 63-2.

All NXMC input functionality is controlled through the JTAG port in compliance with IEEE 1149.1 (see IEEE 1149.1 (JTAG) Test Access Port for details). A separate JTAG TAP controller is instantiated within the NXMC. The following table describes the JTAG pins.

Table 63-1. JTAG pins for NXMC

JTAG port	Input/ output	Description
TDO	O	The Test Data Output (TDO) pin is the serial output for test instructions and data. TDO is three-stateable and is actively driven in the shift-IR and shift-DR controller states. TDO changes on the falling edge of TCK.
TDI	I	The Test Data Input (TDI) pin receives serial test instruction and data. TDI is sampled on the rising edge of TCK and has an internal pull-up resistor.
TMS	I	The Test Mode Select (TMS) input pin is used to sequence the JTAG test controllers' state machine. TMS is sampled on the rising edge of TCK and has an internal pull-up resistor.
TCK	I	The Test Clock (TCK) input pin is used to synchronize the test logic, and control register access through the JTAG port.
TRST	I	The Test Reset ($\overline{\text{TRST}}$) input pin is used to asynchronously initialize the JTAG controller. The $\overline{\text{TRST}}$ pin has an internal pull-down resistor.

Table 63-2. NXMC auxiliary pins

Auxiliary port	Input/ output	Description
MCKO	O	Message Clock Out (MCKO) is a Nexus generated output clock to development tools for timing of MDO and $\overline{\text{MSEO}}$ pin functions. MCKO is programmable through the DC Register.
MDO[4:0]	O	Message Data Out (MDO[4:0]) are output pins used for DTM and WPM (watch point message). External sampling of MDO by the development tool shall occur on rising edge of the Nexus clock (MCKO).
$\overline{\text{MSEO}}$[1:0]	O	Message Start/End Out ($\overline{\text{MSEO}}$) are output pins which indicate when a message on the MDO pins has started, when a variable length packet has ended, and when the message has ended. External sampling of $\overline{\text{MSEO}}$ shall occur on rising edge of the Nexus clock (MCKO).
EVTO	O	Event Out ($\overline{\text{EVTO}}$) is an output which, when asserted, indicates one of two events has occurred based on the EOC bits in the DC Register: • one of the internal or external watchpoints has occurred and EOC = 2'b00 • system-level debug mode was entered (ipg_debug) and EOC = 2'b01 $\overline{\text{EVTO}}$ is held asserted for one cycle.
EVTI	I	Event In ($\overline{\text{EVTI}}$) is an input which initiates synchronization messages. If the Nexus module is enabled at reset, (see Enabling NXMC operation), assertion initiates data trace synchronization messages (provided data trace is enabled).

63.3 Supported messages and TCODEs

The NXMC pins allow for flexible transfer operations via public messages. A TCODE defines the transfer format, the number and/or size of the packets to be transferred, and the purpose of each packet. The IEEE-ISTO 5001-2012 standard defines a set of public messages. The NXMC block supports the public TCODEs listed in the following table. The SRC and MASTER field values are described in the device-specific chapter that describes how the modules are configured.

Table 63-3. Supported public TCODEs

Message name	Min packet size (bits)	Max packet size (bits)	Packet name	Packet type	Packet description
Data Trace - Data Write Message	6	6	TCODE	fixed	TCODE number = 58
	4	4	SRC	fixed	Source processor identifier (multiple Nexus configuration)
	4	4	MASTER	fixed	Indicates which master (ID) initiated the data access
	3	3	DSZ	fixed	Data size (See Table 63-4)
	1	32	U-ADDR	variable	Unique portion of the data write address
	8	64	DATA	fixed	Data write value (size fixed based on DSZ field)

Table continues on the next page...

Table 63-3. Supported public TCODEs (continued)

Message name	Min packet size (bits)	Max packet size (bits)	Packet name	Packet type	Packet description
Data Trace - Data Read Message	6	6	TCODE	fixed	TCODE number = 59
	4	4	SRC	fixed	Source processor identifier (multiple Nexus configuration)
	4	4	MASTER	fixed	Indicates which master (ID) initiated the data access
	3	3	DSZ	fixed	Data size (See Table 63-4)
	1	32	U-ADDR	variable	Unique portion of the data read address
	8	64	DATA	fixed	Data read value (size fixed based on DSZ field)
Error Message	6	6	TCODE	fixed	TCODE number = 8
	4	4	SRC	fixed	Source processor identifier (multiple Nexus configuration)
	4	4	ETYPE	fixed	Error type (See Table 63-5)
	14	14	ECODE	fixed	Error code (See Table 63-6)
Data Trace - Data Write Message w/ Sync	6	6	TCODE	fixed	TCODE number = 60
	4	4	SRC	fixed	Source processor identifier (multiple Nexus configuration)
	4	4	MASTER	fixed	Indicates which master (ID) initiated the data access
	3	3	DSZ	fixed	Data size (See Table 63-4)
	1	32	F-ADDR	variable	Full access address (leading zero (0) truncated)
	8	64	DATA	fixed	Data write value (size fixed based on DSZ field)
Data Trace - Data Read Message w/ Sync	6	6	TCODE	fixed	TCODE number = 61
	4	4	SRC	fixed	Source processor identifier (multiple Nexus configuration)
	4	4	MASTER	fixed	Indicates which master (ID) initiated the data access
	3	3	DSZ	fixed	Data size (See Table 63-4)
	1	32	F-ADDR	variable	Full access address (leading zero (0) truncated)
	8	64	DATA	fixed	Data read value (size fixed based on DSZ field)
Watchpoint Message	6	6	TCODE	fixed	TCODE number = 15
	4	4	SRC	fixed	Source processor identifier (multiple Nexus configuration)
	1	8	WPHIT	variable	Watchpoint source(s) number (See Table 63-22)

Table 63-4. Data trace size (DSZ) encodings (TCODE = 58, 59, 60, 61)

DSZ	Transfer size
001	8-bit
010	16-bit
011	32-bit
100	64-bit
000, 101-111	Reserved

Table 63-5. Error Type (ETYPE) encodings (applicable to all error messages)

ETYPE	Description
0000	Queue overrun caused message (one or more) to be lost
0001	Contention with higher priority message caused message(s) to be lost
0010	Reserved
0011	Reserved
0100	Reserved
0101	Invalid access opcode (Nexus register unimplemented)
0110–1111	Reserved

Table 63-6. Error Code (ECODE) encodings (applicable based on error source)

ECODE		Description[1]
13 to 8	7 to 0	
Source (SRC)		
000000	XXXXXXX1	Watchpoint Message(s) lost
000000	XXXXXX1X	Data Trace Message(s) lost
000000	XXXXX1XX	Reserved
000000	XXXX1XXX	Reserved
000000	XXX1XXXX	Reserved
000000	XX1XXXXX	Reserved
000000	X1XXXXXX	Reserved
000000	1XXXXXXX	Reserved
Source (SRC) n = peripheral index		
CKSRCn	XXXXXXX1	Reserved
CKSRCn	XXXXXX1X	Reserved
CKSRCn	XXXXX1XX	Reserved
CKSRCn	XXXX1XXX	Reserved
CKSRCn	XXX1XXXX	Reserved
CKSRCn	XX1XXXXX	Reserved
CKSRCn	X1XXXXXX	Reserved
CKSRCn	1XXXXXXX	Reserved

1. The SRC field values are described in the device-specific chapter that describes how the modules are configured.

63.4 Register description

This section describes the NXMC register definition. Nexus registers are accessed using the JTAG port in compliance with IEEE 1149.1. See IEEE 1149.1 (JTAG) Test Access Port for details. The complete list of registers is shown in this table.

Table 63-7. NXMC registers

Nexus register	Nexus access opcode (hex)	Read/ write	Read address (hex)	Write address (hex)
Development Control 1 (DC1)	2	R/W	04	05
Development Control 2 (DC2)	3	R/W	06	07
Watchpoint Trigger (WT)	B	R/W	16	17
Data Trace Control (DTC)	D	R/W	1A	1B
Data Trace Start Address1 (DTSA1)	E	R/W	1C	1D
Data Trace Start Address2 (DTSA2)	F	R/W	1E	1F
Data Trace End Address1 (DTEA1)	12	R/W	24	25
Data Trace End Address2 (DTEA2)	13	R/W	26	27
Breakpoint/Watchpoint Control Register1 (BWC1)	16	R/W	2C	2D
Breakpoint/Watchpoint Control Register2 (BWC2)	17	R/W	2E	2F
Breakpoint/Watchpoint Address Register1 (BWA1)	1E	R/W	3C	3D
Breakpoint/Watchpoint Address Register2 (BWA2)	1F	R/W	3E	3F

63.4.1 Development control register 1 (DC1)

The Development Control Registers control the basic development features of the NXMC module. This table shows the format of the DC1.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	0	0	EOC		0	0	WEN	0	0	0	0	0	0	0	0	0	C	0	0	0	0	0	0	0	0	0	EIC		TM		
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The DC1 is described in this table.

Table 63-8. DC1 register field description

Field	Description
31:29	Reserved for future functionality (read as 0)
28:27 EOC	$\overline{\text{EVTO}}$ Control. 00 $\overline{\text{EVTO}}$ upon occurrence of watchpoint (internal) 01 $\overline{\text{EVTO}}$ upon entry into system-level Debug Mode 1x Reserved
26:25	Reserved for future functionality (read as 0)
24 WEN	Watchpoint Trace Enable. 0 Watchpoint Messaging disabled 1 Watchpoint Messaging enabled
23:5	Reserved for future functionality (read as 0)

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The DC2 is described in this table.

Table 63-9. DC2 register field description

Field	Description	
31:24 EWC	$\overline{\text{EVTO}}$ Watchpoint Configuration[1].	
	00000000	No Watchpoints trigger $\overline{\text{EVTO}}$
	1XXXXXXX	Reserved
	X1XXXXXX	Reserved
	XX1XXXXX	Reserved
	XXX1XXXX	Reserved
	XXXX1XXX	Internal Watchpoint #1 triggers $\overline{\text{EVTO}}$
	XXXXX1XX	Internal Watchpoint #2 triggers $\overline{\text{EVTO}}$
	XXXXXX1X	Reserved
	XXXXXXX1	Reserved
23:0	Reserved for future functionality (read as 0)	

[1] The EOC bits in DC1 must be programmed to trigger EVTO on watchpoint occurrence for the EWC bits to have any effect.

63.4.3 Watchpoint trigger register (WT)

The Watchpoint Trigger Register allows the watchpoints defined either internally to the NXMC module or by an external module to trigger actions. These watchpoints can control data trace enable and disable.

The WT bits can be used to produce an address related window for triggering trace messages. This table shows the format of the WT register.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	0	0	0	0	0	DTS			DTE			0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The WT register is described in this table.

Table 63-10. WT register field description

Field	Description[1]

19:0	Reserved for future functionality (read as 0)

[1] The WT bits only enable data trace if the TM bits in the Development Control Register (DC) have not already been set to enable data trace.

63.4.4 Data trace control register (DTC)

The Data Trace Control Register controls whether DTM messages are restricted to reads, writes or both for a user programmable address range. There are two data trace channels controlled by the DTC for the NXMC module. This table shows the format of the DTC register.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RWT1		RWT2		0	0	0	MME	0	0			MID				0	0	0	0	0	0	0	0	RC1	RC2	0	0	0	0	0	0
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The DTC register is described in this table.

Table 63-11. DTC field description

Field	Description
31:30 RWT1	Read/Write Trace 1. 00 No trace messages generated x1 Enable data read trace 1x Enable data write trace

Table continues on the next page...

Table 63-11. DTC field description (continued)

Field	Description

27:25	Reserved for future functionality
24 MME	Multi Master Tracing enable. 0 Tracing enabled only for Master with ID = MID (DTC[19:16]) 1 Tracing enabled for all the Masters
23:20	Reserved for future functionality
19:16 MID	ID of the system bus Master to be traced[1]
15:8	Reserved for future functionality
7 RC1	Range Control 1. 0 Condition trace on address within range (endpoints inclusive) 1 Condition trace on address outside of range (endpoints exclusive)
6 RC2	Range Control 2. 0 Condition trace on address within range (endpoints inclusive) 1 Condition trace on address outside of range (endpoints exclusive)
5:0	Reserved for future functionality

[1] The MASTER field values are described in the device-specific chapter that describes how the modules are configured.

63.4.5 Data trace start address registers 1 and 2 (DTSA1 and DTSA2)

The Data Trace Start Address Registers define the start addresses for each trace channel. This table shows the format of the DTSA1 and DTSA2 registers.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA TRACE START ADDRESS																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

63.4.6 Data trace end address registers 1 and 2 (DTEA1 and DTEA2)

The Data Trace End Address Registers define the end addresses for each Trace channel. This table shows the format of the DTEA1 and DTEA2 registers.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DATA TRACE END ADDRESS																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

This table illustrates the range that are selected for data trace for various cases of DTSA being less than, greater than, or equal to DTEA.

Table 63-12. Data trace address range options

Programmed values	Range control bit value	Range selected
DTSA ≤ DTEA	0	DTSA -> <- DTEA
DTSA ≤ DTEA	1	<- DTSA DTEA ->
DTSA > DTEA	N/A	Invalid range—no trace

Note

> DTSA must be less than (or equal to) DTEA in order to guarantee correct data write/read traces.
>
> When the range control bit is 0 (internal range), accesses to DTSA and DTEA addresses are traced. When the range control bit is 1 (external range), accesses to DTSA and DTEA are not traced.

63.4.7 Breakpoint/watchpoint control register 1 (BWC1)

Breakpoint/watchpoint control register 1 controls the attributes for generation of NXMC watchpoint#1. This table shows the format of the BWC1 register.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	BWE1		BRW1		0	0	0	0	0	0	0	0	0	0	BWR1		BWT1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The BWC1 register is described in this table.

Table 63-13. BWC1 field description

Field	Description
31:30 BWE1	Breakpoint/Watchpoint #1 Enable. 00 Internal Nexus Watchpoint #1 disabled 01 Reserved 10 Reserved 11 Internal Nexus Watchpoint #1 enabled

31:30 BWE2	Breakpoint/Watchpoint #2 Enable. 00 Internal Nexus Watchpoint #2 disabled 01 Reserved 10 Reserved 11 Internal Nexus Watchpoint #2 enabled
29:28 BRW2	Breakpoint/Watchpoint #2 Read/Write Select. 00 Watchpoint #2 hit on read accesses 01 Watchpoint #2 hit on write accesses 10 Watchpoint #2 on read or write accesses 11 Reserved
27:18	Reserved for future functionality (read as 0)
17:16 BWR2	Breakpoint/Watchpoint #2 Register Compare. 00 No Register Compare (same as BWC2[31:30] = 2b00) 01 Reserved 10 Compare with BWA2 value 11 Reserved
15 BWT2	Breakpoint/Watchpoint #2 Type. 0 Reserved 1 Watchpoint #2 on data accesses
14:0	Reserved for future functionality (read as 0)

63.4.9 Breakpoint/watchpoint address registers 1 and 2 (BWA1 and BWA2)

The Breakpoint/Watchpoint Address Registers are compared with system bus addresses in order to generate internal watchpoints. This table shows the format of the BWA1 and BWA2 registers.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	BREAKPOINT / WATCHPOINT ADDRESS																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

63.4.10 Unimplemented registers

Unimplemented registers are those with client select and index value combinations other than those listed in Table 63-7. For unimplemented registers, the NXMC module drives TDO to zero during the SHIFT-DR state. It also transmits an error message with the invalid access opcode encoding (ETYPE = 0101).

63.5 Programming considerations (RESET)

If NXMC register configuration is to occur during system reset (as opposed to debug mode), all NXMC configuration should be completed between the negation of $\overline{\text{TRST}}$ and system reset de-assertion. The JTAG ID register should be read by the tool after negation of $\overline{\text{TRST}}$ and should be programmed before deassertion of system reset.

63.5.1 IEEE 1149.1 (JTAG) Test Access Port

The NXMC module uses the IEEE 1149.1 TAP controller for accessing Nexus resources. The JTAG signals themselves are shared by all TAP controllers on the device. The NXMC module implements a 4-bit Instruction Register (IR). The valid instructions and method for register access are outlined in NXMC register access via JTAG.

63.5.2 Enabling NXMC operation

The Nexus module is enabled by loading a single instruction into the JTAG Instruction Register (IR). Once enabled, the module is ready to accept control input via the JTAG pins.

The Nexus module is disabled when the JTAG state machine reaches the Test-Logic-Reset state. This state can be reached by the assertion of the $\overline{\text{TRST}}$ pin or by cycling through the state machine using the TMS pin. The Nexus module is also disabled if a Power-on-Reset (POR) event occurs.

If the NXMC module is disabled, no trace output is provided. Nexus registers are not available for reads or writes.

63.5.3 Enabling NXMC TAP controller

Assertion of a Power-on-Reset signal or assertion of the $\overline{\text{TRST}}$ pin resets all TAP controllers. Upon exit from the Test-Logic-Reset state, the IR value is loaded with the JTAG ID. When the NXMC TAP is accessed, this information helps the development tool obtain information about the Nexus module it is accessing, such as version, sequence, feature set, etc.

63.5.4 NXMC register access via JTAG

Access to Nexus register resources is enabled by loading a single instruction into the JTAG Instruction Register (IR).

Once the JTAG NEXUS-ACCESS instruction has been loaded, the JTAG port allows tool/target communications with all Nexus registers according to the map in Table 63-7.

Reading/writing of a Nexus register then requires two passes through the Data-Scan (DR) path of the JTAG state machine.

1. The first pass through the DR selects the Nexus register to be accessed by providing an index (see Table 63-7), and the direction (read/write). This is achieved by loading an 8-bit value into the JTAG Data Register (DR). This register has the format shown below.

	7	6	5	4	3	2	1	0
R W	Nexus Register Index							R/W
Reset	0	0	0	0	0	0	0	0

Table 63-15. JTAG DR field description for Nexus register access

Field	Description
Nexus Register Index	Selected from values in Table 63-7
Read/Write (R/W)	0 Read 1 Write

2. The second pass through the DR then shifts the data in or out of the JTAG port, LSB first.

a. During a read access, data is latched from the selected Nexus register when the JTAG state machine passes through the Capture-DR state.

b. During a write access, data is latched into the selected Nexus register when the JTAG state machine passes through the Update-DR state.

63.6 Functional description

The following sections describe the functionality of the NXMC module.

63.6.1 Data trace

This section describes the data trace mechanism supported by the NXMC module. Data trace is implemented via Data Write Messaging (DWM) and Data Read Messaging (DRM), as per the IEEE-ISTO 5001-2012 standard.

63.6.1.1 Data trace messaging (DTM)

NXMC data trace messaging is accomplished by snooping the system bus and storing the information for qualifying accesses (based on enabled features and matching target addresses). The NXMC module traces all data access that meet the selected range and attributes.

63.6.1.2 DTM message formats

The NXMC block supports five types of DTM messages:

- Data write
- Data read
- Data write synchronization
- Data read synchronization
- Error messages

63.6.1.2.1 Data write and data read messages

The data write and data read messages contain the data write/read value and the address of the write/read access, relative to the previous data trace message. The DATA field is considered fixed based on the DSZ encodings to either 8, 16, 32 , 64. Data write message and data read message information is messaged out in the format shown in the following figure. The SRC field values are described in the device-specific chapter that describes how the modules are configured.

Table 63-16. DTM message format for DATA width = 64 bits

8/16/32/64 bits	1–32 bits	3 bits	4 bits	4 bits	6 bits
DATA	U-ADDR	DSZ	MASTER	SRC	TCODE (111010 or 111011)

63.6.1.2.2 Data trace with non-contiguous byte strobes asserted

The v6 extensions to AMBA 2.0 allow system bus transfers with bytes non-asserted byte strobes in between asserted byte strobes. The NXMC does not support transfers with non-contiguous byte strobes asserted. In such a condition, the invalid bytes in the DATA packet are driven to the value of 0xFF.

63.6.1.2.3 DTM overflow error messages

An error message occurs when a new message cannot be queued due to the message queue being full. The FIFO discards incoming messages until it has completely emptied the queue. Once emptied, an error message is queued. The error encoding indicates which type(s) of messages attempted to be queued while the FIFO was being emptied.

If only a data trace message attempts to enter the queue while it is being emptied, the error message incorporates the data trace only error encoding (ECODE = 00000000000010). If a watchpoint also attempts to be queued while the FIFO is being emptied, then the error message incorporates error encoding (ECODE = 00000000000011).

Error information is messaged out in the format shown in this figure. The SRC field values are described in the device-specific chapter that describes how the modules are configured.

Table 63-17. DTM error message format (fixed length = 28 bits)

14 bits	4 bits	4 bits	6 bits
ECODE	ETYPE	SRC	TCODE (001000)

NOTE

The internal queue FIFO is very small. This causes FIFO overflows whenever Trace is enabled on any of the AHB clients and the AHB master module generates >4 burst accesses. If the customer is experiencing a lot of overflow error messages the amount of data snooped by the NXMC should be reduced.

63.6.1.2.4 Data trace synchronization messages

A data trace write/read with synchronization message is messaged via the auxiliary port (provided data trace is enabled) for the following conditions (see Table 63-19):

- Initial data trace message upon exit from system reset or whenever data trace is enabled is a synchronization message.
- Upon returning from a low power state, the first data trace message is a synchronization message.
- Upon returning from debug mode, the first data trace message is a synchronization message.
- After occurrence of queue overrun (can be caused by any trace message), the first data trace message is a synchronization message.
- After the periodic data trace counter has expired indicating 255 without-sync data trace messages have occurred since the last with-sync message occurred.
- Upon assertion of the event in (EVTI) pin, the first data trace message is a synchronization message if the EIC bits of the DC Register have enabled this feature.
- Upon data trace write/read after the previous DTM Message was lost due to a collision while entering the FIFO between the DTM message and any of the following: error message, or watchpoint message or peripheral message.This is a very rare occurrence and possible only in case of continuous burst on the system bus as well as watchpoint events which is unrealistic.

Data trace synchronization messages provide the full address (without leading zeros) and ensure that development tools fully synchronize with data trace regularly. Synchronization messages provide a reference address for subsequent DTMs, in which only the unique portion of the data trace address is transmitted. The format for data trace write/read with synchronization messages is shown in the following figure. The SRC and MASTER field values are described in the device-specific chapter that describes how the modules are configured.

Table 63-18. Data write/read with synchronization message format

8-64 bits	1–32 bits	3 bits	4 bits	4 bits	6 bits
DATA	F-ADDR	DSZ	MASTER	SRC	TCODE (111100 or 111101)

Exception conditions that result in data trace synchronization are summarized in this table.

Table 63-19. Data trace exception summary

Exception condition	Exception handling
System Reset Negation	At the negation of JTAG reset ($\overline{\text{TRST}}$), queue pointers, counters, state machines, and registers within the NXMC module are reset. If data trace is enabled, the first data trace message is a data write/read with synchronization message.
Data Trace Enabled	The first data trace message (after data trace has been enabled) is a synchronization message.
Exit from Low Power/Debug	Upon exit from a low power mode or debug mode the next data trace message is converted to a data write/read with synchronization message.
Queue Overrun	An error message occurs when a new message cannot be queued due to the message queue being full. The FIFO discards messages until it has completely emptied the queue. Once emptied, an error message is queued. The error encoding indicates which type(s) of messages attempted to be queued while the FIFO was being emptied. The next DTM message in the queue is a data write/read with synchronization message.
Periodic Data Trace Synchronization	A forced synchronization occurs periodically after 255 data trace messages have been queued. A data write/read with synchronization message is queued. The periodic data trace message counter then resets.
Event In	If the Nexus module is enabled, an $\overline{\text{EVTI}}$ assertion initiates a data write/read with synchronization message upon the next data write/read (if data trace is enabled and the EIC bits of the DC Register have enabled this feature).
Collision Priority	All messages have the following priority: Error > WPM > DTM. Although a very rare occurrence, during simultaneous burst lower priority messages can be lost due to burst of high priority messages. Proper error messages are generated and in case of DTM lost a subsequent read/write queues a data write/read with synchronization message.

63.6.1.3 Enabling data trace messaging operation

Data trace messaging can be enabled in one of three ways:

- Setting the TM field of the DC Register via JTAG to enable data trace (DC[1]).

- Using the DTS field of the WT Register to enable data trace on watchpoint hits (either watchpoints configured within the NXMC module or external watchpoint inputs controlled by the device).
- By toggling the external start control, which in turn sets the TM field of the DC register to enable data trace. (The TM bit clears and hence the data tracing stops on the toggle of external stop control. In case of conflict between JTAG write and external start/stop control, JTAG write takes precedence.

Note

When enabling the DTM, either via JTAG or external start/stop control, it is important to make sure that all the other controls (i.e. DTC, DTSA/E1/2 and WT register fields) are correctly configured to ensure correct DTM functionality.

63.6.1.4 DTM queueing

The NXMC implements a programmable depth queue for queuing all messages. Messages that enter the queue are transmitted via the auxiliary pins in the order in which they are queued.

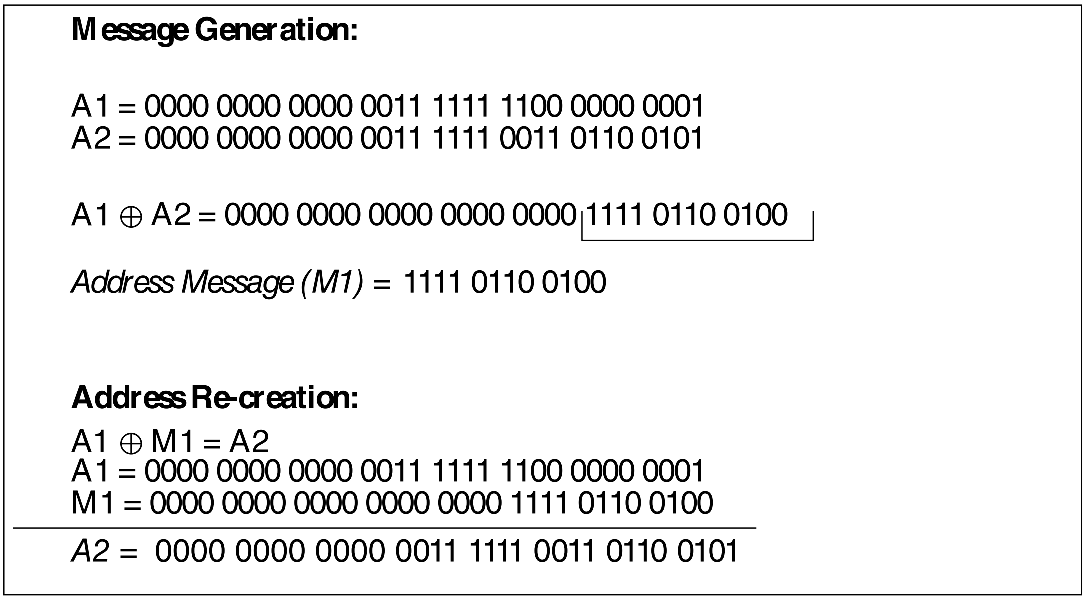
Note

If multiple trace messages need to be queued at the same time, watchpoint messages have the highest priority (WPM > DTM).

63.6.1.5 Relative addressing

The relative address feature is compliant with IEEE-ISTO 5001-2012 and is designed to reduce the number of bits transmitted for addresses of data trace messages. The address transmitted is relative to the address of the previous data trace message. It is generated by XORing the new address with the previous address, and then using only the results up to the most significant 1 in the result. To recreate this address, an XOR of the (most-significant 0-padded) message address with the previously decoded address gives the current address.

For example, if the previous address (A1) = 0x0003FC01, the new address (A2) = 0x0003F365 as shown in this figure.



Message Generation:

A1 = 0000 0000 0000 0011 1111 1100 0000 0001
A2 = 0000 0000 0000 0011 1111 0011 0110 0101

$A1 \oplus A2 = 0000\ 0000\ 0000\ 0000\ 0000\ \underbrace{1111\ 0110\ 0100}$

Address Message (M1) = 1111 0110 0100

Address Re-creation:

$A1 \oplus M1 = A2$
A1 = 0000 0000 0000 0011 1111 1100 0000 0001
M1 = 0000 0000 0000 0000 0000 1111 0110 0100

A2 = 0000 0000 0000 0011 1111 0011 0110 0101

Figure 63-1. Relative addressing example

63.6.1.6 Data trace windowing

Data write/read messages are enabled via the RWT1(2) field in the Data Trace Control Register (DTC) for each DTM channel. Data trace windowing is achieved via the address range defined by the DTEA and DTSA Registers and by the RC1(2) field in the DTC. All system bus DMA initiated read/write accesses which fall inside or outside these address ranges, as programmed, are candidates to be traced.

63.6.1.7 System bus cycle special cases

The system bus cycle special cases are shown in this table.

Table 63-20. System Bus cycle special cases

Special case	Action
System bus cycle with data error	Data trace message discarded
System bus cycle completed without error	Cycle captured and transmitted
System bus cycle is an instruction fetch	Cycle ignored

63.6.1.8 System bus multi-master tracing

DTM tracing can be done either for all the masters or for a single master (indicated by the MID field of the DTC register) based on the DTC register MME field. In case of single master, the correct value needs to be configured in the MID register before enabling the data trace operation.

The MASTER field of the DTM message (see figure in Data write and data read messages for an example) indicates the system bus master for which the trace has been generated. For each masters (0 to 15) there is a parameter associated (MSID0-15) for indicating its actual ID, which finally gets inserted in the MASTER field. The MASTER field values are described in the device-specific chapter that describes how the modules are configured.

63.6.2 Watchpoint support

The NXMC module provides watchpoint messaging via the auxiliary pins, as defined by IEEE-ISTO 5001-2012. Watchpoint messages can be generated by either using the NXMC defined internal watchpoints or by externally defined watchpoint signals.

63.6.2.1 Watchpoint messaging

Enabling watchpoint messaging is accomplished by setting the WEN bit in the DC Register. This bit is set either via JTAG write 1 access or external start indication, and cleared via JTAG write 0 access or external start indication. In case of conflict between JTAG write and external start/stop control, JTAG write takes precedence.

Note

> In case of enabling the watchpoint messaging, either via JTAG or external start/stop control, it is important to make sure that all the other Watch Point Message (WPM) controls (i.e. BWC1/2, BWA1/2 register fields) are configured with the correct values in order to ensure correct WPM operation.

Watchpoint setting is supported through two methods:

- Internal watchpoints—Using the BWC1(2) registers, two independently controlled internal watchpoints can be initialized. When a system bus access address matches on BWA1(2), a watchpoint message is transmitted. The system bus multi-master or single master controls applies here too as explained for DTM (in System bus multi-master tracing).
- External watchpoints—The NXMC module supports two external watchpoint inputs. The optional logic to generate these watchpoint signals is implemented at the device level. The watchpoints are described in the device-specific chapter that describes how the modules are configured. If either of these signals asserts (i.e, on 0-to-1 transition), a watchpoint message is transmitted.

The Nexus module provides watchpoint messaging using the IEEE-ISTO 5001 defined TCODE. When any of the four possible watchpoint sources asserts, a message is sent to the queue to be messaged out. This message indicates the watchpoint number as shown in Table 63-21 and Table 63-22.

Table 63-21. Watchpoint message format (fixed length = 18 bits)

8 bits	4 bits	6 bits
WPHIT (RRRRXXXX)	SRC	TCODE (001111)

Table 63-22. Watchpoint source description

Watchpoint source (8-bits)	Watchpoint description
RRRRXXX1[1]	External Watchpoint #1(device defined)
RRRRXX1X	External Watchpoint #2 (device defined)
RRRRX1XX	Internal Watchpoint #1 (BWA1 match)
RRRR1XXX	Internal Watchpoint #2 (BWA2 match)

[1] R = reserved for future use (insert 0s).

63.6.2.2 Watchpoint error message

An error message occurs when a new message cannot be queued due to the message queue being full. The FIFO discards messages until it has completely emptied the queue. Once emptied, an error message is queued. The error encoding indicates which type(s) of messages attempted to be queued while the FIFO was being emptied.

If only a watchpoint message attempts to enter the queue while it is being emptied, the error message incorporates the watchpoint only error encoding (ECODE = 0000000000001). If a data trace message also attempts to enter the queue while it is being emptied, the error message incorporates error encoding (0000000000011). Error information is messaged out in the format shown in this figure.

Table 63-23. Error message format (fixed length = 28 bits)

14 bits	4 bits	4 bits	6 bits
ECODE	ETYPE	SRC	TCODE (001000)

Chapter 64
Nexus Port Controller (NPC)

64.1 Introduction

The following figure is a block diagram of the Nexus Port Controller (NPC) block.

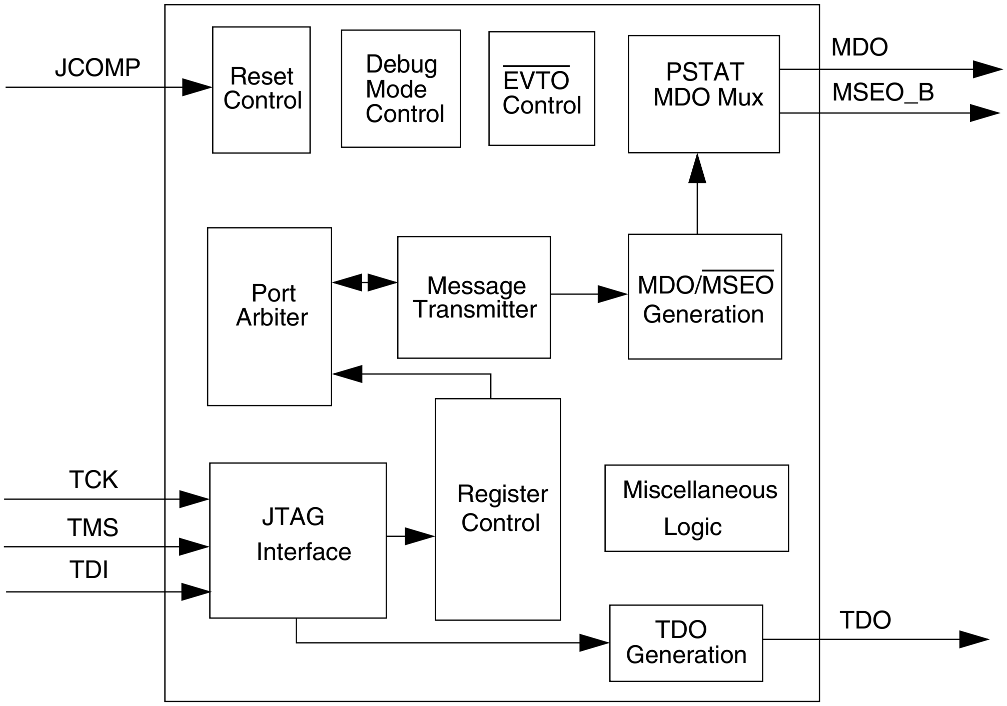


Figure 64-1. Nexus Port Controller Block Diagram

64.1.1 Overview

On a system-on-a-chip device, there are often multiple blocks that require development support. Each of these blocks implements a development interface based on the IEEE-ISTO 5001-2001 standard. The blocks share input and output ports that interface with the development tool. The NPC controls the usage of the input and output port in a manner that allows all the individual development interface blocks to share the port, and appear to the development tool to be a single block.

64.1.2 Features

The NPC block performs the following functions:

- Controls arbitration for ownership of the Nexus Output Port
- Nexus Device Identification Register and Messaging
- Generates MCKO enable and frequency division control signals
- Controls sharing of $\overline{\text{EVTO}}$
- Generates an MCKO clock gating control signal to enable gating of MCKO when the auxiliary output port is idle
- Control of the device-wide debug mode
- Generates asynchronous reset signal for Nexus blocks based on JCOMP input, and power-on reset status
- System clock status indication via MDO[0] following power-on reset
- Controls arbitration for ownership of the Nexus Aurora Link (NAL) in Aurora Link mode

64.1.3 Modes of operation

The NPC block uses the JCOMP input, and an internal power-on reset indication as its primary reset signals. Upon exit of reset, the mode of operation is determined by the Port Configuration Register (PCR) settings.

64.1.3.1 Reset

The NPC block is asynchronously placed in reset when either power-on reset is asserted, JCOMP is not set for Nexus access or the TAP controller state machine is in the Test-Logic-Reset state. Holding TMS high for 5 consecutive rising edges of TCK guarantees entry into the Test-Logic-Reset state regardless of the current TAP controller state.

Following negation of power-on reset, the NPC remains in reset until the system clock achieves lock. The NPC is unaffected by other sources of reset. While in reset, the following actions occur:

- The TAP controller is forced into the Test-Logic-Reset state
- The output port pins are negated
- The TDI, TMS, and TCK TAP inputs are ignored (when in power-on reset or JCOMP not set for NPC operation only
- Registers default back to their reset values

64.1.3.2 Disabled-Port Mode

In disabled-port mode, output pin port enable signals are negated, thereby disabling message transmission. Any debug feature that generates messages can not be used. The primary features available are class 1 features and read/write access to the registers. Class 1 features include the ability to trigger a breakpoint event indication through $\overline{\text{EVTO}}$.

64.1.3.3 Reduced-Port Mode

Reduced-port mode (RPM) is entered by asserting the MCKO_EN bit and negating the FPM bit in the PCR. All trace features are enabled or can be enabled by writing the configuration registers via the TAP. The number of MDO pins available is device-specific.

64.1.3.4 Aurora Link Mode

In Aurora Link mode, trace data is transmitted through the Nexus Aurora Link (NAL) instead of the auxiliary port. For SoCs that support a Nexus Aurora Link, the FPM bit in the PCR functions as the Aurora Link enable, leaving RPM as the only available mode for data transmission via the auxiliary port. Aurora Link Mode is enabled by setting the MCKO_EN and FPM bits and selecting a non-zero value for the ALC_NUM_LN bits in the PCR. The MCKO_DIV value should be set to select a clock frequency equal to the system clock frequency (MCKO_DIV = 000).

64.2 External signal description

64.2.1 Overview

The NPC pin interface provides for the transmission of messages from Nexus blocks to the external development tools and for access to Nexus client registers. The NPC pin definition is outlined in the following table. Pull information for the JTAG signals can be found in the JTAG chapter.

Table 64-1. NPC Signal Properties

Name	Port	Function	Reset State
EVTO_B	Nexus	Event Out pin	0b1
JCOMP	JTAG	JTAG Compliancy and TAP Sharing Control	—
MDO	Auxiliary	Message Data Out pins	0[1]
MSEO	Auxiliary	Message Start/End Out pins	0b11
TCK	JTAG	Test Clock Input	—
TDI	JTAG	Test Data Input	—
TDO	JTAG	Test Data Output	High Z[2]
TMS	JTAG	Test Mode Select Input	—

[1] Following a power-on reset, MDO[0] remains asserted until power-on reset is exited and the system clock achieves lock.

[2] TDO output buffer enable is negated when the NPC is not in the Shift-IR or Shift-DR states. A weak pull may be implemented on TDO at the SoC level.

64.2.2 Detailed signal descriptions

This section describes each of the signals listed in Table 64-1 in more detail. Note that the JTAG test clock (TCK) input from the pin is not a direct input to the NPC. The NPC requires two separate input clocks for TCK clocked logic, one for posedge (rising edge TCK) logic and one for negedge (falling edge TCK) logic. Both clocks are derived from the pin TCK, and generated external to the NPC.

64.2.2.1 EVTO_B — Event Out

Event Out ($\overline{\text{EVTO}}$) is an output pin that is asserted upon breakpoint occurrence to provide breakpoint status indication. The $\overline{\text{EVTO}}$ output of the NPC is generated based on the values of the individual $\overline{\text{EVTO}}$ signals from all Nexus blocks that implement the signal.

64.2.2.2 JCOMP — JTAG Compliancy

The JCOMP signal provides the ability to share the TAP. The NPC TAP controller remains in reset until it is enabled using the JCOMP signal.

64.2.2.3 MDO — Message Data Out

Message Data Out (MDO) are output pins used for uploading OTM, BTM, DTM, and other messages to the development tool. The development tool should sample MDO on the rising edge of MCKO. The width of the MDO bus used is determined by reset configuration.

64.2.2.4 MSEO_B — Message Start/End Out

Message Start/End Out ($\overline{\text{MSEO}}$) is an output pin that indicates when a message on the MDO pins has started, when a variable length packet has ended, or when the message has ended. The development tool should sample $\overline{\text{MSEO}}$ on the rising edge of MCKO.

64.2.2.5 TCK — Test Clock Input

Test Clock Input (TCK) pin is used to synchronize the test logic and control register access through the JTAG port.

64.2.2.6 TDI — Test Data Input

Test Data Input (TDI) pin receives serial test instruction and data. TDI is sampled on the rising edge of TCK.

64.2.2.7 TDO — Nexus Test Data Output

Test Data Output (TDO) pin transmits serial output for instructions and data. TDO is three-stateable and is actively driven in the SHIFT-IR and SHIFT-DR controller states. TDO is updated on the falling edge of TCK and sampled by the development tool on the rising edge of TCK.

64.2.2.8 TMS — Test Mode Select

Test Mode Select Input (TMS) pin is used to sequence the IEEE 1149.1-2001 TAP controller state machine. TMS is sampled on the rising edge of TCK.

64.3 Register definition

This section provides a detailed description of the NPC registers accessible to the end user. Individual bit-level descriptions and reset states of the registers are included.

The following table shows the NPC registers by index values. The registers are not memory-mapped and can only be accessed via the TAP. The NPC block does not implement the client select control register because the value does not matter when accessing the registers.

Note that the bypass and instruction registers have no index values. These registers are not accessed in the same manner as Nexus client registers. Refer to the individual register descriptions for more detail.

Table 64-2. NPC registers

Index	Register
0	Device ID Register (DID)
126	Aurora Configuration Register (ACR)
127	Port Configuration Register (PCR)

64.3.1 Register descriptions

This section consists of NPC register descriptions.

64.3.1.1 Bypass register

The bypass register is a single-bit shift register path selected for serial data transfer between TDI and TDO when the BYPASS instruction or any unimplemented instructions are active. After entry into the Capture-DR state, the single-bit shift register is set to a logic 0. Therefore, the first bit shifted out after selecting the bypass register is always a logic 0.

64.3.1.2 Instruction register

The NPC block uses a 4-bit instruction register as shown in the following table. The instruction register is accessed via the SELECT_IR_SCAN path of the tap controller state machine, and allows instructions to be loaded into the block to enable the NPC for register access (NEXUS_ENABLE) or select the bypass register as the shift path from TDI to TDO (BYPASS or unimplemented instructions).

Instructions are shifted in through TDI while the TAP controller is in the Shift-IR state, and latched on the falling edge of TCK in the Update-IR state. The latched instruction value can only be changed in the Update-IR and Test-Logic-Reset TAP controller states. Synchronous entry into the Test-Logic-Reset state results in synchronous loading of the BYPASS instruction. Asynchronous entry into the Test-Logic-Reset state results in asynchronous loading of the BYPASS instruction. During the Capture-IR TAP controller state, the instruction register is loaded with the value of the previously executed instruction, making this value the register's read value when the TAP controller is sequenced into the Shift-IR state.

	3	2	1	0
R	Previous Instruction Opcode			
W	Instruction Opcode			
Reset:	BYPASS Instruction Opcode (0xF)			

64.3.1.3 Nexus Device ID (DID) Register

The device identification register, shown in the following figure, allows the part revision number, design center, part identification number, and manufacturer identity code of the part to be determined through the output port.

Register index: 0

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Part Revision Number				Design Center						Part Identification Number					
W																
Reset	PRN				DC						PIN					

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Part Identification Number				Manufacturer Identity Code											1
W																
Reset	PIN (cont'd)				0	0	0	0	0	0	0	1	1	1	0	1

Table 64-5. DID field descriptions

Bit	Name	Description
31:28	PRN	Part Revision Number These bits contain the revision number of the part
27:22	DC	Design Center These bits indicate the device design center
21:12	PIN	Part Identification Number These bits contain the part number of the device
11:1	MIC	Manufacturer Identity Code These bits contain the reduced Joint Electron Device Engineering Council (JEDEC) ID for Freescale Semiconductor, 0xE.
0	Bit [0]	IDCODE Register ID Bit [0] identifies this register as the device identification register and not the bypass register

64.3.1.4 Port Configuration Register (PCR)

Register index: 127

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	FPM	MCKO_GT	MCKO_EN	MCKO_DIV			EVT_EN	Reserved	Reserved	0	0	0	ALC_NUM_LN		0	0
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	LP_DBG	0	0	0	0	0	LP2_SYN	LP1_SYN	0	0	0	0	0	0	0	Reserved
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The PCR, shown in the figure above, is used to select the NPC mode of operation, enable MCKO and select the MCKO frequency, and enable or disable MCKO gating. This register should be configured as soon as the NPC is enabled.

The PCR register may be rewritten by the debug tool subsequent to the enabling of the NPC for low power debug support. In this case, the debug tool may set and clear the LP_DBG and LPn_SYN bits, but must preserve the original state of the remaining bits in the register. While enabling the low power mode handshake (setting LP_DBG), the debugger should simultaneously set the LPn_SYN bit. At the end of low-power mode handshake, the LP_DBG and LPn_SYN should be set again if further handshakes between the device and debugger are required.

NOTE

The mode or clock division must not be modified after MCKO has been enabled. Changing the mode or clock division while MCKO is enabled can produce unpredictable results.

Table 64-7. PCR field descriptions

Bit	Name	Description
31	FPM	Full Port Mode The value of the FPM bit determines if Nexus Aurora mode is enabled or if the MDO port is used to transmit messages. 0 A subset of MDO pins are used to transmit messages 1 Nexus Aurora mode enabled
30	MCKO_GT	MCKO Clock Gating Control This bit is used to enable or disable MCKO clock gating. If clock gating is enabled, the MCKO clock is gated when the NPC is in enabled mode but not actively transmitting messages on the auxiliary output port. When clock gating is disabled, MCKO is allowed to run even if no auxiliary output port messages are being transmitted. 0 MCKO gating is disabled 1 MCKO gating is enabled
29	MCKO_EN	MCKO Enable This bit enables the MCKO clock to run. When enabled, the frequency of MCKO is determined by the MCKO_DIV field. 0 MCKO clock is driven to zero 1 MCKO clock is enabled
28:26	MCKO_DIV	MCKO Division Factor The value of this signal determines the frequency of MCKO relative to the system clock frequency when MCKO_EN is asserted. Table 64-8 shows the meaning of MCKO_DIV Values. In this table, SYS_CLK represents the system clock frequency. Set to 000 when Nexus Aurora mode is enabled.
25	EVT_EN	EVTO/EVTI Enable This bit enables the EVTO/EVTI port functions. 0 EVTO/EVTI port disabled 1 EVTO/EVTI port enabled
24	Reserved	
23	Reserved	
19:18	ALC_NUM_LN	Aurora Lane Control, Number of Lanes The value of this bit determines how many high-speed Aurora lanes are enabled 00 0 Lanes Enabled 01 2 Lanes Enabled 10 Reserved 11 Reserved
15	LP_DBG_EN	Low Power Debug Enable

Table continues on the next page...

Table 64-7. PCR field descriptions (continued)

Bit	Name	Description
		This bit enables debug functionality on exit from low power modes on supported devices. 0 Low power debug disabled 1 Low power debug enabled
9	LP2_SYN	Low Power Mode 2 Synchronization These bits are used to synchronize the entry into low power modes between the device and debug tool. Supported devices set these bits before a pending entry into low power mode. After reading the bit as set, the debug tool then clears the bit to acknowledge to the device that it may enter the low power mode. 0 Low power mode entry acknowledged 1 Low power mode entry pending
8	LP1_SYN	Low Power Mode 1 Synchronization These bits are used to synchronize the entry into low power modes between the device and debug tool. Supported devices set these bits before a pending entry into low power mode. After reading the bit as set, the debug tool then clears the bit to acknowledge to the device that it may enter the low power mode. 0 Low power mode entry acknowledged 1 Low power mode entry pending
0	Reserved

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The ACR, shown in the figure above, is used to configure the RXOPT and TXOPT settings of the LVDS receive and transmit pads.

Table 64-10. ACR Field Descriptions

Bit	Name	Description
15:12	LVDS_RXOPT[3:0]	Configures LVDS receive pad options rxopt3, rxopt2, rxopt1, rxopt0
7:0	LVDS_TXOPT[7:0]	Configures LVDS transmit pad options txopt7, txopt6, txopt5, txopt4, txopt3, txopt2, txopt1, txopt0

64.4 Functional Description

64.4.1 NPC reset configuration

The NPC is placed in disabled mode upon exit of reset. If message transmission via the output port is desired, a write to the PCR is then required to enable the NPC and select the mode of operation. Asserting MCKO_EN places the NPC in enabled mode and enables MCKO. The frequency of MCKO is selected by writing the MCKO_DIV field. Asserting or negating the FPM bit selects full-port or reduced-port mode, respectively.

For SoCs that support message transmission via the Nexus Aurora Link, asserting the MCKO_EN and FPM bits and setting the NUM_ALC_LN bits to a non-zero value enables NAL data transmission. Transmission of data via the auxiliary port is enabled only by selecting the RPM configuration in this case.

The following table describes the NPC reset configuration options.

Table 64-11. NPC reset configuration options

Power On Reset status asserted?	JCOMP asserted high	MCKO_EN bit of the Port Configuration Register	FPM bit of the Port Configuration Register	NUM_ALC_LN bits of the PCR > 0	Configuration
yes	X	X	X	X	Reset
no	no	X	X	X	Reset
no	yes	0	X	X	Disabled
no	yes	1	0	X	Reduced Port Mode
no	yes	1	1	yes	Aurora Link Mode

64.4.2 Auxiliary Output Port

The auxiliary output port is shared by each of the Nexus modules on the device. The NPC communicates with each of the Nexus modules and arbitrates for access to the port.

64.4.2.1 Output Message Protocol

The protocol for transmitting messages via the auxiliary port is accomplished with the $\overline{\text{MSEO}}$ functions. The $\overline{\text{MSEO}}$ pins are used to signal the end of variable-length packets and the end of messages. They are not required to indicate the end of fixed-length packets. MDO and $\overline{\text{MSEO}}$ are sampled on the rising edge of MCKO.

The following figure illustrates the state diagram for $\overline{\text{MSEO}}$ transfers. All transitions not included in the figure are reserved, and must not be used.

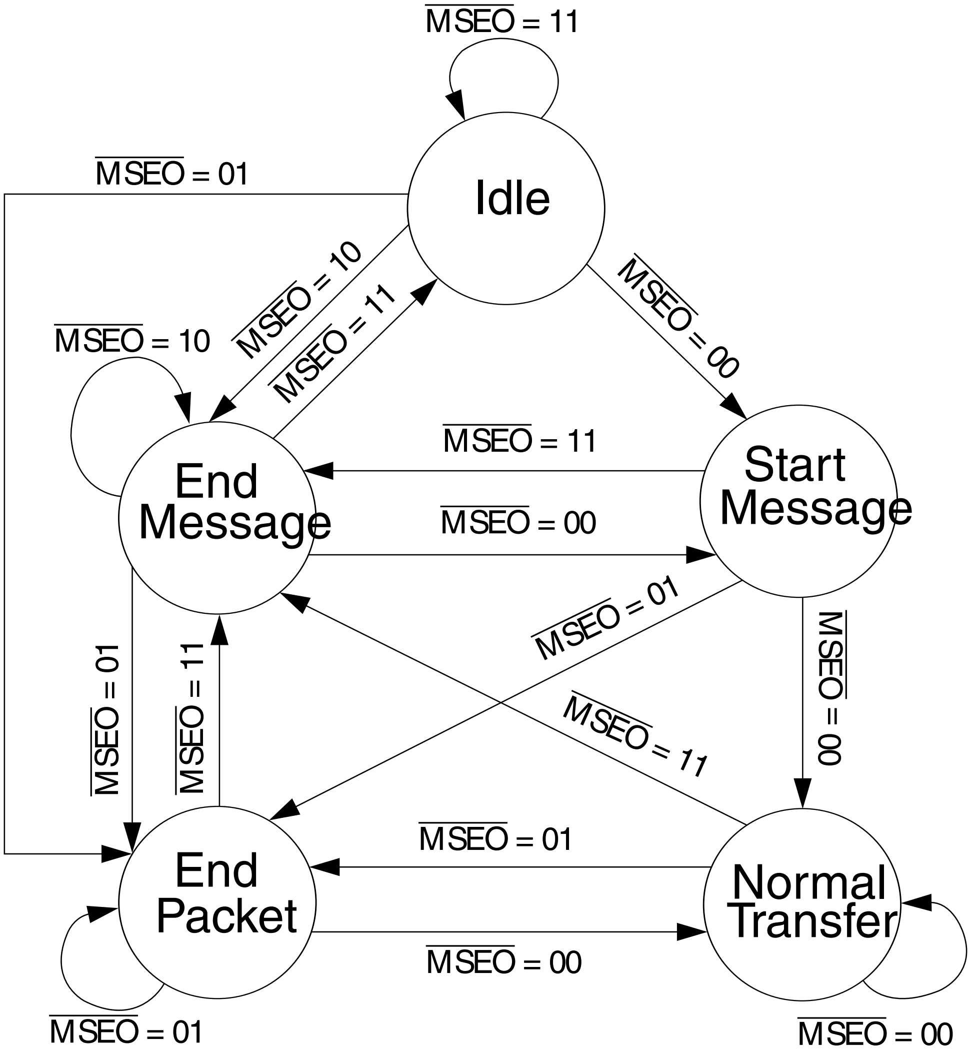

Figure 64-2. $\overline{\text{MSEO}}$ Transfers (for 2-bit $\overline{\text{MSEO}}$)

64.4.2.2 Output Messages

In addition to sending out messages generated in other Nexus blocks, the NPC can also output the device ID message contained in the device ID register on the MDO pins. The device ID message can also be sent out serially through TDO.

Figure 64-3 describes the device ID output message that the NPC can transmit on the auxiliary port. The TCODE is the first packet transmitted.

Message Name	Min. Packet Size (bits)	Max Packet Size (bits)	Packet Type	Packet Name	Packet Description
Device ID Message	6	6	fixed	TCODE	Value = 1
	32	32	fixed	ID	DID register contents
Aurora Link Overrun Error Message[1]	6	6	fixed	TCODE	Value = 8
	4	4	fixed	SRC	Nexus Aurora Link SRC value. Set during SoC integration via plug.
	5	5	fixed	ECODE	Value = 01000. Error code indicating overrun of NAL FIFO.

NOTES:

[1] The Aurora Link Overrun Error Message only transmits when there is a NAL overrun in Nexus Aurora Link Mode. This message is not valid in modes where data is transmitted via the auxiliary port.

Figure 64-3. NPC output messages

64.4.2.3 Rules of Message

- A variable-sized field within a message must end on a port boundary. (Port boundaries depend on the number of MDO pins active with the current reset configuration.)
- A variable-sized field may start within a port boundary only when following a fixed-length field.
- Super-fields must end on a port boundary.
- When a variable-length field is sized such that it does not end on a port boundary, it is necessary to extend and zero fill the remaining bits after the highest order bit so that it can end on a port boundary.
- Multiple fixed-length packets may start and/or end on a single clock.
- When any packet follows a variable-length packet, it must start on a port boundary.
- The field containing the TCODE number is always transferred out first, followed by subsequent fields of information.
- Within a field, the lowest significant bits are shifted out first. The following figure shows the transmission sequence of a message that is made up of a TCODE followed by two fields.

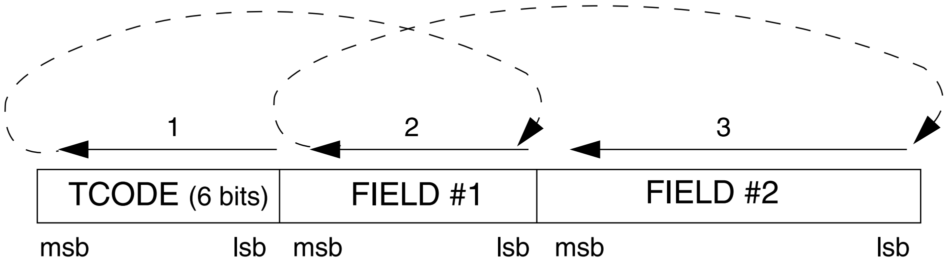

Figure 64-4. Transmission Sequence of Messages

64.4.3 IEEE 1149.1-2001 (JTAG) TAP

The NPC block uses the IEEE 1149.1-2001 test access port (TAP) for accessing registers. Each of the individual Nexus blocks on the device implements a TAP controller for accessing its registers as well. TAP signals include TCK, TDI, TMS, and TDO. There may also be other blocks on the MCU that use the TAP and implement a TAP controller. .

Refer to the IEEE 1149.1-2001 specification for further detail on electrical and pin protocol compliance requirements.

The NPC implements a Nexus controller state machine that transitions based on the state of the IEEE 1149.1-2001 state machine shown in Figure 64-6 . The Nexus controller state machine is defined by the IEEE-ISTO 5001-2001 standard. It is shown in Figure 64-7.

The instructions implemented by the NPC TAP controller are listed in the following table. The value of the NEXUS-ENABLE instruction is 0b0000. Each unimplemented instruction acts like the BYPASS instruction. The size of the NPC instruction register is 4 bits.

Table 64-12. Implemented Instructions

Instruction Name	Private/Public	Opcode	Description
NEXUS-ENABLE	public	0x0	Activate Nexus controller state machine to read and write NPC registers.
BYPASS	private	0xF	NPC BYPASS instruction. Also the value loaded into the NPC IR upon exit of reset.

Data is shifted between TDI and TDO starting with the least significant bit, as illustrated in the following figure. This applies for the instruction register and all Nexus tool-mapped registers.

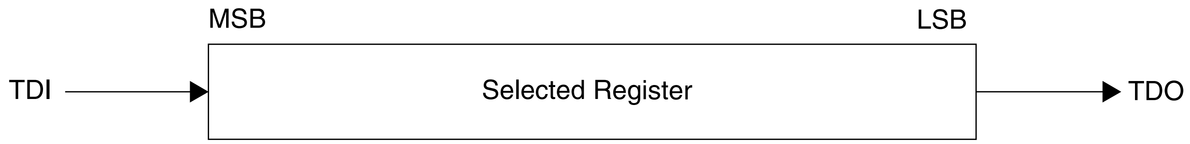

Figure 64-5. Shifting Data Into Register

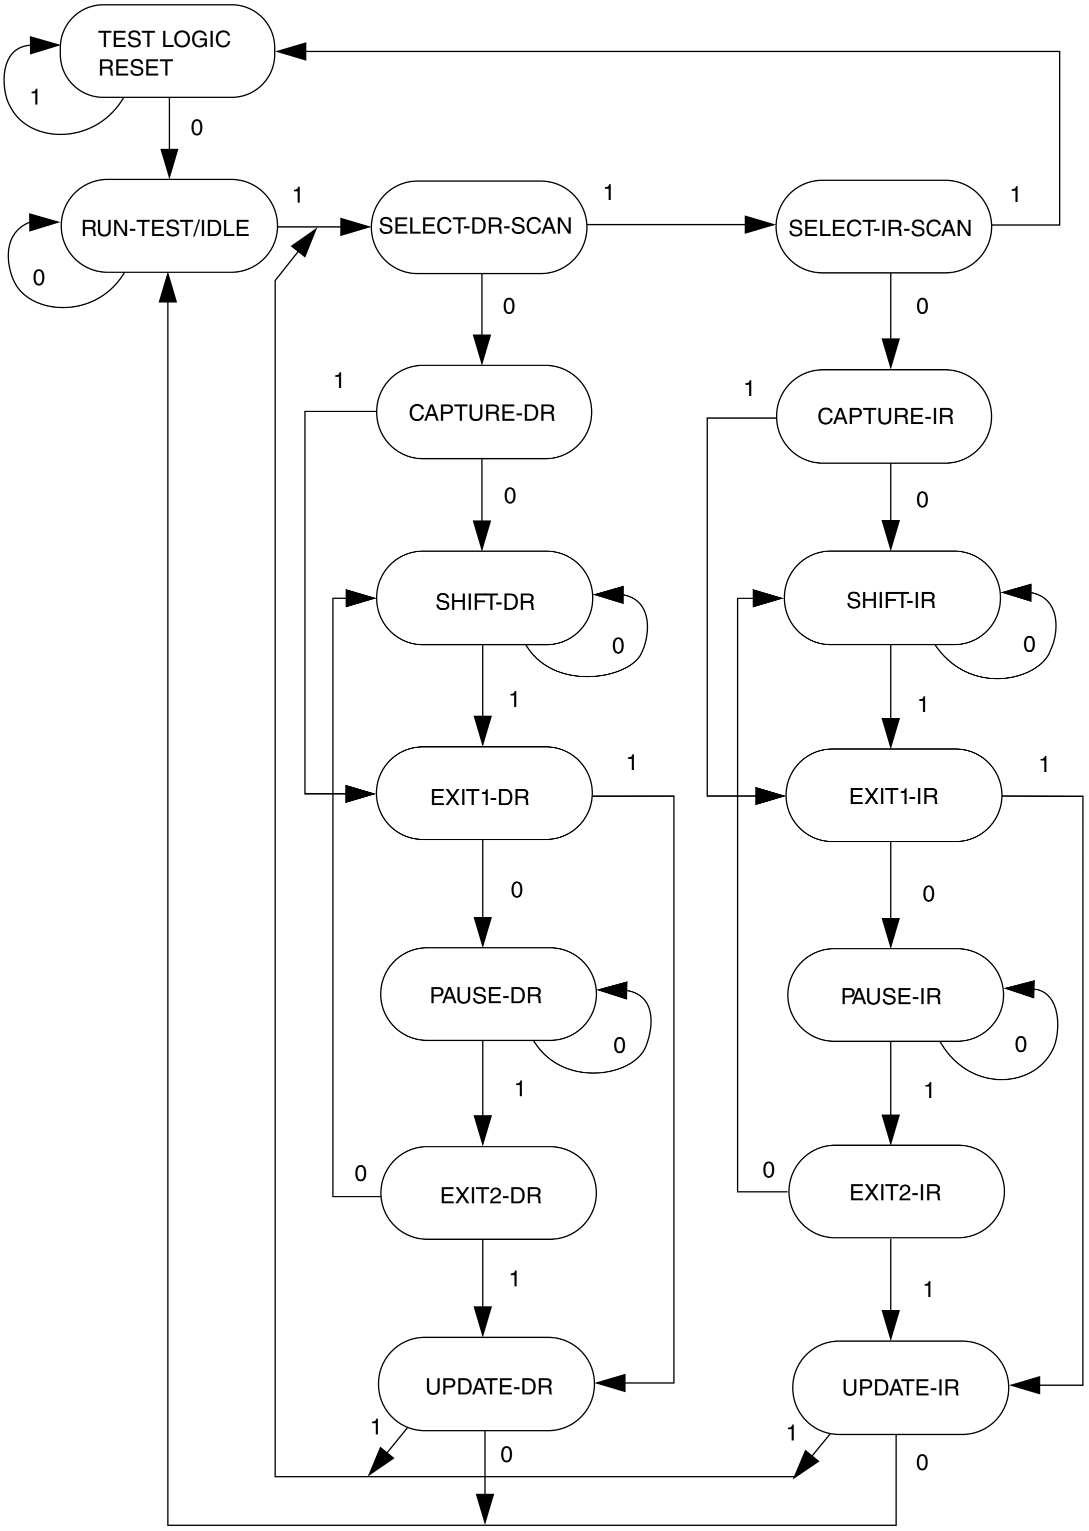
64.4.3.1 Enabling the NPC TAP controller

Assertion of the power-on reset signal or setting JCOMP to a value other than the NPC enable encoding resets the NPC TAP controller. When not in power-on reset, the NPC TAP controller is enabled by driving JCOMP with the NPC enable value and exiting the Test-Logic-Reset state. Loading the NEXUS-ENABLE instruction then grants access to Nexus debug.



NOTE: The value shown adjacent to each state transition in this figure represents the value of TMS at the time of a rising edge of TCK.

Figure 64-6. IEEE 1149.1-2001 TAP Controller State Machine

64.4.3.2 Retrieving device IDCODE

The Nexus TAP controller does not implement the IDCODE instruction. However, the device identification message can be output by the NPC through the output port or shifted out serially by accessing the Nexus Device ID register through the TAP.

Transmission of the device identification message on the auxiliary output port MDO pins occurs immediately after a write to the PCR, if the NPC is enabled for auxiliary port mode. Transmission of the device identification message serially via the TAP is achieved by performing a read of the register contents as described in Selecting a Nexus Client Register. The device identification message is not transmitted on the Aurora Link in Aurora Link mode, and it can be retrieved only via the TAP in that mode.

64.4.3.3 Loading NEXUS-ENABLE Instruction

Access to the NPC registers is enabled when the TAP controller instruction register is loaded with the NEXUS-ENABLE instruction. This instruction is shifted in via the SELECT-IR-SCAN path and loaded in the UPDATE-IR state. At this point, the Nexus controller state machine, shown in Figure 64-7, transitions to the REG_SELECT state. The Nexus controller has three states: idle, register select, and data access. Table 64-13 illustrates the IEEE 1149.1 sequence to load the NEXUS-ENABLE instruction.

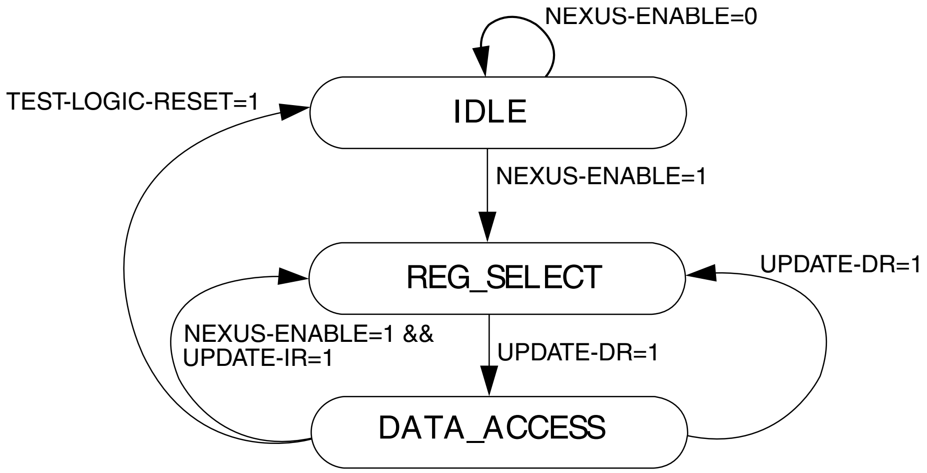


Figure 64-7. NEXUS Controller State Machine

Table 64-13. Loading NEXUS-ENABLE instruction

Clock	TMS	IEEE 1149.1 State	Nexus State	Description
0	0	RUN-TEST/IDLE	IDLE	IEEE 1149.1-2001 TAP controller in idle state
1	1	SELECT-DR-SCAN	IDLE	Transitional state
2	1	SELECT-IR-SCAN	IDLE	Transitional state

Table continues on the next page...

Table 64-13. Loading NEXUS-ENABLE instruction (continued)

Clock	TMS	IEEE 1149.1 State	Nexus State	Description
3	0	CAPTURE-IR	IDLE	Internal shifter loaded with current instruction
4	0	SHIFT-IR	IDLE	TDO becomes active, and the IEEE 1149.1-2001 shifter is ready. Shift in all but the last bit of the NEXUS_ENABLE instruction.
3 TCKS				
8	1	EXIT1-IR	IDLE	Last bit of instruction shifted in
9	1	UPDATE-IR	IDLE	NEXUS-ENABLE loaded into instruction register
10	0	RUN-TEST/IDLE	REG_SELECT	Ready to be read/write Nexus registers

64.4.3.4 Selecting a Nexus Client Register

When the NEXUS-ENABLE instruction is decoded by the TAP controller, the input port allows development tool access to all Nexus registers. Each register has a 7-bit address index.

All register access is performed via the SELECT-DR-SCAN path. The Nexus Controller defaults to the REG_SELECT state when enabled. Accessing a register requires two passes through the SELECT-DR-SCAN path: one pass to select the register and the second pass to read/write the register.

The first pass through the SELECT-DR-SCAN path is used to enter an 8-bit Nexus command consisting of a read/write control bit in the LSB followed by a 7-bit register address index, as illustrated in the following table. The read/write control bit is set to 1 for writes and 0 for reads.

MSB	LSB
7-bit register index	R/W

Figure 64-8. IEEE 1149.1 Controller Command Input

The second pass through the SELECT-DR-SCAN path is used to read or write the register data by shifting in the data (LSB first) during the SHIFT-DR state. When reading a register, the register value is loaded into the JTAG shifter during the CAPTURE-DR state. When writing a register, the value is loaded from the IEEE 1149.1-2001 shifter to the register during the UPDATE-DR state. When reading a register, there is no requirement to shift out the entire register contents. Shifting may be terminated once the required number of bits have been acquired.

The following table illustrates a sequence which writes a 32-bit value to a register.

Table 64-14. Write to a 32-Bit Nexus Client Register

Clock	TMS	IEEE 1149.1 State	Nexus State	Description
0	0	RUN-TEST/IDLE	REG_SELECT	IEEE 1149.1-2001 TAP controller in idle state
1	1	SELECT-DR-SCAN	REG_SELECT	First pass through SELECT-DR-SCAN path
2	0	CAPTURE-DR	REG_SELECT	Internal shifter loaded with current value of controller command input.
3	0	SHIFT-DR	REG_SELECT	TDO becomes active, and write bit and 6 bits of register index shifted in.
7 TCKs				
11	1	EXIT1-DR	REG_SELECT	Last bit of register index shifted into TDI
12	1	UPDATE-DR	REG_SELECT	Controller decodes and selects register
13	1	SELECT-DR-SCAN	DATA_ACCESS	Second pass through SELECT-DR-SCAN path
14	0	CAPTURE-DR	DATA_ACCESS	Internal shifter loaded with current value of register
15	0	SHIFT-DR	DATA_ACCESS	TDO becomes active, and outputs current value of register while new value is shifted in through TDI
31 TCKs				
47	1	EXIT1-DR	DATA_ACCESS	Last bit of current value shifted out TDO. Last bit of new value shifted in TDI.
48	1	UPDATE-DR	DATA_ACCESS	Value written to register
49	0	RUN-TEST/IDLE	REG_SELECT	Controller returned to idle state. It could also return to SELECT-DR-SCAN to write another register.

64.4.4 Nexus JTAG Port Sharing

Each of the individual Nexus blocks on the device implements a TAP controller for accessing its registers. When Nexus has ownership of the TAP, only the block whose NEXUS-ENABLE instruction is loaded has control of the TAP. This allows the interface to all of these individual TAP controllers to appear to be a single port from outside the device. If no register is selected as the shift path for a Nexus block, that block acts like a single-bit shift register, or bypass register.

64.4.5 MCKO Control

MCKO is an output clock to the development tools used for the timing of $\overline{\text{MSEO}}$ and MDO pin functions. MCKO is derived from the system clock and its frequency is determined by the value of the MCKO_DIV field in the PCR. Possible operating frequencies include system clock, one-half system clock, one-quarter system clock, and one-eighth system clock speed.

The NPC also generates an MCKO clock gating control output signal. This output can be used by the MCKO generation logic to gate the transmission of MCKO when the auxiliary port is enabled but not transmitting messages. The setting of the MCKO_GT bit inside the PCR determines whether or not MCKO gating control is active. The MCKO_GT bit resets to a logic 0. In this state gating of MCKO is disabled. To enable gating of MCKO, the MCKO_GT bit in the PCR is written to a logic 1.

64.4.6 $\overline{\text{EVTO}}$ Sharing

The NPC block controls sharing of the $\overline{\text{EVTO}}$ output between all Nexus clients that produce an $\overline{\text{EVTO}}$ signal. The NPC assumes incoming $\overline{\text{EVTO}}$ signals will be asserted for one system clock period. After receiving a single clock period of asserted $\overline{\text{EVTO}}$ from any Nexus client, the NPC latches the result, and drives $\overline{\text{EVTO}}$ for one MCKO period on the following clock. When there is no active MCKO, such as in disabled mode, the NPC drives $\overline{\text{EVTO}}$ for two system clock periods. $\overline{\text{EVTO}}$ sharing is active as long as the NPC is not in reset.

64.4.7 Nexus Reset Control

The JCOMP input that is used as the primary reset signal for the NPC is also used by the NPC to generate a single-bit reset signal for other Nexus blocks. If JCOMP is negated, an internal reset is asserted, indicating that all Nexus modules should be held in reset.

64.4.8 System Clock Locked Indication

Following a power-on reset, MDO[0] can be monitored to provide the lock status of the system clock. MDO[0] is driven to a logic 1 until the system clock achieves lock after exiting power-on reset. Once the system clock is locked, MDO[0] is negated and tools may begin Nexus configuration. Loss of lock conditions that occur subsequent to the exit of power-on reset and the initial lock of the system clock do not cause a Nexus reset, and therefore do not result in MDO[0] driven high.

64.4.9 Data Transmission via Nexus Aurora Link

The NPC supports data transmission over a high-speed serial Nexus Aurora Link (NAL). The NPC's role in Aurora Link data transmission is to route trace data to the NAL while continuing to manage arbitration between Nexus clients for the right to transmit data. In addition, the NPC monitors the NAL transmit queue and will halt further data transmission from Nexus clients if the queue is in danger of an overrun condition. In the event of an overrun condition, the NPC transmits a standard Nexus error message.

Once the PCR is configured for Aurora Link Mode (MCKO_EN bit set, FPM bit set, ALC_NUM_LN set to non-zero value), the NPC waits for the NAL to acknowledge it is ready to receive data before starting data transmission. All data transmitted in Aurora Link mode is transmitted in frames, with each frame consisting of 8192 bytes of data. The first beat of each frame is accompanied by the assertion of the start of frame control signal, and the last beat of each frame is accompanied by the assertion of the end of frame control signal. Each beat of valid NAL data from the NPC is also accompanied by the assertion of the NAL data valid message signal.

Data received by the NAL is held in a FIFO until it can be sent out on the Aurora Link. The NPC keeps track of the NAL FIFO fill level. To help prevent an overrun of the NAL FIFO, the NPC holds off further grants to all clients if the NAL FIFO is filled above the watermark level. In the event that the NAL FIFO is overrun with data, the NPC transmits its FIFO overrun error message shown in Figure 64-3.

64.5 Initialization/Application Information

64.5.1 Accessing NPC tool-mapped registers

To initialize the TAP for Nexus register accesses, the following sequence is required:

1. Enable the Nexus TAP controller
2. Load the TAP controller with the NEXUS-ENABLE instruction

To write control data to NPC tool-mapped registers, the following sequence is required:

1. Write the 7-bit register index and set the write bit to select the register with a pass through the SELECT-DR-SCAN path in the TAP controller state machine.
2. Write the register value with a second pass through the SELECT-DR-SCAN path. Note that the prior value of this register is shifted out during the write.

To read status and control data from NPC tool-mapped registers, the following sequence is required:

1. Write the 7-bit register index and clear the write bit to select register with a pass through SELECT-DR-SCAN path in the TAP controller state machine.

2. Read the register value with a second pass through the SELECT-DR-SCAN path. Data shifted in is ignored.

See the IEEE-ISTO 5001-2001 standard for more detail.

Chapter 65
Nexus Aurora Link (NAL)

65.1 Introduction

The Aurora Protocol is used to send debug information over a high-speed serial link out of the device. The Nexus Aurora Link (NAL) consists of all the logic on the MCU needed to implement the connection up to the physical-layer SerDes and transceivers; it includes Aurora control and data multiplexing, data-encoding and striping, and the Physical Coding Sublayer (PCS) portion of the protocol. The following figure details the NAL block diagram. The number of lanes, n, is 2.

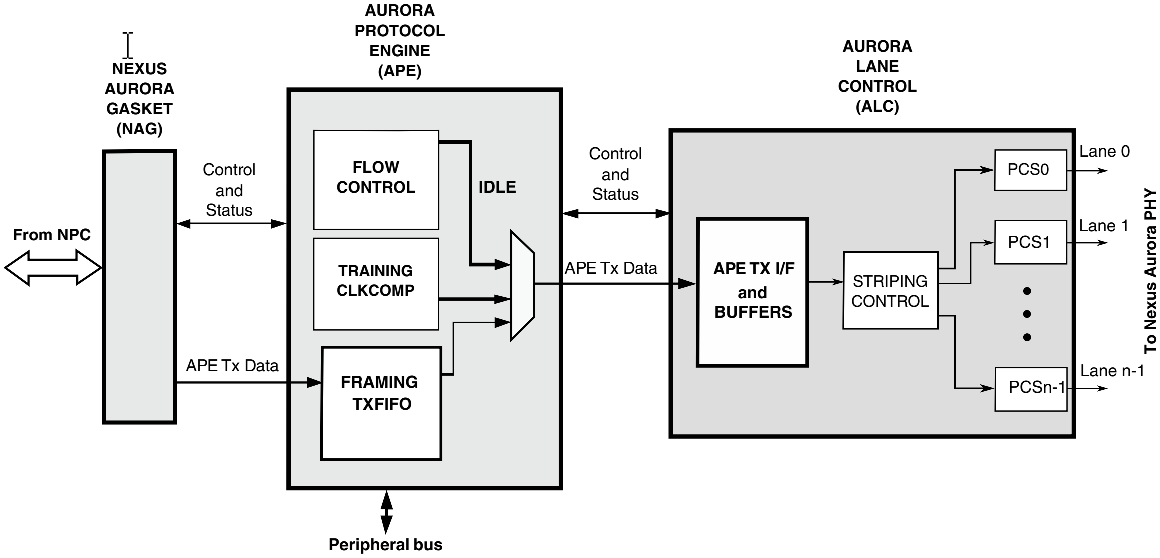

Figure 65-1. NAL block diagram

Debug data in the Nexus format from multiple clients is collected by the Nexus Port Controller (NPC) ; messages are then packetized and sent across an asynchronous clock boundary-crossing gasket to the Aurora Protocol Engine, which performs all the logical layer functions and flow control; data from the protocol engine is sent on to the Aurora Lane Control (ALC) block, which performs data-striping and sizing, based on the number of lanes selected for debug; it also performs the PCS functions of the link. The PCS drives the Nexus Aurora Physical (NAP) interface. The NAP, in conjunction with the NAL, supports one-way simplex high-speed serial communication with an external debugger.

The NAL is composed of three main blocks: the NPC/Aurora Gasket, the Aurora Protocol Engine, and Aurora Lane Control. The table below lists NAL functionality by block and lists the high level features for the Nexus Aurora PHY.

Table 65-1. NAL and NAP feature summary

Sub-Component	Feature
NPC Aurora Gasket (NAG)	• Transmit FIFO to buffer data as it crosses the NPC/NAL clock-domain boundary and Transmit FIFO space available indication to NPC. The NPC uses Transmit FIFO space available indication(s) to determine if data can be sent to the NAL. • Platform to Domain clock domain crossing. The NPC is on the core clock domain while the NAP is on a domain sourced from the external PHY clock input signals.
Aurora Protocol Engine (APE)	• Link training • Per the Aurora Protocol specification, clock-compensation, and data framing
Aurora Link Control (ALC)	• Striping of data stream from the Aurora core across all available lanes in two-byte chunks • PCS functionality for NAL
Nexus Aurora PHY (NAP)	• Physical transmission of serial data to device pins • External clock source for SerDes clock domain

65.2 Transmit operation

During transmit operation, the NPC collects debug data from Nexus clients over a 32-bit interface: 30 bits are used for MDO and 2 bits are used for MSEO information. The NPC places MDO data into a payload (maximum payload size depends on the number of lanes, each lane has a maximum of 7424 symbols before terminating the payload) and adds the following:

- 16-bit start symbol
- 16-bit end symbol

Each payload is transferred from the NPC to the NPC/NAL gasket, through the Aurora Protocol Engine, the Aurora Lane Control and finally out to the device SerDes/LVDS pins through the NAP.

After each end symbol packet transfer, the NAL adds a clock compensation sequence needed for downstream SerDes devices to remain synchronized to the MCU.

NOTE

Symbol counting for clock compensation starts just prior to the verification symbols; therefore, training symbols are excluded when counting.

65.3 Nexus Aurora formatting

The Aurora physical interface is the transport mechanism for Nexus messages. The Nexus messages are formatted by the Aurora formatter and striped into Aurora lanes. The Nexus messages themselves encapsulated into a virtual Nexus port that consists of a 30-bit Message Data Output (MDO) port and a 2-bit Message Start/End Output (MSEO) signal. The MSEO portion of the port is the two least significant bits (LSB) of the 32-bit Aurora message. The rest of the 32-bit Aurora frame consists of 30 MDO bits that are added LSB first.

65.4 Static training

The NAL supports static training. The NAL performs Static training by using programmable timers to determine how long to stay in each stage of the training process. In static training, there is no communication between the channel partners to exchange training status; rather the NAL sends the align/bond/verify sequence to its partner for a set amount of time sufficient for the receive partner to complete the training stage.

Note

Prior to initialization, the NAL must be reset to its POR state; to do this, assert the block reset. See the RST bit field description in the NAL General Control Register (NAL_GCR).

The following steps enable static training:

1. Write 80000000h to NAL_GCR
2. Write 00000000h to NAL_GCR
3. Write 80783C0Fh to NAL_TCR
4. Write 80000000h to NAL_GCR
5. Write 00000000h to NAL_GCR
6. Write A0408000h to NPC_PCR

This resets the channel and start the training routine. The time spent in each stage can range from 16 to 3072 cycles; once a counter times out, a counter time-out signal is asserted to the Aurora Protocol Engine (APE) to prompt it to move to the next stage.

Additionally, it is possible to hold the training procedure in any of the stages indefinitely, by setting one of the three hold bits (AHD/BHD/VHD). When set, these bits cause the channel to sit in Align/Bond/Verify until unset, allowing a user to interactively step through the training procedure by monitoring the status at the debugger side and then stepping the device side to the next stage.

During the Aurora training sequence, the NAL generates a specific set of character sequences per the Aurora protocol specification which are to be transmitted simultaneously on all lanes.

65.5 Clock compensation considerations

The Aurora Protocol Specification describes clock compensation as a means for the link to compensate for clock rate differences between the transmitter and receiver. The spec requires that a clock compensation be inserted at a minimum every 10000 symbol pairs; this should allow the link to accomodate up to a 200 ppm difference in clock rates.

Due to the fact that the NAL is restricted to only inserting clock-compensation sequences after an end-of-frame, it may not be possible to always meet the Aurora spec requirement. However, there are ways to control the framing of data through the link and insure that satisfactory performance is maintained. There are two types of scenarios that can prevent an adequate number of clock compensation sequences from being generated: the sparse data case and the unframed data case. In the sparse data case, there are long periods of time when no data is flowing through the link; no data means no frames. In the unframed case, there is plenty of data, but this data is not framed, and so again, clock-compensation never gets a chance to make it out.

The unframed case is simplest to address. The NPC can either operate in framed or unframed mode. In unframed mode, an end-of-frame is only injected when the NPC runs out of data (as soon as new data is collected, it is sent out accompanied with a start-of-frame; if the NPC is configured in this mode, the clock-compensation spec can easily be violated. However, in framed mode, an end-of-frame/start-of-frame pair is injected after every 256 data transmissions. Here, each frame consists of 256 x AW symbol pairs. Inside the APE, a clock-compensation counter keeps track of how much data has been transmitted to the ALC since the last clock-compensation sequence; once the counter hits 7424, clock-compensation will be sent on the next end-of-frame.

On the other hand, even if the NPC is in framing mode, there is little that can be done if the NPC has no data to send. In the sparse data scenario, the NAL could end up transmitting idles for an undetermined number of cycles while waiting for the NPC to provide new data. However, a user can get around this problem by insuring that the NPC always has at least some minimal amount of data to send. There are several ways to do this:

- If full-duplex infrastructure is available, then the simplest thing to do is for the debugger to monitor the TX data stream from the NAL for long idle periods. If the link has been idle for longer than some minimal amount of time (say 8000 symbol pairs), then the debugger could send in a read request through the aurora-in RX port -- a quick NRR read of the dev_id register would be ideal for this purpose. The NPC would then return the requested data, accompanied by a start-of-frame/end-of-frame pair, which the NAL could then tag with clock-compensation. See the NPC block guide for more details on aurora-in NRR access.
- If full-duplex is not available, then the debugger could still force the NPC to send the dev_id message by going through the JTAG/SAP port and setting the NPC SRESET bit. Reinitializing the NPC puts it back into its startup state, wherein it will invariably send device ID before doing anything else. The only drawbacks to this approach are its long latency (going through JTAG) and the fact that NPC must be correctly reconfigured after every SRESET.
- Another approach is to use periodic watchpoints to insure that the data stream never falls completely silent for more than some predefined count. Most nexus clients, including the NPC itself, can generate a watchpoint sync message based on an external or internal trigger. By hooking one of these triggers up to a counter (a performance-monitor, event-processing unit debug counter can be used for this purpose), we can insure that, even if there is no other trace data traffic, there will at least be periodic watchpoint messages which can be used to trigger clock compensation. The drawback here is that it requires devoting one of the debug counters for clock compensation, but this may not always be a problem: one of the proposed methods of correlating nexus timestamps from different asynchronous domains is to use the same sort of periodic sync trigger to force all asynchornous clients to send a stamped watchpoint message at (roughly) the same time. This asynchronous sync trigger can also be used for clock compensation.

65.6 Programmable registers

The Nexus Aurora Link (NAL) module provides a Nexus parallel to Aurora formatting for the MCU trace information. These registers are not memory-mapped and can only be accessed via the JTAG interface.

Table 65-2. NAL memory map

Offset	Register name	Width (in bits)	Access	Reset value
0h	NAL General Status Register (NAL_GSR)	32	R	See section
8h	NAL General Control Register (NAL_GCR)	32	R/W	0000_0000h
Ch	NAL Training Control Register (NAL_TCR)	32	R/W	0000_0000h

65.6.1 Nexus Aurora Link General Status Register (NAL_GSR)

The NAL_GSR is a read only register that describes the status of the NAL. See the chip-specific NAL information for the NAL_GSR reset value.

Chapter 66
Nexus Aurora PHY (NAP)

66.1 Introduction

The Nexus Aurora PHY (NAP), in conjunction with the Nexus Aurora Link (NAL), supports one-way simplex high-speed serial communication with an external debugger. Configuration settings in the Nexus Port Controller (NPC) Port Configuration Register (NPC_PCR) specify the NAP and NAL lane configuration. The NAL performs all logical layer functions, flow control, data-striping and sizing based on the number of data lanes available for use, and physical coding sublayer functions on the data being sent to the NAP for transmission. The NAP receives 8b/10b encoded data from the NAL then serializes and transmits this data through a given PHY lane's Low Voltage Differential Signaling (LVDS) buffers to an external debugger.

Each NAP lane consists of a data symbol character accumulator which registers the 10-bit character for that lane from the NAL on the rising edge of the NAL clock. Next, a serializer takes the 10-bit character and serializes it into the individual data bits that are then transmitted at the PHY clock rate via the LVDS output drivers to the external debugger receive channel.

Note

> The NAL performs static link training for an attached debugger's PHY. The NAP is not directly aware of the link training operation, since it merely transmits the data presented to it by the NAL.

On the receive side of the external debugger, it is the responsibility of the external debugger to perform elastic buffering, symbol detection, symbol locking (called Lane Alignment in Aurora terminology), 10b/8b decoding, decode and disparity error tracking in the received data stream.

The following figure shows a high level block diagram of the High Speed Nexus Interface and the NAP.

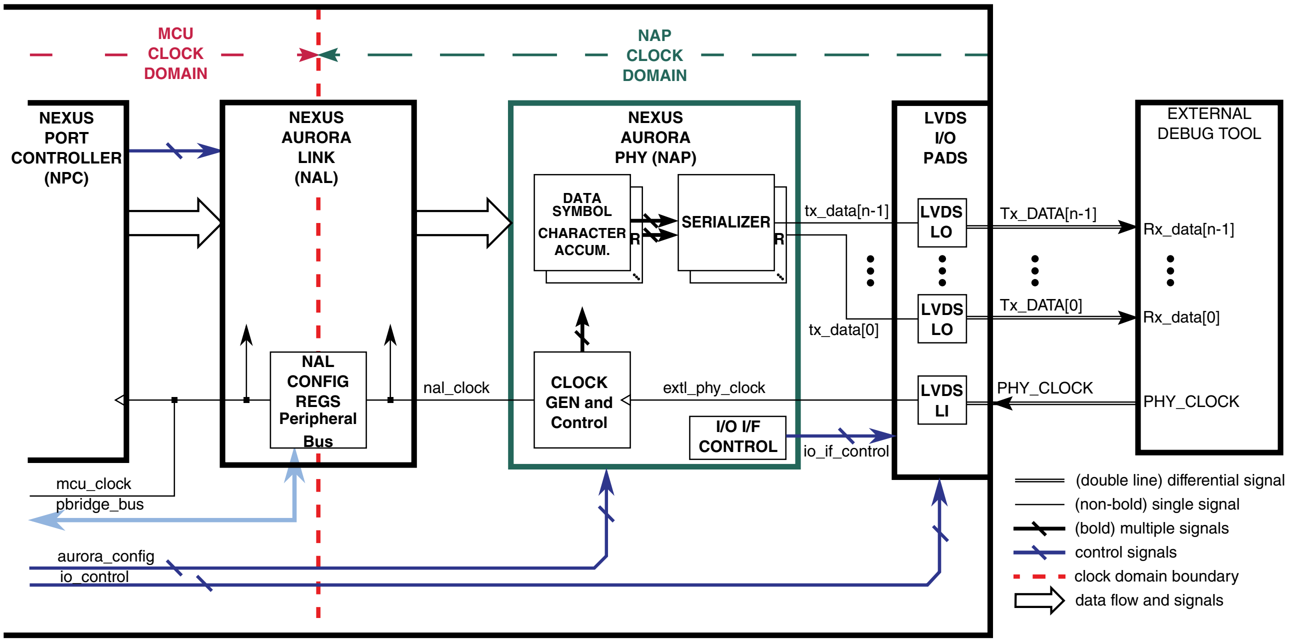

Figure 66-1. High speed Nexus interface block diagram

66.1.1 Features

The features of the NAP are as follows:

- Xilinx Aurora Protocol Specification V2.x compliant
- 1Gb/s per channel trace data payload bandwidth with 1.25 GHz clock
- Simplex mode with static (timer-based) channel training

66.1.2 Modes of operation

The operating mode of the NAP is determined by the device control signals. The functional configuration is determined by the NPC_PCR setting; functional operation is enabled by the NPC.

66.1.2.1 Reset

During Nexus Reset all internal NAP resources are reset, all output ports are disabled, and all inputs are ignored. Since there is no device clock domain logic in the NAP itself, the NAP is unaffected by device system reset. Depending on the NAP configuration settings, the NAP may activate upon exiting Nexus Reset if any Aurora lanes are enabled during this reset mode, else it remains disabled and inactive.

66.1.2.2 Link training

Before beginning trace output mode operation, the Aurora Link must go through a training process conducted by the NAL to ensure that an external debugger can correctly reconstruct the transmitted data stream. Training proceeds once the link powers up, and must complete successfully before data transmission can occur.

The NAL initializes and trains the Aurora Link in a simplex configuration using a timer based static-training method. The initialization and training sequence described in Aurora Protocol Specification progresses from one step to the next via the use of programmable timers contained in the NAL. A timer is programmed for each stage of training and as each timer expires, the training sequence proceeds to the next stage until complete. The NAP is not directly aware of the link training operation, since it merely transmits the data presented to it by the NAL.

66.1.2.3 Transmit

During Nexus trace output operation, it is the responsibility of the NPC to push data into the Aurora Link at a sufficiently high rate to ensure that the link does not become data-starved. The NAL and NAP support up to 2 transmit lanes. The Aurora encapsulated data is modified by the NAL to ensure the appropriate number of symbols are transmitted through the NAP.

66.2 External signal description

The external signals of the NAP are listed in the following table. Each of the NAP signals consists of a positive and negative differential pair.

Table 66-1. NAP signals

Signal Name	Direction	Description
PHY_CLOCK (CLKP/CLKN)	Input	NAP clock input from external debug tool

Table continues on the next page...

Table 66-1. NAP signals (continued)

Signal Name	Direction	Description
TX Data0 (TX0P/TX0N)	Output	NAP Tx data for lane 0
TX Data1 (TX1P/TX1N)	Output	NAP Tx data for lane 1

66.3 Memory map and register definition

There are no control, configuration or status registers within the NAP. All control, configuration and status options for number of lanes and LVDS pads are handled in the NPC_PCR which is described in the NPC Chapter.

66.4 Functional description

High-level descriptions of the operation of the NAP and its main functional blocks are given in the following sections.

66.4.1 Data symbol character accumulator

The data symbol character accumulator portion of the NAP for each lane is made up of a symbol character register whose inputs are connected to the 10-bit NAL character bus. The data symbol character accumulator essentially registers a 10-bit character for that lane simultaneous with the rising edge of the NAL clock and presents the 10-bit quantity to the serializer at the appropriate times.

66.4.2 Serializer

The serializer portion of the NAP for each lane takes the data captured by that lane's Data Symbol Character Accumulator and demuxes the data to provide a single serial stream of symbol data to be output by the LVDS LO buffer for that lane at the PHY clock rate.

The following figure shows a high level timing diagram that demonstrates the operation of the serializer for a NAP lane, where S0–S9 represents a 10-bit symbol, S10–S19 represent the next symbol, and so on.

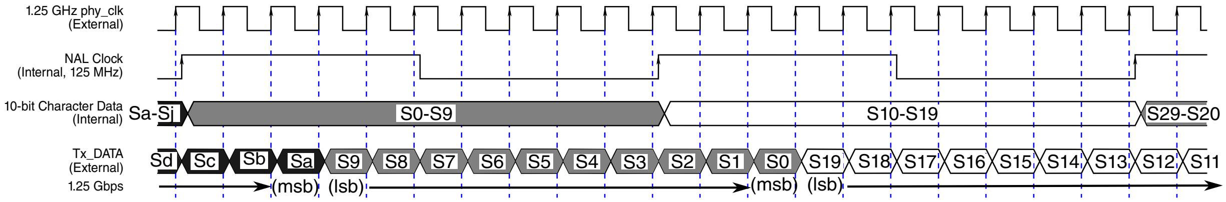

Figure 66-2. Serializer timing diagram

66.4.3 Clock generation and control

The Clock Generation and Control block is responsible for generating the necessary clocks and state signals needed by the rest of the NAP. The Data Symbol Character Accumulators and serializers are the main consumers of the signals generated by the Clock Generation and Control block.

66.5 Initialization information

The NAP does not require initialization other than the Nexus Reset and programming of the NPC_PCR to configure the number of lanes and LVDS pads.

Chapter 67
Cyclic Redundancy Check (CRC) Unit

67.1 Introduction

The Cyclic Redundancy Check (CRC) computing unit is dedicated to the computation of CRC, off-loading the CPU. Each context has a separate CRC computation engine in order to allow the concurrent computation of the CRC of multiple data streams. The CRC computation is performed at speed without wait-state insertion. Bit-swap and bit-inversion operations can be applied on the final CRC signature. Each context can be configured with one of three hard-wired polynomials, normally used for most of the standard communication protocols. The data stream supports multiple data width (byte/ halfword/word) formats.

67.2 Main features

- 3 contexts for the concurrent CRC computation are supported
- Separate CRC engine for each context
- Zero-wait states during the CRC computation (pipeline scheme)
- Three hard-wired polynomials (CRC-8, CRC-32 Ethernet, and CRC-16-CCITT)
- Support for byte, halfword, or word width of the input data stream

67.2.1 Standard features

- Peripheral bus interface
- CRC-8 VDA CAN

- CRC-16-CCITT
- CRC-32 Ethernet (see note below)

NOTE

Although the CRC-32 Ethernet polynomial is used for CRC generation, the generation algorithm differs (MISR) from the one used by the Ethernet protocol (IEEE 802).

67.3 Block diagram

The top level diagram of the CRC module is given in the following figure. Refer to Main features for number of contexts in this module.

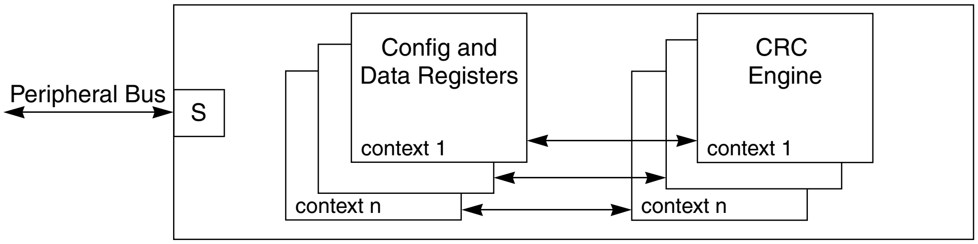

Figure 67-1. CRC top level diagram

67.4 External signal description

The CRC module does not generate any external signals.

67.4.1 Peripheral bus interface

The peripheral bus interface is a slave bus used for configuration and data streaming (CRC computation) purposes via CPU or DMA. The following bus operations (contiguous byte enables) are supported:

- Word (32 bits) data write/read operations to any registers
- Low and high halfword (16 bits, data[31:16] or data[15:0]) data write/read operations to any registers

- Byte (8 bits, data[31:24], data[23:16], data[15:8], or data[7:0]) data write/read operations to any registers
- Any other operation (free byte enables or other operations) must be avoided.

The CRC module generates a transfer error in the following cases:

- Any write/read access to the register addresses not mapped on the peripheral but included in the address space of the peripheral
- Any write/read operation different from byte/halfword/word (free byte enables or other operations) on each register

The registers of the CRC module are read/write accessible in each access mode:

- user
- supervisor

The following summarizes bus operation performance:

- Zero wait states (single bus cycle) for each write/read operation to the CRC_CFG and CRC_INP registers
- Zero wait states (single bus cycle) for each write operation to the CRC_ CSTAT register
- Double wait states (3 bus cycles) for each read operation to the CRC_ CSTAT or CRC_OUTP registers immediately following (next clock cycle) a write operation to the CRC_CSTAT, CRC_INP, or CRC_CFG registers belonging to the same context; in all the other cases, no wait states are inserted

67.5 CRC memory map and registers

CRC memory map

CRC_OUTP*n* field descriptions

Field	Description
0–31 OUTP	Final CRC signature

CRC_OUTP*n* field descriptions (continued)

Field	Description
	This register includes the final signature corresponding to the CRC_CSTAT register value eventually swapped and inverted. In the case of the CRC-CCITT polynomial, only the 16 least-significant bits are significant. The 16 MSB bits are set to 0 during the computation. In the case of the CRC-8 polynomial, only the 8 least-significant bits are significant. The 24 most-significant bits are set to 0 during the computation.

67.6 Functional description

The CRC module supports the CRC computation for each context. Each context has its own complete set of registers, including the CRC engine. The data flow of each context can be interleaved. The data stream can be structured as a sequence of bytes, halfwords, or words. The input data sequence is provided, eventually mixing the data formats (byte, halfword, and word), writing to the input data register (CRC_INP).

The data stream is generally executed by *n* concurrent DMA data transfers (mem2mem) where *n* is less or equal to the number of contexts.

The standard generator polynomials are given in Equation 56 on page 2681, Equation 57 on page 2681, and Equation 58 on page 2681 for the CRC computation of each context. Two separate registers are available: CRC_INP for writing data and CRC_CSTAT for retrieving the (accumulated up to now) CRC.

$$x^8 + x^4 + x^3 + x^2 + 1$$

Equation 56. CRC8 VDA CAN

$$x^{16} + x^{12} + x^5 + 1$$

Equation 57. CRC-CCITT (x.25 protocol)

$$x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

Equation 58. CRC-32 (Ethernet protocol)

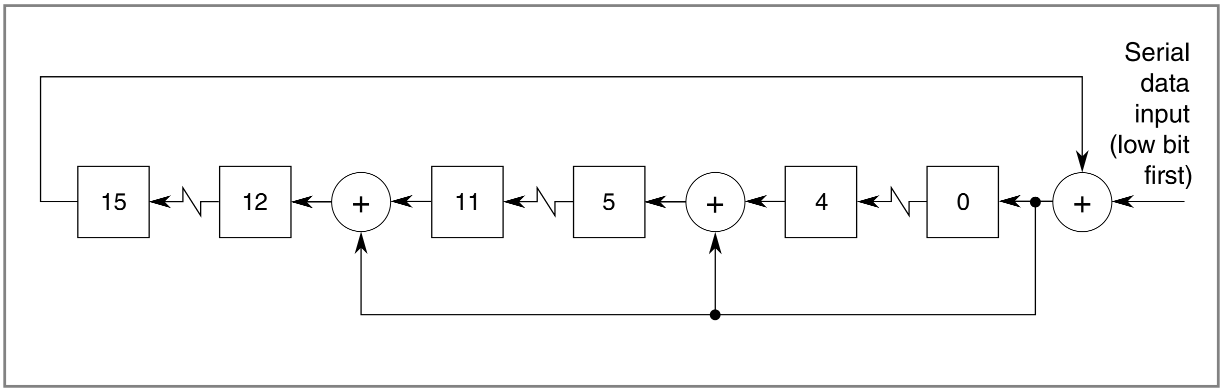

Figure 67-2. CRC-CCITT engine concept scheme

The initial seed value of the CRC can be programmed by initializing the CRC_CSTAT register. A diagram illustrating serial data loading of the CRC engine is shown in Figure 67-2 for the CRC-CCITT. Note that, conceptually, the least-significant, or "right-most," bit shown in Input Register (CRC_INP*n*), is fed first into the engine. The actual implementation executes the CRC computation in a single clock cycle (parallel data loading). A pipeline scheme has been adopted to decouple the IPS bus interface from the CRC engine in order to allow the computation of the CRC at speed (zero wait states).

If the CRC signature is used for encapsulation in the data frame of a communication protocol (for example, SPI, etc.), a bit swap (high bit for low bit or low bit for high bit) and/or bit inversion of the final CRC signature can be applied to CRC_OUTP before transmitting the CRC.

Use of the CRC module is summarized in the flow chart given in Figure 67-3.

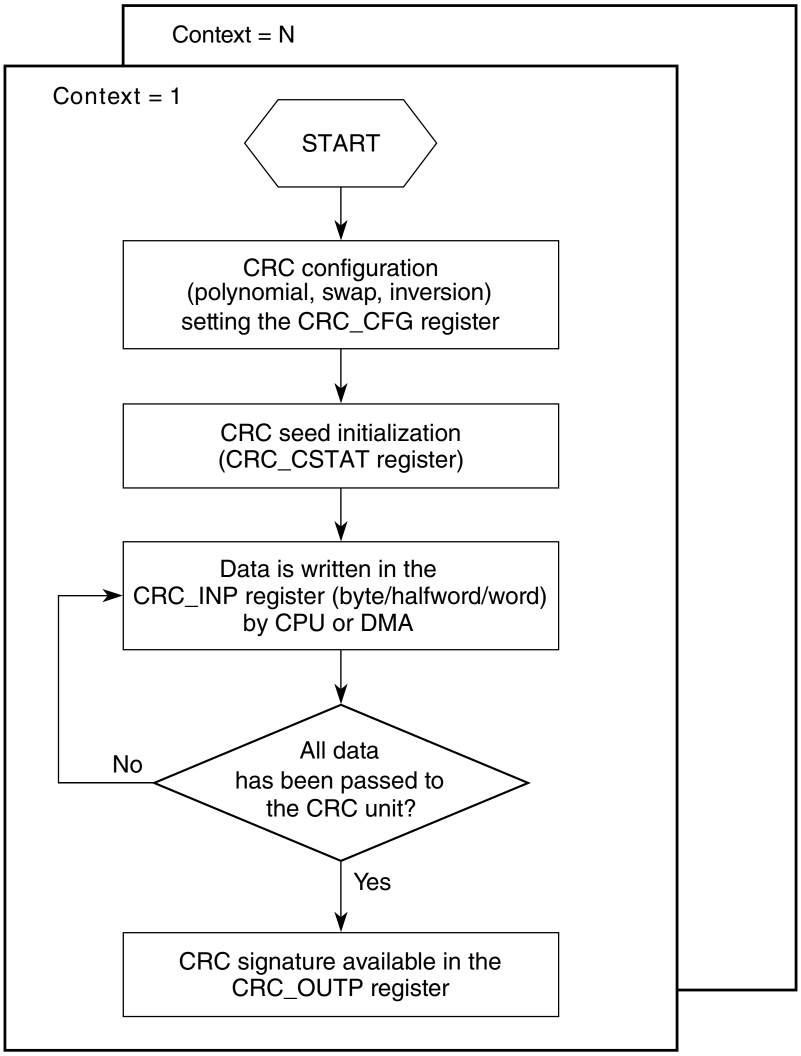

Figure 67-3. CRC computation flow

67.7 Use cases

67.7.1 Programming example

The number of contexts depends on the application. The overall number of contexts for the CRC peripheral depends on the number of peripherals that concurrently require intervention by the CRC module. Two main use cases are considered:

- Calculation of the CRC of the configuration registers during the process safety time
- Calculation of the CRC on the incoming/outcoming frames for the communication protocols (not protected with CRC by definition of the protocol itself) used as a safety-relevant peripheral

The signature of the configuration registers is computed correctly only if these registers do not contain any status bit.

Assuming that the DMA engine has *n* channels (greater than or equal to the number of contexts) configurable for the following types of data transfer—mem2mem, periph2mem, mem2periph—the following sequence, as shown in the following figure, is applied to manage the transmission data flow:

1. DMA/CRC module configuration (context x, channel x) by CPU
2. Payload transfer from the MEM to the CRC module (CRC_INP register) after MSB-to-LSB change (input mirroring) to calculate the CRC signature (phase1) by DMA (mem2mem data transfer, channel x)
3. CRC signature copy from the CRC module (CRC_OUTP register) to the MEM (phase 2) by CPU
4. Data block (payload + CRC) transfer from the MEM to the PERIPH module (for example, SPI Tx FIFO) (phase 3) by DMA (mem2periph data transfer, channel x)

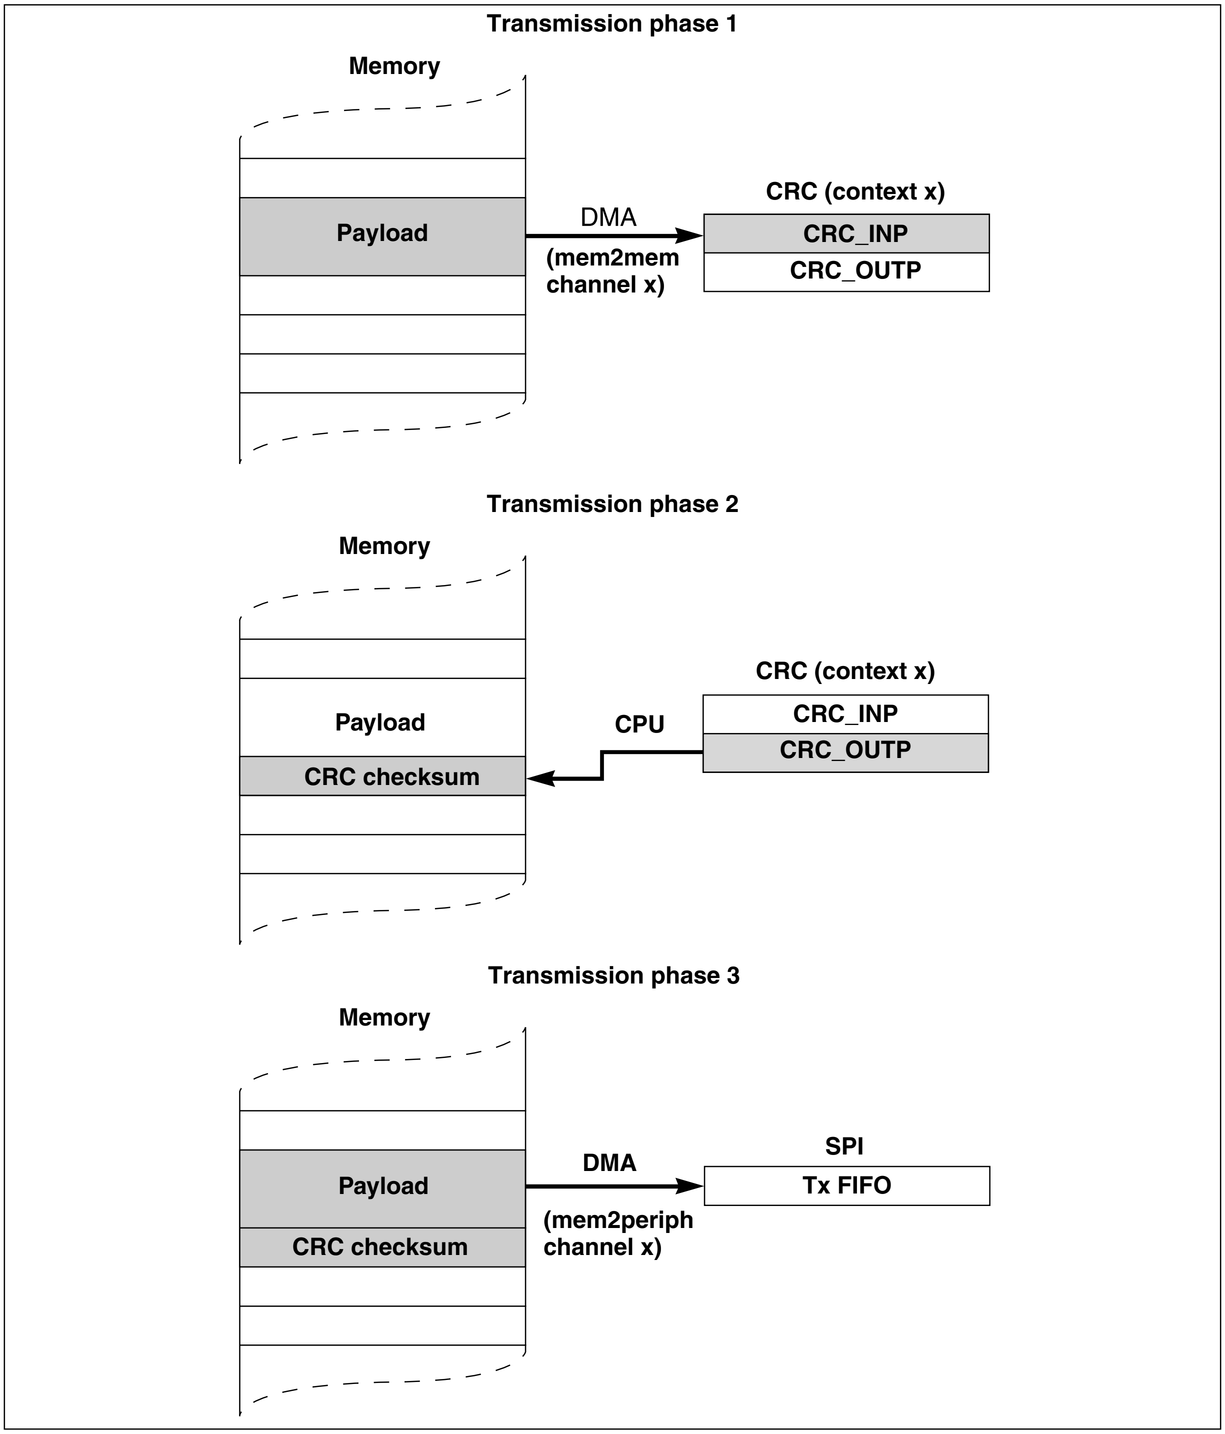

Figure 67-4. DMA-CRC transmission sequence

67.7.2 Register programming

- INV and/or SWAP (affecting the output only) can be applied to CRC-8, CRC-16, and CRC-32. Both can be applied together.

- SWAP_BITWISE (affecting the input only) can be applied for all polynomials if required by an application.
- SWAP_BYTEWISE (affecting the input only) can be applied for CRC-16 and CRC-32 polynomials only.
- SWAP_BITWISE has priority over SWAP_BYTEWISE when both are applied together.
- When generating CRC-32 for the Ethernet standard the user needs to set SWAP_BYTEWISE together with INV and SWAP.
- When generating CRC-16 the user needs to set SWAP_BITWISE bit.

Chapter 68
Memory Error Management Unit (MEMU)

68.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The MEMU is responsible for collection and reporting of error events associated with ECC (Error Correction Code) logic used on:

- System RAM
- Peripheral RAM
- Flash memory

When any of the following events occur the MEMU receives an error signal which causes an event to be recorded and corresponding error flags to be set and reported to FCCU (Fault Collection and Control Unit).

- Correctable Error: It comprises the following:
  - Single Bit error in the data part that is detected via ECC for:
    - System RAM
    - Peripheral RAM
    - Flash memory
  - Single Bit error in the data part that is detected via MBIST on any RAM.
- Uncorrectable Error: It comprises the following:
  - Multiple bit error that is detected via ECC for:
    - System RAM
    - Peripheral RAM
    - Flash memory
  - Multiple bit error that is detected via MBIST on any SRAM. Based on MBIST implementation, the MBIST might report several correctable errors in the same

word instead of an uncorrectable one. It is the task of the software after MBIST to aggregate these reports and detect the uncorrectable error.
    - Addressing errors and unused data bit errors detected by ECC logic.

The MEMU system connections are chip-specific; see the chip-specific MEMU information.

When multiple errors are indicated from various sources at same instant, an Overflow can be indicated by the MEMU to the FCCU. Overflow can also be indicated if the reporting table entries are full and a new unique error is reported by the system.

MEMU processes the errors based on whether they are correctable or uncorrectable (from either ECC or MBIST logic), independent of the source generating these errors.

The MEMU has multiple instances of the basic reporting block; one each for:

- System RAM ECC and MBIST
- Peripheral RAM ECC
- Flash memory ECC

Each instance has two reporting tables. Correctable errors are reported in one table, and the uncorrectable errors are reported in the other.

See Design overview for the reporting block details.

68.2 Features

The MEMU has the following features:

- Supports up to 128 error sources per the following reporting blocks (the number of error sources are chip-specific; see the chip-specific MEMU information):
    - System RAM ECC and MBIST
    - Peripheral RAM ECC
    - Flash memory ECC
- Support for error reporting from the following category of error sources (both for ECC and MBIST):
    - System RAM
    - Peripheral RAM
    - Flash memory
- Unique reported errors are logged into the module's reporting table which is accessible to CPU via memory mapped CPU register programming interface.

- MEMU handles overflow during error assertion and reports status accordingly.
- Unique errors are stored in correctable and non correctable section of the reporting table and corresponding indication is generated to the FCCU.
- CPU can program the known errors into the reporting table to avoid their re-reporting by MEMU.
- CPU can clear the reporting table errors.
- The reporting table for uncorrectable errors supports only 1 entry.

68.3 Block diagram

68.4 Design overview

The MEMU should be enabled on power-on reset. The user software can write known error addresses into the reporting table to prevent reporting of those errors addresses to FCCU should they later be accessed in operation. All writes into the reporting table by the CPU that assert the Valid Bit (of the respective reporting table entry) will be indicated as a new error detected and will be reported to the FCCU. This feature can also be used as self-checking option of the MEMU and the MEMU-FCCU connection.

The MEMU design does not limit any particular sequence or errors. See Handling overflows (Multiple error reporting), for details on overflow behaviors.

The basic algorithm flow/architecture for error reporting in the MEMU is summarized below:

1. Synchronizer block

   For asynchronous inputs, a FIFO-based structure (per asynchronous channel) is implemented. All the error inputs (correctable error reported, uncorrectable error reported, error address and bad bits/syndrome) are concatenated and stored in the FIFO. While storing the entry in the FIFO, a duplicity check is performed with the previously stored entry (the entry which was stored in the last cycle). If both the entries are duplicate the new entry is deleted and the pointers are rolled back to the old value, otherwise the new entry is stored. Whenever there is an overflow (FULL condition) in the Asynchronous FIFO, it is denoted by setting the Error Buffer Overflow or the EBO flag to the FCCU and the corresponding bit in the Concurrent Overflow Register is set.

   For synchronous inputs, inputs are sampled whenever the corresponding clock synchronizing signal is asserted for a particular channel.

2. Error Processing block

   This block is used to process the incoming errors coming from the device.

   - Error Sequencer is used for sequencing the errors so that these are processed one per clock. In case of more than one errors detected by the sequencer logic, one is sent for the processing (error comparison block), the other is stored in the error buffer and the rest are marked as overflows in the Concurrent overflow register.
   - All the sequences of incoming errors are supported. However, in case of multiple errors being asserted in back to back clock cycles, MEMU will process the errors being forwarded by the sequencer logic and register the rest of the errors as Concurrent Overflows in the Concurrent Overflow Register.
   - While storing the error in the error buffer, uniqueness is determined by comparing the error address, correctable or uncorrectable error type and the bad bit/syndrome (depending on ECC or MBIST logic) of the incoming error with the one stored in buffer. If the error buffer is full, and the incoming error to be stored in the error buffer is not yet in the error table, Error Buffer Overflow (EBO) is registered and the corresponding bit in the Concurrent Overflow Register is set., else the incoming error is dropped.

- While doing the error buffer uniqueness check, the type of error i.e Correctable Error (CE) or Uncorrectable Error UCE) is also compared, hence even if the Error Address and the Bad bit/syndrome fields (Depending on whether the incoming error is generated from ECC or MBIST logic) of the incoming error matches with the error buffer, if the type of errors (CE and UCE) differ they are treated as unique
- Determine the type and uniqueness of errors in the error comparison block and store them in the correct reporting table (correctable or uncorrectable)
- Generate signals to assert the necessary flags. Be aware that it takes several MEMU clock cycles (<=5 unless the error gets temporarily stored in the error buffer due to a collision) for an error report to cause a signal to be sent to the FCCU.

3. Reporting table

   This is a pre-defined table in the MEMU to store the details for the device. For the reporting table if the entry is unique it is stored in the reporting table. If the entry is not unique it is not stored and discarded.

   The MEMU asserts proper flags when error is stored in the reporting table or an overflow is asserted. Flags are also asserted when the software writes the VLD bit to the reporting table.

   The CPU can clear the flags signaling errors or overflows to the FCCU directly by writing 1 at the corresponding valid bit of the status register (i.e. ..._CERR_STS or ..._UNCERR_STS). The clearing of flags is totally independent from the status of VLD bits in the reporting table.

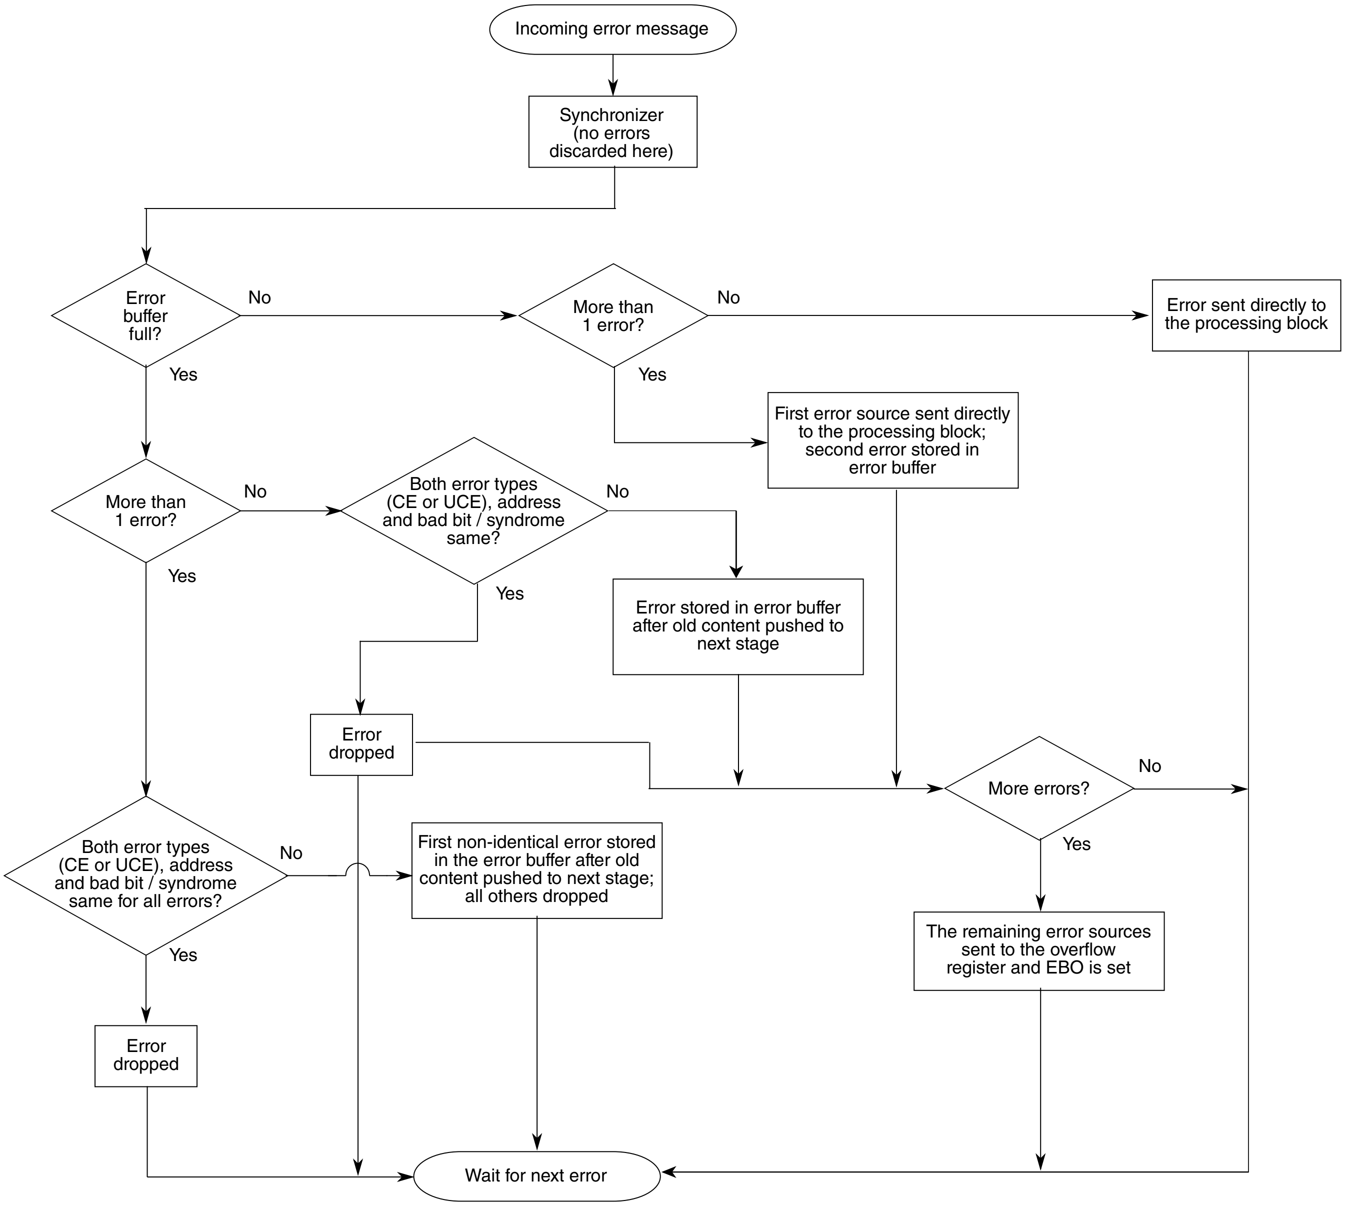
   The reporting table sizes are chip-specific; see the chip-specific MEMU information.

4. Register block

   The CPU register programming interface provides the memory-mapped registers necessary for the CPU to access the reporting table and other control and status registers for the modules. Flags to FCCU will be asserted on write by CPU to the valid bit or by MEMU itself if a unique error is stored. However, in the situation when both MEMU and the CPU are accessing the same Register location, a wait cycle will be signaled to the CPU and the CPU command will be completed in the next clock cycle.

   The software, in principle, is not supposed to write VLD to 1 if it is already 1.

   The CPU register interface provides the decoding of the peripheral signals to allow access to the reporting table and other registers in module.



Incoming error message
Synchronizer (no errors discarded here)
Error buffer full?
No
Yes
More than 1 error?
No
Yes
Error sent directly to the processing block
First error source sent directly to the processing block; second error stored in error buffer
More than 1 error?
No
Yes
Both error types (CE or UCE), address and bad bit / syndrome same?
No
Yes
Error stored in error buffer after old content pushed to next stage
Error dropped
More errors?
No
Yes
Both error types (CE or UCE), address and bad bit / syndrome same for all errors?
No
Yes
First non-identical error stored in the error buffer after old content pushed to next stage; all others dropped
The remaining error sources sent to the overflow register and EBO is set
Error dropped
Wait for next error

68.5 External signal description

MEMU has no external signals.

68.6 Memory map and register definition

This section describes the registers on this module.

68.6.1 Overview

The memory map comprises 32-bit aligned registers that can be accessed via 8-bit,16-bit, or 32-bit accesses. Write access to reserved address locations will generate a transfer error. Read data from reserved locations will also generate a transfer error and the read data bus will return all 0's.

NOTE

The module does not check for correctness of the programmed values in registers. Software must ensure that the correct values are being written.

NOTE

The memory map in this section shows all the possible registers on this module and the associated offsets (which vary depending on the number of registers actually implemented). The actual availability, number and addresses of registers, and number of reported errors in the reporting table are chip-specific; see the Device Configuration chapter that describes how modules are configured and connected.

MEMU memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	Control register (MEMU_CTRL)	32	R/W	0000_0000h	68.6.2/2698
4	Error flag register (MEMU_ERR_FLAG)	32	w1c	0000_0000h	68.6.3/2698
C	Debug register (MEMU_DEBUG)	32	R/W	0000_0000h	68.6.4/2702
20	System RAM correctable error reporting table status register (MEMU_SYS_RAM_CERR_STS0)	32	R/W	0000_0000h	68.6.5/2704

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MEMU_CTRL field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 SWR	Software Reset bit. Setting this will clear status flags and overflow register. However, the reporting table registers are not cleared. This bit will auto clear on next clock cycle. 0 No reset. 1 Reset asserted.
17–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

68.6.3 Error flag register (MEMU_ERR_FLAG)

Bits in the ERR_FLAG register indicate:

- A new entry in an error reporting table has been made (indicated by PR_CE, PR_UCE, F_CE, F_UCE, SR_CE, and SR_UCE)
- An overflow condition has been encountered when attempting to make a new entry in an error reporting table (indicated by SR_UCO, SR_CEO, F_UCO,F_CEO, PR_UCO, and PR_CEO)
- An overflow condition has been encountered in the internal error processing buffer of a MEMU reporting block.

Individual flags can be cleared by writing a '1'. This also resets the corresponding error indication to FCCU. Flags will not automatically reset if entries are removed from the reporting table. They have to be explicitly cleared by SW.

Bits SR_UCO, SR_CEO, F_UCO, F_CEO, PR_UCO, and PR_CEO are asserted when an overflow in the uncorrectable error reporting table is detected.

Access: User read/write

Address: 0h base + 4h offset = 4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

MEMU_ERR_FLAG field descriptions

Field	Description
0–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 PR_CE	Peripheral RAM ECC Correctable Error detect flag.

Table continues on the next page...

MEMU_ERR_FLAG field descriptions (continued)

Field	Description
	Indicates that a new and unique Peripheral RAM ECC correctable error is detected. Asserted when a new entry is inserted into the correctable error reporting table (either by CPU or module). 0 No new and unique error detected. 1 New entry in correctable error reporting table is made.
12 PR_UCE	Peripheral RAM ECC Uncorrectable Error Detect flag. Asserted when a new Peripheral RAM ECC uncorrectable error was detected or a new entry is inserted into the uncorrectable error reporting table (either by CPU or module). 0 No new and unique error detected. 1 New entry in uncorrectable error reporting table is made.
13 PR_CEO	Peripheral RAM ECC Correctable error Overflow flag. Asserted when the Peripheral RAM ECC correctable error reporting table is full and a new entry is attempted to be made to this table. 0 No Overflow. 1 Overflow in the correctable error reporting table detected.
14 PR_UCO	Peripheral RAM ECC Uncorrectable error Overflow flag. Asserted when the Peripheral RAM ECC uncorrectable error reporting table is full and a new entry is made to this table. 0 No Overflow. 1 Overflow in the uncorrectable error reporting table detected.
15 PR_EBO	Peripheral RAM ECC Error buffer Overflow flag. Asserted when the internal error processing buffer of Peripheral RAM ECC MEMU reporting block has overflowed. This can happen when too many errors are reported in a short interval of time for processing by MEMU. The channel(s) from which error reports were dropped due to the overflow are indicated in the XXXXX_OFLW registers. This field will also be set to 1 if the input ASYNC FIFOs overflow. 0 No Overflow. 1 Overflow in the internal error processing buffer detected.
16–18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 F_CE	Flash ECC Correctable Error Detect flag. Indicates that a new and unique Flash ECC correctable error was detected. Asserted when a new entry to the correctable error reporting table is done (either by CPU or module). 0 No new and unique error detected. 1 New entry in correctable error reporting table is made.
20 F_UCE	Flash ECC Uncorrectable Error Detect flag. Asserted when: • a new Flash ECC uncorrectable error was detected. • a new entry to the uncorrectable error reporting table is done (either by CPU or module) 0 No new and unique error detected. 1 New entry in uncorrectable error reporting table is made.
21 F_CEO	Flash ECC Correctable Error Overflow flag. Asserted when the Flash ECC correctable error reporting table is full and a new entry is made to this table.

Table continues on the next page...

MEMU_ERR_FLAG field descriptions (continued)

Field	Description
	0 No Overflow. 1 Overflow in the correctable error reporting table detected.
22 F_UCO	Flash ECC Uncorrectable Error Overflow flag. Asserted when the Flash ECC uncorrectable error reporting table is full and a new entry is made to this table. 0 No Overflow. 1 Overflow in the uncorrectable error reporting table detected.
23 F_EBO	Flash ECC Error buffer Overflow. Flag Asserted when the internal error processing buffer of Flash ECC MEMU reporting block has overflowed. This can happen when too many errors are reported in a short interval of time for MEMU to process them all. The channel(s) from which error reports were dropped due to the overflow are indicated in the XXXXX_OFLW registers. This field will also be set to 1 if the input ASYNC FIFOs overflow. 0 No Overflow. 1 Overflow in the internal error processing buffer detected.
24–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 SR_CE	System RAM ECCand MBIST Correctable Error detect flag. Indicates that a new and unique System RAM ECCand MBISTcorrectable error is detected. Asserted when a new entry to the correctable error reporting table is done (either by CPU or module). 0 No new and unique error detected. 1 New entry in correctable error reporting table is made.
28 SR_UCE	System RAM ECCand MBIST Uncorrectable Error Detect flag. Asserted when: • A new System RAM ECCand MBIST uncorrectable error is detected • A new entry to the uncorrectable error reporting table is done (either by CPU or module) 0 No new and unique error detected. 1 New entry in uncorrectable error reporting table is made.
29 SR_CEO	System RAM ECCand MBIST Correctable error Overflow flag. Asserted when the System RAM ECCand MBIST correctable error reporting table is full and a new entry is made to this table. 0 No Overflow. 1 Overflow in the correctable error reporting table detected.
30 SR_UCO	System RAM ECCand MBIST Uncorrectable error Overflow flag. Asserted when the System RAM ECCand MBIST uncorrectable error reporting table is full and a new entry is made to this table. 0 No Overflow. 1 Overflow in the uncorrectable error reporting table detected.
31 SR_EBO	System RAM ECCand MBIST Error buffer Overflow.

Table continues on the next page...

MEMU_ERR_FLAG field descriptions (continued)

Field	Description
	Flag asserted when the internal error processing buffer of System RAM ECCand MBIST MEMU reporting block has overflowed. This can happen when too many errors are reported in a short interval of time for processing by MEMU. The channel(s) from which error reports were dropped due to the overflow are indicated in the XXXXX_OFLW registers. This field will also be set to 1 if the input ASYNC FIFOs overflow. 0 No Overflow. 1 Overflow in the internal error processing buffer detected.

68.6.4 Debug register (MEMU_DEBUG)

This register is used to check the connections between MEMU & FCCU.

The error output of the MEMU towards FCCU shall stay set if forced until reset by SW via the MEMU in the normal way.

Access: User read/write

Address: 0h base + Ch offset = Ch

MEMU_FLASH_OFLW*n* field descriptions

Field	Description
0–31 OFLW	Overflow Bit. Each bit corresponds to an error source and is asserted when any of the conditions mentioned in Handling overflows (Multiple error reporting) occurs.

68.7 Functional description

In this section, the term "bad bit" and "syndrome" are equivalent, and are used to indicate the position of the bit in error.

68.7.1 Initializing MEMU

MEMU is always enabled and can be configured by user software for known errors which the system/application has collected over a period of time. The MEMU logic will not update the reporting table corresponding to the programmed values which have the VLD bit SET.

The user software can write into the reporting table and must make VLD bit ='1' for the programmed entry to be valid. Any write by the CPU that asserts the VLD bit will cause a corresponding flag to FCCU.

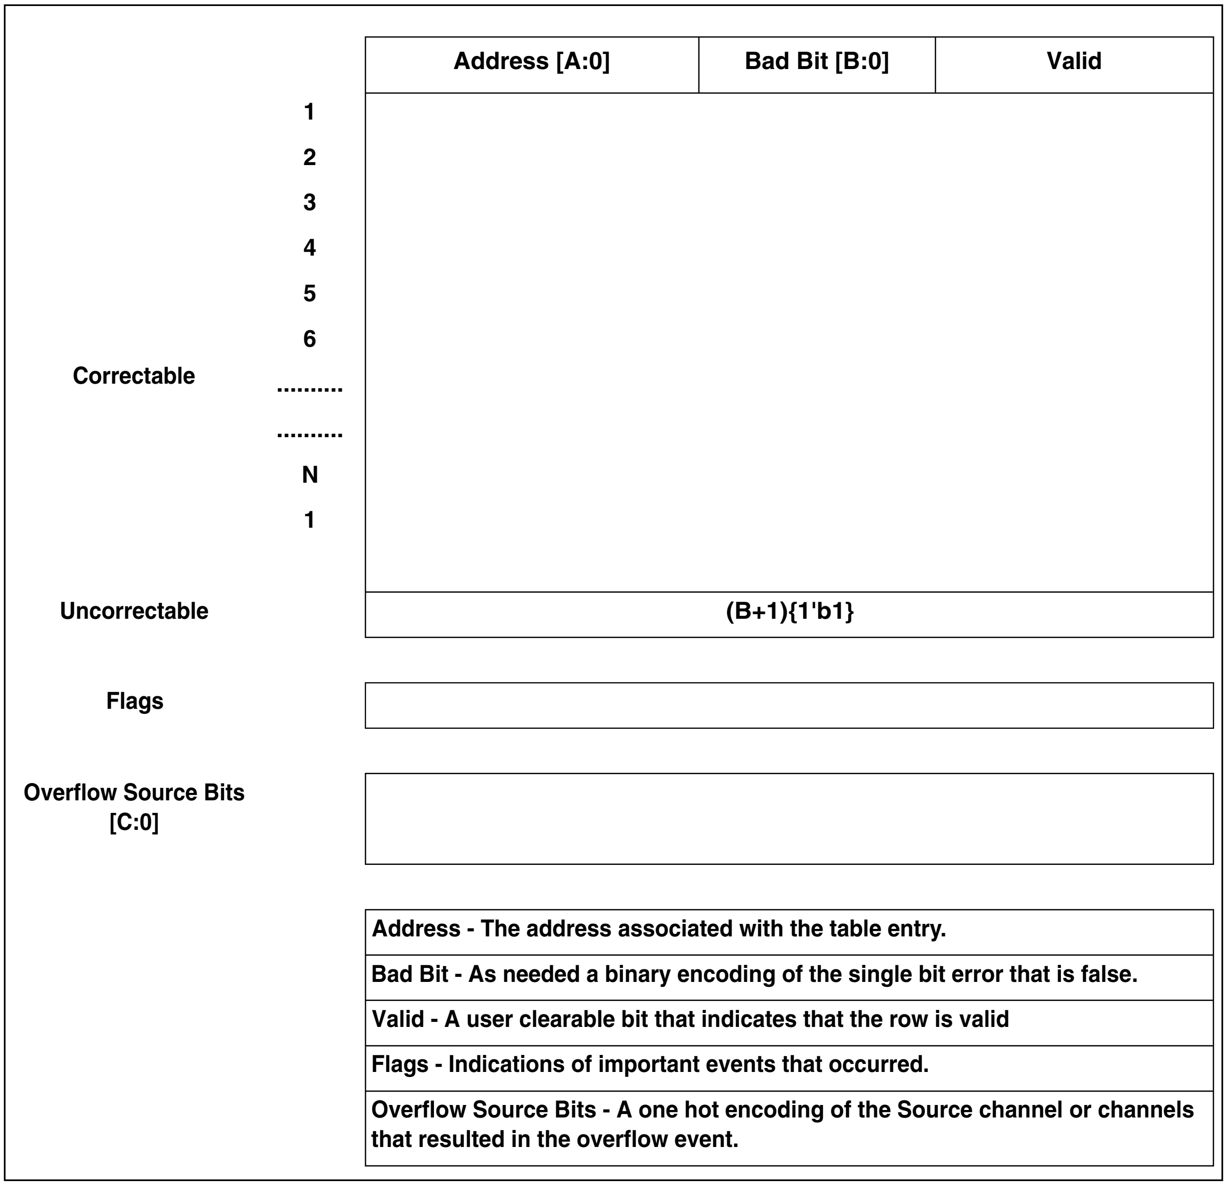
The software can program the table with known error addresses by setting the valid bit and storing the corresponding error address. The sequence of programming to prevent a collision of reporting table entries written by the HW and the SW is as follows:

1. Check that the VLD bit is not set,
2. Write an invalid address/bad bit information,
3. Set VLD bit,
4. Check that the address still has an invalid value,
5. Write address/bad bit information to desired address.

If the FCCU is programmed to cause an IRQ on new MEMU table entries, steps 3 to 5 should be executed with interrupts disabled to prevent any error handling SW to read the invalid address written in step 2). Note that in the case the software is in between the 3rd and the 5th step, and the MEMU writes an error with the same address that Software wants to program, both the errors will be stored in the reporting table (i.e. duplicate entries).

68.7.2 Reading the reporting table

The software at any time can read the reporting table via the software programming interface. It should read the entries with the valid bit set and take necessary action. To invalidate any entry, the valid bit must be cleared. Reading an entry which does not have the VLD bit set will return invalid data.



Address - The address associated with the table entry.

Bad Bit - As needed a binary encoding of the single bit error that is false.

Valid - A user clearable bit that indicates that the row is valid

Flags - Indications of important events that occurred.

Overflow Source Bits - A one hot encoding of the Source channel or channels that resulted in the overflow event.

Figure 68-4. Generic representation of the reporting table of one MEMU reporting block

68.7.3 Handling overflows (Multiple error reporting)

When a bit in the overflow registers (either error buffer or reporting table though the overflow registers are same) is asserted it can indicate the occurrence of one of the following conditions:

1. Error buffer overflow–More than two memories reporting an error at the same instant or the input ASYNC FIFOs reach the FULL level (overflow)
   - More than 2 errors detected at same time. This would lead to overflow in the error buffer. MEMU can process only one error at a time while storing the other in the error buffer. So this would be indicated as an overflow. The uniqueness check in the input buffer does not "guarantee" that an ECC-supervised memory with only one error will not be marked as overflow source. If that one error occurs together with two (or more) additional errors at the same cycle it can get flagged as an overflow.
2. Correctable/Uncorrectable Error Overflow–Overflow in correctable and uncorrectable reporting table occurs only when a unique entry is to be stored but the tables are already full (all entries have valid bit set).
   - An ECC error which matches the address of an MBIST error is dropped (same as if it matched the address of an ECC error). In case, where a MBIST error comes with ECC error already in the table, both the address and bad bits are compared to determine uniqueness.
3. The Overflows will be stored in the bit-wise order i.e., if the error bit 31 reports an error, the bit 31 of the overflow register will be set to '1'.

Chapter 69
Fault Collection and Control Unit (FCCU)

69.1 Introduction

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The Fault Collection and Control Unit (FCCU) offers a hardware channel to collect faults and to place the device into a safe state when a failure in the device is detected. No CPU intervention is requested for collection and control operation.

The FCCU offers a systematic approach to fault collection and control. The distinctive features of the module are:

- Redundant collection of hardware checker (for example, RCCU) results
- Redundant collection of fault information from safety relevant modules on the device
- Collection of test results
- Configurable fault control
- Configurable internal reactions for each NCF:
  - No reaction
  - IRQ
  - Short functional reset
  - Long functional reset
  - NMI
- External reactions via configurable output pins
- Watchdog timer for the reconfiguration phase

- The FCCU's configuration is lockable:
  - Permanently locked until next reset or transiently locked until a specific key is written. FCCU gets transiently locked again if an invalid key is written into FCCU_TRANS_LOCK register (that is, other than 0xBC). Key to lock the FCCU permanently is 0xFF, written in the FCCU_PERMNT_LOCK register.
- One of the error out pins is high to indicate operational (OK) state (in bi-stable operation mode). The above is not true in case the error out protocol is configured to be a toggling protocol, for example, dual rail and time switching.
- After power on, the EOUT signals have high impedance.[1] They show operational state only on software request.
- In case of a failure event or on software request for Error pin indication, the pin(s) are set to faulty state for a minimum time T_min, even if SW tries to release it before (for the case of error pin configured in Bi-stable mode only).
- The overall fault detection, processing and indication time is less than 10 ms.
- The actual maximum time is 5 CLKSAFE cycles**.**

The FCCU circuitry is checked at the start-up by the self-checking procedure. The FCCU is operative with the default configuration immediately after the completion of the self-checking procedure. Internal (short or long functional reset request pulse, interrupt request) and external (EOUT signaling) reactions are statically defined or programmable. The default configuration can be modified only in the CONFIG state. FCCU is designed to function when CLKSYS is faster than the CLKSAFE clocks.

69.1.1 Acronyms and abbreviations

Term	Description
CF	Critical fault
CPU	Central processing unit
EOUT	Error out
FOSU	FCCU output supervision unit
FSM	Finite state machine
INTC	Interrupt controller
intf	Interface
IRQ	Interrupt request
MC_ME	Mode entry module

Table continues on the next page...

[1] Actual value depends on device specific setting at pad level.

Term	Description
NCF	Noncritical fault
NMI	Nonmaskable interrupt
RCC	Redundancy control checkers
RCCU	Redundancy control checker unit
SoC	System-on-chip
STCU	Self-test control unit
SW	Software
WKPU	Wake-up unit

69.2 Main features

- Management of non-critical faults
- HW or SW fault recovery management
- Fault detection and collection
- Fault injection (fake faults)
- External reaction (fault state): EOUT signaling. Error indication via the pin(s) is controlled by the FCCU.
- Internal chip reactions (alarm state): interrupt request
- Internal chip reactions (fault state):
  - long functional reset request pulse
  - short functional reset request pulse
  - NMI
- Bi-Stable, Dual-Rail and Time Switching output protocols on EOUT
- Internal (to the FCCU) watchdog timer for the reconfiguration phase
- Configuration lock

69.3 Block diagram

The following figure is a top-level diagram of the FCCU module.

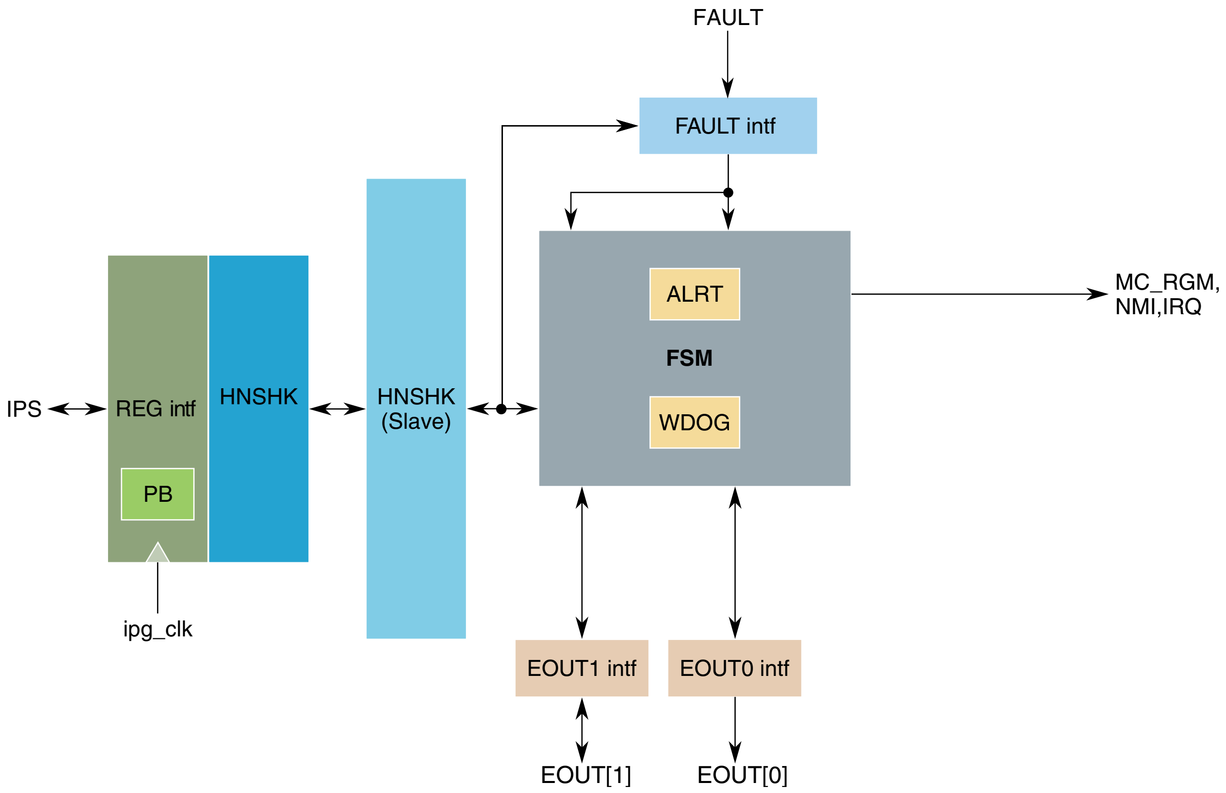


Figure 69-1. FCCU block diagram

This table describes the FCCU submodules.

Table 69-1. FCCU submodules

Submodule	Description
REG intf	Includes the register file, the IPS bus interface, the IRQ interface and the parity block (PB) for the configuration registers
HNSHK blocks (master and slave blocks)	Includes the FSM's ability to support the handshake between the REG interface and the FSM unit due to the usage of 2 asynchronous clocks (IPS system clock and RC oscillator clock)
FSM unit	Implements the main functions of the FCCU. The FSM also includes the: • Watchdog timer (WDG) • Alarm timer (ALRT)
FAULT intf	Implements the interface for the fault conditioning and management
EOUTx units	Implement the output stage to manage the EOUT interfaces

69.4 Signal description

69.4.1 Signals

This table describes the signals on the boundary of FCCU.

Signal	Direction	Function	Active level	Clock
Clock and reset				
CLKSYS	Input	System Clock—Supplies the primary clock.	Rising edge	—
CLKSAFE0	Input	Safe Clock 0—Supplies one of two 16 MHz clocks for use by various redundant submodules. This clock and CLKSAFE1 are often referred to as the same clock (CLKSAFE).	Rising edge	—
CLKSAFE1	Input	Safe Clock 1—Supplies one of two 16 MHz clocks for use by various redundant submodules. This clock and CLKSAFE0 are often referred to as the same clock (CLKSAFE).	Rising edge	—
EOUT interface				
EOUT[1:0]	Output	Error Output—Indicate to off-chip logic that a fault has occurred. For more information, see EOUT interface.	Programmable	CLKSAFE0, CLKSAFE1
WKPU interface				
NMIWKPU	Input	WKPU Nonmaskable Interrupt Request—Receives nonmaskable interrupt requests from the WKPU module.	Low	CLKSYS
WAKEWKPU	Output	Wake WKPU—Wakes the WKPU module to bring the chip out of dormant state when FCCU enters Fault state as the result of a noncritical fault for which NMI is enabled as the reaction (FCCU_NMI_ENa[NMIENx]).	High	CLKSAFE0, CLKSAFE1
Interrupt interface				
NMIOUT	Output	Nonmaskable Interrupt Output—Sends a nonmaskable interrupt request to the processor core or cores when FCCU enters Fault state as the result of a noncritical fault for which NMI is enabled as the reaction (FCCU_NMI_ENa[NMIENx]).	Low	CLKSYS

69.5 Functional description

69.5.1 Definitions

In general, the following definitions are applicable for the fault management:

- HW recoverable fault: the fault indication is an edge-triggered and level-sensitive signal that remains asserted until the fault cause is deasserted. That is, if logical 0 on the fault signal indicates fault, then the status flags are valid as long as the fault line stays at 0. The status is automatically cleared when the fault signal goes to 1. Typically the fault signal is latched external to the FCCU in the module where the fault occurred. The FCCU state transitions are consequently executed on the state changes of the input fault signal. No SW intervention in the FCCU is required to recover the fault condition.
- SW recoverable fault: the fault indication is a signal asserted without a defined time duration. The fault signal is latched in the FCCU. The fault recovery is executed following a SW recovery procedure (status/flag register clearing).

HW recoverable is an option to exclude the handling of error source/s by FCCU management SW, in case it is known that the fault is recoverable by itself when the fault condition gets corrected.

This table describes the types of resets.

Reset type	Function
Destructive	Initializes the entire chip as the result of a power-failure condition.
Long functional	Initializes the digital circuitry except for FCCU and STCU2.
Short functional	Initializes the digital circuitry except for OCOTP, FCCU, and STCU2.

For more information on each type of reset, see the MC_RGM and reset chapters.

69.5.2 FSM description

FCCU functionality is depicted by the finite state machine (FSM) state diagram.

Basically four states are identified with the following meaning:

- Configuration: Used only to modify the configuration of FCCU from its default. A subset of the FCCU registers, dedicated to define the FCCU configuration (global configuration, reactions to fault, timeout, noncritical fault masking) can be accessed in write mode only in Configuration state.

  Configuration state is accessible only in Normal state and if the configuration is not locked. The permanent configuration lock can be disabled by a reset which also resets the FCCU., The transient lock register is unlocked by writing BCh into it. FCCU gets transiently locked again if an invalid key is written into FCCU_TRANS_LOCK register (that is, other than BCh). Key to lock FCCU permanently is FFh, written in the FCCU_PERMNT_LOCK register.

  After the release of reset the state of the transient lock will be locked. The state of the permanent lock will be unlocked.

  The locking feature only restricts the FSM movement into Configuration state. Once the user enters Configuration state and then tries to lock the configuration by writing either to TRANS_LOCK or PERMT_LOCK, the locking of configuration will be effective after FCCU moves to Normal state, it will not be effective in the current Configuration state.

  The Configuration to Normal state transition can be executed by SW or automatically following a timeout condition of the watchdog. In case the timeout information and the SW request to mode change to Normal appears at the same time, watchdog timeout has the priority and hence the Configuration registers (those that are writable only in Configuration state) are reset to their default values. The movement to Normal is made.

  The incoming faults, occurring during the configuration phase (Configuration state) are latched in order to process them when FCCU is moved into Normal state, according to the new configuration.

  All pending faults that occur during Configuration state result in both of the following:

  - Highest-priority state transition
  - Interrupt generation (NMI or alarm IRQ)

  If the state transition occurs, it gives the reset reaction corresponding to the worst case based on all the faults (pending or nonpending faults) that occurred during Configuration state.

- Normal: This is FCCU's operating state when no faults are occurring. It is also the default state on the reset exit. Following state transitions occur on one of the following events:

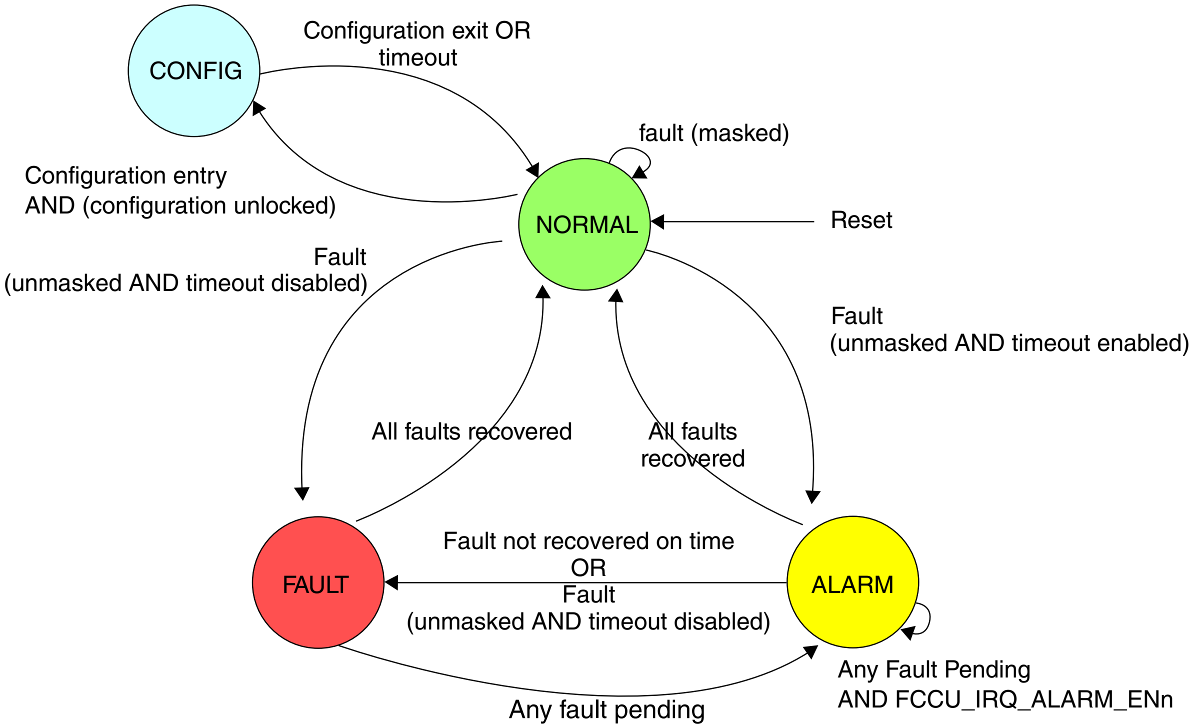
    - unmasked noncritical faults with the timeout disabled → FCCU moves to Fault state
    - unmasked noncritical faults with the timeout enabled → FCCU moves to Alarm state
    - masked noncritical faults → FCCU stays in Normal state
- Alarm: FCCU moves into Alarm state when an unmasked noncritical fault occurs and the timeout is enabled. The transition to Alarm state goes along with an interrupt alarm, if enabled. By definition, this fault may be recovered within a programmable timeout period, before it generates a transition to Fault state. The timeout is reinitialized if FCCU enters Normal state. The timeout restarts following the recovery from Fault state.
- Fault: FCCU moves into Fault state when one of the following condition occurs:
    - timeout related to a noncritical fault when FCCU is in Alarm state
    - unmasked noncritical faults with the timeout disabled

The transition from Normal/Alarm to Fault state goes along with the generation of:

- NMI interrupt (optional)
- EOUT signaling (optional)
- SW option: Soft reaction (Short functional reset request pulse if configured)
- SW option: Hard reaction (Long functional reset request pulse if configured)
- Non Maskable Interrupt (NMI) is routed only to the Safety Core

After moving to Fault state, if there is either a previous pending fault or a new fault for which NMI is enabled, NMI generation takes place.

Multiple faults can occur at the same time. Consider the case where there is a fault for which Alarm state is enabled and IRQ is programmed along with a fault for which Alarm state is disabled. In that case, the FSM moves to Fault state, but with the generation of alarm IRQ for the fault which has IRQ enabled.



CONFIG
Configuration exit OR timeout
Configuration entry AND (configuration unlocked)
fault (masked)
NORMAL
Reset
Fault (unmasked AND timeout disabled)
Fault (unmasked AND timeout enabled)
All faults recovered
All faults recovered
FAULT
Fault not recovered on time OR Fault (unmasked AND timeout disabled)
ALARM
Any Fault Pending AND FCCU_IRQ_ALARM_ENn
Any fault pending

Figure 69-2. FCCU state diagram

69.5.3 Fault priority scheme and nesting

The FAULT state has a higher priority than the ALARM state in case of concurrent fault events (non-critical) that occur in the NORMAL state.

The ALARM to FAULT state transition occurs if a non-critical fault (unmasked and with time-out disabled) is asserted in the ALARM state.

The ALARM to NORMAL state transition occurs only if all the non-critical faults (including the faults that have been collected after the entry in the ALARM state) have been cleared (SW or HW recovery); otherwise the FCCU will remain in the ALARM state.

The FAULT to NORMAL state transition occurs only if all the non-critical faults (including the faults that have been collected after the entry in the FAULT/ALARM state) have been cleared (SW or HW recovery); otherwise the FCCU will move to the ALARM state (if any non-critical fault is still pending and the time-out is not elapsed).

In general, no fault nesting is supported except for the non-critical faults that cause an ALARM to FAULT state transition. In this case the NCF timer is stopped until the FAULT state is recovered. If FCCU is in ALARM state and another fault comes, which has its alarm timeout enabled, then the alarm timer shall not reload and shall not start again.

69.5.4 Fault recovery

The following timing diagrams describe the main use cases of the FCCU in terms of fault events and related recovery.

A typical sequence related to a non-critical FAULT management (ALARM state), see Figure 69-3 and Figure 69-4, is as follows:

- non-critical fault assertion
- FCCU state transition (automatic): NORMAL → ALARM
  - alarm interrupt request (if enabled)
  - time-out running
- system state: RUN
- alarm interrupt management: FAULT recovery (by SW)
  - FCCU state transition ALARM → NORMAL

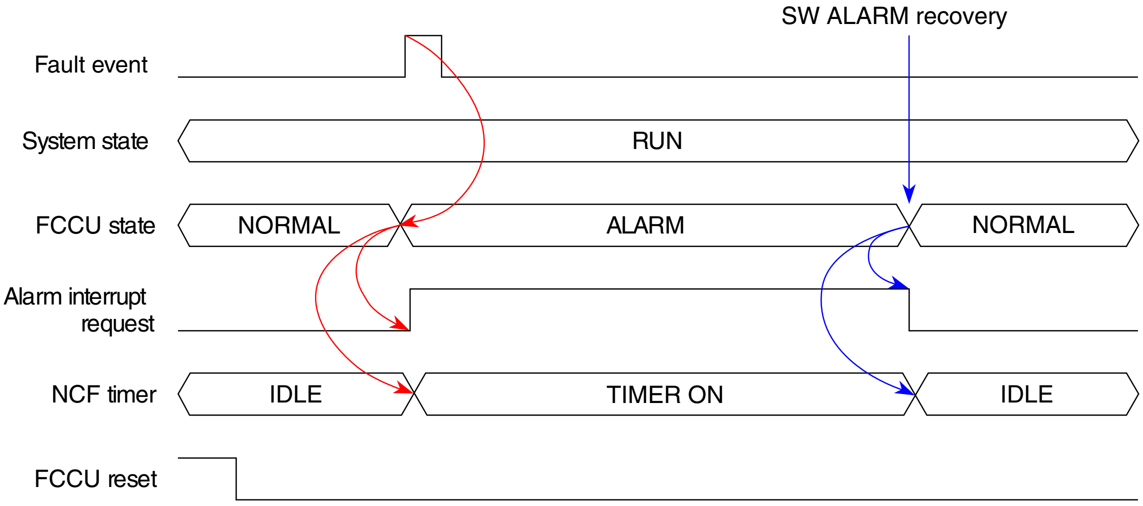


Figure 69-3. Non-critical FAULT (ALARM state) recovery (a)

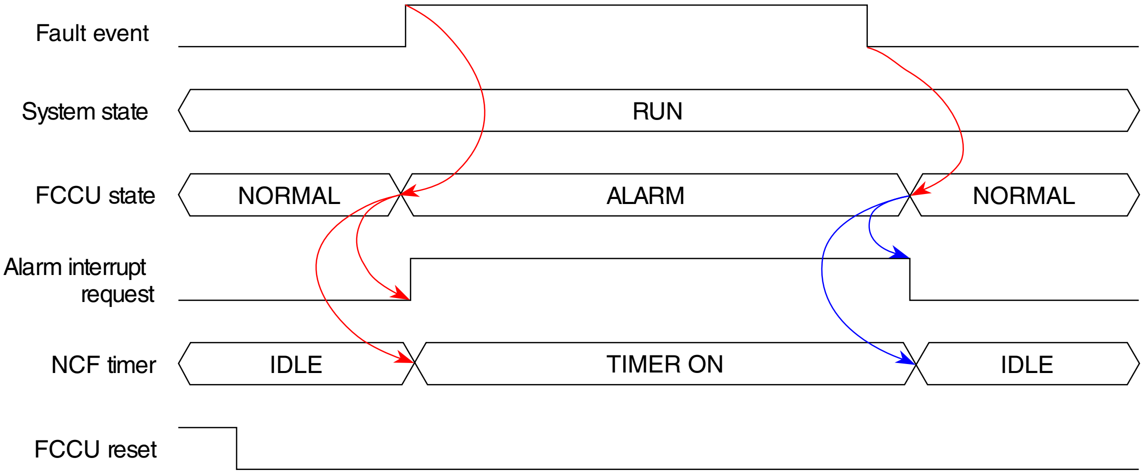

Figure 69-4. Non-critical FAULT (ALARM state) recovery (b)

A typical sequence related to a FAULT management (ALARM → FAULT state), see Figure 69-5, is as follows:

- non-critical fault assertion
- FCCU state transition (automatic): NORMAL → ALARM
    - alarm interrupt request (if enabled)
    - time-out running
- FCCU state transition (following the time-out trigger): ALARM → FAULT
    - NMI assertion (if enabled)
- system state transition: RUN → SAFE
- NMI interrupt management (if enabled)
    - FAULT recovery (by SW): FCCU state transition FAULT → NORMAL
    - system state transition: SAFE → RUN

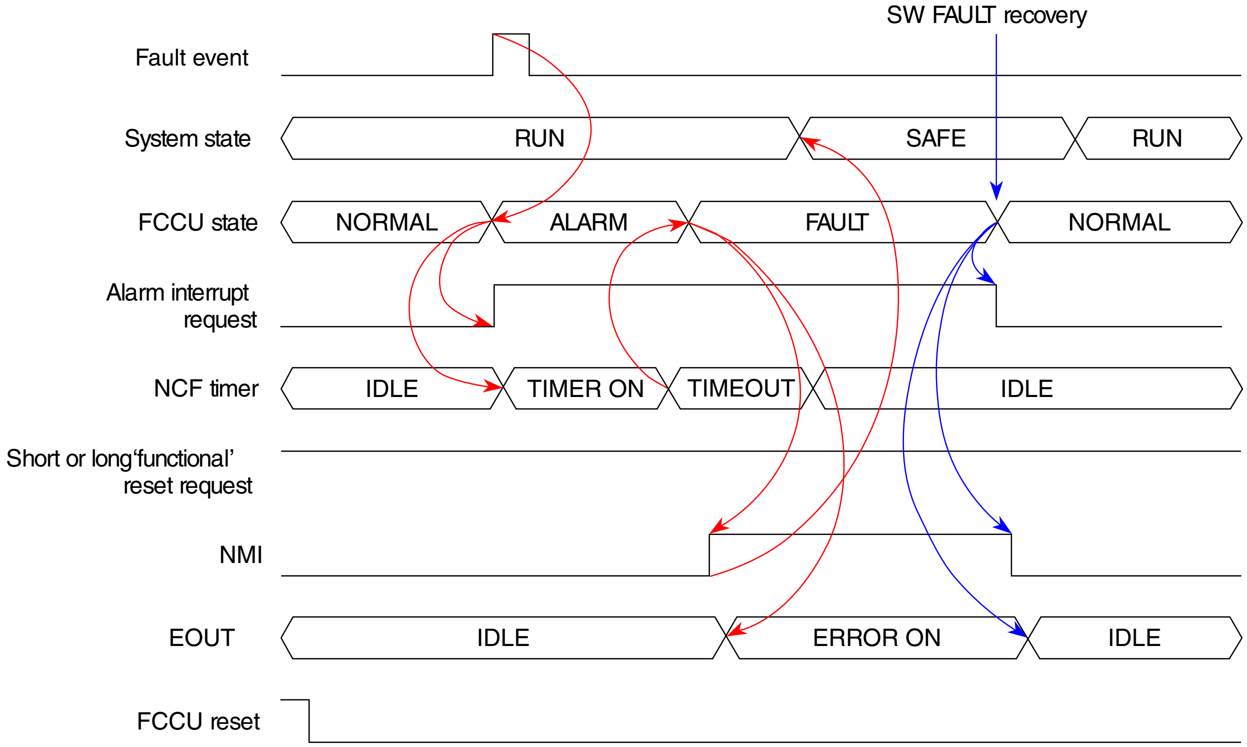

Figure 69-5. FAULT (ALARM → FAULT state) recovery

69.5.5 NMI/WKPU interface

NMIOUT is connected to all processor cores on the chip but is masked when any one of the following is true:

- An FCCU asynchronous reset is in progress.
- The chip is in RESET mode.
- The chip has automatically entered DRUN mode from RESET mode and software has not yet requested another mode.

This figure shows the logical scheme.

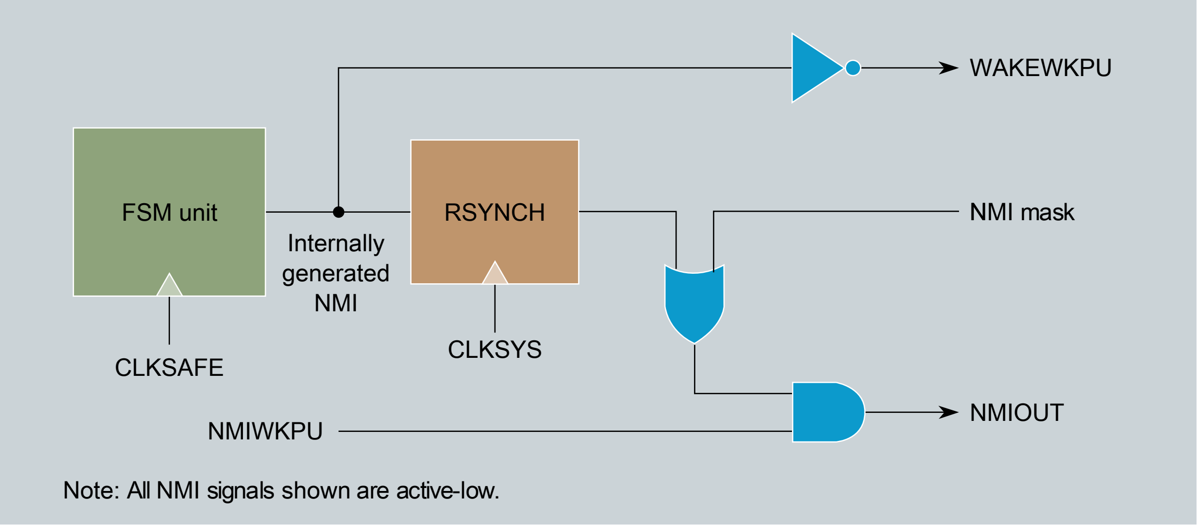

Figure 69-6. NMI/WKPU scheme

69.5.6 STCU interface

The STCU interface includes:

- A set of signals resulting from the self-checking procedure connected externally at the FCCU.

  The STCU fault signals are processed by the FCCU when the SoC is re-booted following the self-testing procedure. The STCU includes a status register that stores the self-testing results (flags).
- a mask that inhibits the EOUT dummy signaling until the STCU self-checking procedure has been completed.

During the self-testing procedure, depending on the STCU results, three cases are applicable:

1. STCU completes the self-testing procedure successfully. The SoC reboots and the FCCU is responsible for fault collection and indication.
2. STCU completes the self-testing procedure with low severity failures. The FCCU records the fault condition but does not, by default, trigger a reset cycle.
3. STCU completes the self-testing procedure with serious failures. The FCCU triggers a reset cycle in response to this fault input from the STCU. Because the fault condition survives reset, new reset cycles are subsequently triggered until the reset escalation feature takes control, freezing the chip in the reset state until a POR. This feature is optionally programmable using MC_RGM.

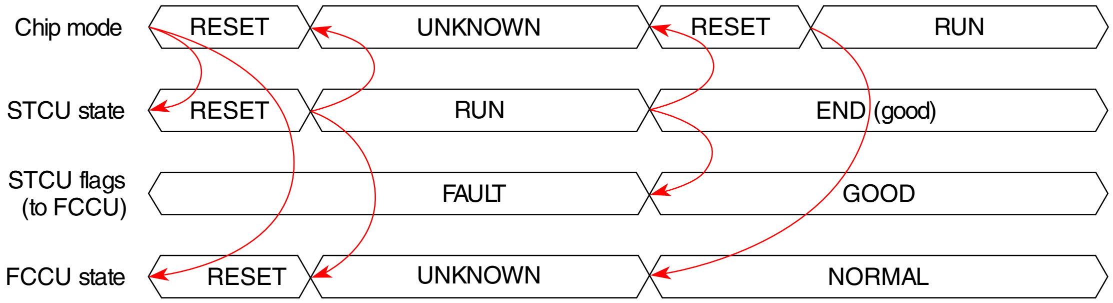

Figure 69-7. STCU-FCCU (case 1)

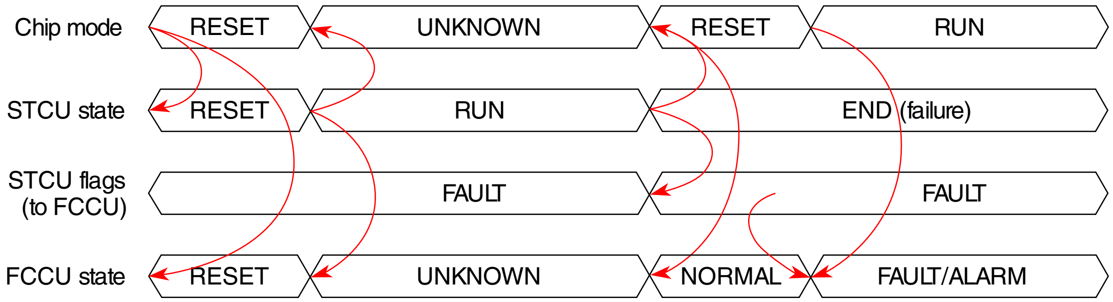

Figure 69-8. STCU-FCCU (case 2)

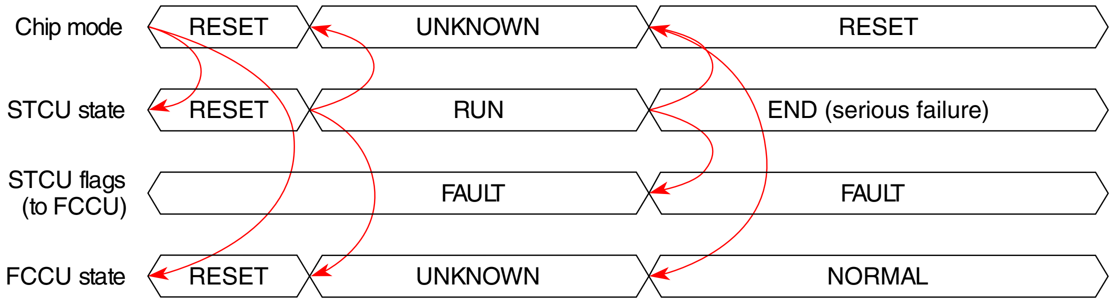

Figure 69-9. STCU-FCCU (case 3)

69.5.7 EOUT interface

The FCCU provides up to two bidirectional signals (EOUT[1:0]) as a failure indication to the external world. For information on the availability and names of these FCCU signals on the boundary of this chip, see the chip-specific FCCU information.

Different fault-output modes (protocols) for the fault-output (EOUT) interface are supported (FCCU_CFG[FOM]):

- Dual-Rail
- Time-Switching

- Bistable
- Test

You can further configure the fault-output modes using the following attributes:

Attribute	Field	Setting used in the example diagrams and tables that follow
Switching mode	FCCU_CFG[SM]	Slow
Polarity selection	FCCU_CFG[PS]	For the faulty indication, EOUT1 is high, and EOUT0 is low.
Derived prescaler	FCCU_CFG[FOPE], FCCU_CFG[FOP]	0

With a CLKSAFE frequency of 16 MHz, this drives a signal of 61 Hz on EOUT.

The external monitor of the EOUT protocol should oversample the EOUT signals in order to synchronize periodically the external clock (used by the monitor) and CLKSAFE (which detects the edge transition of the EOUT protocol) in Dual-Rail or Time-Switching fault-output mode.

In case of a failure event or on software request for EOUT indication, the signal(s) are set to the faulty state for a minimum time T_min, even if software tries to release it before. If software configures the error pins to OK(1), and if a fault comes trying to drive the pin to NOK(0), then priority is given to the fault indication and the error signals indicate NOK, such as an incoming fault is not masked when software has set the error signal to high. During the T_min by a non-software fault, the FCCU FSM moves independently of this signal state (low), and as soon as the timer expires, the pin behavior is dictated by the state in which the FSM finds itself in, and it is not possible to set the signals to OK by software moving FCCU to Configuration state, as long as this timer is running. No software intervention is needed to bring the signal from the low state.

Software can bring the pin back to OK state by clearing the faults and waiting for the T_min interval to expire, after which the FCCU automatically enters Normal state and the error signal indicates OK.

In case another failure event happens within T_min after a first one, the T_min counter is restarted.

These resets influence the state of the failure indication pins:

- Power on reset
- Destructive reset (including when an FOSU timeout occurs due to FCCU failing to react)
- Chip pin reset (RESET_B)

Other resets should not influence the state of the failure indication pins.

NOTE

The transition from Fault to Configuration state is not possible but is shown to display the behavior in all four states—reset, normal, error, and configuration.

NOTE

FCCU remains in Normal state when a fault is disabled; therefore, <i>NA</i> (not applicable) appears in the following table.

NOTE

The following table is valid only after software has enabled the EOUT signals (FCCU_CFG[FCCU_SET_AFTER_RESET].

Table 69-2. FCCU error pin behavior on state transitions

<table>
<tr><th rowspan="3">Fault signaling state</th><th colspan="3">Transition from Normal to Fault state</th><th colspan="3" rowspan="2">Normal+Configuration states</th><th colspan="3">Transition from Normal to Alarm state</th></tr>
<tr><th colspan="3">with Fault disabled | enabled</th><th colspan="3">with Fault disabled | enabled</th></tr>
<tr><th>Internal error pin</th><th>Error pin enable</th><th>Error pad</th><th>Internal error pin</th><th>Error pin enable</th><th>Error pad</th><th>Internal error pin</th><th>Error pin enable</th><th>Error pad</th></tr>
<tr><td>Disabled</td><td>NA | OK</td><td>NA | 1</td><td>NA | OK</td><td>OK</td><td>1</td><td>OK</td><td>NA | OK</td><td>NA | 1</td><td>NA | OK</td></tr>
<tr><td>Enabled</td><td>NA | NOK</td><td>NA | 1</td><td>NA | NOK</td><td>OK</td><td>1</td><td>OK</td><td>NA | OK</td><td>NA | 1</td><td>NA | OK</td></tr>
</table>

NOTE

The first time FCCU is in Configuration state, the EOUT pads are in a high-impedance state; thereafter, their states reflect the programmed EOUT protocol.

69.5.7.1 Dual-rail protocol

Dual-rail encoding is an alternate method for encoding bits. In contrast with classical encoding, where each signal carries a single-bit value, dual-rail encoded circuits use two wires to carry each bit. The encoding scheme is given in Table 69-3 and the related timing diagram is given in Figure 69-10 and Figure 69-11.

Table 69-3. Dual-rail encoding

Logical state	Dual-rail encoding (output pins EOUT[1:0])	Note
non-faulty	10	toggling
non-faulty	01	
faulty	00	toggling
faulty	11	

Table continues on the next page...

Table 69-3. Dual-rail encoding (continued)

Logical state	Dual-rail encoding (output pins EOUT[1:0])	Note
reset	Hi impedence[1]	no toggling
configuration	same as NORMAL	toggling

[1] Final value depends on the SoC setting at pad level.

As long as FCCU is in NORMAL or ALARM state, output will show "non-faulty" signal. Output pins EOUT[0:1] will toggle between 01 and 10 with a given frequency of 61 Hz.

In the RESET phase the output pins are set as "high impedance".

Note

> Figure 69-10 and Figure 69-11 are formatted to display the behavior in all four phases (reset, normal, error, and config), not to imply transitions between one phase to another. In particular, transition from error phase to config phase is not possible.

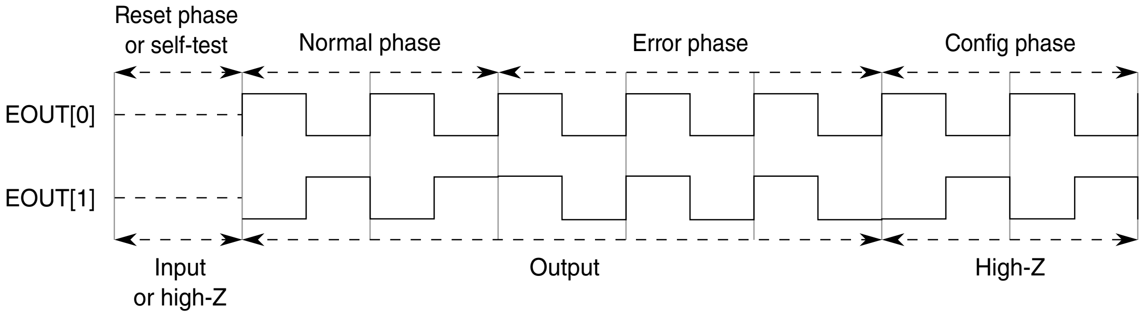

Figure 69-10. Dual-rail protocol (slow switching mode)

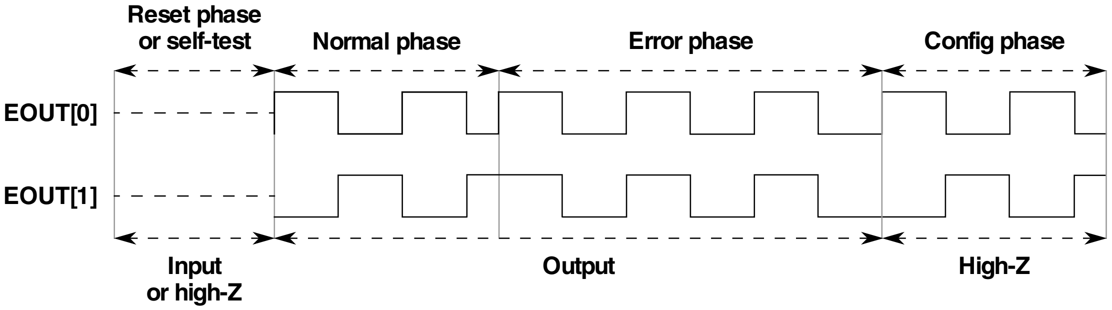

Figure 69-11. Dual-rail protocol (fast switching mode)

69.5.7.2 Time-switching protocol

The encoding scheme is given in Table 69-4 and the related timing diagram is given in Figure 69-12.

Table 69-4. Time-switching encoding

Logical state	Time-switching encoding (output pins EOUT[1:0])	Note
non-faulty	10	toggling
non-faulty	01	
faulty	10	no toggling
reset	high-Z[1]	no toggling
configuration	same as NORMAL	toggling

[1] Final value depends on device specific settings at pad level.

As long as FCCU is in NORMAL or ALARM state, outputs will show "non-faulty" signal. Output pins #0, #1 will toggle between 01 and 10 with frequency specified by the CFG[FOP].

In the FAULT state, the output pin EOUT[0] is set as low.

In Time Switching mode the second output (EOUT[1]) is the inverted signal of first output (EOUT[0]).

In the RESET phase the output pins are set as "high impedance".[2]

Note

Figure 69-12 is formatted to display the behavior in all four phases (reset, normal, error, and config), not to imply transitions between one phase to another. In particular, transition from error phase to config phase is not possible.

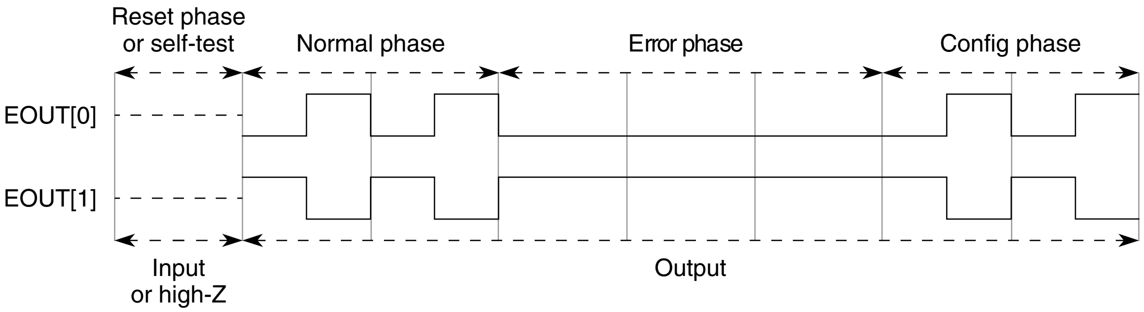

Figure 69-12. Time-switching protocol

[2] Actual value depends on device specific settings at pad level.

69.5.7.3 Bi-stable protocol

The encoding scheme is given in Table 69-5 and the related timing diagram is given in Figure 69-13.

Table 69-5. Bi-stable encoding

Logical state	Bi-stable encoding (output pins EOUT[1:0])	Note
non-faulty	01	no toggling
faulty	10	no toggling
reset	high-Z[1]	no toggling
configuration	same as NORMAL	no toggling

[1] Final value depends on device specific settings at pad level.

In the FAULT state, the faulty logical state is indicated. In NORMAL or ALARM state, "no-faulty" state is indicated. In Bi-stable mode the second output (EOUT[1]) is the inverted signal of first output (EOUT[0]).

In the RESET phase the output pins are set as "high impedance".[3]

Note

> Figure 69-13 is formatted to display the behavior in all four phases (reset, normal, error, and config), not to imply transitions between one phase to another. In particular, transition from error phase to config phase is not possible.

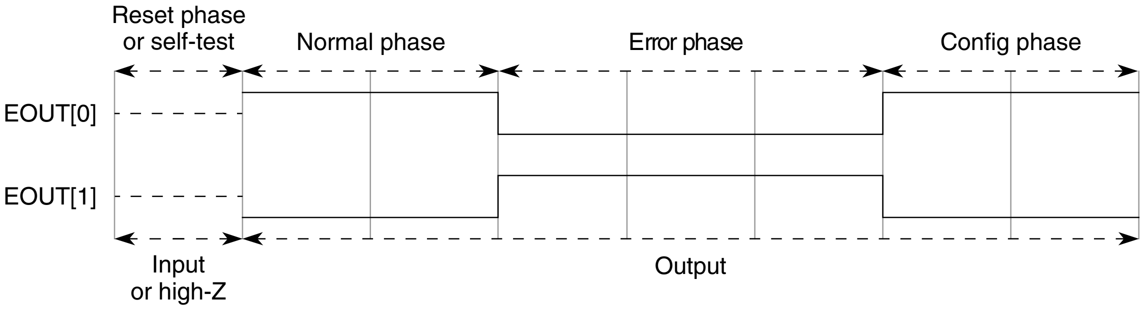

Figure 69-13. Bi-stable protocol

69.5.8 Error signal flow

See the chip-specific FCCU information for the diagram of the signal flow.

[3] Actual value depends on device specific settings at pad level.

69.6 Register descriptions

The FCCU registers are listed in the table below. Any address offset not explicitly mentioned in this table is reserved.

The FCCU supports word (32-bit), half-word (16-bit), and byte (8-bit) read and write accesses.

Follow these register-access guidelines:

- Don't read from or write to any addresses that are not shown in the following table. Doing so may result in a transfer error.
- Don't write to any of the configuration registers unless FCCU is in Configuration state. Doing so results in a transfer error.
- Don't write to FCCU_TRANS_LOCK or FCCU_PERMNT_LOCK unless your code runs in Supervisor mode. Doing so results in a transfer error.

All the registers accessible in write mode only in CONFIG state are referred as configuration registers. These configuration registers return to the default value after configuration watchdog timer expires. These are the registers protected by FCCU_TRANS_LOCK and FCCU_PERMNT_LOCK registers. The configuration register setting has effect only when the FCCU state exits from the CONFIG state.

For each possible NCF failure source a different reaction shall be configurable through the use of NMI, IRQ, long/short reset selection registers as well as no reaction by disabling the former registers. It is not possible for a single event upset to switch off all reactions on failures as implementation is per fault source (but it will be possible to switch them all off by SW if intended). Failures themselves are not able to disable all reactions and indications.

The FCCU is not reset by short or long functional resets.

69.6.1 Control (FCCU_CTRL)

The FCCU_CTRL register allows the following operations to be executed:

- moving the FCCU state from the NORMAL state into the CONFIG state
- moving the FCCU state from the CONFIG state into the NORMAL state
- reading or to clear the NCF status register
- reading the FCCU FSM status register
- reading or to clear the FCCU freeze registers
- reading the ALARM timer
- reading the Watchdog timer

Some critical operations require a key as defined in the FCCU_CTRLK register.

Address: 0h base + 0h offset = 0h

FCCU_CTRL field descriptions

Field	Description
0 FILTER_ BYPASS	Filter bypass 0 glitch filter not bypassed 1 glitch filter bypassed
1–2 FILTER_WIDTH	Filter width 00 filters glitches up to 50 μs 01 filters glitches up to 75 μs 10 filters glitches up to 100 μs 11 filters glitches up to 100 μs
3–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 DEBUG	Debug Mode Enable Specifies whether Debug mode is enabled. If so, FCCU enters Debug mode when the Debug signal is asserted. When FCCU enters Debug mode, it halts operation and remains in the state it was in before it entered Debug mode. **NOTE:** FOSU doesn't halt when FCCU enters Debug mode. Therefore, FOSU can still cause a reset if a fault occurs while FCCU is in Debug mode.

Table continues on the next page...

FCCU_CTRL field descriptions (continued)

Field	Description
	0 Disabled 1 Enabled
23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–25 OPS	Operation status. This bit can be read and cleared (via OP15 operation) by the software. 00 Idle 01 In progress 10 Aborted 11 Successful
26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–31 OPR	Operation run. The SW application must not modify the OPR field (any write operation will be ignored) until the completion of the operation. Once the operation has been completed, the operation status (OPS) is set and the OPR field is automatically cleared (OPR = 000). The opcode OP12 must not be programmed. The OPR field is automatically set to OP12 when the FCCU_NCF_S registers are cleared by a write-clear operation into the related register. The opcode OP14 must not be programmed. The OPR field is automatically set to OP14 when the timeout occurs (FCCU_CFG_TO) during the configuration procedure => the FCCU state is automatically forced in NORMAL mode setting the default configuration. In this phase any write operation to the FCCU configuration registers is inhibited. In the case of OP15, the operation is successful immediately and OPS/OPR are cleared instantly. The operations OP21-OP30 are forbidden. In case of execution, they return an ABORT response without any side effect. The ABORT response occurs in the following cases: • wrong access (missing or wrong key) to the FCCU_NCF_S register (clear operation OP12) • wrong access (missing or wrong key) to the FCCU_CTRL register (OP1, OP2 operation) • OP1 (CONFIG command) execution when FCCU state /= NORMAL or configuration locked 00000 No operation [OP0] 00001 Set the FCCU into the CONFIG state [OP1] 00010 Set the FCCU into the NORMAL state [OP2] 00011 Read the FCCU state (see the FCCU_STAT register) [OP3] 00100 Read the FCCU frozen status flags (see the N2AF_STATUS register) [OP4] 00101 Read the FCCU frozen status flags (see the A2FF_STATUS register) [OP5] 00110 Read the FCCU frozen status flags (see the N2FF_STATUS register) [OP6] 00111 Read the FCCU frozen status flags (see the F2AF_STATUS register) [OP7] 01000 Reserved 01001 Reserved 01010 Read the NCF status register (see the FCCU_NCF_S register) [OP10] 01011 Reserved 01100 NCF status clear operation in progress (see the FCCU_NCF_S register) [OP12] 01101 Clear the freeze status registers (see the freeze registers) [OP13]

69.6.2 Control Key (FCCU_CTRLK)

The FCCU_CTRLK register implements the key access for the operations OP1, OP2 according to the following sequence:

1. Write the key into the FCCU_CTRLK register.
2. Write the FCCU_CTRL register (operations OP1 or OP2).

NOTE

The FCCU_CTRLK and FCCU_CTRL registers must be written with consecutive instructions. Both registers must be written as 32-bit values. Do not use read-modify-write instructions, such as bit field instructions, to modify these registers.

The FCCU_CTRLK register is not readable, a 0000_0000h value is always returned in case of read operation. The key must be written by a word (32 bits) data write operation.

Address: 0h base + 4h offset = 4h

Field	Description

69.6.3 Configuration (FCCU_CFG)

Defines the global configuration for FCCU.

NOTE

This register is writable only when FCCU is in Configuration state.

NOTE

If you specify a new value for any of the fields in this register that affect the EOUT signals while the EOUT fault-indication timer is running (FCCU is indicating a fault on the EOUT signals), FCCU doesn't use the new settings you specified until after the EOUT fault-indication timer expires (FCCU stops indicating a fault on the EOUT signals).

Address: 0h base + 8h offset = 8h

FCCU_CFG field descriptions

Field	Description
0–6 Reserved	This field is reserved.
7 FCCU_SET_ AFTER_RESET	This bit controls the enable of the EOUT signals after reset lifts. After power-on the EOUT signals shall be in a high-impedance state. **NOTE:** The actual value depends on the chip settings at the pad level. They will go to normal state only on software request, that is, this field is set to 1. It is software's responsibility to write 1 to this field; otherwise, the error pin stays in a high-impedance state after reset lifts and FCCU is not functioning. 0 FCCU's error indication stops functioning and the EOUT signals are in a high-impedance state (the actual value depends on the chip settings at the pad level). 1 Write to start FCCU functioning.
8–9 FCCU_SET_ CLEAR	Error pin state can be controlled by these bits These bits clear(0) and set(1) the error pin. Higher priority is of the FCCU_SET_AFTER_RESET bit's capability to lead the error pins to Hi-Z. **NOTE:** Actual value depends on the SoC settings at pad level. Switch to software configuration (01, 11) comes into effect when FCCU FSM leaves Configuration state. After this is in effect, software maintains priority over FCCU FSM except for the case of 11 mentioned above. The switch back to FSM control is again done by writing into these fields with 00 or 10. 00 FCCU acts independent of above software control 01 Both error signals are set to low. 10 FCCU acts independent of above software control. 11 Both error signals are set to high (write not possible when FCCU is already in the T_min timer phase or if FCCU enters Fault state by capture of a fault).
10–11 Reserved	This field is reserved.

Table continues on the next page...

FCCU_CFG field descriptions (continued)

Field	Description
12–15 Reserved	This field is reserved. Always write the reset value to this field.
16 FOPE	Fault-Output (EOUT) Prescaler Extension For fault-output (EOUT) signaling, specifies the most significant bit of the derived prescaler that controls the signaling frequency. For more information, see the description of the FOP field.
17–18 Reserved	This field is reserved. Always write the reset value to this field.
19 Reserved	This field is reserved. Always write the reset value to this field.
20 Reserved	This field is reserved. Always write the reset value to this field.
21 SM	Fault-Output (EOUT) Switching Mode For fault-output (EOUT) signaling, controls how quickly the signals switch between faulty and nonfaulty indication. Applies only to Dual-Rail and Time-Switching fault-output modes. 0 Slow: No EOUT frequency violation during the FCCU state transition (Normal to Fault or vice versa, and Configuration to Normal). The indication transition occurs after a maximum delay equal to the duration of the semiperiod of the EOUT frequency. 1 Fast: The indication transition (Normal to Fault or vice versa, and Configuration to Normal) occurs immediately. A pulse with the minimum duration corresponding to the CLKSAFE period can occur in this mode. It implies a frequency violation of the EOUT protocol.
22 PS	Fault-Output (EOUT) Polarity Selection For fault-output (EOUT) signaling, controls the polarity of the signals for fault-output-mode indications that hold the signals low or high (versus toggling them or placing them in a high-impedance state). Applies only to Time-Switching fault-output mode (for faulty and configuration indications) and Bistable fault-output mode (for all indications). 0 For the faulty indication, EOUT1 is high, and EOUT0 is low. 1 For the faulty indication, EOUT1 is low, and EOUT0 is high.
23–25 FOM	Fault-Output (EOUT) Mode For fault-output (EOUT) signaling, controls the protocol of the signaling. **NOTE:** In the test modes, a simple double-stage resynchronization stage is used to resynchronize the EOUT input/outputs with CLKSAFE. 000 Dual-Rail (default state) [EOUT[1:0]= outputs] 001 Time-Switching [EOUT[1:0]= output to be used] 010 Bistable 011 Reserved 100 Reserved 101 Test 0 (controlled by the FCCU_EINOUT register; EOUT1 is an output; EOUT0 is an input) 110 Test 1 (controlled by the FCCU_EINOUT register; EOUT1 and EOUT0 are both outputs) 111 Test 2 (controlled by the FCCU_EINOUT register; EOUT1 is an input; EOUT0 is an output)
26–31 FOP	Fault-Output (EOUT) Prescaler For fault-output (EOUT) signaling, specifies the least significant bits of the derived prescaler that controls the signaling frequency. The derived prescaler is the concatenation of FOPE and FOP and is represented by *{FOPE, FOP}*.

Table continues on the next page...

FCCU_CFG field descriptions (continued)

Field	Description
	The following equation defines the signaling frequency in terms of the CLKSAFE frequency ($CLKSAFE_{freq}$) and the derived prescaler: $EOUT_{freq} = CLKSAFE_{freq} / ((\{FOPE, FOP\} + 1) \times 2 \times 2048)$ The following values and meanings are for the derived (7-bit) prescaler, not FOP alone. The meanings show the derived prescaler followed by the corresponding value by which the input clock frequency is then divided. 0000000: 0; divide by 2 × 2048 (4096) 0000001: 1; divide by 4 × 2048 (8192) 0000010: 2; divide by 6 × 2048 (12,288) … 1111101: 125; divide by 252 × 2048 (516,096) 1111110: 126; divide by 254 × 2048 (520,192) 1111111: 127; divide by 256 × 2048 (524,288) **NOTE:** The value of FOP after a Configuration-state timeout is 001000b (divide by 18 × 2048, or 36,864).

69.6.4 Noncritical Fault Configuration (FCCU_NCF_CFG*n*)

Contains the configuration of noncritical faults in terms of fault-recovery management. The configuration depends on the type of signaling of a fault event. Hardware-recoverable faults should be configured only if a previous latching stage captures and holds the physical fault; otherwise, the fault can be lost. All other faults should be configured as software faults.

NOTE

> These registers are writable only when FCCU is in Configuration state.

This table shows the noncritical-fault configuration-register channels.

Table 69-6. Noncritical-fault configuration-register channels

Address offset	Register name	Channel range (x) (bit location [0:31])

FCCU_NCF_CFG*n* field descriptions

Field	Description
0–31 NCFCx	Noncritical Fault Configuration. Defines the fault recovery mode. Hardware-recoverable faults are self-recovered (status flag clearing and related) if the root cause (input fault) has been removed. Software-recoverable faults are recovered (status flag clearing) by software clearing of the related status flag. See Table 69-6 for register offset to channel number relationship. 0 Hardware-recoverable fault 1 Software-recoverable fault

69.6.5 Noncritical Fault State Configuration (FCCU_NCFS_CFG*n*)

The FCCU_NCFS_CFGx registers contain the configuration of each non-critical fault in terms of fault reaction (short or long functional reset request pulse) when it is the root cause for the FAULT state transition.

NOTE

These registers are writable only when the FCCU is in the CONFIG state.

NOTE

Do not configure the same channel for both a RESET reaction in the FCCU_NCFS_CFGn register and an NMI reaction in the FCCU_NMI_ENn register at the same time.

Table 69-7 shows FCCU configuration register channels.

Table 69-7. FCCU NCFS configuration register channels

FCCU_NCFS_CFG*n* field descriptions

Field	Description
0–31 NCFSCx	Non-critical fault state configuration See Table 69-7 for register offset to channel number relationship. 00 No reset reaction 01 Short functional reset request pulse (FAULT state reaction) 10 Long functional reset request pulse (FAULT state reaction) 11 No reset reaction

69.6.6 Noncritical Fault Status (FCCU_NCF_S*n*)

The FCCU_NCF_Sx register contains the latched fault indication collected from the non-critical fault sources. Faults are latched also in the CONFIG state and independently from the enabling or reactions programmed for the NCF.

No reactions are executed until the FCCU moves in the NORMAL state.

FCCU reacts and moves from the NORMAL state into the ALARM state only if the respective enable bit for a fault is set in the FCCU_NCF_Ex register and the respective enable bit for the timeout is set in the FCCU_TOEx register.

FCCU reacts and moves from the NORMAL or ALARM state into the FAULT state if the respective enable bit for a fault is set in the FCCU_NCF_Ex register and the respective enable bit for the timeout is disabled in the FCCU_TOEx register.

FCCU reacts and moves from the ALARM state into the FAULT state if the timeout (FCCU_TO register) is elapsed before recovering from the fault.

The timeout is stopped only when the FCCU returns in the NORMAL state.

The FCCU_NCF_Sx register is encoded respectively into the N2FF_STATUS or A2FF_STATUS register to freeze the entry condition in the FAULT state. The status bits of the FCCU_NCF_Sx register, configured as SW recoverable faults, can be cleared by the following locked sequence:

1. Write the proper key into the FCCU_NCFK register.

2. Clear the status (flag) bit NCFSx => the opcode OP12 is automatically set into the FCCU_CTRL.OPR field.
3. Wait for the completion of the operation (FCCU_CTRL.OPS field).
4. Read the FCCU_NCF_Sx register in order to verify the effective deletion and in case of failure to repeat the sequence.

As result of the above sequence, in addition the FAULT interface provides support to clear the external fake FAULT root .

NOTE

There should not be any other operation in between the above steps.

The FCCU moves from the FAULT or ALARM state into the NORMAL state if all the source faults that caused the transition into the FAULT state have been removed (HW recoverable fault) or cleared via SW (SW recoverable fault). In case of nested faults that are not all recovered, the FCCU will remain in the FAULT or ALARM state.

The SW application executes the FCCU_NCF_Sx read operation by the following sequence:

1. Set the OP10 operation into the FCCU_CTRL.OPR field.
2. Wait for the completion of the operation (FCCU_CTRL.OPS field).
3. Read the FCCU_NCF_Sx register.

In case of re-configuration of the FCCU (CONFIG state), before to return in NORMAL state the pending status bits into the FCCU_NCF_Sx must be cleared in order to avoid a false transition in ALARM/FAULT state.

The following faults are ignored:

- to write a wrong key into the FCCU_NCFK register
- to attempt to clear a HW recoverable fault

Table 69-8 shows FCCU NCF status register channels.

Table 69-8. FCCU NCF status register channels

FCCU_NCF_S*n* field descriptions

Field	Description
0–31 NCFSx	Non-critical fault status. The status bits related to the non-critical fault configured as HW recoverable faults are read-only and the flag is self cleared when the fault source is removed. See Table 69-8 for register offset to channel number relationship. 0 No "non-critical" fault latched 1 "Non-critical" fault latched

69.6.7 Noncritical Fault Key (FCCU_NCFK)

The FCCU_NCFK register implements the key access to clear the status flags of the FCCU_NCF_Sx register.

The status bits of the FCCU_NCF_Sx register, configured as SW recoverable faults, can be cleared by the following locked sequence:

1. Write the key into the FCCU_NCFK register.
2. Clear the status (flag) bit NCFSx .

The key must be written for each FCCU_NCF_Sx clear operation.

The FCCU_NCFK register is not readable; a 0000_0000h value is always returned in case of read operation.

Address: 0h base + 90h offset = 90h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

FCCU_NCFK field descriptions

Field	Description
0–31 NCFK	Non-critical fault key = AB34_98FEh

69.6.8 Noncritical Fault Enable (FCCU_NCF_E*n*)

The FCCU_NCF_En registers enable the fault sources to allow a transition from the NORMAL into the FAULT or ALARM state. In case of fault masking, the respective status bit into the FCCU_NCF_Sn register is set (for debugging purposes), only the reaction is masked.

NOTE

These registers are writable only when the FCCU is in the CONFIG state.

NOTE

Any enabled fault should be programmed to result in a defined action. For example, set up an ALARM IRQ action by programming the IRQ Alarm Enable Register (FCCU_IRQ_ALARM_ENn).

Table 69-9 shows FCCU NCFE enable register channels.

Table 69-9. FCCU NCF enable register channels

FCCU_NCF_E*n* field descriptions

Field	Description
0–31 NCFEx	Non-critical fault enable See Table 69-9 for register offset to channel number relationship. 0 No actions following the respective non-critical fault assertion 1 FCCU moves to ALARM or FAULT state

69.6.9 Noncritical Fault Timeout Enable (FCCU_NCF_TOE*n*)

The FCCU_NCF_TOEx registers enable a transition from the NORMAL state into the ALARM state if the respective non-critical fault is enabled (NCFEx and NCFTOEx are set). In case the respective timeout is disabled (NCFTOEx is cleared) and the non-critical fault is enabled (NCFEx is set) the FCCU moves into the FAULT state if the related non-critical fault is asserted. The timer (preset with the timeout value defined by FCCU_TO register) is started when the FCCU moves into the ALARM state. If the fault is not recovered within the timeout the FCCU moves from the ALARM state to the FAULT state.

NOTE

> These registers are writable only when the FCCU is in the CONFIG state.

Table 69-10 shows FCCU NCF timeout enable register channels.

Table 69-10. FCCU NCF timeout enable register channels

FCCU_NCF_TOE*n* field descriptions

Field	Description
0–31 NCFTOEx	Fault timeout enable See Table 69-10 for register offset to channel number relationship. 0 FCCU moves into the FAULT state if the respective fault is enabled 1 FCCU moves into the ALARM state if the respective fault is enabled

69.6.10 Noncritical Fault Timeout (FCCU_NCF_TO)

Defines the preset value of the timer for the recovery of enabled noncritical faults. Once FCCU enters Alarm state, following the assertion of a noncritical fault that is enabled (NCFEa and NCFTOEa are set), the timer starts the countdown.

If the fault is not recovered within the timeout period, the FCCU moves from the Alarm state to the Fault state. The alarm timeout value should be programmed to be less than FOSU_COUNT, or destructive resets may be generated by FOSU timeouts.

NOTE

> This register is writable only when FCCU is in Configuration state.

Address: 0h base + B4h offset = B4h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

FCCU_NCF_TO field descriptions

Field	Description
0–31 TO	Noncritical Fault Timeout Timeout = (TO) × T $_{RC16MHz}$

69.6.11 Configuration-State Timeout (FCCU_CFG_TO)

The FCCU_CFG_TO register defines the preset value of the watchdog timer for the recovery from the CONFIG state. Once FCCU enters in CONFIG state, following a SW request (OP1 opcode), the watchdog timer is initialized and starts the countdown if the reset is not asserted.

If the configuration is not completed within the timeout, the FCCU moves automatically from the CONFIG state to the NORMAL state and the default values for all the configuration register is restored. Configuration registers are those registers which can be written only in CONFIG state. The description for a configuration register will contain a NOTE that it is writable only in the CONFIG state. The watchdog timeout is clocked with CLKSAFE. The default timeout value is 4.096 ms. Longer activation of CONFIG state can lead to resets if a failure is indicated during the time the FCCU is in CONFIG state due to FOSU.

NOTE

> The FCCU_CFG_TO register is writable in any state excluding the CONFIG state as follows the execution of the OP1 opcode (NORMAL to CONFIG state) and until the completion of the OP2 opcode (CONFIG to NORMAL state).

In case of watchdog timeout the FCCU_CFG_TO register is not accessible until the OP14 operation (CONFIG to NORMAL) has been completed.

NOTE

> When the configuration watchdog timer expires, FCCU changes the value of this register to its reset value.

Address: 0h base + B8h offset = B8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

0–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
29–31 TO	Configuration timeout Timeout = $T_{RC16MHz} \times 2^{(TO + 10)}$ 000 Timeout = 64 µs ... 111 Timeout = 8.192 ms

69.6.12 IO Control (FCCU_EINOUT)

The FCCU_EINOUT register allows the following operations typically in NORMAL state:

- to control the EOUT[1] output level when the FCCU is configured in "Test1" or "Test0" fault output mode (FCCU_CFG.FOM)

- to control the EOUT[0] output level when the FCCU is configured in "Test1" or "Test2" fault output mode (FCCU_CFG.FOM)
- to observe the EOUT[1:0] signals in input mode

Table 69-11 shows Bi-stable encoding.

Table 69-11. Bi-stable encoding

Mode = FCCU_CFG.FOM	EOUT[0]	EOUT[1]
Test1	output	output
Test2	output	input
Test0	input	output

NOTE

Due to the resynchronization stage of the EOUT interface, there is a latency of a few CLKSAFE cycles following a write/read operation of the FCCU_EINOUT register.

0–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26 EIN1	Error input 1. The EIN1 captures the respective fccu_ein[1] input signal. While this field is set to zero by reset, a read of this field always returns the logic value on the fccu_ein[1] pin. 0 when fccu_ein[1] = 0 1 when fccu_ein[1] = 1
27 EIN0	Error input 0.The EIN0 captures the fccu_ein[0] input signal. While this field is set to zero by reset, a read of this field always returns the logic value on the fccu_ein[0] pin. 0 when fccu_ein[0] = 0 1 when fccu_ein[0] = 1
28–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 EOUT1	Error out 1 (significant only if the FCCU_CFG.FOM = Test1 or Test0 => EOUT[1] configured in output mode). The EOUT1 set/clear the respective EOUT[1] output signal if FCCU_CFG.FOM = 110 or 101, otherwise it is a "don't-care" value. **NOTE:** When the configuration watchdog timer expires, FCCU changes the value of this field to its reset value. 0 force EOUT[1] = 0 1 force EOUT[1] = 1
31 EOUT0	Error out 0 (significative only if the FCCU_CFG.FOM = Test1 or Test2 => EOUT[0] configured in output mode). The EOUT0 set/clear the respective EOUT[0] output signal if FCCU_CFG.FOM = 110 or 111, otherwise it is a "don't care" value. **NOTE:** When the configuration watchdog timer expires, FCCU changes the value of this field to its reset value. 0 force EOUT[0] = 0 1 force EOUT[0] = 1

69.6.13 Status (FCCU_STAT)

The FCCU_STAT register includes the FCCU status for debugging/test purposes. The FCCU finite state machine operates by the RC oscillator clock asynchronous with the system clock. The FCCU status read operation requires a safe mechanism operated by a HW/SW synchronization sequence. The SW application executes a FCCU status read operation by the following sequence:

1. Set the OP3 operation into the FCCU_CTRL.OPR field.
2. Wait for the completion of the operation (FCCU_CTRL.OPS field).
3. Read the FCCU status (FCCU_STAT register).

69.6.14 NA Freeze Status (FCCU_N2AF_STATUS)

The N2AF_STATUS register contains a unique code to identify the "non-critical fault" source (fccu_ncf[x]) that caused the state transition from the NORMAL state to the ALARM state. In case of multiple fault conditions the fault source cannot be identified. This register is for test/debug purposes.

The SW application executes the N2AF_STATUS read operation by the following sequence:

1. Set the OP4 operation into the FCCU_CTRL.OPR field.
2. Wait for the completion of the operation (FCCU_CTRL.OPS field).
3. Read the N2AF_STATUS register.

The SW application executes the N2AF_STATUS clear operation by the following sequence:

1. Set the OP13 operation into the FCCU_CTRL.OPR field.
2. Wait for the completion of the operation (FCCU_CTRL.OPS field). (All the freeze registers are cleared by this operation.)

Address: 0h base + C4h offset = C4h

69.6.15 AF Freeze Status (FCCU_A2FF_STATUS)

The A2FF_STATUS register contains a unique code to identify the timeout trigger (non-critical fault) that caused the state transition from the ALARM state to the FAULT state. In case of multiple fault conditions the fault source cannot be identified. This register is for test/debug purposes.

The SW application executes the A2FF_STATUS read operation by the following sequence:

1. Set the OP5 operation into the FCCU_CTRL.OPR field.
2. Wait for the completion of the operation (FCCU_CTRL.OPS field).
3. Read the A2FF_STATUS register.

The SW application executes the FCCU_AFFS clear operation by the following sequence:

1. Set the OP13 operation into the FCCU_CTRL.OPR field.
2. Wait for the completion of the operation (FCCU_CTRL.OPS field).

All the freeze registers are cleared by this operation.

69.6.18 Noncritical Fault Fake (FCCU_NCFF)

The FCCU_NCFF register contains a unique code to set a non-critical fault in mutually exclusive mode by the external FAULT interface (signal setting). It allows the SW emulation of the non-critical faults, by the injection of the fault directly in the FAULT root, in order to verify the entire path and reaction. The reaction following a fake non-critical fault cannot be masked. The FCCU_NCFF is a write-only register with a set of codes corresponding to each non-critical fault injection.

Address: 0h base + DCh offset = DCh

69.6.19 IRQ Status (FCCU_IRQ_STAT)

The FCCU_IRQ_STAT register provides the FCCU interrupt status related to the following events:

- Configuration timeout error
- Alarm interrupt
- NMI interrupt

The configuration timeout interrupt is asserted if the CFG_TO_STAT bit of the FCCU_IRQ_STAT register is set and the CFG_TO_IEN bit of the FCCU_IRQ_EN register is also set. It is cleared when a 1 is written to the CFG_TO_STAT bit.

The NMI and ALARM interrupts are asserted and cleared according to the FCCU state. The status bits of the FCCU_IRQ_STAT trace the status of the related interrupt lines.

69.6.21 XTMR (FCCU_XTMR)

The FCCU_XTMR register contains the read values of the Alarm or Watchdog Timer. These timers are clocked by CLKSAFE.

The SW application executes the timer read operation by the following sequence:

1. Set any of the following operations into the FCCU_CTRL.OPR field:
    - OP17
    - OP19
2. Wait for the completion of the operation (FCCU_CTRL.OPS field).
3. Read the FCCU_XTMR register.

Table 69-12 shows Timer state/value.

Table 69-12. Timer state/value

69.6.25 Delta T (FCCU_DELTA_T)

The FCCU_DELTA_T register is used for programming the value of delta_T constant, in microseconds.

NOTE

This register can be written only when the FCCU is in CONFIG state.

NOTE

Reserved bits should always be written as all 0's.

Address: 0h base + F8h offset = F8h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

FCCU_DELTA_T field descriptions

Field	Description
0–1 Reserved	This field is reserved.
2–15 Reserved	This field is reserved.
16–17 Reserved	This field is reserved.
18–31 DELTA_T	Controls the minimum amount of time (T_min) that the EOUT fault-indication timer runs according to this equation: T_min = 250 µs + DELTA_T FCCU starts the EOUT fault-indication timer when all of the following are true: • The EOUT fault-indication timer isn't already running. • FCCU enters Fault state as the result of a fault. When the EOUT fault-indication timer is already running and a new fault occurs: • When FCCU is in Configuration state: FCCU doesn't restart the EOUT fault-indication timer. • When FCCU is in Normal state or Alarm state: • And Alarm state is enabled for the fault (noncritical): FCCU enters (or remains in) Alarm state but doesn't restart the EOUT fault-indication timer. • And Alarm state is disabled for the fault (noncritical) or not applicable: FCCU enters Fault state and restarts the EOUT fault-indication timer. • When FCCU is in Fault state: FCCU restarts the EOUT fault-indication timer. FCCU stops and reinitializes the EOUT fault-indication timer when all of the following are true: • T_min has expired. • All faults that caused FCCU to enter or remain in Fault state since FCCU started the EOUT fault-indication timer have been cleared, causing FCCU to return to Normal state. The following values and meanings are for DELTA_T: 00_0000_0000_0000: 0 µs 00_0000_0000_0001: 1 µs … 11_1111_1111_1110: 16,382 µs 11_1111_1111_1111: 16,383 µs **NOTE:** The specified values for DELTA_T may vary ±2% due to the post-trimming inaccuracy of the CLKSAFE clocks.

69.6.26 IRQ Alarm Enable (FCCU_IRQ_ALARM_EN*n*)

These registers enable the corresponding IRQ alarm.

Table 69-13 shows FCCU IRQ alarm enable register channels.

Table 69-13. FCCU IRQ alarm enable register channels

Address offset	Register name	Channel range (x) (bit location [0:31])
0FCh	FCCU_IRQ_ALARM_EN0	IRQENE[31:0]
100h	FCCU_IRQ_ALARM_EN1	IRQENE[63:32]
104h	FCCU_IRQ_ALARM_EN2	IRQENE[95:64]

NOTE

These registers can be written only when the FCCU is in CONFIG state.

Address: 0h base + FCh offset + (4d × i), where i=0d to 2d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

FCCU_EOUT_SIG_EN*n* field descriptions

Field	Description
0–31 EOUTENx	Fault-Output (EOUT) Signaling Enable Writable only when FCCU is in Configuration state. Controls whether fault-output (EOUT) signaling is enabled for the associated noncritical fault channel (x) when FCCU is configured for Bistable fault-output mode (FCCU_CFG[FOM]). Fault-output signaling is always enabled for the associated channel, regardless of the value of this field, when FCCU is configured for any other fault-output mode. **NOTE:** To ensure that the FOSU module is aware that fault-output signaling is enabled as a reaction for the associated noncritical fault channel (so that FOSU doesn’t mistakenly generate a destructive chip reset), you must set this field to enabled when FCCU is configured for any mode other than Bistable fault-output mode. For the mapping of the EOUTENx fields among registers, see the earlier table in this register description. 0 Disabled 1 Enabled

69.7 FCCU Output Supervision Unit

The FOSU provides a supervision of the primary fault notification path by analyzing FCCU behavior for correctness. It waits for any reaction of the FCCU in a fixed time window after a fault is signaled.

The intention of the FOSU is to provide a secondary fault reaction path in most cases when the FCCU fails but not to needlessly propagate a fault which is already handled by the FCCU in a full chip reset. Only a failed primary fault reaction (that is, FCCU's failure) is a reason for the secondary reaction to take over (and generate a destructive reset request).

There is a 'do nothing' input coming from the FCCU that indicates that the FCCU is programmed for no reaction for ALL FAULTS. It is a "static" input in the sense that it does not change after FCCU configuration. The FOSU masks the incoming faults with the 'do nothing' control from the FCCU, meaning that a fault is not captured by the FOSU if the 'do nothing' signal is asserted, (i.e., a disabled fault). There is no minimum pulse width requirement on the fault indication other than what is required by the technology, which is the same as that of the FCCU. FOSU does not monitor FCCU for the case of faults occurring during CONFIG state. Also, the case of a continuously incoming disabled fault being enabled later, is not monitored.

The FOSU contains a timer with a duration of FOSU_COUNT, driven by CLKSAFE. The timer is initialized and started on any captured, enabled fault. While the timer is running, any subsequent captured fault will neither restart nor reinitialize the timer. The timer is stopped when the FCCU shows any of the following reactions (the FOSU does not check whether the reaction is the configured one for the faults which occurred):

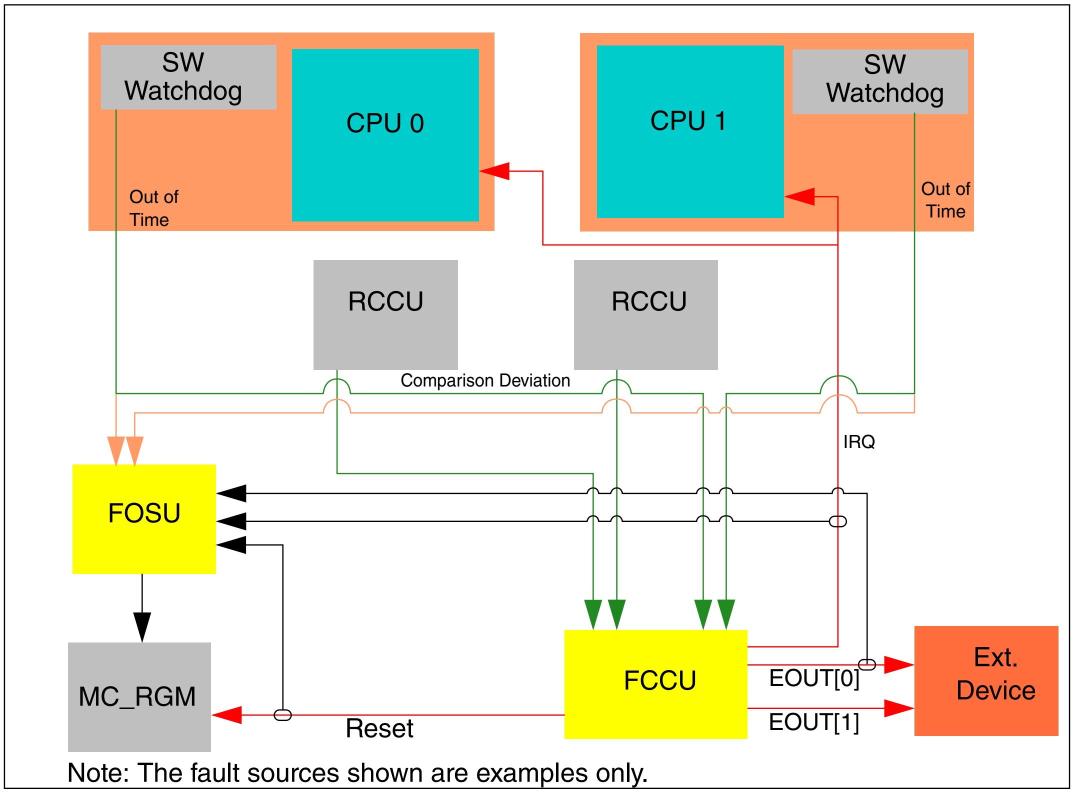
- Reset: Long or short functional reset
- IRQ: NMI or Alarm
- Error out triggered (by FCCU or by SW)

When the timer is stopped, the fault capture logic is cleared in order to ensure that the timer is not restarted due to faults still 'stuck' in the capture logic. The timer will then be restarted by the next new failure indication. When the timer expires, the FOSU's failure indicator output is asserted after it ensures that the fault is enabled and the static "fccu program to do nothing" signal is deasserted. This is because FCCU uses settings after it exits CONFIG state, even if fault captured before the exit.

The FOSU's failure indicator output is connected to one of the MC_RGM's 'destructive' reset inputs, so its assertion will cause a reset sequence to be initiated starting at PHASE0. The FOSU module is reset with the same reset as is used by the FCCU, which is asserted on power-on, 'destructive', and external resets. When this reset is asserted, the FOSU's capture logic is cleared, its timer is kept stopped and in a non-expired state, and its failure indicator output is deasserted.

NOTE

FOSU is triggered on assertion of enabled fault. In case the triggering fault is disabled, FOSU times-out without reaction. All intermediate faults are masked (not monitored) during this timeout cycle.



Note: The fault sources shown are examples only.

Figure 69-14. FOSU connections to the FCCU and MC_RGM

It is important to remember that there will be no FCCU reaction to a fault while the FCCU is in the CONFIG state. For this reason, the FCCU should not be kept in CONFIG for longer than the FOSU_COUNT duration. Otherwise, there is a risk that an incoming error report causing the FOSU to mistakenly see the FCCU as having failed, and then resets the MCU.

NOTE

FCCU and FOSU timeout counter settings: The FCCU counter value should always be programmed less than the FOSU counter value, FOSU_COUNT, or destructive resets may be generated by an FOSU time-out. This ensures that the FOSU reacts only when the FCCU fails to react to any particular fault.

69.8 Use cases and limitations

69.8.1 Misconfigurations

The following configurations are appropriate:

1. If at least one reaction to fault is enabled by default then the corresponding fault should also be enabled by default.
2. Enabling a fault but disabling all reactions is not a meaningful configuration from safety point of view.
3. Disable the fault and also its reactions. Applicable when a specific fault line is not of interest in a specific application scenario

   Example: FCCU goes into ALARM state due to a failure, but the IRQ is disabled for that failure.
4. If the user programs the FCCU for a higher timeout value than what is hardcoded for FOSU, then FCCU reacts later than what FOSU would be expecting and, as a result, FOSU will generate destructive reset request on its timeout.

69.8.2 Recommendations to configure FCCU

1. After a power on, 'destructive', or long external reset, where both system and FCCU are reset, the following steps could be followed to configure FCCU:
   a. Check and clear any pending fault status
   b. Verify FCCU is in NORMAL state, else repeat step(a) above
   c. Configure FCCU
2. After a short external or any 'functional' reset of the system, arising out of a reset request from FCCU or other sources, the following steps could be followed to reconfigure FCCU:
   a. If active, wait for the Error out T_min to expire
   b. Check and clear fault status
   c. Error pin moves to "non faulty" state, once fault status is cleared and T_min expires
   d. Verify FCCU is in NORMAL state, else repeat step(a) above
   e. Read and verify value in FCCU_NCF_Ex
   f. Reconfigure FCCU, if necessary

Chapter 70
Self-Test Control Unit (STCU2)

70.1 Introduction

The Self-Test Control Unit (STCU2) controls the execution of the built-in self-test of the MPC5744P.

The built-in self-test supports in the application:

- Memory (RAM/ROM) Built-In Self-Test (MBIST) at startup and shutdown.
- Scan-based Logic BIST for digital logic (LBIST), which is divided into multiple partitions, at startup and shutdown.

The following table summarizes the three self-test modes. For detailed descriptions of the modes, see Use cases and limitations.

Table 70-1. STCU2 self-test modes

Self-test mode	Description	Availability
Normal self-test mode	MBIST for all memories with a checkerboard/inverted checkerboard algorithm LBIST on all partitions	In startup mode and shutdown mode
Long self-test mode	MBIST for all memories with the reduced RAM and ROM algorithm LBIST on all partitions	Only during shutdown mode
Diagnostic mode	MBIST for all memories with the full RAM and ROM algorithm LBIST on all partitions	Only during shutdown mode

In application mode, the STCU2 initiates self-test execution:

- after Power-on Reset (POR)
- after external reset (if triggered as long-functional reset)
- after destructive reset
- when initiated by software

The STCU2 communicates any fault information to the Fault Control and Collection Unit (FCCU) and to the Reset Generation Module (MC_RGM).

The startup self-test is implemented by Freescale. The user can choose either to run normal self-test execution during startup of the device or to bypass the startup self-test execution by programming the appropriate records in the UTEST flash memory.

The shutdown self-test sequence is user programmable and must be started by the user application on demand. This self-test can be executed at less critical times in the application. After the self-test is executed during shutdown, a long functional reset is initiated, and the self-test results are accessible.

The STCU2 includes the SSCM DCF bus to load the self-test parameters from flash memory—consisting of both the test flash memory, which is programmed by Freescale, and the UTEST flash, which is user-programmable—during the startup self-test phase.

70.2 Functional description

70.2.1 FCCU interface

The FCCU interface is the hardware flag mechanism towards the system that indicates detection of an STCU2 critical fault and/or an STCU2 non-critical fault during the self-test sequence.

The FCCU interface allows the user application to check the integrity of the critical fault and non-critical fault connection lines between the STCU2 and the FCCU. See the description of FCCU fault injection mechanism to understand how this set/clear mechanism works.

70.2.2 Watchdogs

The STCU2 implements three different watchdog ensure that operations are finished in time.

70.2.2.1 Initialization sequence

The STCU2 has two initialization operating modes: program the self-test sequence and run it or bypass completely the self-test sequence. In case there are faults during the initialization phase preventing the selection of one of these two operating modes, a hard-coded Watchdog time-out flags the wrong behavior.

70.2.2.2 LBIST and MBIST scheduling

If the selected LBISTs or MBISTs are not completed during the self-test's assigned time, the current execution of LBISTs or MBISTs is interrupted and a failure is flagged in:

- STCU_ERR_STAT[WDTO] and STCU_MBEL or STCU_LBE for a startup self-test
- STCU_ERR_STAT[WDTOSW] and STCU_MBELSW or STCU_LBESW for a shutdown self-test

NOTE

The only sequence possible is to run MBISTs first and then LBISTs.

70.2.2.3 Write access time-out

The access on the STCU2 registers during the self-test configuration phase (both shutdown and startup) is protected by a security key mechanism to prevent any unwanted write access, as described in the STCU_SKC register description. In addition to this safety feature, there is a hardware Watchdog that, after 4096 STCU2 clock cycles, locks access. In that event, the user must re-apply the STCU_SKC keys.

70.2.3 SSCM interface

The SSCM interface is used to program the STCU2's configuration parameters during the startup sequence without CPU intervention after a reset trigger event initializes the STCU2.

70.3 Register description: configuration registers

Use these registers to configure self-tests.

The reset value of each of these registers can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

These registers of the STCU2 module are accessible (read/write) in each access mode: user or supervisor.

The following read operations (contiguous byte enables) are supported:

- Word (32-bit) data read operations to any registers

- Low and high half-word (16-bit, data[31:16] or data[15:0]) data read operations to any registers
- Byte (8-bit, data[31:24] or data[23:16] or data[15:8] or data[7:0]) data read operations to any registers

The STCU2 module generates a transfer error in the following cases:

- Any write/read access to the register addresses not mapped on the peripheral but included in the address space of the peripheral
- Any write/read operation different from byte/half-word/word (free byte enables or other operations) on each register
- Any write operation on Security Key register applying a wrong sequence of keys (the two write operations cannot be interleaved with other access to STCU2 registers)
- Any write operation performed on a register when the Security keys have not been applied
- Any write operation performed on read-only registers

Write operations to fields marked as reserved do not generate the transfer error.

70.3.1 STCU2 Run Software Register (STCU_RUNSW)

This register initiates the shutdown self-test.

The reset value of this register can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to this register for each shutdown self-test.

70.3.2 STCU2 SK Code Register (STCU_SKC)

The STCU_SKC register implements the security key code mechanism needed to access in write mode to the other STCU2 registers. In order to unlock the STCU2 for shutdown self-test the software (IPS bus) must apply the following sequence:

1. write key1 into the STCU_SKC register
2. write key2 into the STCU_SKC register

A byte write operation is not allowed because the full key must be recognized as one unit.

See Table 70-4 for the key values to write to this register for each shutdown self-test.

The reset value of this register can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

The STCU_SKC register is not readable. A read operation always returns the value 00000000h.

NOTE

After the self-test sequence has been completed, the SSCM interface is no longer available.

In case of invalid access or sequence (key1 and key2 must be applied consecutively), a transfer error on the IPS or SSCM bus is asserted depending on the selected source. The STCU2 write access is locked. To unlock the access, re-apply the sequence.

If the STCU2 register access lasts for longer than 4096 cycles, the STCU2 write access is locked as described in Write access time-out. In this case, to re-enable the write access to the STCU2, apply the sequence again.

In case it is required to extend the STCU2 register access cycles before the hard-coded WDG time-out expires, apply only key2. The effect of this write operation is to re-initialize the WDG time-out counter. In such a condition, do not apply key1. If it is applied, a transfer error on the IPS or SSCM bus is asserted depending on the selected source, and the STCU2 write access is locked. To unlock the access, re-apply the sequence.

70.3.3 STCU2 Configuration Register (STCU_CFG)

This register includes global configuration controls for the STCU2.

The reset value of this register can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to this register for each shutdown self-test.

70.3.4 STCU2 Watchdog Register Granularity (STCU_WDG)

This register defines the time budget of LBIST and MBIST execution.

The reset value of this register can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to this register for each shutdown self-test.

70.3.5 STCU2 Shutdown LBIST Reset Management (STCU_LBRMSW)

The STCU_LBRMSW register enables and ensures the correct reset sequence after shutdown self-test execution.

The reset value of this register can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to this register for each shutdown self-test.

70.3.6 STCU2 LBIST Control Register (STCU_LB*n*_CTRL)

The STCU_LBn_CTRL register defines the control settings of the corresponding LBIST.

The reset value of each of these registers can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to each register for each shutdown self-test.

70.3.7 STCU2 LBIST PC Stop Register (STCU_LB*n*_PCS)

The STCU_LBn_PCS register contains pattern-related information.

The reset value of each of these registers can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to each register for each shutdown self-test.

70.3.8 STCU2 Shutdown LBIST MISR Expected Low Register (STCU_LB*n*_MISRELSW)

The STCU_LBn_MISRELSW register contains MISR signature-related information.

The reset value of each of these registers can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to each register for each shutdown self-test.

70.3.9 STCU2 Shutdown LBIST MISR Expected High Register (STCU_LB*n*_MISREHSW)

The STCU_LBn_MISREHSW register contains MISR signature-related information.

The reset value of each of these registers can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to each register for each shutdown self-test.

70.3.10 STCU2 MBIST Control Register (STCU_MB*n*_CTRL)

The STCU_MBn_CTRL register contains control settings for the corresponding MBIST.

The reset value of each of these registers can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to each register for each shutdown self-test.

70.4 Register description: clock configuration register

DCL memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
FFC0_0104	Different Clock register (DCL_IPS0)	32	R/W	See section	70.4.1/2785

70.4.1 Different Clock register (DCL_IPS0)

This register selects different clock configurations for the self-test.

The reset value of this register can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

See Table 70-4 for the value to write to this register for each shutdown self-test.

70.5 Register description: status registers

Read these registers to determine the status and results of executed self-tests.

The reset value of each of these registers can vary by device version and due to various dependencies, such as flash memory configuration or the result (pass/fail) of MBISTs and LBISTs.

These registers of the STCU2 module are accessible in each access mode: user or supervisor.

The following read operations (contiguous byte enables) are supported:

- Word (32-bit) data read operations to any registers
- Low and high half-word (16-bit, data[31:16] or data[15:0]) data read operations to any registers
- Byte (8-bit, data[31:24] or data[23:16] or data[15:8] or data[7:0]) data read operations to any registers

The STCU2 module generates a transfer error in the following cases:

- Any write/read access to the register addresses not mapped on the peripheral but included in the address space of the peripheral
- Any write/read operation different from byte/half-word/word (free byte enables or other operations) on each register
- Any write operation on Security Key register applying a wrong sequence of keys (the two write operations cannot be interleaved with other access to STCU2 registers)
- Any write operation performed on a register when the Security keys have not been applied
- Any write operation performed on read-only registers

Write operations to fields marked as reserved do not generate the transfer error.

70.5.1 STCU2 Error Register (STCU_ERR_STAT)

The STCU_ERR_STAT register includes the status flags related to the STCU2 internal error conditions occurred during the configuration or the self-test execution.

The CFSF and NCFSF can be set/cleared using the FCCU dedicated channels.

The access to this register is described in the figure and as follows:

- If you select the byte write capability to write only the CFSF and NCFSF, then there is no restriction in writing these bits.
- If your software performs the write operations on other bits besides CFSF/NCFSF, then a transfer error is generated only if the value you are writing to the other bits differs from their value currently stored in the register. This functionality has been implemented to prevent potential compilation behavior that might invalidate the CFSF/NCFSF single bit set/clean capability.

STCU_ERR_STAT field descriptions

Field	Description
0–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 LOCKESW	Shutdown LOCK Error You can always read this field. The content of this field is initialized to its reset value as soon as a shutdown self-test is initiated. 0 The PLL was correctly locked during the self-test sequence 1 This flag highlights that an unexpected PLL unlock event occurred during the shutdown self-test sequence execution. The shutdown self-test run was stopped and the status of the currently running LBISTs or MBISTs was saved into the related registers.
12 WDTOSW	Shutdown Watchdog time-out You can always read this field. The content of this field is initialized to its reset value as soon as a shutdown self-test is initiated. 0 LBIST and MBIST time slots have been completed within the assigned watchdog time. 1 LBIST and MBIST time slots have not been completed within the assigned watchdog time or there are internal mismatches among End of Execution signals. The possible conditions that flag the failures are the following: • At least one MBIST did not finish • At least one LBIST did not finish
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

STCU_ERR_STAT field descriptions (continued)

Field	Description
14 ENGESW	Shutdown Engine Error You can always read this field. The content of this field is initialized to its reset value as soon as a shutdown self-test is initiated. 0 Valid Engine execution 1 Invalid Engine execution. The following conditions set this bit: • STCU2 state machines (Watchdog, Master and Loader/Shifter) select an unused code • Pass/fail status between MBIST logic and STCU is not aligned • MBIST finished status between MBIST logic and STCU is not aligned
15 INVPSW	Shutdown Invalid Pointer You can always read this field. The content of this field is initialized to its reset value as soon as a shutdown self-test is initiated. 0 Valid linked pointer list 1 Invalid linked pointer list. The following conditions set this bit: • Initial LBIST or MBIST pointer is out of range • LBIST is selected when MBIST is concurrently running or vice versa • Error in the LBIST/MBIST linking (execution generates an infinite loop)
16–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 CFSF	Critical Faults Status Flag This flag reports the global status of the CF. 0 No errors that trigger the Critical Faults condition 1 There are errors that trigger the Critical Faults condition
23 NCFSF	Non-Critical Faults Status Flag 0 No errors that trigger the Non-Critical Faults condition 1 There are errors that trigger the Non-Critical Faults condition
24–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 LOCKE	Startup LOCK Error 0 The PLL was correctly locked during the startup self-test sequence 1 This flag highlights that an unexpected PLL unlock event occurred during the startup self-test sequence execution. The startup self-test run was stopped and the status of the currently running LBISTs or MBISTs was saved into the related registers.
28 WDTO	Startup Watchdog time-out 0 LBIST and MBIST time slots have been completed within the assigned watchdog time. 1 LBIST and MBIST time slots have not been completed within the assigned watchdog time or there are internal mismatches among End of Execution signals. The conditions that flag the failures are the following: • The startup self-test execution was not prevented correctly. (This condition is possible for only the "No self-test execution" startup self-test selection.) • The STCU2 configuration through the SSCM was interrupted. The startup self-test did not execute properly. (This condition is possible for only the "Normal startup self-test" startup self-test selection.) • At least one MBIST did not finish • At least one LBIST did not finish

Table continues on the next page...

STCU_ERR_STAT field descriptions (continued)

Field	Description
29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 ENGE	Startup Engine Error 0 Valid Engine execution 1 Invalid Engine execution. The following conditions set this bit: • STCU2 state machines (Watchdog, Master and Loader/Shifter) select an unused code • Pass/fail status between MBIST logic and STCU is not aligned • MBIST finished status between MBIST logic and STCU is not aligned
31 INVP	Startup Invalid pointer 0 Valid linked pointer list 1 Invalid linked pointer list. The following conditions set this bit: • Initial LBIST or MBIST pointer is out of range • LBIST is selected when MBIST is concurrently running or vice versa • Error in the LBIST/MBIST linking (execution generates an infinite loop)

70.5.2 STCU2 Startup LBIST Status Register (STCU_LBS)

The STCU_LBS register includes the results corresponding to the execution of the startup LBIST.

Address: 0h base + 2Ch offset = 2Ch

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Table continues on the next page...

STCU_MBELSW field descriptions (continued)

Field	Description
31 MBESW0	Shutdown End status of the MBIST0 **NOTE:** The MBIST0 logic involves the BAM ROM. The 4N checkerboard algorithm (as it is processed during normal shutdown self-tests) does not run on MBIST0. This bit is meaningful only after execution of a long self-test mode or of the diagnostic self-test mode. 0 MBIST execution still ongoing 1 MBIST execution finished

70.6 Use cases and limitations

The STCU2 module is designed to give a high degree of flexibility by providing multiple self-test types. The following tables summarize the provided STCU2 self-test operations.

NOTE

Make sure that the flash is in IDLE state before starting LBIST (Self Test) operation.

Table 70-2. Startup self-test

Self-test	Coverage	BIST details	Execution time
No self-test execution	No coverage	No LBIST No MBIST	0 ns
Normal startup self-test	Coverage of ≥ 90% stuck-at	LBIST on all partitions MBIST for all memories with a 4N checkerboard algorithm	Max. 18 ms total execution time

Table 70-3. Shutdown self-tests

Self-test	Stuck-at coverage	Transition coverage	LBIST details	MBIST details	Execution time
Normal shutdown self-test	≥ 90% on all partitions	≥ 60% on partition C0 ≥ 60% on partition C1 No transition coverage on partitions P0 and P1	LBIST on all partitions	MBIST for all memories with a 4N checkerboard algorithm	Max. 51 ms total execution time
Long shutdown self-test				MBIST on all memories with reduced RAM and ROM algorithm (without ASOF)	Max. 68 ms total execution time
Diagnostic shutdown self-test	≥ 90% on partition C0 ≥ 90% on partitions C1, P0, and P1	≥ 60% on partition C0 ≥ 60% on partition C1 No transition coverage on partitions P0 and P1		MBIST on all memories with full RAM and ROM algorithm	

70.6.1 Startup self-test sequence

If the normal startup self-test mode is chosen, the system startup sequence includes the following activities if any of the STCU reset conditions is valid.

1. The STCU is configured via DCF during reset phase 3.
2. After the exit from reset phase 3, the STCU powers a self-test setup phase.
3. Self-test executes / MBIST phase
4. Self-test executes / LBIST phase
5. The STCU collects all BIST results and stores them internally.
6. The STCU arranges a long functional reset.

70.6.2 Startup self-test mode selection

This chip offers two startup self-test variants.

- No self-test execution
- Normal startup self-test

For correct system behavior one of these modes must be configured. To configure one of these modes, program particular DCF records in the UTEST flash memory.

To configure "No self-test execution": Store the following DCF record as the first record in the UTEST flash memory.

```
00000400h
00080000h
```

To configure "Normal startup self-test": Store the following DCF record as the first record in the UTEST flash memory.

```
00000301h
00080000h
```

NOTE

During startup self-tests, once the STCU2 registers are configured they cannot be overridden.

70.6.3 Shutdown self-test sequence

This is the typical mode of using the STCU2 module during the application run.

70.6.3.1 Preparation before initiating an STCU shutdown self-test

Before you initiate the execution of an STCU shutdown self-test, you must complete the following prerequisite procedure to prepare the chip.

1. End the currently running application, including graceful termination of peripherals as required by the application.
2. Configure FlexRay and CAN clock sources and divider for self-test:
    a. Configure FRAY_PLL_CLK clock as PLL0 PHI divided by 2: MC_CGM_AC1_DC0[DIV]=1h.
    b. Select FRAY_PLL_CLK as the FRAY_CLK clock source: FR_MCR[CLKSEL]=1.
    c. Select CAN_PLL_CLK as the CAN_CLK clock source: CAN_CTRL1[CLKSRC]=1.
3. Ensure PBRIDGE clock is not over clocked (maximum frequency is 50MHz) when SYS_CLK is switched to 200MHz.
    - Configure PBRIDGE*_CLK as SYS_CLK (system clock) divided by 4: MC_CGM_SC_DC0[DIV]=3h.
4. Configure DRUN to turn off PLL1 (to save power), turn off PLL0 so PLL0 can be re-configured for the required 200MHz self-test clock frequency, turn on the XOSC as it is needed to provide the PLL0 reference clock during self-test, and select IRCOSC to source SYS_CLK:
    a. Select IRCOSC as the SYS_CLK clock source: MC_ME_DRUN_MC[SYSCLK]=0000b.
    b. Enable XOSC: MC_ME_DRUN_MC[XOSCON]=1 (will be required for PLL0).
    c. Disable PLL0: MC_ME_DRUN_MC[PLL0ON]=0.
    d. Disable PLL1: MC_ME_DRUN_MC[PLL1ON]=0.
    e. Gate off all peripheral clocks because they should not be running: MC_ME_RUN_PC0[DRUN]=0, MC_ME_PCTLn[RUN_CFG]=000b.

5. Activate new configuration by performing mode change to DRUN: MC_ME_MCTL[TARGET_MODE]=0011b (see the MC_ME chapter for mode change request details).
6. Configure PLL0 for required 200MHz self-test frequency:
   a. Configure PLL0 to provide 200MHz at its PHI output: PLLDIG_PLL0DV (values depend on XOSC frequency).
   b. Select XOSC as PLL0's reference clock: MC_CGM_AC3_SC[SELCTL]=1.
7. Configure DRUN mode to turn on PLL0 and select PLL0 PHI to source SYS_CLK:
   a. Enable XOSC: MC_ME_DRUN_MC[XOSCON]=1.
   b. Enable PLL0: MC_ME_DRUN_MC[PLL0ON]=1.
   c. Disable PLL1: MC_ME_DRUN_MC[PLL1ON]=0.
   d. Select PLL0 PHI as the SYS_CLK clock source: MC_ME_DRUN_MC[SYSCLK]=0010b.
8. Activate new configuration by performing mode change to DRUN: MC_ME_MCTL[TARGET_MODE]=0011b (see the MC_ME chapter for mode change request details).
9. Select PLL0 PHI to source all auxiliary clocks used during self-test:
   a. Select PLL0 PHI as the MOTC_CLK, SGEN_CLK, and ADC_CLK clock source: MC_CGM_AC0_SC[SELCTL]=2h.
   b. Select PLL0 PHI as the LFAST PLL clock source: MC_CGM_AC5_SC[SELCTL]=2h.

70.6.3.2 Shutdown self-test initiation procedure

To initiate a shutdown self-test, execute the following steps for the desired self-test mode. All accesses must be processed without interruption. The values to write to each register appear in Table 70-4.

1. Configure the STCU_SKC register by first writing the key1 value and then writing the key2 value.
2. Configure the STCU_MBn_CTRL registers.
3. Configure the STCU_CFG register.

4. Configure all STCU_LBn_CTRL registers.
5. Configure all STCU_LBn_PCS registers.
6. Configure all STCU_LBn_MISRELSW registers.
7. Configure all STCU_LBn_MISREHSW registers.
8. Configure the STCU_WDG register.
9. Configure the STCU_LBRMSW register.
10. Configure the DCL_IPS0 register.
11. Configure the STCU_RUNSW register. This access immediately starts the shutdown self-test execution.

NOTE

During shutdown self-tests, once the STCU2 registers are configured they cannot be overridden via IPS until the self-testing is complete.

The following table identifies the values to write to the STCU registers to configure each type of shutdown self-test.

Table 70-4. STCU register configuration for shutdown self-tests

STCU register	Shutdown self-tests

70.6.3.3 Shutdown self-test execution sequence

1. The user configures the STCU by following the self-test initiation procedure.

2. The STCU powers a self-test setup phase.
3. Self-test executes / MBIST phase
4. Self-test executes / LBIST phase
5. The STCU collects all BIST results and stores them internally.
6. The STCU arranges a long functional reset.

70.7 MBIST partitioning

The following table describes the mapping between the MBIST number, as the STCU2 captures it, and the appropriate memory in the design.

Table 70-5. MBIST mapping

MBIST number	Memory in design
MBIST0	BAM ROM

Chapter 71
Register Protection (REG_PROT)

71.1 Overview

NOTE

> For the chip-specific implementation details of this module's instances, see the chip configuration information.

The Register Protection (REG_PROT) module offers a mechanism to protect defined memory-mapped address locations in a module under protection from being written. The address locations that can be protected are module-specific.

The protection module is located between the module under protection and the peripheral bridge (PBRIDGE/AIPS-Lite). This is shown in the following figure.

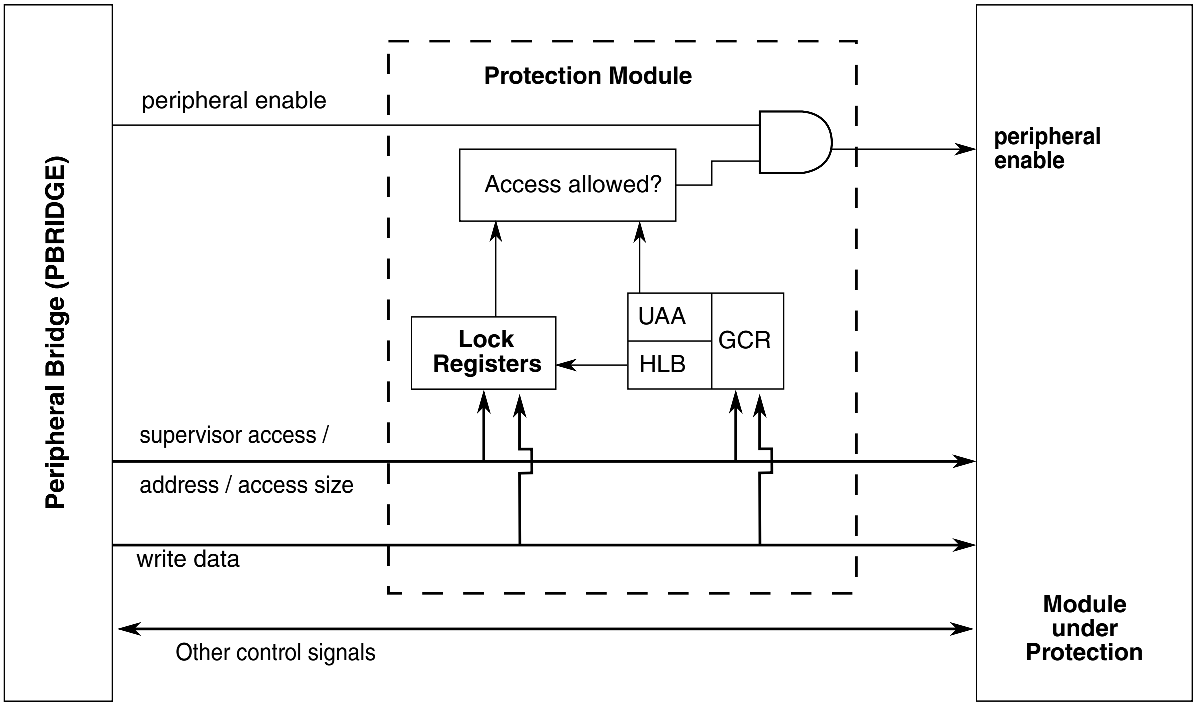

Figure 71-1. REG_PROT Block Diagram

71.2 Features

Register Protection includes these distinctive features:

- Restrict write accesses for the module under protection to supervisor mode only
- Lock registers for first 6 KB of memory-mapped address space
- Write to address mirror automatically sets corresponding lock bit
- Once configured lock bits can be protected from changes

71.3 Modes of operation

The Register Protection module is operable when the module under protection is operable.

71.4 External signal description

There are no external signals.

71.5 Memory map and register definition

This section provides a detailed description of the memory map of a module with register protection. The original 16 KB module memory space is divided into five areas as shown in the following figure.

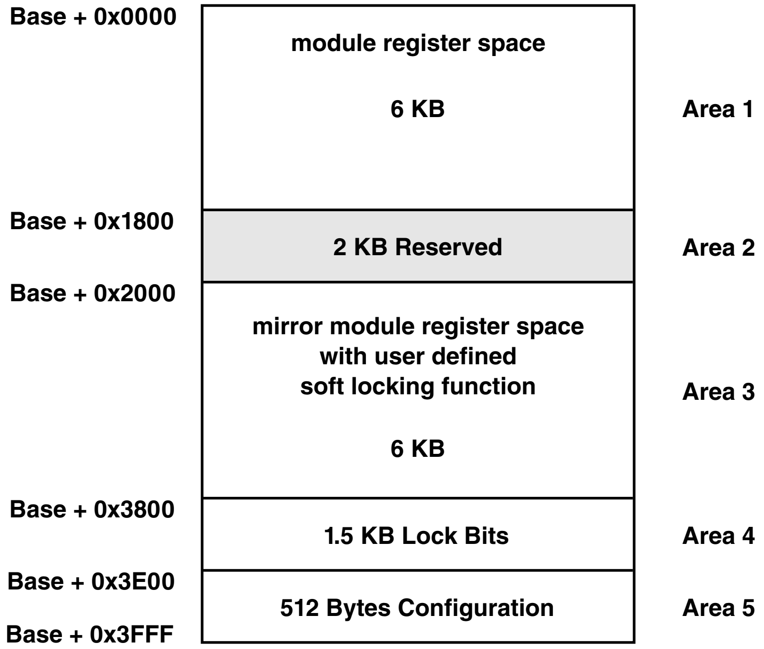

Figure 71-2. REG_PROT Memory Diagram

- Area 1 is 6 KB and holds the normal functional module registers and is transparent for all read/write operations.
- Area 2 is 2 KB starting at offset 0x1800 is a reserved area, which shall not be accessed.
- Area 3 is 6 KB, starting at offset 0x2000 and is a mirror of area 1. A read/write access to an offset 0x2000+X will read/write the register at offset X. However a write access to offset 0x2000+X will additionally set the optional Soft Lock Bits for this offset X in the same cycle as the register at offset X is written. This provides for an automatic write and lock operation. Not all registers in area 1 need to have protection defined by associated Soft Lock Bits. For unprotected registers at offset Y, accesses to offset 0x2000+Y will be identical to accesses at offset Y.
- Area 4 is 1.5 KB and holds the Soft Lock Bits, one bit per byte in area 1. The four Soft Lock Bits associated with one module register word are arranged at byte boundaries in the memory map. The Soft Lock Bit registers can be directly written using a bit mask.
- Area 5 is 512 bytes large and holds the configuration bits of the protection mode. There is one configuration hard lock bit per module that prevents all further modifications to the Soft Lock Bits and can only be cleared by a system reset once set. The other bits, if set, will allow user access to the protected module.

If any locked byte is accessed with a write transaction, a transfer error will be issued to the system and the write transaction will not be executed. This is true even if not all accessed bytes are locked.

Accessing unimplemented 32-bit registers in Areas 4 and 5 will result in a transfer error.

71.5.1 Memory map

Following is the memory map for a module which is protected via a REG_PROT module.

Table 71-1. Generic Protected Module Memory Map

Offset	Use
0x0000	Module Register 0 (MR0)
0x0001	Module Register 1 (MR1)
0x0002	Module Register 2 (MR2)
0x0003 - 0x17FF	Module Register 3 (MR3) - Module Register 6143(MR6143)
0x1800 - 0x1FFF	Reserved
0x2000	Module Register 0 (MR0) + Set Soft Lock Bit 0 (LMR0)
0x2001	Module Register 1 (MR1) + Set Soft Lock Bit 1 (LMR1)
0x2002 - 0x37FF	Module Register 2 (MR2) + Set Soft Lock Bit 2 (LMR2) - Module Register 6143 (MR6143) + Set Soft Lock Bit 6143 (LMR6143)
0x3800	Soft Lock Bit Register 0 (SLBR0): Soft Lock Bits 0-3
0x3801	Soft Lock Bit Register 1 (SLBR1): Soft Lock Bits 4-7
0x3802 - 0x3DFF	Soft Lock Bit Register 2 (SLBR2): Soft Lock Bits 8-11 -Soft Lock Bit Register 1535 (SLBR1535): Soft Lock Bits 6140-6143
0x3E00 - 0x3FFB	Reserved
0x3FFC	Global Configuration Register (GCR)

Note

Reserved registers in area #1 will be handled as specified in the protected module's documentation.

71.5.2 Register descriptions

This section describes in address order all the REG_PROT registers. Each description includes a standard register diagram with an associated figure number. Details of register bit and field function follow the register diagrams, in bit order.

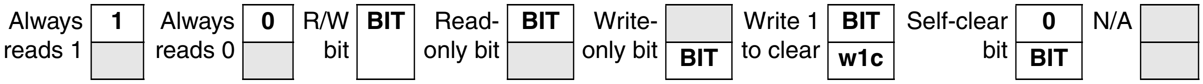

Figure 71-3. Register description

71.5.2.1 Module Registers (MR0-6143)

This is the lower 6 KB module memory space which holds all the functional registers of the module that is protected by the REG_PROT module.

71.5.2.2 Module register and set soft lock bit (LMR0-6143)

This is memory area #3 that provides mirrored access to the MR0-6143 registers with the side effect of setting Soft Lock Bits in case of a write access to a MR that is defined as protectable by the locking mechanism. Each MR is protectable by one associated bit in a SLBRn.SLBm, according to the mapping described in the Soft Lock Bit Register section.

71.6 Memory map and registers

REG_PROT memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
3800	Soft Lock Bit Register n (REG_PROT_SLBRn)	8	R/W	00h	71.6.1/2825
3FFC	Global Configuration Register (REG_PROT_GCR)	32	R/W	0000_0000h	71.6.2/2827

71.6.1 Soft Lock Bit Register *n* (REG_PROT_SLBRn)

The Soft Lock Bit Registers hold the Soft Lock Bits for the protected registers in memory area #1, which is the normal register address space of the protected module. Each SLB register has a four Soft Lock Bits (SLB0-SLB3), each of which controls write access to a byte in memory area #1. Each Soft Lock Bit also has a corresponding Write Enable bit in the same register that controls whether the Soft Lock Bit can be written. The following table shows the mapping between the Soft Lock Bits to the bytes in memory area #1.

Table 71-2. Soft Lock Bits vs. Protected Address

Soft Lock Bit	Protected address
SLBR0.SLB0	MR0
SLBR0.SLB1	MR1
SLBR0.SLB2	MR2
SLBR0.SLB3	MR3
SLBR1.SLB0	MR4
SLBR1.SLB1	MR5
SLBR1.SLB2	MR6

Table continues on the next page...

Table 71-2. Soft Lock Bits vs. Protected Address (continued)

Soft Lock Bit	Protected address
SLBR1.SLB3	MR7
SLBR2.SLB0	MR8
...	...

NOTE

- As many as 1536 Soft Lock Bit Registers (SLBRn) may be implemented, depending on the number of protected module register bytes.
- Access in User Mode is read-only; in Supervisor Mode access is read/write.

Address: 0h base + 3800h offset = 3800h

Bit	0	1	2	3	4	5	6	7

REG_PROT_GCR field descriptions

Field	Description
0 HLB	Hard Lock Bit This register cannot be cleared once it is set by software. It can only be cleared by a system reset.

Table continues on the next page...

REG_PROT_GCR field descriptions (continued)

Field	Description
	NOTE: Access in User Mode is read-only; in Supervisor Mode access is read/write. 1 All SLB bits are write protected and can not be modified. 0 All SLB bits are accessible and can be modified.
1–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 UAA	User Access Allowed. 1 The registers in the module under protection can be accessed in the mode defined for the module registers without any additional restrictions. 0 The registers in the module under protection can only be written in supervisor mode. All write accesses in non-supervisor mode are not executed and a transfer error is issued. This access restriction is in addition to any access restrictions imposed by the protected IP module.
9–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

71.7 Functional description

The following sections describe the functional characteristics of the Register Protection module.

71.7.1 General

This module provides a generic register (address) write-protection mechanism. The protection size can be:

- 32-bit (address == multiples of 4)
- 16-bit (address == multiples of 2)
- 8-bit (address == multiples of 1)

Which addresses are protected and the protection size depends on the SoC and/or module.

For all addresses (peripheral registers) that are protected there are SLBRn.SLBm bits that specify whether the address is locked. When an address is locked it can only be read but not written in any mode (supervisor/normal). If an address is unprotected the corresponding SLBRn.SLBm bit is always 0b0 no matter what software is writing to.

71.7.2 Change lock settings

To change the setting whether an address is locked or unlocked the corresponding SLBRn.SLBm bit needs to be changed. This can be done using the following methods:

- Modify the SLBRn.SLBm directly by writing to area #4
- Set the SLBRn.SLBm bit(s) by writing to the mirror module space (area #3)

Both methods are explained in the following sections.

71.7.2.1 Change lock settings directly via Area #4

In memory area #4 the lock bits are located. They can be modified by writing to them. Each SLBRn.SLBm bit has a mask bit SLBRn.WEm which protects it from being modified. This masking makes clear-modify-write operations unnecessary.

The following figure shows two modification examples. In the left example there is a write access to the SLBRn register specifying a mask value which allows modification of all SLBRn.SLBm bits. The example on the right specifies a mask which only allows modification of the bits SLBRn.SLB[3:1].

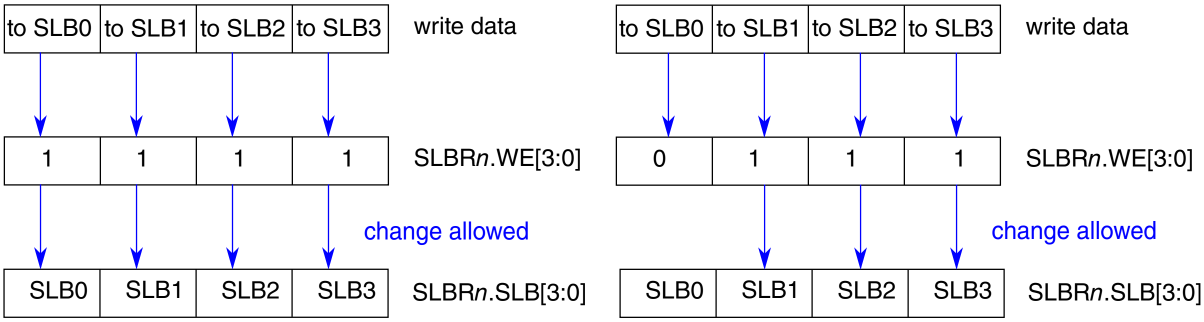

Figure 71-4. Change lock settings directly via Area #4

The previous figure shows four registers that can be protected 8-bit wise. The following figures show registers with 16- and 32-bit protection respectively:

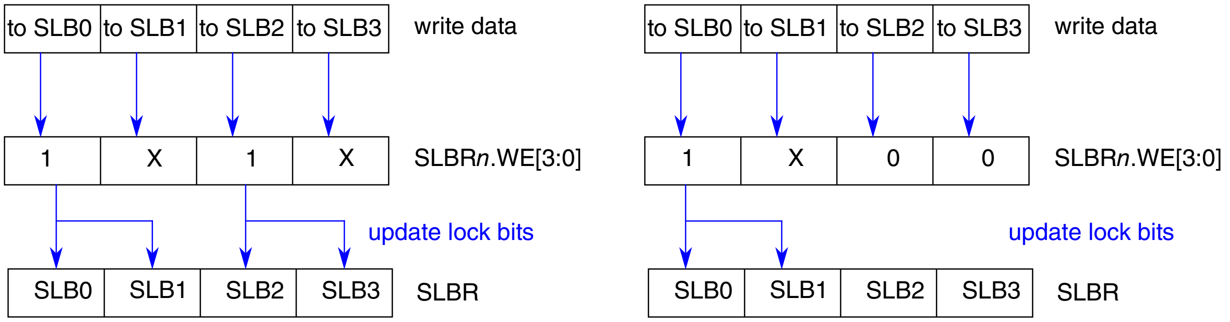

Figure 71-5. Change lock settings for 16-bit protected addresses

On the right side of the previous figure it is shown that the data written to SLBRn.SLB[0] is automatically written to SLBRn.SLB[1] also. This is done as the address reflected by SLBRn.SLB[0] is protected 16-bit wise. Note that in this case the write enable SLBRn.WE[0] must be set while SLBRn.WE[1] does not matter. As the enable bits SLBRn.WE[3:2] are cleared the lock bits SLBRn.SLB[3:2] remain unchanged.

In the example on the left side of the previous figure the data written to SLBRn.SLB[0] is mirrored to SLBRn.SLB[1] and the data written to SLBRn.SLB[2] is mirrored to SLBRn.SLB[3] as for both registers the write enables are set.

The next figure shows a 32-bit wise protected register. When SLBRn.WE[0] is set the data written to SLBRn.SLB[0] is automatically written to SLBRn.SLB[3:1] also. Otherwise SLBRn.SLB[3:0] remains unchanged.

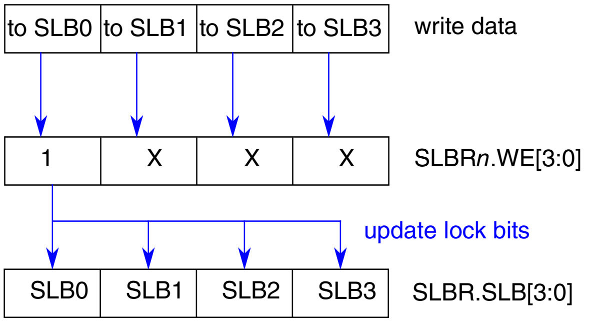

Figure 71-6. Change lock settings for 32-bit protected addresses

The following figure shows a mixed protection size configuration:

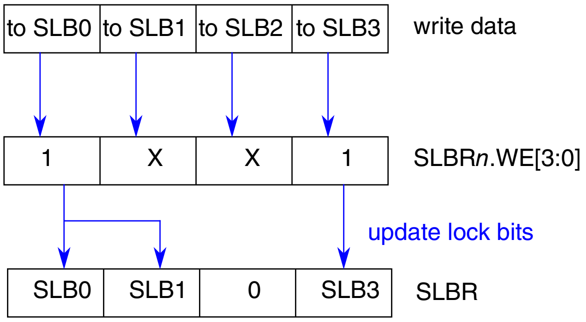

Figure 71-7. Change lock settings for mixed protection

The data written to SLBRn.SLB[0] is mirrored to SLBRn.SLB[1] as the corresponding register is 16-bit protected. The data written to SLBRn.SLB[2] is blocked as the corresponding register is unprotected. The data written to SLBRn.SLB[3] is written to SLBRn.SLB[3].

71.7.2.2 Enable locking via mirror module space (Area #3)

It is possible to enable locking for a register after writing to it. To do so the mirrored module address space must be used. For example:

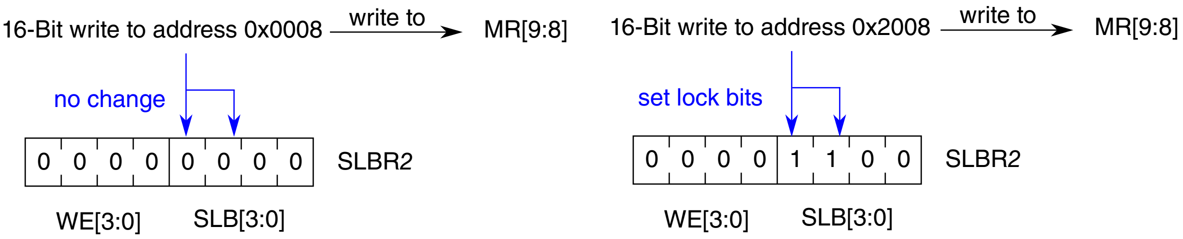

Figure 71-8. Enable Locking Via Mirror Module Space (Area #3)

When writing to address 0x0008 the registers MR9 and MR8 in the protected module are updated. The corresponding lock bits remain unchanged (see the left part of Figure 71-5).

When writing to address 0x2008 the registers MR9 and MR8 in the protected module are updated. The corresponding lock bits SLBR2.SLB[1:0] are set while the lock bits SLBR2.SLB[3:2] remain unchanged (right part of Figure 71-5).

The following figure shows an example where some addresses are protected and some are not:

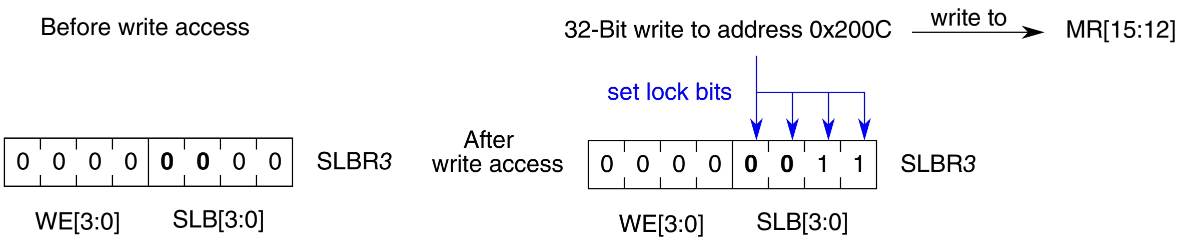

Figure 71-9. Enable locking for protected and unprotected addresses

In the previous figure addresses 0x0C and 0x0D are unprotected. Therefore their corresponding lock bits SLBR3.SLB[1:0] are always 0b0 (shown in bold). When doing a 32-bit write access to address 0x200C only lock bits SLBR3.SLB[3:2] are set while bits SLBR3.SLB[1:0] stay 0b0.

Note

> Lock bits can only be set via writes to the mirror module space. Reads from the mirror module space will not change the lock bits.

71.7.2.3 Write protection for locking bits

Changing the locking bits through any of the procedures mentioned in Change lock settings directly via Area #4 and Enable locking via mirror module space (Area #3) is only possible as long as the bit GCR.HLB is cleared. Once this bit is set the locking bits can no longer be modified until there is a system reset.

71.7.3 Access errors

The protection module generates transfer errors under several circumstances. For the area definition refer to Figure 71-2

1. If accessing area #1 or area #3, the protection module will pass on any access error from the underlying Module under Protection.
2. If user mode is not allowed, user writes to all areas will assert a transfer error and the writes will be blocked.
3. If accessing the reserved area #2, a transfer error will be asserted.
4. If accessing unimplemented 32-bit registers in area #4 and area #5 a transfer error will be asserted.
5. If writing to a register in area #1 and area #3 with Soft Lock Bit set for any of the affected bytes a transfer error is asserted and the write will be blocked. Also the complete write operation to non-protected bytes in this word is ignored.

6. If writing to a Soft Lock Register in area #4 with the Hard Lock Bit being set a transfer error is asserted.
7. Any write operation in any access mode to area #3 while Hard Lock Bit GCR.HLB is set

Chapter 72
Wakeup Unit (WKPU)

72.1 Introduction

NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The Wakeup Unit (WKPU) supports one external source that can cause non-maskable interrupts to on-chip cores and wakeup events to the system. The figure below shows the WKPU block diagram and its interfaces to other system components.

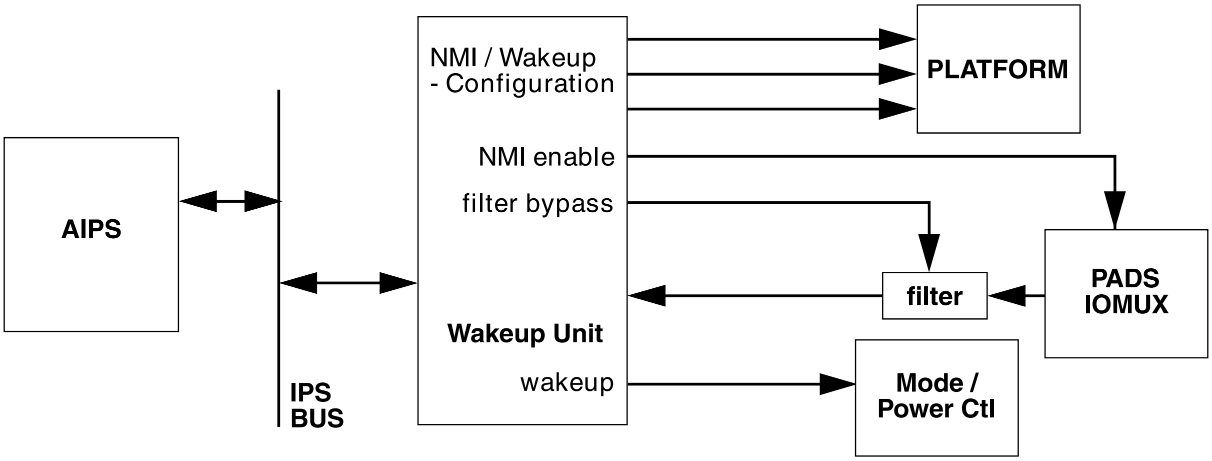

Figure 72-1. WKPU and connected system components

72.2 Features

The WKPU supports these features:

- Non-maskable Interrupt support with:

  - One external NMI source
  - One analog glitch filter
- Independent interrupt destination for each core:
  - Non-maskable interrupt
  - Critical interrupt
  - Machine check request
- Active edge selection control for events to each core
- Configurable system wakeup triggering from NMI source(s)

72.3 External signal description

The WKPU has signal inputs that can be used as external interrupt sources in normal run mode or as system wakeup sources in certain power down modes.

72.4 WKPU memory map and register definition

This section provides a detailed description of all registers accessible in the WKPU module.

NOTE

Reserved registers will read as 0, writes will have no effect. Transfer error will be generated when trying to access completely reserved register space.

WKPU memory map

Address offset (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
0	NMI Status Flag Register (WKPU_NSR)	32	w1c	0000_0000h	72.4.1/2836
8	NMI Configuration Register (WKPU_NCR)	32	R/W	See section	72.4.2/2838

72.4.1 NMI Status Flag Register (WKPU_NSR)

This register holds the non-maskable interrupt status flags.

NOTE

This register is accessible by 8-, 16-, and 32-bit read/write operations.

Access: User read/write

Address: 0h base + 0h offset = 0h

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

WKPU_NSR field descriptions

Field	Description
0 NIF0	NMI Status Flag 0. This flag can be cleared only by writing a 1. Writing a 0 has no effect. If enabled (NREE0 or NFEE0 set), NIF0 causes an interrupt request. 0 No event has occurred on the pad 1 An event as defined by NREE0 and NFEE0 has occurred
1 NOVF0	NMI Overrun Status Flag 0. This flag can be cleared only by writing a 1. Writing a 0 has no effect. It will be a copy of the current NIF0 value whenever a NMI event occurs, thereby indicating to the software that a NMI occurred while the last one was not yet serviced. If enabled (NREE0 or NFEE0 set), NOVF0 causes an interrupt request. 0 No overrun has occurred on NMI input 0 1 An overrun has occurred on NMI input 0
2–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Field	Description
18–23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

72.4.2 NMI Configuration Register (WKPU_NCR)

This register holds the configuration bits for the non-maskable interrupt settings.

NOTE

- This register is accessible by 8-, 16-, and 32-bit read/write operations.
- Writing a 0 to both NREE[*n*] and NFEE[*n*] disables the NMI functionality completely (i.e., no system wakeup or interrupt will be generated on any pad activity).

Access: User read/write

Address: 0h base + 8h offset = 8h

* Notes:

- See the chip-specific WKPU information for the reset value of this register.

WKPU_NCR field descriptions

Field	Description
0 NLOCK0	NMI Configuration Lock Register 0. Writing a 1 to this bit locks the configuration for the NMI until it is unlocked by a system reset . Writing a 0 has no effect.

Table continues on the next page...

WKPU_NCR field descriptions (continued)

Field	Description
1–2 NDSS0	NMI Destination Source Select 0. **NOTE:** If this field is configured for machine check exception, the following steps must be performed in order to receive the exception on the NMI Pad: 1. Set MSR[ME], Machine Check Enable field of the core's Machine State Register, to 1. 2. Set HID0[EMCP] to 1. 00 Non-maskable interrupt 01 Critical interrupt 10 Machine check request 11 Reserved
3 NWRE0	NMI Wakeup Request Enable 0 **NOTE:** If wakeup requests are disabled, the corresponding NDSS field must be set to 11 to disable wakeups from an NMI, critical interrupt, or machine check. 0 System wakeup requests from the corresponding NIF0 bit are disabled. 1 A set NIF0 bit or set NOVF0 bit causes a system wakeup request.
4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5 NREE0	NMI Rising-edge Events Enable 0. 0 Rising-edge event is disabled 1 Rising-edge event is enabled
6 NFEE0	NMI Falling-edge Events Enable 0. 0 Falling-edge event is disabled 1 Falling-edge event is enabled
7 NFE0	NMI Filter Enable 0. Enable analog glitch filter on the NMI pad input. 0 Filter is disabled 1 Filter is enabled
8–31 Reserved	This field is reserved. Always write 0 to this field.

72.5 Functional description

This section provides a functional description of the WKPU.

72.5.1 Non-maskable interrupts

The WKPU supports the generation of 3 types of interrupts per NMI input to the SoC. The WKPU supports the capturing of a second event per NMI input before the interrupt is cleared, thus reducing the chance of losing an NMI event, though it creates an overrun condition.

Each NMI passes through a bypassable analog glitch filter.

NOTE

Glitch filter control and pad configuration should be done while the NMI is disabled in order to avoid erroneous triggering by glitches caused by the configuration process itself.

NOTE

The figure below represents a generic configuration and might not represent this particular device's configuration. See the chip-specific information for details on this chip's WKPU.

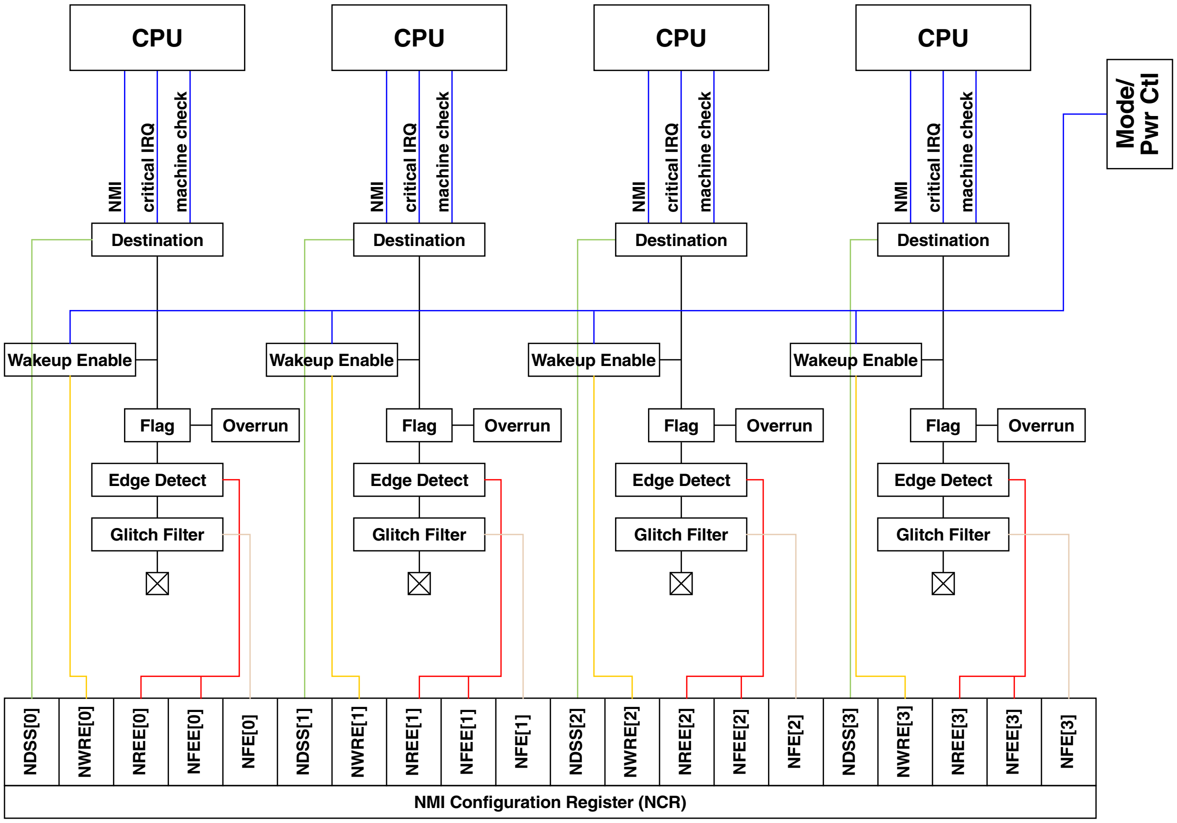

Figure 72-2. NMI pad diagram

72.5.1.1 NMI management

Each NMI can be enabled or disabled independently. This can be performed using the single NCR register laid out to contain all configuration bits for a given NMI in a single byte (see NMI Configuration Register (WKPU_NCR)). A pad defined as an NMI can be configured by the user to recognize interrupts with an active rising edge, an active falling edge or both edges being active. A setting of having both edge events disabled results in no interrupt being detected and should not be configured.

The active NMI edge is controlled by the user through the configuration of the NREE and NFEE bits.

Note

> After reset, NREE and NFEE are set to '0', therefore the NMI functionality is disabled after reset and must be enabled explicitly by software.

Once a pad's NMI functionality has been enabled, the pad cannot be reconfigured in the IOMUX to override or disable the NMI. Please see chip specific section for details on NMI implementation.

The NMI destination interrupt is controlled by the user through the configuration of the NDSS bits. See NMI Configuration Register (WKPU_NCR) for details.

Each NMI supports a status flag and an overrun flag which are located in the NSR register (see NMI Status Flag Register (WKPU_NSR)). This register is a clear-by-write-1 register type, preventing inadvertent overwriting of other flags in the same register. The status flag is set whenever an NMI event is detected. The overrun flag is set whenever an NMI event is detected and the status flag is set (i.e. has not yet been cleared).

Note

> The overrun flag is cleared by writing a '1' to the appropriate overrun bit in the NSR register. If the status bit is cleared and the overrun bit is still set, the pending interrupt will not be cleared.
>
> During an NMI ISR, on wakeup of the SoC from an NMI, any writes to ECC-protected memory must have the correct ECC.

Appendix A Protected Registers

The following table identifies registers that are protected on this device.

Table A-1. Protected registers

Appendix B
Release Notes

B.1 General changes throughout and Preface

- System Status and Configuration Module (SSCM)
  - For BMODE of SSCM System Status (SSCM_STATUS) added description of setting 010b for SCI Serial Boot Loader

- LINFlexD :
  - In UART mode features, added a bullet "12-bit + parity reception"
  - In UART mode, added "13-bit frames" in existing list
  - In Introduction, Updated paragraph as "The LINFlexD also provides support for some of the basic UART transfers of 8-bit, 9-bit, 16-bit, and 17-bit frames and also 12-bit data frame + parity reception in UART mode for MSC support."
  - Added 13-bit frames as a new section
  - In RDFL_RFC, Updated description at 3b'010 and 3b'100
  - In UART Mode Control Register (LINFlexD_UARTCR), added WLS bit and removed Reserved bit
  - In UART receiver, added two notes starting with "When WLS bit = 1...."

- Mode Entry Module (MC_ME) :
  - MC_ME_PS3[S_FLEXRAY] updated as Read-only bit.

- Analog-to-Digital Converter (ADC) :
  - In Main Configuration Register (ADC_MCR), Added ADC_MCR[TRGEN] and ADC_MCR[EDGE] fields. Earlier these fields were marked as Reserved.

- ADC Configuration :
  - Added a Note in DMA interface section

B.2 Introduction changes

- In Table 2-1, ADC Analog Reference voltage updated as “3.15 V to 5.5 V”.

B.3 Embedded Memory changes

- No substantial content changes

B.4 Signal Description changes

- In Table 4-7 short signal description of:
  - Port pin I[5] is changed from "LFAST PLL Phase 0 clock on negative terminal" to "SIPI/LFAST PLL Phase 0 clock on negative terminal"
  - Port pin C[12] is changed from "LFAST PLL Phase 0 clock on positive terminal" to "SIPI/LFAST PLL Phase 0 clock on positive terminal"
- In LVDS pins/balls deleted ‘Debug LFAST’ from footnote in table.

B.5 Memory Map changes

- In Table 5-1, added footnote in DMAMUX_0 and DMAMUX_1 entries at PCTL 36 and PCTL 146 respectively

- In Table 5-6, In DCF Records row :
  - Updated End address column to 0x004009FF
  - Updated Allocated size (bytes) column to 2048

- In Table 5-1, the Reserved row from 0xFFC08000 to 0xFFC0C003 address is now split into two separate rows:
  - 0xFFC08000 to 0xFFC0BFFF - Reserved
  - 0xFFC0C000 to 0xFFC0C003 - Generic Control Register

B.6 Functional Safety changes

- No substantial content changes

B.7 Chip Configuration changes

- Rewrote FCCU chip-specific register reset values, formerly titled "FCCU register default values." Added rows for the FCCU_CFG_TO and FCCU_NCF_TO registers. Because the information about the reset value of FCCU_CFG after a configuration timeout is now covered in the register description, deleted the related information in the row for the FCCU_CFG register. Corrected the reset value of FCCU_NCFS_CFG0 from 0002_0000h to 0000_0000h.

- Reset value of SSCM_MEMCONFIG[MREV] is changed form 1h to 2h in SSCM_MEMCONFIG reset value section.

- Added Motor control configurations as a new section
- In Table 7-33
  - Added footnote to NCF[14]
  - Previous errata e7858 integrated into reference manual, added footnote to NCF[26]
  - Updated the signal description for NCF[33]
  - Removed "Default Functional Reset (Short, Long, None)" column from this table and added a note: "Functional reset is not generated by any of the fault by default (after reset)."
  - Updated Signal description column for various NCF's.
- In Table : Corresponding error sources for OFLWn registers, added footnote in “Core I-Cache - MEMU_SYS_RAM_OFLW0: bit 1” and “Core D-Cache - MEMU_SYS_RAM_OFLW0: bit 2” rows.

- In Platform Configuration Module (PCM) :
  - Reset value of PCM_IAHB_BE1 register changed to 0007_0707h.

• Reset value of PCM_IAHB_BE2 register changed to 0007_0707h. • In PCM_IAHB_BE1 register : Access for the reserved bit fields [5:7], [21:23] and [29:31] are changed to R/W. • In PCM_IAHB_BE2 register : Access for the reserved bit fields [13:15] and [29:31] are changed to R/W. • PCM_IAHB_BE1[PRE] changed to Reserved bit. • PCM_IAHB_BE2[PRE] changed to Reserved bit. • Added Note in Periodic Interrupt Timer (PIT) configuration section
• In System Status and Configuration Module (SSCM) configuration added a note "UART and SCI are used interchangeably in the document beyond this point."
• In Table 7-16, removed the redundant Reserved rows from the table for better readability • In Table 7-12, updated OPACR value for SAR ADC_0 to 127
• In Ethernet (ENET) configuration : • Previous errata e7251 integrated into reference manual : added a Note • Added a new paragraph : "The ENET module's RMII_CLK can be output ...." • Added a new sub section : Generic Control Register
• Added a footnote in Figure 7-8
• Added a Note in Flash Memory Controller (PFLASH) configuration section
• In Debug section, added Table 7-34
• Updated Software Watchdog Timer (SWT) configuration section
• Updated Table 7-3
• Updated paragraph text in Fault inputs section • Previous errata e8229 integrated into reference manual : added a new section FCCU chip-specific glitch-filter guidelines

B.8 Reset changes

• No substantial content changes

B.9 DCF Records changes

• In DCF clients available in the SOC section : Updated table

B.10 Device Security changes

• No substantial content changes

B.11 Debug changes

• Previous errata e8014 integrated into reference manual, added a note in Introduction section.
• In DID register reset and parameter values, added a new maskset bullet point as: Maskset N15P: 29B4501Dh

- Added a new section Device identification register reset values.
- Previous errata e6726 integrated into reference manual : In Features, added Note - "MCKO may be gated one clock period early when ...."

B.12 Power Management changes

- In Power-on Reset the slow ramp up / ramp down of battery supply and following VDD is changed from 0.5 V / min. to 0.9 V / sec.

B.13 Clocking changes

- Updated Figure 13-1, to show PLL1 as a source for AUX Clock Selector 0. - Updated Figure 13-3 :BIU clock input signal connection changed from MOTC_CLK to PGBRIDGEx_CLK for CTU and SGEN blocks.
- Previous errata e8227 integrated into reference manual, added note in Peripheral clocks section. - Updated paragraph text in Clock monitoring - In Clock generation, added a Note.

B.14 e200z4 Core Complex Overview changes

- No substantial content changes

B.15 Core description module changes

- Table 15-4 :
  - Correction: se_lbz latency is 2 (was previously stated as 22)
  - Clarification: Footnote added to se_lwz latency ("Aligned")
  - Clarification: Footnote added to se_sth latency ("Aligned")
  - Clarification: Footnote added to se_stw latency ("Aligned")
- Table 15-5 :
  - Clarification: Footnote added to divwo[.] latency ("With early-out capability, timing is data-dependent.")
  - Clarification: Footnote added to divwu[.] latency ("With early-out capability, timing is data-dependent.")
  - Clarification: Footnote added to divwuo[.] latency ("With early-out capability, timing is data-dependent.")
  - Clarification: Footnote added to e_lhau latency ("Aligned.")
  - Clarification: Footnote added to lhaux latency ("Aligned.")
  - Clarification: Footnote added to lhax latency ("Aligned.")
  - Clarification: Footnote added to lhbrx latency ("Aligned.")
  - Clarification: Footnote added to e_lhz latency ("Aligned.")
  - Clarification: Footnote added to e_lhzu latency ("Aligned.")
  - Clarification: Footnote added to lhzux latency ("Aligned.")
  - Clarification: Footnote added to lhzx latency ("Aligned.")
  - Clarification: Footnote added to lwbrx latency ("Aligned.")
  - Clarification: Footnote added to e_lwz latency ("Aligned.")

  - Clarification: Footnote added to e_lwzu latency ("Aligned.")
  - Clarification: Footnote added to lwzux latency ("Aligned.")
  - Clarification: Footnote added to lwzx latency ("Aligned.")
  - Clarification: Footnote added to mfdcr latency ("Plus additional synchronization time.")
  - Clarification: Footnote added to mfspr (DEBUG, CACHE, LMEM < MPU) latency ("Plus additional synchronization time.")
  - Clarification: Footnote added to mpure latency ("Plus additional synchronization time.")
  - Clarification: Footnote added to mpuwe latency ("Plus additional synchronization time.")
  - Clarification: Footnote added to msync latency ("Plus additional synchronization time.")
  - Clarification: Footnote added to mtmsr latency ("Plus additional synchronization time.")
  - Clarification: Footnote added to mtspr (DEBUG, CACHE, LMEM < MPU) latency ("Plus additional synchronization time.")
  - Clarification: Footnote added to e_sth latency ("Aligned.")
  - Clarification: Footnote added to sthbrx latency ("Aligned.")
  - Clarification: Footnote added to e_sthu latency ("Aligned.")
  - Clarification: Footnote added to sthux latency ("Aligned.")
  - Clarification: Footnote added to sthx latency ("Aligned.")
  - Clarification: Footnote added to e_stw latency ("Aligned.")
  - Clarification: Footnote added to stwbrx latency ("Aligned.")
  - Clarification: Footnote added to e_stwu latency ("Aligned.")
  - Clarification: Footnote added to stwux latency ("Aligned.")
  - Clarification: Footnote added to stwx latency ("Aligned.")
- Table 15-6 :
  - Clarification: Footnote added to efsmsub throughput ("Destination register is also a source register, so for full throughput, back-to-back operations must use a different destination register.")
  - Clarification: Footnote added to efsnmadd throughput ("Destination register is also a source register, so for full throughput, back-to-back operations must use a different destination register.")
  - Clarification: Footnote added to efsnmsub throughput ("Destination register is also a source register, so for full throughput, back-to-back operations must use a different destination register.")
- Table 15-8 :
  - Clarification: Footnote added to throughput ("Timing is data-dependent.")
- Table 15-18 :
  - For Reserved bits 8:11, 13:14, 19:24, and 28, changed footnote number from 2 to 1

- Instruction timing :
  - Changes to Instruction class cycle counts (Table 15-3):
    - "Description" column heading changed to "Throughput"
    - "Integer: compare" latency is 1 (previously was no value)
    - "Integer: compare" throughput is 1 (previously was no value)
    - Extraneous row (Branch with Latency 3/2/1) deleted
  - Changes to Instruction timing by mnemonic—16-bit instructions (Table 15-4):
    - Correction: Previously, se_cmpl instruction appeared twice. Second instance changed to se_cmpli
  - Changes to Instruction timing by mnemonic—32-bit instructions (Table 15-5):
    - Correction: Extraneous ">" suffix deleted from addco[.] instruction
    - Correction: e_sc latency value is 4 (previously stated as 1).
    - Correction: Latency value for mtspr (except DEBUG, msr, hid0/1) is 1 (previously stated as "i").

- Machine State Register (MSR) :
  - Bits added to register figure and field descriptions table:
    - SPV (SP/Embedded FP/Vector available)
    - WE (Wait State (Power management) enable)
    - FP (Floating-Point Available)
    - FE0 (Floating-point exception mode 0)
    - FE1 (Floating-point exception mode 1)
    - IS (Instruction Address Space)
    - DS (Data Address Space)

NOTE: None of the above bits are functional. They were previously shown as reserved bits but are redefined to clearly show any deviations from Book III-E of the Power ISA version 2.06 specification.

- Dual-issue operation :

• Footnote added to items in Concurrent instruction issue capabilities table: "Excludes divide/sqrt class instructions occurring in both issue slots" • Instruction timing : • Minor editorial (non-technical) changes • Changes to Instruction class cycle counts table (Table 15-3): • Throughput value for load multiple and store multiple instruction classes is 1 + *n*/2
• DMEM Control Register 0 (DMEMCTL0) : • First sentence of DSWCE field value 11 description changed to, "Slave write data is checked and corrected for errors on partial-width (1, 2, 3, 5, 6, or 7 byte, or misaligned 4-byte) writes." (was "...(1-, 2-, or 3-byte) writes.")
• Branch Unit Control and Status Register (BUCSR) : • New section
• Local Data memory overview : • Content added describing front door and backdoor accesses to local Data memory • Editorial changes
• Local Data memory overview : • Clarification: "The local memory is dual-ported, with a dedicated port for CPU accesses and a shared slave port for external accesses" changed to "The local memory has one dedicated port for CPU accesses and another shared slave port for external accesses"

B.16 SIUL2 module changes

• Added note in the bit description for ODE bit under SIUL2 Multiplexed Signal Configuration Register (SIUL2_MSCR*n*) register. • Editorial change made to SIUL2 Interrupt Filter Clock Prescaler Register (SIUL2_IFCPR) register description
• Previous errata e7788 integrated into the RM: Added text to the existing note ("unless it is 8 bit.....reserved register space") to "Memory map and register description" section.

B.17 Crossbar switch module changes

• Changed occurrences of "AXBS" or "AXBS module" to "Crossbar Switch."
• General operation : Removed phrase, ", other than the flash (if present),". Removed last paragraph that began with "If present, the flash slave port..."
• Features : • Replaced "64-bit data bus" with "Up to single-clock 64-bit transfer". • Replaced "Support for byte, 2-byte, 4-byte, 8-byte, and 32-byte burst transfers" with "Support for burst transfers of up to 16 beats of data". • Memory Map / Register Definition :Edited introductory text and note. Added paragraph to note beginning with , "All references to the crossbar switch..." • Added content to note in Control Register (XBAR_CRS*n*) description about HPE fields.
• Removed bullet beginning with, "Operation at a 1-to-1 clock frequency..." from Features.

B.18 XBIC module changes

• Overview : Removed content which is not useful to customer.

- Features : Removed bullet beginning with "hready, hresp0, and hresp2..."
- Functional description : Section has been rewritten. Removed "XBIC H Matrix Definition" table.
- Block diagram :
  - Replaced cross references to figures with "the following diagram."
  - In XBIC system block diagram, corrected label on top green signal to "hready, hresp0, hresp2".
  - Removed figure, "XBIC block diagram".

- Changed "last transfer" to "first transfer" in XBIC_EAR register description.

- Minor editing.
- XBIC Error Status Register (XBIC_ESR) : Previous errata e8310 integrated into the RM: Added note to register description.
- XBIC Error Address Register (XBIC_EAR) : Previous errata e8310 integrated into the RM: Added note to register description.

B.19 AIPS module changes

- Edited General operation.

B.20 SMPU module changes

- In Figure 20-1 of Block diagram section: in upper right corner, changed "Internal peripheral bus" to "Register access"
- In Features section:
  - Removed what was the first list item: "Support for a maximum of 16 program-visible 128-bit region descriptors, accessible as four 32-bit words each. "
  - Changed first (formerly second) list item from "Each region descriptor defines an arbitrarily-sized space, aligned anywhere in memory" to "Arbitrarily sized protection regions alignable anywhere in memory."
  - Moved first five list items to highest level in list hierarchy
- For Error Address Register, Bus Master n (SMPU_EAR*n*) changed reset value from "Undefined at reset" to 0000_0000h
- For Error Detail Register, Bus Master n (SMPU_EDR*n*) changed reset value from "Undefined at reset" to 0000_0080h
- In Hit determination section:
  - Replaced Boolean equation for hit determination with new sentence: "When RGD*n*_Word3[VLD] is 1, a region hit occurs when the requested address is between the start address (RGD*n*_Word0[SRTADDR]) and the end address (RGD*n*_Word1[ENDADDR]), inclusive."
  - Changed first Note from "The SMPU does not verify that ENDADDR >= SRTADDR" to "If ENDADDR < SRTADDR, no hit occurs."
- Changed title of Final evaluation and error terminations section (formerly was "Putting it all together and error terminations")

B.21 INTC module changes

- In Interrupt sources, changed "chapter that describes how modules are configured and connected" to "chip-specific INTC information".

- In TIMERn, changed INUM to IRQ.

- In Block diagram, revised the stem sentence and figure title to indicate that the diagram is an example of a four-processor configuration, and that the actual number of supported processors is given in the chip-specific INTC information.

• In Features, ensured that the bulleted list shows only those processors supported on this chip. • Revised Memory map and register definition to show only those registers and fields actually present on this chip.
• In Features, changed "monitor the latency of up to 4 interrupt sources per corresponding Processor" to "monitor the latency of interrupt sources for a corresponding Processor". • In Memory map and register definition, changed "Although INTC_SSIn are 8 bits wide..." to "Although INTC_SSCIRn are 8 bits wide...".
• In Memory map and register definition : • Added Figure 21-2 and surrounding text explaining write restrictions for PSR*n* and SSCIR*n*. • In INTC Priority Select Register (INTC_PSR*n*) and INTC Software Set/Clear Interrupt Register (INTC_SSCIR*n*), added "See Figure 21-2 for limitations on writing to this register."

B.22 eDMA module changes

• Changed description for value b101 of TCD_ATTR[SSIZE] to "32-byte burst (4 beats of 64 bits)". • eDMA initialization : Changed "ERQ register" to "ERQH and ERQL registers" in bullet 5.
• Made several editorial corrections and improvements. • Made editorial change to Features : "data packet" to "transferred data".
• Added note to DMA_DCHMIDn[EMI] bit field description.
• Fault reporting and handling : Added note re. cancel transfer request. Added note re. channel priority errors. • Block parts : Changed "16 bytes of register storage" to "a data buffer" in Data path description. • Added note to DMA_CR[CLM] description re. restriction on use of continuous link mode.
• In section "Peak transfer rates", added a note stating "All architectures will not meet the assumptions listed above. See the SRAM configuration section for more information."
• Features : Removed bullet beginning with, "Support to cancel transfers..." • Made editorial changes in Fault reporting and handling.
• Editorial changes.
• Removed "(INTC)" from Interrupt Request Register (DMA_INT) description. • Changed the following descriptive names of registers and fields: • TCD Minor Byte Count (Minor Loop Disabled) to TCD Minor Byte Count (Minor Loop Mapping Disabled). • TCD Signed Minor Loop Offset (Minor Loop Enabled and Offset Disabled) to TCD Signed Minor Loop Offset (Minor Loop Mapping Enabled and Offset Disabled). • TCD Signed Minor Loop Offset (Minor Loop and Offset Enabled) to TCD Signed Minor Loop Offset (Minor Loop Mapping and Offset Enabled). • Link Channel Number to Minor Loop Link Channel Number (DMA_TCDn_CITER_ELINKYES[LINKCH]). • Link Channel Number to Major Loop Link Channel Number (DMA_TCDn_CSR[MAJORLINKCH]).
• Edited Introduction. • Edited note in UCE field description in Error Status Register (DMA_ES). • Dynamic channel linking : Added cross-reference to TCD structure.
• Edited Features.
• Edited CLM description.
• Error Status Register (DMA_ES) : Added two causes of channel errors to list in register description.

B.23 DMAMUX module changes

• Removed the address information of CHCFG1 register (base address + 0x01) and CHCFG8 (base address + 0x08) from the section "Enabling and configuring sources."

B.24 EIM module changes

- Edited throughout
- In Memory map and register definition introduction text, changed register mnemonic from "Word" to "WORD"
- Error Injection Channel Descriptor, Word1 (EIM_EICHD*n*_WORD1)
    - Changed name of field from Upper Data Mask (UDATA_MASK) to Data Mask Bytes 0-3 (B0_3DATA_MASK), and changed references to the field accordingly
    - In B0_3DATA_MASK description, added text: "For details about which bits in this field are implemented for the applicable channel and how the bits map to bytes 0-3 of the read data bus, see the chip-specific EIM information."
- Error Injection Channel Descriptor, Word2 (EIM_EICHD*n*_WORD2)
    - Changed name of field from Lower Data Mask (LDATA_MASK) to Data Mask Bytes 4-7 (B4_7DATA_MASK), and changed references to the field accordingly
    - In B4_7DATA_MASK description, added text: "For details about which bits in this field are implemented for the applicable channel and how the bits map to bytes 4-7 of the read data bus, see the chip-specific EIM information."
- Functional description
    - Added a Note: "When the use case for a channel requires writing any EICHD_WORD register, write the EICHD_WORD register before executing the two-stage enable mechanism. A successful write to any EICHD_WORD register clears the corresponding EICHEN[EICHEN] field."

- Overview
    - Added Note preceding diagram: "The following diagram shows an example EIM implementation with a 64-bit read data bus and an 8-bit checkbit bus."
    - To title of Figure 24-1 added: "(64-bit read data bus and 8-bit checkbit bus)"
- Memory map and register definition
    - Reorganized first paragraph into subsection titled "Programming model access"
    - Completely revised second paragraph and reorganized it into subsection titled "Error injection channel descriptor: function and structure"
    - For Error Injection Channel Enable register (EIM_EICHEN) edited and reorganized register and field descriptions and renamed field from EICHEN to EICH0EN
    - Renamed registers and changed references to them accordingly:
        - EICHD_WORD0 to EICHD0_WORD0
        - EICHD_WORD1 to EICHD0_WORD1
        - EICHD_WORD2 to EICHD0_WORD2
    - For CHKBIT_MASK in Error Injection Channel Descriptor, Word0 (EIM_EICHD*n*_WORD0) added text to field description: "The width of the field for the channel is defined in the chip-specific EIM information."
    - Incorporated editorial changes in descriptions of Error Injection Channel Descriptor, Word1 (EIM_EICHD*n*_WORD1) and Error Injection Channel Descriptor, Word2 (EIM_EICHD*n*_WORD2)
    - Revised descriptions of B0_3DATA_MASK field in Error Injection Channel Descriptor, Word1 (EIM_EICHD*n*_WORD1) and B4_7DATA_MASK field in Error Injection Channel Descriptor, Word2 (EIM_EICHD*n*_WORD2)
- Edited all content in Functional description

- In Memory map and register definition changed first sentence:
    - from: "The EIM provides an IPS programming model mapped to a standard 16 KB slot for an on-platform peripheral."
    - to: "The EIM provides an IPS programming model mapped to an on-platform peripheral slot."

- Memory map and register definition
    - Minor editorial changes: in each list item of first two unordered lists, capitalized first letter of first word

---

- Memory map and register definition
    - Edited and reorganized text in Error injection channel descriptor: function and structure

---

B.25 PLLDIG changes

• Editorial updates throughout. • Clock configuration   • Updated equations in section.
• PLLDIG PLL1 Divider Register (PLLDIG_PLL1DV)   • Updated 'PLL0' to 'PLL1' in Register description, "...effective after PLL1 is disabled, then reenabled."
• PLLDIG PLL0 Divider Register (PLLDIG_PLL0DV)   • Replaced the sentence, "The values of PREDIV and MFD..." with "PLL0DV can be modified at anytime..." in the register description. • PLLDIG PLL1 Divider Register (PLLDIG_PLL1DV)   • Updated register description. • PLLDIG PLL1 Frequency Modulation Register (PLLDIG_PLL1FM)   • Removed the sentence, "Changing the values of PLL1FM[MODEN] and PLL1FM[MODSEL] fields..." in the register description. • Clock configuration   • Add equation headings and titles to equations.
• Removed section "Maximum Lock Time".
• PLLDIG PLL1 Frequency Modulation Register (PLLDIG_PLL1FM)   • Removed the text ", however, the output clock from PLL..." from the last sentence in the register description. • Normal mode with reference, PLL0 or both PLLs enabled   • Replaced "output divider (Reduced Frequency Divider) and whether PLL modulating is enabled" with "and modulation enable are" in second paragraph.   • Updated the end of the first sentence, "In normal mode, PLL0 receives..." • Introduction   • Removed "The chip provides a user interface and control over" from the first sentence which now reads "The Dual PLL system composed of..."
• PLLDIG PLL1 Control Register (PLLDIG_PLL1CR)   • Added updated content to the register description. • PLLDIG PLL1 Status Register (PLLDIG_PLL1SR)   • Added updated content to the register description.
• Removed the section "Acronyms and Abbreviations". • Frequency modulation   • Updated the equation in the Note, from "$f_{max} = f_{sys} \times (1 + (MD\%)).$" to "$f_{max} = f_{sys} \times (1 + (MD\% / 100)).$"
• PLLDIG PLL1 Frequency Modulation Register (PLLDIG_PLL1FM)   • Removed the text "the binary equivalent of" from the field descriptions of INCSTP and MODPRD.
• PLLDIG PLL0 Control Register (PLLDIG_PLL0CR)   • Updated reset value of reserved field at location 21(Reserved), and changed the access to RO.
• Frequency modulation   • Updated the sentence "If center modulation is selected..." to "If center modulation is used..." in the Note "The device maximum operating frequency..."
• Register PLLDIG PLL1 Divider Register (PLLDIG_PLL1DV)   • Replaced the register description with updated content.
• PLLDIG PLL1 Frequency Modulation Register (PLLDIG_PLL1FM)   • Updated MODSEL bitfield value descriptions for both 0 and 1.
• PLLDIG PLL1 Frequency Modulation Register (PLLDIG_PLL1FM)   • Removed the sentence "Modulation period (PLL1FM[MODPRD]) and increment step..." from the register description. • PLLDIG PLL1 Fractional Divide Register (PLLDIG_PLL1FD)   • Removed the sentence "The dither disable (PLLDIG_PLL1FD[DTHDIS]) and..." from the register description.
• Frequency modulation

  - Updated figure Figure 25-1 to show correct modulation depth.

- In PLLDIG PLL1 Fractional Divide Register (PLLDIG_PLL1FD)
  - Replaced DTHDIS field with Reserved field at offset 15.

B.26 CMU changes

- CLKMN1 supervisor
  - Updated NOTE to read "(HFREF$_{Actual}$ = (HFREF$_{Ideal}$ ÷ 0.95)" instead of "(HFREF$_{Actual}$ = (HFREF$_{Ideal}$ + 2) × 1.05)".
  - Added "The actual LFREF value will be 762 when the accuracy is taken into consideration (LFREF$_{Actual}$ = (LFREF$_{Ideal}$ ÷ 1.05)." to the NOTE.

- Main features
  - Updated second bullet to "CLKMN0_RMT monitoring with respect to CLKMT0_RMN ÷ $2^{CSR[RCDIV]}$ clock."
- Added CMU_ prefix in front of register/field names that did not previously include it.
- CMU Frequency Display Register (CMU_FDR)
  - Updated register description placing items in a bullet list.
- CMU Interrupt Status Register (CMU_ISR)
  - Updated Note in register description, "All flags in the CMU_ISR are set..."
  - Updated bitfield description FHHI
  - Updated bitfield description FLLI
- Frequency meter
  - Added "[FD]" to end of CMU_FDR throughout where it was not previously included.

- CMU Interrupt Status Register (CMU_ISR)
  - Updated the Note in the OLRI bitfield description, "When attempting to enter STOP mode..."

B.27 MC_CGM changes

- Previous errata e7103 integrated into reference manual, added a note "If the current system clock source.....of the switch." in SELSTAT bit of System Clock Select Status Register (MC_CGM_SC_SS) register.
- Previous errata e7250 integrated into reference manual, added a note "Always write.....registers." and changed bit access from RO to RW in DE bit of System Clock Divider 0 Configuration Register (MC_CGM_SC_DC0) register.

- Updated the bit-width of MC_CGM_AC0_SC[SELCTL] to [5:7] and added the clock source availability for PLL1 PHI at 100b.
- Updated the bit-width of MC_CGM_AC0_SS[SELSTAT] to [5:7] and added the clock source availability for PLL1 PHI at 100b.
- Added Note in MC_CGM_AC0_SC register description.

B.28 XOSC changes

- No substantial content changes

- XOSC Control Register (XOSC_CTL)
  - Updated XOSC_CTL[I_OSC] field access.

B.29 IRCOSC changes

- Frequency trimming calculation
  - Updated table contents replacing δF_{var_SW} with δf_{TRIM}.
  - Updated all instaces of "F" with "*f*" to represent frequency.

B.30 PRAMC module changes

- SRAM controller memory map and register definition :
  - Note added regarding caution required when reconfiguring platform RAM controller during device operation
- e2eECC considerations on less-than-64-bit write transactions :
  - Added to end of section: "Malfunction of the ECC logic described above may result in the corruption of the SEC/DED event reporting. The RAM controller performs EDC after ECC check on all read-modify-write transactions. If a mismatch is detected, indicating a failure in the ECC logic, the event is reported to the FCCU module."
- Less than 64-bit writes :
  - Added single bit and multi bit error signals to Read-modify-write data path figure
  - Changed hardware signal names to names that describe signal function more clearly
- Optional read wait-state :
  - All references to the PRCR1 register changed to "PRCRx". This is only an editorial change--there is no change to any register name or function.
- Read and write operations (formerly "Read / Write introduction" :
  - Section completely rewritten

B.31 Flash memory controller module changes

- Functional description :
  - Deleted from first sentence: "As shown in the block diagram"
- ECC on data flash accesses :
  - Editorial changes
  - Clarification: Following note added: "EEPROM should be avoided for storage of executable code."
- Platform Flash Remap Descriptor Enable Register (PFLASH_PFCRDE) :
  - Clarification: Only CRD0EN - CRD7EN fields (bits 0 - 7) are valid for this device because it can have a maximum of 8 overlay regions. The remaining bits are read only zero reserved bits.
- Platform Flash Remap Control Register (PFLASH_PFCRCR) :
  - Correction: PFLASH_PFCRCR[SAFE_CAL] field description updated to state the correct reduced number of calibration regions available if SAFE_CAL=1. When the SAFE_CAL field is set, the number of available calibration regions is reduced by half. For this device, if SAFE_CAL=1, the number of calibration regions available is reduced to 4.
- Platform Flash Configuration Register 1 (PFLASH_PFCR1) :
  - Clarification: The PFLASH_PFCR1[P0_BFEN] field can only be updated when PFLASH_PFCR3[BFEN_LK]=0.
- Platform Flash Configuration Register 3 (PFLASH_PFCR3) :
  - Reserved field at bit 15 deleted
  - New field added at bit15: BFEN_LK. This field must be set to 0 before the PFCR1[P0_BFEN] field can be updated.

• Platform Flash Calibration Region Descriptor n Word0 (PFLASH_PFCRDn_Word0) : • Clarification: Previously the LSTARTADDR field was shown as a 32-bit field with read/write access. The address is a 32-bit address but the least significant 4 bits are always 0 and are now shown as a reserved read only zero field. • Platform Flash Calibration Region Descriptor n Word1 (PFLASH_PFCRDn_Word1) : • Clarification: Previously the PSTARTADDR field was shown as a 32-bit field with read/write access. The address is a 32-bit address but the least significant 4 bits are always 0 and are now shown as a reserved read only zero field.
• Platform Flash Configuration Register 1 (PFLASH_PFCR1) : • Clarification: All "1xx" values in the APC field have the same effect. Previously, the values, 100, 101, 110, and 111 in the APC field were listed individually and had identical descriptions. They are now condensed into a single entry, "1xx" in the value list to reduce the possibility of confusion.
• Platform Flash Configuration Register 1 (PFLASH_PFCR1) : • Note added to PFLASH_PFCR1[APC] field description: "A value of '1' in the most significant bit causes the flash controller to function in retrograde/legacy mode, in which there is no pipelining between the sampling of flash read data and the presentation of the next address for flash lookup."
• ECC on data flash accesses : • Clarification: If a non-correctable error is detected, the flash memory controller returns a value of FFFF_FFFFh to the requesting master.
• Access protections : • Content previously located in the "Error termination" and "Flash error response operation" sections moved to this section. • Error termination : • Section deleted • Flash error response operation : • Section deleted • Read cycles - buffer miss : • Section deleted • Read cycles - buffer hit : • Section deleted
• Throughout: • Editorial changes
• Platform Flash Configuration Register 3 (PFLASH_PFCR3) : • Correction: Access type of bit 11 in the PFLASH_PFCR3 register has been changed from read-only to read/write. The bit is reserved and has no underlying function.
• Features : • Correction: "Nexus trace stream interface supports message dumping to the on-chip overlay RAM" removed from features list (feature is only supported in devices with dedicated on-chip overlay RAM) • Functional description : • Correction: "Nexus trace" removed from list of modules interfaced with the flash memory controller (The Nexus interface is only supported by the flash memory controller in devices with dedicated on-chip overlay RAM) • PFlash calibration remap support : • Correction: "Can be used to hold device debug trace stream" removed from list of features supported by the overlay function (This feature is implemented only in devices with dedicated on-chip overlay RAM) • Correction: "Timing for calibration accesses to a particular overlay RAM is only guaranteed if it is not being used as a destination for trace streaming at the same time" removed (Trace streaming is only available in devices with dedicated on-chip overlay RAM)
• Platform Flash Configuration Register 1 (PFLASH_PFCR1) : • Clarification: Following statement added to PFLASH_PFCR1[APC] field description: "For valid RWSC and APC combinations please refer to the device data sheet. • Following note in PFLASH_PFCR1[APC] field description reformatted into note list: "A value of '1' in the most significant bit causes the flash controller to function in retrograde/legacy mode, in which there is no pipelining between the sampling of flash read data and the presentation of the next address for flash lookup." • Added to note list in PFLASH_PFCR1[APC] field description: "Flash operation is not guaranteed for RWSC/APC combinations other than those specified in the data sheet."

- Clarification: Updated portion of PFLASH_PFCR1[RWSC] field description that points to data sheet for valid values to state, "For valid RWSC and APC combinations please refer to the device data sheet. (was "The required settings are documented in the device data sheet")
- Clarification: Following statement in PFLASH_PFCR1[RWSC] field description reformatted as item in note list for emphasis: "Higher operating frequencies require non-zero settings for this field for proper flash operation"
- Clarification: Added to note list in PFLASH_PFCR1[RWSC] field description: "Flash operation is not guaranteed for RWSC/APC combinations other than those specified in the device data sheet"

B.32 c55fmc module changes

- Features :
  - Clarification: Feature "Triple Voted Flops for flash functions requiring high reliability" changed to, "Triple Voted Flops for flash functions requiring high reliability, e.g., internal trimming, redundancy, and mode control"

- Over-Program Protection 0 register (C55FMC_OPP0) :
  - Correction: Two most significant bits of the register always reset to 0 (previously shown as dependent on chip configuration)
  - Clarification: Footnote in register diagram replaced with footnotes stating that the reset value of each field (LOWOPP and MIDOPP) varies among devices
- Over-Program Protection 1 register (C55FMC_OPP1) :
  - Correction: Sixteen most significant bits of the register always reset to 0 (previously shown as varying among devices)
  - Clarification: Footnote in register diagram replaced with footnote stating that the reset value of the HIGHOPP field varies among devices
- Over-Program Protection 2 register (C55FMC_OPP2) :
  - Clarification: Footnote in register diagram replaced with footnote stating that the reset value of the A256KOPP field varies among devices
- Over-Program Protection 3 register (C55FMC_OPP3) :
  - Correction: Sixteen most significant bits of the register always reset to 0 (previously shown as varying among devices)
  - Clarification: Footnote in register diagram replaced with footnote stating that the reset value of the A256KOPP field varies among devices

B.33 Flash OTP changes

- No substantial content changes

B.34 DSMC module changes

- No substantial content changes

B.35 ADC Configuration changes

- In CTU interface, added Note: "CTU Clock (MC_CLK) and ADC_CLK should either be same and synchronous or CTU can also operate with ADC_CLK being an integer plus half (1.5, 2.5,3.5, ...) of MC_CLK clock."

- Added a new topic ADC channel conversion under ADC pin muxing

B.36 ADC module changes

- Features :
  - Added list of channels for each group of ADC channels.
- In Normal conversion :
  - Added list of channels for each group of ADC channels.
- In Presampling channel enable :
  - Added list of channels for each group of ADC channels.
- In Injected conversion :
  - Added list of channels for each group of ADC channels.
- In Analog watchdog setting :
  - Added list of channels for each group of ADC channels.
- ADC clock prescaler and sample time settings :
  - Added list of channels for each group of ADC channels.

- Self test (Quick-Check/Safety mode) :
  - Clarification: ADC self test step 1, "Supply self-test (analog supply)", was previously described as "Measures the analog supply for the ADC". Changed to: "Measures the analog supply voltage (VDDA) and divides the result by the bandgap voltage (result from Algorithm S step 0). The VDDA conversion result is written to ADC_STDR1[TCDATA]. The final result (after division) consists of an integer portion and a fractional portion, both of which are written to the ADC_STDR2 register."
  - Comment added regarding pre- and post-conversion scaling of the analog supply voltage that results in the least significant bits of the VDDA conversion result always being '0'.
- Self Test Data Register 1 (ADC_STDR1) :
  - Updated register description: "The ADC_STDR1 register contains the most current result data for conversions executed during ADC self test. Additionally, the register contains status bits to indicate whether result data has been read and whether existing conversion data has been overwritten by a newer result."
  - Note added: "For Algorithm S step 1, the result data contained in this register is not the final step 1 result. The step 1 data is the conversion of the analog supply (VDDA). This VDDA conversion result is divided by the Algorithm S step 0 conversion data and the result is written to the ADC_STDR2 register."
  - Detailed note added regarding pre- and post-conversion scaling of the analog supply voltage that results in the least significant bits of the VDDA conversion result always being '0'.

- Calibration, BIST Control and status Register (ADC_CALBISTREG) :
  - Default register reset value changed to C037_0670h (was 2037_06F0h)
- Conversion Timing Register 0 (ADC_CTR0) :
  - Default register reset value value changed to 0000_0014h (was 0000_0016h)
- Conversion Timing Register 1 (ADC_CTR1) :
  - Default register reset value value changed to 0000_0014h (was 0000_0016h)

- Self Test Analog Watchdog Register 0 (STAW0R) :
  - Correction: The ADC_STAW0R[THRL] register field description has been updated to state that if the analog watchdog is enabled, the STSR1[ERRx] status bit is set if STDR1[TCDATA]) < THRL. Previously stated that the input was expected in 2's complement format and that the error bit would be set if (Absolute value of STDR1[TCDATA]) > (Absolute value of THRL). The value entered is NOT interpreted as 2' complement.
  - Correction: The ADC_STAW0R[THRH] register field description has been updated to state that if the analog watchdog is enabled, the STSR1[ERRx] status bit is set if STDR1[TCDATA]) > THRH. Previously stated that the

input was expected in 2's complement format and that the error bit would be set if (Absolute value of STDR1[TCDATA]) > THRH.. The value entered is NOT interpreted as 2' complement.

- Throughout Memory Map/Register Definition :
  - Changed Vref to VREF
  - Spelling corrections
  - Formatting changes
- Self Test Analog Watchdog Register 0 (ADC_STAW0R) :
  - Register description updated
  - Clarification. Note added to ADC_STAW0R[THRH] and ADC_STAW0R[THRL] field descriptions: "The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment, i.e., introduction of noise from outside of the device minimized. The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments."
  - ADC_STAW0R[AWDE] field description updated
  - ADC_STAW0R[WDTE] field description updated
- Self Test Status Register 3 (ADC_STSR3) :
  - Correction: Equation in ADC_STSR3[DATA0] field changed to "Test channel data = VREF/VBGAP" (was "... VBGAP/VREF")
- Self Test Analog Watchdog Register 1A (ADC_STAW1AR) :
  - Register description updated
  - Clarification. Note added to ADC_STAW1AR[THRH] and ADC_STAW1AR[THRL] field descriptions: "The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment, i.e., introduction of noise from outside of the device minimized. The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments."
- Self Test Analog Watchdog Register 1B (ADC_STAW1BR) :
  - Register description updated
  - Clarification. Note added to ADC_STAW1BR[THRH] and ADC_STAW1BR[THRL] field descriptions: "The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment, i.e., introduction of noise from outside of the device minimized. The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments."
- Self Test Analog Watchdog Register 2 (ADC_STAW2R) :
  - Register description updated
  - Clarification. Note added to ADC_STAW2R[THRL] field description: "The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment, i.e., introduction of noise from outside of the device minimized. The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments."
- Self Test Analog Watchdog Register 4 (ADC_STAW4R) :
  - Register description updated
  - Clarification. Note added to ADC_STAW4R[THRH] and ADC_STAW4R[THRL] field descriptions: "The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment, i.e., introduction of noise from outside of the device minimized. The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments."
  - ADC_STAW4R[AWDE] field description updated
  - ADC_STAW4R[WDTE] field description updated
- Self Test Analog Watchdog Register 5 (ADC_STAW5R) :
  - Register description updated
  - Clarification. Note added to ADC_STAW5R[THRH] and ADC_STAW5R[THRL] field descriptions: "The recommended watchdog threshold values are set according to expected and tested results in a noise-controlled environment, i.e., introduction of noise from outside of the device minimized. The setting may need to be adjusted to prevent a given threshold value from falsely reporting fault detections in applications operating in noisier environments."

- In Calibration (High Accuracy mode), removed "For example, if the ADC is calibrated with a 3.3V reference and operated with a 5V reference, it must be recalibrated".

- Editorial updates throughout chapter.
- Conversion data processing
  - Updates throughout section.

- In bitfield JECH of ISR
    - Added NOTE, "If there is no channel selected in the ADC_JCMR*n* register(s)..." to field description.
- In bitfield ECH of ISR.
    - Added NOTE, "If there is no channel selected in the ADC_JCMR*n* register(s)..." to field description.
- Offset and Gain User Register (ADC_OFSGNUSR)
    - Removed "[15 bit accurate]" from the field descriptions of OFFSET_USER and GAIN_USER.
    - Added note "A detailed description of the use of OFSGNUSR..." to register description.
- User-defined offset and gain values and its subsections
    - Significant updates throughout.
- Conversion time
    - Changed title to 'Conversion time' from 'Compare phase time'
    - Significant updates throughout.

- NSTART
    - Added Note to the MCR[NSTART] bitfield description, "This bit cannot be set (1) when PWDN = 1. This bit is always cleared when PWDN = 1."

- Register CTR0 (Conversion Timing Register 0 (ADC_CTR0))
    - Added Note "The Bandgap voltage sampling time is controlled..." to the CTR0[INPSAMP] field description (INPSAMP).

- Self Test Status Register 2 (ADC_STSR2) :
    - Correction: OVFL bit is read-only (previously was shown as R/W)

- Presampling channel enable
    - Updated "VDD_HV_ADV (Power High voltage Supply for ADC, SGEN)" to "VDD_HV_ADV/8 (Power High voltage Supply for ADC, SGEN divided by 8)" in table Table 36-1.

- In bitfield PRECONV of PSCR
    - Added "This bit has no effect on conversion of a channel..." to the field description.

- Presampling channel enable
    - Updated formatting of table Table 36-2, added table title, and added a cross reference to the table in the preceding text.
    - Updated formatting of table Table 36-1, added table title, and added a cross reference to the table in the preceding text.
    - Added cross reference in first paragraph to the PSCR register.

- Main Configuration Register (ADC_MCR)
    - Updated the field access of Reserved field at bit location 6 (Reserved) to RW.
    - Added Note to Reserved bit field 6 description (Reserved)"User must not overwrite default value of this field."

- Calibration (High Accuracy mode)
    - Updated content throughout.

- Parts of the ADC
    - Removed "TEST Interface" bidirectional i/o from Figure 36-1.

- Parts of the ADC
    - Updated 'ADC high-level block diagram' Figure 36-1 removing the text "and external" from "(to on-chip and external mux)". It now reads "(to on-chip mux)"

- Removed the text "BCTU" throughout section "Memory Map/Register Definition".

- Crosstriggering Unit interface
    - Changed the signal name 'ctu_push' to 'ctu_EOC' in Figure 36-4.
- OPMODE
    - Updated field and field values descriptions.

- Features
    - Reformatted bullet "Modes of operation".

- Self Test Analog Watchdog Register 4 (ADC_STAW4R)
    - Updated field description of THRH.
    - Updated field description of THRL.
- Self Test Analog Watchdog Register 5 (ADC_STAW5R)

• Updated field description of THRH.   • Updated field description of THRL. • Removed section "User Defined Offset and Gain values".
• Calibration, BIST Control and status Register (ADC_CALBISTREG)   • Added the Note "This setting is used only when the application..." to the NR_SMPL field description. • Self Test Analog Watchdog Register 4 (ADC_STAW4R)   • Reformatted Note in THRL field description. • Calibration, BIST Control and status Register (ADC_CALBISTREG)   • Updated reset value of OPMODE.
• Register DMA Enable register (ADC_DMAE)   • In the DCLR bitfield value description for the case when DCLR=1, added note "When DCLR is set, ADC DMA channels should only execute read accesses on ADC_CDR*n* registers."
• Register Offset and Gain User Register (ADC_OFSGNUSR)   • Removed Note "A detailed description of the..." from register description.
• Calibration, BIST Control and status Register (ADC_CALBISTREG)   • Updated the Note in the NR_SMPL field description to "The 16 samples setting is used only when the application..."
• Calibration, BIST Control and status Register (ADC_CALBISTREG)   • Updated register reset value.

B.37 Temperature Sensor changes

• In Temperature formula, removed the equations for K1, K2, K3, K4, and dependent content. • In Temperature formula, removed the "Calibration Points" figure and its introductory sentence.
• Editorial changes and rephrased text in Introduction, Functional Description and Temperature threshold detection (digital output generation).
• "Temperature Sensor" title is changed as "Temperature Sensor (TSENS)".

B.38 SGEN changes

• In Status Register (SGEN_STAT), changed access type of SGEN_STAT[SERR] from Read/write to Write one to clear.

B.39 eTimer module changes

• Removed the word "other" from the ETIMER_CH*n*_HOLD register description and HOLD field description.
• Channel Block Diagram   • Added "eTimer Channel Block Diagram" image that removed the 'Fault' input on the 'OFLAG Control' block.
• In Channel n Status Register (ETIMER_CH*n*_STS), access for bits [6:15] has been changed from Read/write to Write one to clear.
• Editorial cleanup throughout chapter.

B.40 FlexPWM module changes

• Added register access information to all register descriptions. • Made editorial improvements throughout chapter.
• Submodule n Status Register (FlexPWM_SUB0_STS) :   • Access type for following fields changed to write 1 to clear (was R/W): REF, RF, CFX1, CFX0, CMPF   • Added reserved register at address offset 0x14A
• Added point "Capture is supported only for X channels not A and B channels" in Features section

B.41 CTU module changes

• In CTU_CR section note, added CTU_ODIS to the list of bits that can be read and set by software.
• Changed registers CTU_TGSCRR, CTU_FDCR, and CTU_CNTRNGR to 16 bits wide.
• Revised CTU_EFR[ICE] field description. • In ADC commands list, revised note to clarify command list execution. • In ADC command list format, revised command sequencing description to clarify the concept of a single command list.
• Previous errata e8137 integrated into the RM: In CTU_EFR and CTU_IFR register sections, added note to clarify flag behavior at reset.
• Revised CTU_IFR register description to read "The IFR register bits are cleared . . ." (was "The EFR register bits are cleared . . .").
• Editorial changes and improvements. • In ADC command list format, revised "Command list sequencing" figure and corresponding figure description.
• In ADC results FIFOs, changed text to "The CTU FIFOs are fixed depth" (was "The CTU supports several...").
• In Error Flag Register (CTU_EFR), revised note ("The ERRCMP field reads 0...") (was "The Tn_OE fields read 0...").
• Previous errata e7338 integrated into the RM: added note ("If the system attempts to access...") to "Memory Map and Registers" section.

B.42 STM module changes

• In Functional description   • Incorporated minor edits
• For reserved fields of following registers, added text to each field description: "This field is reserved."   • STM Control Register (STM_CR)   • STM Channel Control Register (STM_CCR*n*)   • STM Channel Interrupt Register (STM_CIR*n*)

B.43 SWT module changes

• Memory Map and Registers: incorporated various edits

- In SWT_CR register
  - In section title, changed SWR to SWT
  - Edited text in section, including in footnote

- In Servicing operations incorporated minor editorial/formatting changes

- In SWT Control Register (SWT_CR) changed Reserved from read-only and always zero to read/write

- In SWT Service Register (SWT_SR) description of WSC field, changed beginning of second sentence from "If the SWT_CR[KEY] bit is set" to "If the SWT_CR[SMD] field is 01b"
- In SWT Service Key Register (SWT_SK) description of SK field, changed beginning of second sentence from "If SWT_CR[KEY] is set" to "If SWT_CR[SMD] is 01b"

- In Overview changed final three sentences:
  - From: "If this servicing action does not occur before the timer expires the SWT generates an interrupt or hardware reset. The SWT can be configured to generate a reset or interrupt on an initial time-out. A reset is always generated on a second consecutive time-out."
  - To: "If this servicing action does not occur before the timer expires, the SWT generates an interrupt or hardware reset request. The SWT can be configured to generate a reset request or interrupt on an initial time-out. The SWT always generates a reset request on a second consecutive time-out."
- In SWT Control Register (SWT_CR) description of ITR field
  - Added a Note: "For a description of how this chip implements SWT reset requests resulting from SWT time-outs, see the chip-specific SWT information."
  - In descriptions of field values, changed "reset" to "reset request"
- In Time-out
  - Changed the description of a reset time-out result from "reset" to "reset request"
  - Edited and reorganized entire section

B.44 PIT module changes

- Added information about register access level at the end of each register description

- In PIT_MCR register, added a note to MDIS bit field -"Always write....clock generation module."

- Added note to Example configuration for chained timers

B.45 FlexCAN module changes

- Interrupts
  - In first paragraph, added references to ECC-related interrupts
  - Added new final paragraph about ECC-related interrupts
  - Edited text and standardized format of references to registers

- In Error and Status 1 register (CAN_ESR1) description, incorporated minor edits in first and third paragraphs, and changed second paragraph:
  - from: "The CPU read action clears bits 15-10. Therefore the reported error conditions (bits 15-10) are those that occurred since the last time the CPU read this register. Bits 9-3 are status bits."
  - to: "A CPU read operation clears the following fields to 0, so these fields report error conditions that occurred after the last time the CPU read this register: BIT1ERR, BIT0ERR, ACKERR, CRCERR, FRMERR, and STFERR. TXWRN, RXWRN, IDLE, TX, FLTCONF, and RX provide status information."

- In the Overview section's last sentence of the second paragraph, changed "See the chip configuration details" to "See the chip-specific FlexCAN information"

- Changed "MCU" to "chip" throughout the chapter.

- In Table 45-10 of Rx FIFO structure

- Added "Format" to first column of first row
- Changed notation of bit ranges (in parentheses) for RXIDA, RXIDB_n, and RXIDC_n

B.46 Zipwire module changes

- In Zipwire interconnections : Updated bullet from "Tx and Rx connections to the pads via the SIUL and the MSCR registers" to "Tx and Rx configuration is controlled by LFAST Control registers".
- Removed "LFAST clocking" section.

- In Architecture : Removed paragraph text "The LVDS pads are shared with other I/O and GPIO.".

B.47 SIPI module changes

- In In ARR register added a note "This register is writeable only when SIPI_MCR[INIT] = 1." Also removed sentence, "This register can be read or written anytime." from register description.

- In CCR0[WRT], removed a note "Only transfers with channel 2 can write 1 to this bit. All other channels forces SIPI_CCRn[ST] = 0. The SIPI_CCR2[WRT] and SIPI_CCR2[ST] bits must be set for streaming." from the WRT bit field of CCR0-CCR3 registers.
- Added bit field brief description of WRT bit in CCR2 register.

- Updated bit field access for SIPI_ACR[ADCNT] and SIPI_ACR[Reserved] to read write.

B.48 LFAST module changes

- Editorial changes.

- Removed reference to 312/320 MHz and referred to as high data rate. Updated in:
  - External signals section.
  - LFAST operating data rates section.
  - Features section.
  - Auto correlation section.
  - Figure 48-6 figure.
  - LFAST Speed Control Register (LFAST_SCR) : Updated description for bit-value 1 of RDR and TDR bit.
- Editorial changes.
- Removed table from LFAST operating data rates section.

- LVRXOP bit in LFAST LVDS Control Register (LFAST_LCR) is split into 3 individual bits:
  - LVRXOP[2] changed to LVRXOP_TR.
  - LVRXOP[1] changed to Reserved.
  - LVRXOP[0] changed to LVRXOP_BR.
- Updated the access value of LVLPEN bit to Read/Write in LFAST LVDS Control Register (LFAST_LCR).

- Updated the description of [LVCKSS] bit in LFAST LVDS Control Register (LFAST_LCR).

- In Memory map and register definition, added note "Read/Write accesses to all unimplemented registers and write accesses to Read only register will return a Transfer Error.".
- Updated the register-access value of LFAST Rx ICLC Interrupt Status Register (LFAST_RIISR) register from R/W to W1C.

B.49 SPI module changes

• Included two topics Modified SPI Transfer Format (MTFE = 1, CPHA = 0) and Modified SPI Transfer Format (MTFE = 1, CPHA = 1).
• Reduced bit width of SPI_CTARn_SLAVE [FMSZ] from 5 to 4 and updating the bit to reserved. • In RSER register, added "Always write the reset value to this field." to some of the Reserved bits. Also, updated bit field access to RW for these bits. • In PUSHR register, added note "Always write the reset value to this field." to Reserved bits. Also, updated bit field access to RW for these bits.
• In Memory Map/Register Definition section, added RXFRn to statement re. write accesses results in transfer error. • Updated bit field description for SPI_MCR[PCSIS]. • Updated bit field description for SPI_PUSHR[PCS].
• Updated section, Continuous Serial Communications Clock
• Editorial updates.
• Updated bit field description for SPI_MCR[MTFE] • Updated SPI block diagram.
• Updated SPI_MCR[MDIS] bit field description for setting default reset value to 1 instead of 0. • In SPI_CTARn[FMSZ], updated description of 'fr' to 'register interface clock frequency'.
• Updated register description for SPI_PUSHR and SPI_PUSHR_SLAVE. • Updated bit field description and width for SPI_PUSHR_SLAVE[TXDATA]
• Added note to SPI_MCR[PCSIS] bit field. • Updated bit field description for SPI_TXFRn[TXCMD_TXDATA].
• Changed "MCU" to "chip" throughout the chapter.
• Removed note from Section, SIN—Serial Input
• In Serial Peripheral Interface (), Previous errata e6904 integrated into reference manual: Added note in SPI_RXFRn register description.

B.50 FlexRay module changes

• Memory map and register definition : Editorial updates.
• Slot Status Counter Condition Register (FR_SSCCR) : In FR_SSCCR[STATUSMASK[3:0]] bit field name, removed the text [3:0].
• In Features, added "Dual Channel Support" feature.
• In Memory map and register definition , added a paragraph, "Address offset - 0x0Ah ,0xDEh-0xE0h should not be accessed by application as corresponding feature/s are not available. Therefore, transfer error will not be generated at these offsets."

B.51 SRX/SENT module changes

• In Features changed sentence from "Supports compensation for variation in SENT Tx Clock up to ±25% and adjusts its measurement for drift and jitter in the Transmitter and Receiver clocks per channel" to "Supports compensation for

variation in SENT Tx Clock up to ±25% and adjusts its measurement for drift in the Transmitter and Receiver clocks per channel". • In Slow Serial Message Ready Status Register (SRX_SMSG_RDY) changed Note to "Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver". • In Fast Message Ready Status Register (SRX_FMSG_RDY) changed Note to "Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver". • In Initialization sequence, Note removed as it was taken care of via ERR007425 • In Fast Message DMA Control Register (SRX_FDMA_CTRL) changed Note to "Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver". • In Slow Serial Message DMA Control Register (SRX_SDMA_CTRL) changed Note to "Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver". • In Fast Message Ready Interrupt Control Register (SRX_FRDY_IE), changed Note to "Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver". • In Slow Serial Message Ready Interrupt Enable Register (SRX_SRDY_IE) changed Note to "Reads of bits beyond those for the supported number of channels should be ignored. Writes to these bits is ignored by the Receiver". • In Input programmable filter updated value of FIL_CNT for the example shown and updated the diagram • In CRC check removed Note • In Fast Message Ready Status Register (SRX_FMSG_RDY) removed a Note • In Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CH*n*_CLK_CTRL) added a Note to the field CM_PRSC • In Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CH*n*_CLK_CTRL) changed sentence from "The generated Receiver Clock is compensated for variations, clock drift and jitter that might occur in the Sensor Tx Clock" to "The generated Receiver Clock is compensated for variations and clock drift that might occur in the Sensor Tx Clock". • In Channel 'n' Status Register (n=0 to (CH-1)) (SRX_CH*n*_STATUS) changed SMSG_OFLW bitfield description. • In Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CH*n*_CONFIG) changed description of field values of bitfield SRX_CHn_CONFIG[FCRC_TYPE] and SRX_CHn_CONFIG[SCRC_TYPE]. • In Adjustment for variation in sensor (Tx) clock deleted note that starts with "At ambient ...". • In Receiver diagnostics changed bullet point from "Checksum error. Two 4-bit CRC checks and one 6-bit CRC check according to the message type. User has a programmable option to select the method of CRC to use i.e. Legacy or XOR-based" to "Checksum error. Two 4-bit CRC checks and one 6-bit CRC check according to the message type. User has a programmable option to select the method of CRC to use i.e. Legacy or Recommended.". • In Nibble value check changed intoductory sentence from "As part of this check, the lengths of the following nibbles are checked to remain in between 0 and 15 ticks:" to "As part of this check, the lengths of the following nibbles are checked to remain in between 0 and 15 nibble values(11.5 ticks to 27.5 ticks):". • In CRC check changed text in introductory paragraph from "XOR-based CRC implementation" to "new recommended CRC implementation". • In Pause pulse diagnostic update changed table caption and deleted FMSG_OFLW row. • In High frequency receiver clock (protocol clock) requirements modified entire content within this heading.
• In Data Control Register 1 (SRX_DATA_CTRL1), changed reset value of each 3-bit Reserved field from 001b to 000b. • In Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CH*n*_CLK_CTRL), changed access of CM_PRSC field from read/write to read-only.
• In Time stamp logic changed text: • Was: "For example, if the high frequency receiver clock is 59 MHz, the required prescaler value to generate a time stamp clock of 1 µs resolution is 60"   • Now: "For example, if the high frequency receiver clock is 60 MHz, the required prescaler value is 59 to generate a time stamp clock of 1 µs resolution"
• In DMA Slow Serial Message Bit3 Read Register (SRX_DMA_SMSG_BIT3) changed field name SRX_DMA_SMSG_BIT3[ID7_4_D3_0] to SRX_DMA_SMSG_BIT3[ID7_4_ID3_0].
• Minor editorial changes.
• In Global Control Register (SRX_GBL_CTRL) changed range of values from "1 to 255" to "0 to 255" in GBL_CTRL[TSPRC] field description.
• Previous errata e8082 integrated into reference manual: In Fast messages buffers/FIFO added the note "In the case of a fast message overflow and continuous reading of register …".

B.52 LINFlexD module changes

- Editorial updates in the following sections:
    - Slave mode
    - Identifier filtering
    - Start detection and break delimiter detection in receiver
    - UART receiver
    - UART transmitter

- Previous errata e7589 integrated into reference manual: In the LINTCSR[MODE] field description added NOTEs.

- Added list item, "When IPG_STOP is requested..." in section: Use cases and limitations which was previously deleted.

- Updated the note: "When the MODE bit is 0, any activity on the transmit ..." written in the register description of LINTCSR.
- Updated the reset value note written in the IOPE bit reset value of register LINCR2.

- In section: Master mode, changed 'BDR[0:7]' to 'BDRL and BDRM'

- In section: Memory map and register description,
    - Updated the note: "In Master mode, the registers IFCR0 – IFCR15...". Added table: "Offsets of the register from offsets 8C to 9C", below the note.
    - Minor editorial updates in register 'LINFlexD_LINCR1', bit field 'LASE'
    - Removed phrase "Parity sent is Even" from the bit field description of bits 'WL0' and 'WL1' of register LINFlexD_UARTCR

- In section: Memory map and register description,
    - Removed reset value of register 'LINFlexD_LINSR' and added the following note to the bit reset value of bit field 'RDI:
        - "Reset value of RDI reflects the RX pin state"
    - Updated the bit field description of bit fields 'Reserved' and 'DTE' of register 'LINFlexD_DMATXE'.
    - Updated the bit field description of bits fields 'Reserved' and 'DRE' of register 'LINFlexD_DMARXE'.
    - Removed description/note related to 'ROSE' bit from registers: UARTSR and LINFBRR respectively.

- In section: Timeout error,
    - Changed 'At the end of the ID, ocr_2 is loaded with 36 (maximum possible response space)' to 'At the end of the ID, OC2 is loaded with 36 (maximum possible response space) + LINFlexD_LINTCSR[CNT]'
    - Changed 'ocr_2' to 'OC2'

- In section: Memory map and register description,
    - Removed sentence "The reset value is the 2Dh = 45 ... the LIN specification." from the description of 'HTO' bit of register 'LINTOCR'
- In section: Interrupts, added note: "Rx interrupt due to ... LSIE is enabled." in the figure: 'Interrupt diagram'

- In section: Memory map and register description,
    - In register LINSR,
        - Changed the access of bit field 'LINS' to ROWO (was RO)
        - Added note 'The value of this bit field doesn’t change ... LIN state event. to the bit field description. '
    - In register, UARTSR, updated the bit field description of bit DRFRFE.
    - In register, UARTSR, updated the bit field description of bit DTFTFF.
    - In register LINTOCR, clarified the reset value note of bit field HTO.

- Updated section: Header error

- In section: Memory map and register description,
    - In register UARTCR, enhanced the bitfield description of bits WL0, WL1, PC0, and PC1.

- Updated section: Baud rate generation

- In section: Memory map and register description,
    - In register 'LINESR' updated the bitfield description of 'OCF'

- Added section: LINFlexD Clock Tolerance

• In section Memory map and register description:, updated note 'In Master Mode, read access to IFMI register and ...'
• In section Timeout error, heading Response timeout mechanism: • Changed 'Nominal_time_out-Correction_factor' to 'Nominal_time_out + LINFlexD_LINTCSR[CNT]'   • Added note 'The value of nominal_time_out ... '
• In section Memory map and register description: • Added note: "Any access to A0 location ... transfer error."
• In section: Timeout, figure: Timeout, changed OC1 to OC2 • In section: Timeout error heading: Header timeout mechanism, updated bullet: "If the counter starts after 11 ... " • Updated note: "The LINFlexD module ..." present in UARTCR register.
• Updated section:Timer • In section: Memory map and register description   • Updated the access of register UARTCTO to R in table: LINFlexD memory map   • Removed phrase 'free running' from bit LINTCSR[CNT].

B.53 ENET module changes

• Added Input Capture and Output Compare.
• Corrected field width of ENET_MRBR[R_BUF_SIZE].
• Corrected access type of ENET_ATCR[Reserved] to WOO and added note to its description that it must be written with one.
• In MDIO clause 22 frame format changed "IEEE803.2" to "IEEE 802.3". • Made improvements to Block diagram figure.
• Memory map/register definition : Added statement regarding allowed access width to registers and made editorial changes. • Transmit Inter-Packet Gap (ENET_TIPG) : Corrected description of IPG field. • Inter-packet gap (IPG) : Corrected text regarding IPG values. • Removed sentences regarding register reset/initialization in Physical Address Lower Register (ENET_PALR) and Physical Address Upper Register (ENET_PAUR). • Corrected references to specific bit numbers in ENET_RDSR, ENET_TDSR, and ENET_MRBR descriptions. • Improved descriptions of Statistic Registers fields. • Removed Receive Parser block from Figure 53-5.
• Updated COUNT field descriptions in Frames Received OK Statistic Register (ENET_IEEE_R_FRAME_OK), Frames Transmitted with Single Collision Statistic Register (ENET_IEEE_T_1COL), and Octet Count for Frames Received without Error Statistic Register (ENET_IEEE_R_OCTETS_OK). • Changed occurrences of DMA to uDMA, where appropriate, for clarity. • Added note to ENET_IEEE_T_FRAME_OK[COUNT] description. • Added note to ENET_IEEE_R_OCTETS_OK[COUNT] description. • Added receive and transmit FIFO depths to FIFO thresholds.
• Added description of uDMA to Overview. Replaced "DMA" with "uDMA" in Transmit FIFO Watermark Register (ENET_TFWR) and Soft reset. • Added sections for RMON_T_DROP, IEEE_T_DROP, IEEE_T_SQE, and RMON_R_RESVD_0 registers. • Added new IEEE 802.3 Clause 45 content: • Added this feature to Ethernet MAC features.   • Modified ENET_MMFR field descriptions.   • Changed content and title of MDIO clause 22 frame format.   • Added MDIO clause 45 frame format. • In ENET_TCSRn[TMODE} description, changed "1100 Reserved" to "110X Reserved". • External signal description : Corrected description of ENET_TCSR*n*[TIE] regarding interrupts. Corrected description of ENET_TCSR*n*[TIE] regarding DMA requests.
• Maximum Receive Buffer Size Register (ENET_MRBR) : Edited register and field descriptions for clarity regarding max. receive buffer size and how value is formed.

- Collision detection and handling — half-duplex operation only : Added Warning regarding use of Ethernet PHYs that support the "heartbeat" feature.

- Changed both MAC frame format overview figures in Ethernet MAC frame formats.
- Changed field description of ENET_ATCR[CAPTURE].
- Edited introductory text in Memory map/register definition.
- Edited description for Overrun in Enhanced receive buffer descriptor.
- Edited Overview and removed "10/100" in last paragraph.
- Editorial changes.

- Timer Period Register (ENET_ATPER) : Added note to PERIOD description about value.

- MII Speed Control Register (ENET_MSCR) :
  - Changed "internal module clock" to "internal module clock (i.e., IPS bus clock)".
  - Edited MII clock freqency calculation example.
  - In header of "Programming Examples for MSCR" table, changed "Internal MAC clock frequency" to "Internal module clock frequency".
- Receive FIFO overflow : In MII Receive portion of diagram, changed "MII_RXEN" to "MII_RXDV".
- MDIO clock generation : Changed "internal bus clock" to "internal bus clock (i.e., IPS bus clock)".

B.54 MC_RGM changes

- No substantial content changes

B.55 BAM changes

- No substantial content changes

B.56 SSCM module changes

- Updated Features list

- In CERS bit description, added "If a non-permanent error is detected, this bit can be cleared by writing a 1."

- In Table 56-8 updated 0:31 | 0100_000Ah to 0:31 | 0100_000Ch

- In Boot mode functionality in SBL bullet removed text "(support for the FlexRay interface is planned on future devices)".
- In Hardware configuration removed table column "standby RAM boot flag".
- In Securing the microcontroller added "DCF" to the table titles for Table 56-8, Table 56-9, and Table 56-10.

- In Boot and alternate boot sectors updated second bullet.

- In CER removed "(with PARITY enabled)" from the bit description.

- In CERS added cross-reference to CERS-DCF Mechanism.

- In SSCM System Status (SSCM_STATUS) register's CER field description, changed first sentence and added sentence:
  - was: "This field indicates that the SSCM has detected a configuration error during reset while loading DCF clients."
  - now: "This field indicates that the SSCM has detected a configuration error during reset while loading initial device configuration. See the chip-specific SSCM information for details about sources of the error."

- Added section: CERS-DCF Mechanism

- In Memory map and register definition, added additional text ("that is, you should not..") to note regarding register accesses.
- Editorial changes.

- Revised CERS-DCF Mechanism.
- In CER, added cross-reference to CERS-DCF Mechanism.

- Note updated in Memory map and register definition from "SSCM does not support transfer errors in memory holes" to "SSCM does not generate transfer errors in all memory holes".

- Previous errata e8014 integrated into reference manual, Added a note "When external reset......... reset" in Unsecuring the microcontroller section.

- Removed sentence "To modify.....password" in Securing the microcontroller section.

B.57 PMC changes

- In Default Mode removed paragraph: "This startup self test function also provides gating of the reset phase3 exit in MC_RGM. This means the MC_RGM will not be able to exit from phase 3 until the self test is successfully completed."

- In Reset Event Selection 0 (PMC_RES_0) description, added second sentence to Note: "The user should configure a functional reset for an LVD/HVD only for debugging purposes and never for any actual application."

- For Event Status Register 0 (PMC_ESR_0)
  - Changed access of register from read/write to "write 1 to clear"
  - Changed access of every implemented field from read/write to "write 1 to clear"
  - Replaced VD0_C, VD15_C, VD12_C, VD5_C, VD2_C, and VD1_C with Reserved fields
- In Temperature Event Status register (PMC_ESR_TD) for TEMP1_3, TEMP1_2, TEMP1_0, TEMP0_3, TEMP0_2, and TEMP0_0 fields:
  - Changed access of these fields from read/write to "write 1 to clear"
  - In description of these fields, changed second sentence:
    - from: "It is asserted when the temperature exceeds its corresponding threshold, and clears when the temperature falls below its corresponding threshold and a one is written to this bit location."
    - to: "Its value becomes 1 when the temperature exceeds its corresponding threshold, and that value clears to 0 when 1 is written to this location."
  - In description of these fields, removed sentences about field dependencies (following sample is from TEMP1_3 description): "If the IER[TS1_3IE] bit is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP1_3] is also asserted, a system reset is generated, which clears IER[TS1_3IE] and negate the interrupt request. If REE_TD[TEMP1_3] is asserted and a destructive reset is selected (via RES_TD[TEMP1_3] being 0), then a destructive reset is generated. If RES_TD[TEMP1_3] is set, then a functional reset is generated."
- In Temperature Event Status register (PMC_ESR_TD) for TEMP1_3_OP, TEMP1_2_OP, TEMP1_0_OP, TEMP0_3_OP, TEMP0_2_OP, and TEMP0_0_OP fields:
  - In description of these fields, added sentences about field dependencies that were removed from corresponding TEMPn_m description (following sample is from TEMP1_3_OP description): "If IER[TS1_3IE] is also asserted, an interrupt is sent to the CPU. If REE_TD[TEMP1_3] is also asserted, a system reset is generated, which clears IER[TS1_3IE] and negates the interrupt request. If REE_TD[TEMP1_3] is asserted and a destructive reset is selected because RES_TD[TEMP1_3] is 0, then a destructive reset is generated; if RES_TD[TEMP1_3] is 1, then a functional reset is generated."

- In Temperature Reset Event Enable register (PMC_REE_TD) description, added Note and changed second paragraph:
  - from: "These bits are loaded from flash memory during the boot sequence. If the values loaded from flash memory are 1, enabling the reset event, these bits cannot be cleared to 0 to disable the event."
  - to: "The register's reset value applies until the portion of the boot sequence that loads a value for the register from a DCF record in the UTEST area of flash memory. The DCF record for this register is PMC_LVD_MISC. The user can change the loaded value by programming a new DCF record for PMC_LVD_MISC in the UTEST

area. If the loaded value programs any flag bit to be enabled (set to 1), the bit cannot be disabled (cleared to 0) by software through IPS programming."

- In Temperature Reset Event Selection register (PMC_RES_TD) description, added new second paragraph: "The register's reset value applies until the portion of the boot sequence that loads a value for the register from a DCF record in the UTEST area of flash memory. The user can change the loaded value by programming a new DCF record in the UTEST area."

- In Reset Event Enable 0 (PMC_REE_0) description:
  - Removed from first paragraph: "These bits are loaded from the flash during the boot sequence. If the flash loaded bits are programmed to be enabled (set), these bits cannot be disabled (cleared)."
  - Added new second paragraph: "The register's reset value applies until the portion of the boot sequence that loads a value for the register from a DCF record in the UTEST area of flash memory. The user can change the loaded value by programming a new DCF record in the UTEST area. If the loaded value programs any flag bit to be enabled (set to 1), the bit cannot be disabled (cleared to 0) by software through IPS programming."
- For following Reset Event Enable 0 (PMC_REE_0) fields, clarified voltage-detect event to which each field applies:
  - VD6RE_C
  - VD4RE_C
  - VD3RE_H
  - VD3RE_C

- For Event Status Register 0 (PMC_ESR_0) field VD4_C
  - Changed first sentence of field description from "This read-only bit is the low-voltage status flag associated with the voltage level detect for the low voltage cold point supply" to "This read-only bit is the high-voltage status flag associated with the voltage level detect for the high-voltage cold point supply."
  - In description of field value 1, changed "HVD occurrence detected on the low voltage supply" to "HVD occurrence detected on the high-voltage supply."

B.58 MC_PCU changes

- No substantial content changes

B.59 MC_ME changes

- Previous errata e6574 integrated into reference manual:
  - In HALT0 Mode, added a new paragraph "If a HALT0 mode transition request is generated at the same time that an interrupt request occurs ...."
  - In STOP0 Mode, added a new paragraph "If a STOP0 mode transition request is generated at the same time that an interrupt request occurs ......"

- In HALT0 Mode, added a new bullet "XBAR masters cannot operate in system HALT0 mode as they are clock gated. Also, NPC should be enabled if mode transition is initiated while debugger is connected."
- In STOP0 Mode, added a new bullet "XBAR masters cannot operate in system STOP0 mode as they are clock gated. Also, NPC should be enabled if mode transition is initiated while debugger is connected."

- Added a new section: Mode transition and progressive clock switching
- In System Clock Switching, updated paragraph "If the value of the PWRLVL field of the ME ..."

B.60 Core Debug Support changes

- No substantial content changes

B.61 JTAGC module changes

- No substantial content changes

B.62 Core Nexus Module changes

- Nexus Development Control Register 4 (DC4) :
  - Corrected broken link.
  - Removed footnote from "DC4 field descriptions" table.

- Replaced nex_evto_b with evto_b throughout chapter.

- Added missing TSTAMP sub-row to each Message Name row in Table 62-2 table.
- Data Acquisition Trace event : in figure, corrected "TCODE(011011)" to "TCODE(000111)".
- Added Timestamp field (TSTAMP).
- Data Trace Messaging (DTM) : Changed "in one of three ways." to "in one of the following ways."

B.63 NXMC module changes

- Previous errata e7974 integrated into the Reference Manual: Added Note in DTM overflow error messages, "The internal queue FIFO is very small. This causes FIFO overflows whenever Trace is enabled on any of the AHB clients and the AHB master module generates >4 burst accesses. If the customer is experiencing a lot of overflow error messages the the amount of data snooped by the NXMC should be reduced."

- Editorial change in DTM overflow error messages section

B.64 NPC module changes

- Updated PCR[FPM] description from "1 Reserved" to "1 Aurora mode enabled" .

- In Port Configuration Register (PCR), added "Nexus" to PCR[FPM] description.

- Updates throughout: removed various instances of "auxiliary", changed "auxiliary" to "output", changed "Auxiliary" to "Nexus" and removed text "As an alternative to data transmission on the Nexus auxiliary port".
- In Port Configuration Register (PCR) :
  - Added text "Set to 000 when Nexus Aurora mode is enabled" to PCR[MCKO_DIV] description.
  - Updated PCR[FPM] description.

- In Port Configuration Register (PCR), added text "While enabling the low power mode handshake (setting LP_DBG), the debugger should simultaneously set the LPn_SYN bit. At the end of low-power mode handshake, the LP_DBG and LPn_SYN should be set again if further handshakes between the device and debugger are required." to second paragraph.

B.65 NAL changes

- No substantial content changes

B.66 Nexus Aurora Phy changes

- No substantial content changes

B.67 CRC module changes

- Title corrected for section "Register programming".
- Added information about register access level at the end of each register description.
- Editorial changes.
- In CRC_CFG*n*[SWAP], updated bit description text from "The swap operation is a bit-by-bit rotation of the content" to "The swap operation is a bit-by-bit swapping of the content".
- In CRC_CFG*n*[INV], removed the bit-description text "in case of CRC-CCITT polynomial, the inversion operation is applied on the 16 least-significant bits.".
- Updated title of Signal description section to External signal description.
- In Block diagram, updated reference to Main features section to see the number of contexts of CRC.

B.68 MEMU changes

- In Memory map and register definition, added register access level information to all register descriptions.

- Previous errata e8145 integrated into this reference manual: In System RAM uncorrectable error reporting table address register (MEMU_SYS_RAM_UNCERR_ADDR), in the ERR_ADD field description, deleted "This register must be READ ONLY when its corresponding valid bit is not asserted."
- Previous errata e8145 integrated into this reference manual: In Peripheral RAM uncorrectable error reporting table address register (MEMU_PERIPH_RAM_UNCERR_ADDR), in the ERR_ADD field description, deleted "This register must be READ ONLY when its corresponding valid bit is not asserted."
- Previous errata e8145 integrated into this reference manual: In Flash memory uncorrectable error reporting table address register (MEMU_FLASH_UNCERR_ADDR), in the ERR_ADD field description, deleted "This register must be READ ONLY when its corresponding valid bit is not asserted."

- Editorial changes.
- In Introduction and Features :
  - Standardized the names of the error-reporting categories for consistency:
    - System RAM
    - Peripheral RAM
    - Flash memory
  - Changed "see the Device Configuration chapter that describes how modules are configured and connected" to "see the chip-specific MEMU information."

• In Design overview, changed "see the Device Configuration chapter that describes how modules are configured and connected" to "see the chip-specific MEMU information." • In Flash memory correctable error reporting table status register (MEMU_FLASH_CERR_STS*n*), in the BAD_BIT field description, changed "bit position in RAM" to "bit position in flash memory".
• Revised Figure 68-2 and Figure 68-3. • In System RAM uncorrectable error reporting table address register (MEMU_SYS_RAM_UNCERR_ADDR), added "This field must be read-only when its corresponding valid bit (SYS_RAM_UNCERR_STS[VLD]) = 0." to the ERR_ADD field description. • In Peripheral RAM uncorrectable error reporting table address register (MEMU_PERIPH_RAM_UNCERR_ADDR), added "This field must be read-only when its corresponding valid bit (PERIPH_RAM_UNCERR_STS[VLD]) = 0." to the ERR_ADD field description. • In Flash memory uncorrectable error reporting table address register (MEMU_FLASH_UNCERR_ADDR), added "This field must be read-only when its corresponding valid bit (FLASH_UNCERR_STS[VLD]) = 0." to the ERR_ADD field description.
• In Design overview, deleted "The MEMU block has three instantiations of the basic reporting block along with a common CPU interface for the user software to access the storage block.". • In Overview, deleted the paragraph beginning with "The Control, Error Flag, and Debug".

B.69 FCCU module changes

• EOUT interface   • Reorganized the sentence about resets' effect on failure indication pins as two sentences and a list   • In the list, added "FOSU time-out reset" as a reset type that influences the state of failure indication pins
• Changed reset value of FCCU_CTRL register from 0x0000_0000 to 0x0000_00C0. (OPS field changed from 00b to 11b.)
• In NCF Fake Register (FCCU_NCFF), changed register description.
• INTRODUCTION SECTION - Removed phrase "(after the boot)"
• INTRODUCTION SECTION - Change "Internal reactions (independently configurable for each NCF):" to "Configurable internal reactions for each NCF:" • INTRODUCTION SECTION - Change "External reaction (failure is reported to the outside world via one or more output pins)" to "External reactions via configurable output pins" • INTRODUCTION SECTION - Removed phrase "without CPU intervention". • INTRODUCTION SECTION - Removed phrase "for application/test/debugging purposes" • INTRODUCTION SECTION - Changed "FCCU is designed for assuming that the system clock is faster than the IRC clock" to "The FCCU is designed to function when the system clock is faster than the IRC clock." • FSM description - Change "After reset lifts, the state shall be transiently locked (permanent lock → is unlocked and transient lock → is locked)." to "After the release of reset the state of the transient lock will be locked. The state of the permanent lock will be unlocked." • In the FCCU_CTRLK register description, change note "There should not be any other operation in between the above steps." to "The FCCU_CTRLK and FCCU_CTRL registers must be written with consecutive instructions. Both registers must be written as 32-bit values. Do not use read-modify-write instructions, such as bit field instructions, to modify these registers." • In section FCCU_DELTA_T, FCCU_IRQ_ALARM_ENn, FCCU_NMI_ENn, FCCU_EOUT_SIG_ENn descriptions: Changed, "This register can be written only when the FCCU is in CONFIG state." to Note. • In FCCU_CFG_TO description changed "oscillator" to "IRCOSC". Changed part of description to Note.
• For FCCU_NCF_CFGn, FCCU_NCFS_CFGn, FCCU_NCF_En, FCCU_NCF_TOEn and MCS registers: Changed the reset value of the registers from 0x0000_0000 to X. Added the following footnote to each register: The reset value is chip-specific. See the chip-specific FCCU information. Added the following note to register descriptions: The reset value is chip-specific. See the chip-specific FCCU information. For all configuration registers, made the following text into a note: These registers can be written only when the FCCU is in CONFIG state. • INTRODUCTION -- Changed bullet item "Configurable and graded fault control" to "Configurable fault control" • INTRODUCTION -- In bullet item "Permanently locked until next reset ...., Changed "FCCU_TRANS_LOCK" to "FCCU_PERMNT_LOCK"

• INTRODUCTION -- Changed "failure indication" to "error out" • MAIN features -- Changed "Failure indication" to "Error indication" • FSM description -- Changed reference to state diagram. • FSM description -- Changed "Following one of the following events" to "Following state transitions occur on one of the following event" • Corrected notation for binary numbers. • FCCU state diagram -- Changed block text on CONFIG state from "AND NOT (configuration locked)" to "AND (configuration unlocked)" • FCCU state diagram -- Added block text to ALARM state -- "Actual text in diagram is "Any Fault Pending AND FCCU_IRQ_ALARM_ENn"" • EOUT interface -- Throughout section changed uppercase "ERROR" to "FAULT".
• At the end of EOUT interface section, added NOTE on state of EOUT pads.
• FCCU_CTRL register, FILTER_WIDTH field -- Changed 10 bit description from "filters glitches up to 100 µs for 20 MHz IRC clock" to "filters glitches up to 100 µs". Changed 11 bit description from "filters glitches up to 100 µs for 20 MHz irc clock" to "filters glitches up to 100 µs"
• Added the following note to the FCCU_NCFS_CFGn and FCCU_NMI_ENn register descriptions: Do not configure the same channel for both a RESET reaction in the FCCU_NCFS_CFGn register and an NMI reaction in the FCCU_NMI_ENn register at the same time. • The following text was added to the EIN1 bit description of the FCCU_EINOUT register -- While this field is set to zero by reset, a read of this field always returns the logic value on the fccu_ein[1] pin. The following text was added to the EIN0 bit description of the FCCU_EINOUT register -- While this field is set to zero by reset, a read of this field always returns the logic value on the fccu_ein[0] pin.
• Acronyms and Abbreviations section: Added IRCOSC entry into the Acronyms and Abbreviations table. • FCCU_CTRL register, removed "configure the glitch filter present on location given by FILTER_POSITION parameter" • FCCU_CTRL[DEBUG] description, changed ipg_debug to debug. • Added the note "The reset value is chip-specific. See the Chip Configuration chapter for details." at the beginning of the following sections: NCF Configuration Register (FCCU_NCF_CFGn), NCFS Configuration Register (FCCU_NCFS_CFGn), NCF Enable Register (FCCU_NCF_En) and NCF Time-out Enable Register (FCCU_NCF_TOEn)
• Minor non-technical grammatical corrections. • FCCU_CFG_TO register description - replaced "See FCCU register set table." with "The description for a configuration register will contain a NOTE that it is writable only in the CONFIG state."
• FCCU_CFG register, FOP bit field description -- added the following note: The FCCU_CFG register value after a CFG timeout will be 0x0000_0008.
• In Dual-rail protocol, corrected the error-phase portion of Figure 69-11.
• FCCU_STAT register, STATUS field -- Changed "UNKNOWN" to "Reserved" in bit field descriptions. • Use Cases and Limitations section, Misconfigurations heading -- removed "Software reset is optional. NOTE: Software reset is not required for all devices." • FCCU_CFG register, FOP field description -- Changed "EOUTirq = / (FOP + 1) ...." to "EOUTirq = / (FOPE:FOP + 1) ...."
• In Definitions, after the list of applicable reset types, added this information: *For more information on each type of reset, see the MC_RGM and reset chapters.*
• In the FCCU_CFG register description, rewrote the field descriptions for FOPE and FOP.
• In the FCCU_CFG_TO register description, added this note to the register's function description: *When the configuration watchdog timer expires, FCCU changes the value of this register to its reset value.* • In the FCCU_EINOUT register description, added this note to the description of the EOUT1 and EOUT0 fields: *When the configuration watchdog timer expires, FCCU changes the value of this field to its reset value.* • In the FCCU_STAT register description, changed the access type of the ESTAT field from *RW* to *RO*.
• In FSM description, added the paragraph that begins with the sentence *Multiple faults can occur at the same time.*
• In FSM description, added the paragraph that begins with the phrase *After moving to FAULT state*. • In OPR, added statement about OP15.
• In the FCCU_CFG register description, in the description for the FCCU_SET_CLEAR field, changed *by writing into these fields with 00 or 10 or by going to CONFIG state* to *by writing into these fields with 00 or 10*.

• In the FCCU_CFG register description, for the FCCU_SET_CLEAR field, changed the meaning of the value 01 from *Error Pin goes in Faulty state* to *Both error signals are set to low*. • In the FCCU_CFG register description, for the FCCU_SET_CLEAR field, changed the meaning of the value 11 from *write: Error Pin goes OK state (write not possible when FCCU already in the T min timer phase or if FSM enters in FAULT state by capture of a fault)* to *Both error signals are set to high (write not possible when FCCU is already in the T_min timer phase or if FCCU enters Fault state by capture of a fault)*.
• In FSM description, added two paragraphs that begin with the phrase *All pending faults that occur during CONFIG state*.
• In Main features, changed *Fault detection collection* to *Fault detection and collection*. • In Block diagram, changed the stem sentence for the table to *This table describes the FCCU submodules.*
• In FCCU Output Supervision Unit, changed the first sentence of the third paragraph to *There is a 'do nothing' input coming from the FCCU that indicates that the FCCU is programmed for no reaction for ALL FAULTS*
• In Definitions, changed the descriptions of the reset types from a list to a table, clarified the description of the destructive reset, and corrected the descriptions of the long and short functional resets.
• In the FCCU_CFG register description, added this note: *If you specify a new value for any of the fields in this register that affect the EOUT signals while the EOUT fault-indication timer is running (FCCU is indicating a fault on the EOUT signals), FCCU doesn't use the new settings you specified until after the EOUT fault-indication timer expires (FCCU stops indicating a fault on the EOUT signals).*
• Changed all references to the IRCOSC and RCOSC clocks so they are in terms of CLKSAFE, which represents either CLKSAFE0 or CLKSAFE1, both of which appear on the boundary of the module. • In EOUT interface, deleted this sentence: *The EOUT frequency is generated by dividing the CLKSAFE frequency by a fixed factor of* 2^{18}.
• Rewrote Signals (previously titled "Pinout"). • In the FCCU_DELTA_T register description, rewrote the field description for DELTA_T.
• In Introduction, changed *when the system clock is faster than the IRC clock* to *when CLKSYS is faster than the CLKSAFE clocks*. • In Acronyms and abbreviations, removed the row for IRCOSC. • In Acronyms and abbreviations, added a row for CF. • Rewrote NMI/WKPU interface. • Revised Figure 69-6 to use signal abbreviations that match those used in NMI/WKPU interface and now described in Signals. Also changed *All NMI signals are shown active-low* to *All NMI signals shown are active-low*.
• In Figure 69-14, added the following note: *The fault sources shown are examples only.*
• In the Noncritical Fault Timeout (FCCU_NCF_TO) register description, deleted the register reset value and replaced it with a footnote to indicate that it is chip-specific. Also corrected the register access type to *RW* and edited the register description for grammar and style. • In the Noncritical Fault Configuration (FCCU_NCF_CFG*n*) register description, deleted the register reset value and replaced it with a footnote to indicate that it is chip-specific. Deleted the following redundant note: *The reset value is chip-specific. See the chip-specific FCCU information.* Edited the register description for grammar and style.
• In the FCCU_MCS register description, changed the reset value of the register to 0 with a footnote to indicate that the MC_ME module changes the value of the register immediately after the chip leaves RESET mode. Rewrote the rest of the register description for clarity.
• For Reserved field of Configuration (FCCU_CFG)   • Changed the field access from read-only and always zero to read/write.   • In field description, added text: "Always write the reset value to this field."
• In the FCCU_CFG register description, added a footnote to the diagram to indicate that the register reset value is chip-specific. Deleted a similar note in the function description. Changed the access type of some reserved fields. • In the Noncritical Fault Timeout Enable (FCCU_NCF_TOE*n*) register description, changed the register access type to *R/W*. • In the FCCU_CFG_TO register description, deleted the register reset value and replaced it with a footnote to indicate that it is chip-specific.
• In the FCCU_STAT register description, in the description of the ESTAT field, deleted this paragraph: *SW can write this bit with a different value. The new value is valid for 1 clock cycle, thereafter it returns to indicate the actual value being driven from FCCU. For example in non-faulty states, this bit reads 0 and can be set for one cycle to 1. Similarly*

in faulty state, this bit reads 1 and SW can write it to 0 and after one cycle the bit reads 1 again. Edited the ESTAT description for style.

- In the FCCU_CTRL register description, rewrote the description of the DEBUG field.
- In Register descriptions, replaced the two paragraphs that begin with *The FCCU generates an access error in the following cases* with a paragraph that begins with *Follow these register-access guidelines*.

- In Use cases and limitations, changed all occurrences of *Tmin* to *T_min*.
- In the FCCU_DELTA_T register description, added this note to the end of the description of the DELTA_T field: *The specified values for DELTA_T may vary ±2% due to the post-trimming inaccuracy of the CLKSAFE clocks.*
- In Introduction, removed this sentence from the list because it duplicates information in the description of FCCU_DELTA_T[DELTA_T] and provides the wrong maximum value for DELTA_T: *T_min = 250 µs + delta_T, with delta_T parameter being configurable by SW up to 16.67 ms*.
- In STCU interface, changed *This feature is optionally programmable inside the STCU.* to *This feature is optionally programmable using MC_RGM.*

- In Introduction :
  - In the sublist for the list item *Configurable internal reactions for each NCF*, changed *No reset reaction* to *No reaction*.
  - Changed the list item *After power-on the error out pins have high impedance. FCCU goes to operational state only on software request.* to *After power on, the EOUT signals have high impedance. They show operational state only on software request.*

- In Definitions, in the list item *HW recoverable fault*:
  - Changed *until the fault cause is asserted* to *until the fault cause is deasserted*.
  - Changed *That is, if 0 on the fault signal indicates fault, then the status flags are valid until the fault line is '0'* to *That is, if logical 0 on the fault signal indicates fault, then the status flags are valid as long as the fault line stays at 0*.
  - Changed *Typically the fault signal is latched in an external module at the FCCU* to *Typically the fault signal is latched external to the FCCU in the module where the fault occurred*.

- In FSM description :
  - Edited the content for style and usage.
  - In the list item *Configuration*, changed *The configuration state is used only to modify the default configuration of the FCCU* to *Used only to modify the configuration of FCCU from its default*.
  - In the stem sentence for the second list, changed *The transition from NORMAL/ALARM state goes along with the generation of* to *The transition from Normal/Alarm to Fault state goes along with the generation of*.

- In section Block diagram, Figure 69-1 :
  - Corrected bidirectional arrow between "FAULT" and block "FAULT intf" to a unidirectional arrow from "FAULT" to "FAULT intf".
  - Added "IRQ" to text label "MC_RGM, NMI"
- In section FSM description in the second paragraph of the first bullet, modified sentence "The permanent configuration lock can be disabled by a reset of the FCCU".
- In section FCCU Output Supervision Unit :
  - In the third paragraph, corrected "an enabled fault" to "a disabled fault".
  - In the fourth paragraphs, corrected "the FCCU does not check..." to "the FOSU does not check..."

- In EOUT interface :
  - Edited the section for style, usage, grammar, clarity, and structure, which included reordering some information and moving some information to the appropriate register descriptions.
  - Changed *Destructive reset* to *Destructive reset (including when an FOSU timeout occurs due to FCCU failing to react)*.
  - Deleted the list item *FOSU timeout reset*.
  - Changed *The FCCU provides up to two bidirectional signals (EOUT interface)* to *The FCCU provides up to two bidirectional signals (EOUT[1:0])*.
  - Changed *These signals need to be mapped to appropriate pins for external visibility* to *For information on the availability and names of these FCCU signals on the boundary of this chip, see the chip-specific FCCU information*.
  - In the list that begins with *These resets influence the state of the failure indication pins*, changed *Pin reset (RESET_b)* to *Chip pin reset (RESET_B)*.

- In the FCCU_CFG register description, edited the following field names and descriptions for clarity:
  - FOPE
  - SM

• PS • FOM • FOP
• Rewrote the FCCU_EOUT_SIG_EN register description for clarity. • Added the following note to the FCCU_EOUT_SIG_EN[EOUTENx] field description: *To ensure that the FOSU module is aware that fault-output signaling is enabled as a reaction for the associated noncritical fault channel (so that FOSU doesn't mistakenly generate a destructive chip reset), you must set this field to enabled when FCCU is configured for any mode other than Bistable fault-output mode.*
• In FSM description, in the list item *Configuration*, added the following: *The locking feature only restricts the FSM movement into Configuration state. Once the user enters Configuration state and then tries to lock the configuration by writing either to TRANS_LOCK or PERMT_LOCK, the locking of configuration will be effective after FCCU moves to Normal state, it will not be effective in the current Configuration state.*

B.70 STCU2 changes

• In Startup self-test mode selection, added Note: "During startup self-tests, once the STCU2 registers are configured they cannot be overridden." • In "Shutdown self-test initiation procedure, added Note: "During shutdown self-tests, once the STCU2 registers are configured they cannot be overridden via IPS until the self-testing is complete."
• Added modules for Partition C0 in Table 70-6. • Added a note "Make sure that the flash is in IDLE state before starting LBIST (Self Test) operation." in Use cases and limitations.
• In Table 70-6, added RCCU module in Partition C1 and ENET module in Partition P0.
• Updated STCU online configuration in Table 70-4.

B.71 REG_PROT module changes

• In Memory map and register definition, made editorial changes.
• In Overview, added AIPS_LITE as an option to use the term PBRIDGE (PBRIDGE/ AIPS_LITE). • In General, modified the sentence "For all addresses that are protected …" to "For all addresses (peripheral registers) that are protected ….". • Removed topic "Initialization/application information".

B.72 WKPU module changes

• Editorial changes.
• In NMI Configuration Register (WKPU_NCR), changed the field name in NCR[NDSS0] note from HID0[MCP_EN] to HID0[EMCP].
• In WKPU memory map and register definition, modified the note "Reserved registers will read...". • In NMI management, added a sentence "Please see chip specific section for details on NMI implementation".
• Added register access level information.
• In Non-maskable interrupts, changed "The WKPU supports the capturing of a second event per NMI input before the interrupt is cleared, thus reducing the chance of losing an NMI event" to "The WKPU supports the capturing of a

second event per NMI input before the interrupt is cleared, thus reducing the chance of losing an NMI event, though it creates an overrun condition."

- Changed NMI Status Flag Register (WKPU_NSR) access type from read/write to W1C.
- In External signal description, deleted a paragraph.

B.73 Protected Registers changes

- No substantial content changes
